### WILLIAM SAUNDERS, M.D. F.R.S.

FELLOW OF THE ROYAL COLLEGE OF PHYSICIANS;
OF THE ANTIQUARIAN AND OTHER SOCIETIES;

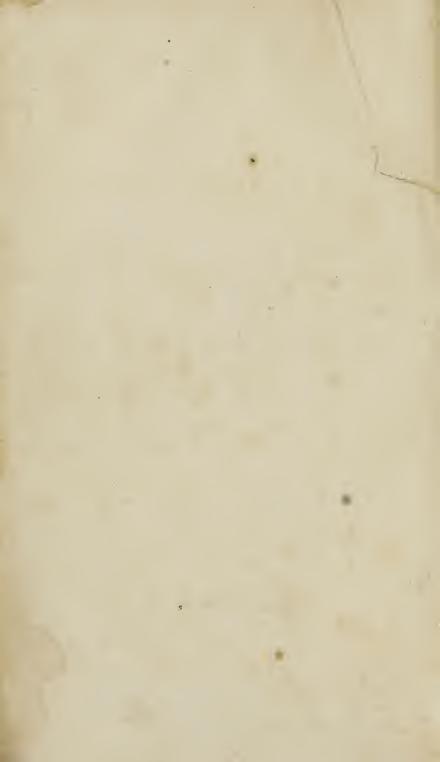

THIS WORK IS DEDICATED,

AS A MARK OF RESPECT AND ESTEEM,

BY HIS SINCERE FRIEND,

THE AUTHOR.

A. BITNER Jr.

## PREFACE.

WHEN Dr. Quincy published the first edition of his Lexicon Medicum, mathematical principles were generally adopted to explain the actions of the animal frame: hence we find in his work a continual recurrence to them. Since his time the functions of the animal economy and the knowledge of anatomy have received successive improvements, and the fashionable follies of mathematical explications have been reduced to their proper standard. To preserve the name which Dr. Quincy so deservedly obtained, and to render his work as useful as possible, such alterations and amendments were made in every following edition, as were suited to the doctrine of the times. It nevertheless has so happened, that his work, even in the thirteenth edition, contains very many of the absurdities of his day: The anatomical explanations are given in the language of the old schools, too often tedious, and abounding with every hypothesis; the physiology of the human body has been almost wholly overlooked; and all useful nosological descriptions omitted. Similar deficiences and useless exuberances occur in every other department of the work.

When, therefore, the present editor was solicited to undertake its revision, he thought he could not do a more acceptable office to the public, than almost wholly new model it. With this view he has been careful to collect such information as may render the work generally useful. Particular attention has been paid to the derivation of the terms, the anatomical description of the various parts, and the explanation of their functions; the diseases are considered according to the most approved nosological arrangement, and their symptoms and distinctions clearly enumerated: the materia medica and the preparations, especially those which enter the last edition of the London Pharmacopæia, have been amply considered; the improvements of modern Chymistry every where introduced, and the terms in Surgery, Midwifery, Medical Botany, and other Branches of Natural Philosophy, as far as connected with Medical Science, have been fully treated. In doing this, the editor has availed himself of the labours of the most eminent writers on the different branches of medicine, and has made such extracts, abridgments, translations, and selections, as the extent of the work would admit. It was his original intention to have given to each writer the merit of the particular description selected from his work; but having occasion to consult, frequently to abridge, and sometimes to alter various passages in works connected with his subject: and finding it difficult. and in many instances impossible to discover the original writer of several articles; and at the same time attended with no particular dvantage, he prefers making a general acknowledgment of his oblirations than to particularize the respective labours of each individual.

The following have principally contributed toelucida to the several subjects. Accum, Aiken, Albinus, Bell, Bergius, Blanchard, Burns, Burserius, Callisen, Castelli, Chaptal, Cooper, Cruickshank, Cullen, Denman, Duncan, Edinburgh Dispensatory, Endinburgh Encyclopædia, Editors of Motherby's Dictionary, Fourcroy, Green, Haller, Hunter, Innes, Latta, Lavoisier, Lewis, Linnæus, Meyer, Murray, Nicholson, Pott, Richeraud, Richter, Sannders, Sanvage, Scarpa, Smith, Sæmmering, Swediaur, Symonds, Thomas, Thomson, Turton, Vaughan, Vossius, Willan, Willich's Encyclopædia, Wilson, Woodville.

A. BITNER Jr.

#### A NEW

# MEDICAL DICTIONARY.

-----

. AA. ANA. (From ava, which signifies of each.) A term in pharmacy.

It is never used but after the mention of two or more ingredients, when it implies, that the quantity mentioned of each ingredient should he taken; e.g. B. Potassæ nitratis: Sacchari albi āā Zj. i. e. Take the nitrate of potash and white sugar, of each one drachm.

ABAM. A term used by some ancient

chymists for lead.

ABACTUS. Abigeatus. Among the ancient physicians, this term was used for a miscarriage, procured by art, or force of medicines, in contradistinction to abortus, which meant a natural miscarriage. moderns know no such distinctions.

ABACUS. (From a Hebrew word, signifying dust.) A table for preparations, so called from the usage of mathematicians of drawing their figures upon tables sprin-

kled with dust.

ABAISIR. Abasis. Spodium Arabum. Ivory black; and also calcareous powder. ABALIENATIO. A decay of the body, or

mind.

ABALIENATUS. Corrupted. A part so destroyed as to require immediate extirpation; also the fault or total destruction of the senses, whether external or internal, by disease.

ABANET. (Hebrew, the girdle worn by

the Jewish priests.) A girdle-like bandage.

Aranga. Ady. The palm of the Island of St. Thomas, from which Thernal's re-

storative is prepared.

ABAPTISTA. (From a, priv. et βατία, to plunge.) Abaptiston. The shoulders of the old trepan. This term is employed by Galen, Fabricius ab Aquapendente, Scultetus, and others, to denote the conical saw with a circular edge, (otherwise called modiolus, or terebra,) which was formerly used by surgeons to perforate the cranium.

ABARNAHAS. See Abaptista. ABARNAHAS. Ovum ruffum. A chemical term formerly used in the transmutation of metals, signifying luna plena, magnes, or magnesia.

ABARTAMEN. Plumbum, or lead.

ABARTICULATION. (From ab, and articulus, a joint.) That species of articulation which has evident motion. See *Diarthrosis*.

ABAS. (An Arabian word.) The scald-

head; also epilepsy.

ABASIS. See Abaisir.

ABBREVIATION. The principal uses of medicinal abbreviations are in prescriptions; in which they are certain marks, or half words, used by physicians for despatch and conveniency when they prescribe, thus: - readily supplies the place of recipeh. s. that of hora somni-n. m. that of nux moschata-elect. that of electarium, &c.; and in general all the names of compound medicines, with the several ingredients, are frequently wrote only up to their first or second syllable, or sometimes to their third or fourth, to make them clear and expressive. Thus Croc. Anglic. stands for Crocus Anglicanus-Conf. Aromat. for Confection Aromatica, &c. A point being always placed at the end of such syllable shews the word to be incomplete.

ABDOMEN. (From abdo, to hide, because it hides the viscera. It is also derived from abdere, to hide, and omentum, the caul; and by others it is said to be only a termination, as from lego, legumen, so from

abdo, abdomen.) The belly.

The abdomen is the largest cavity in the body, bounded superiorly by the diaphragm by which it is separated from the chest : inferiorly by the bones of the pubis and ischium; on each side by various muscles, the short ribs and ossa ilii; anteriorly by the abdominal muscles, and posteriorly by the vertebræ of the loins, the os sacrum and os coccygis. Internally it is invested by a smooth membrane called peritoneum, and externally by muscles and common integuments.

In the cavity of the abdomen are contained,

1. Anteriorly and laterally.

The cpiploon. 2. The stomach. 3. The large and small intestines. 4. The mesentery. 5. The lacteal vessels. 6. The pancreas. 7. The spleen. 8. The liver and gall-bladder.

Posteriorly, without the peritoneum, are,

1. The kidneys. 2. The supra-renal glands. 3. The ureters. 4. The receptaculum chyli. 5. The descending aorta. 6. The ascending vena cava.

3. Inferiorly in the pelvis, and without the

peritoneum,

In men, 1. The urinary bladder. 2. The spermatic vessels. 3. The intestinum rectum.

In women, beside the urinary bladder and intestinum rectum, there are,

1. The uterus. 2. The four ligaments of the uterus. 3. The two ovaria. 4. The two Fallopian tubes. 5. The vagina.

The fore part of this cavity, as has been mentioned, is covered with muscles and common integuments, in the middle of which is the navel. It is this part of the body which is properly called abdomen; it is distinguished, by anatomists, into regions.

The posterior part of the abdomen is called the loins, and the sides the *Epicolic* 

regions

Abdominal Hernia. See Hernia Abdominalis.

Abdominal muscles. See Muscles.

Abdominal ring. See Annulus Abdominis. Abdominal regions. See Regions.

ABDUCENS LABIORUM. A name given by Spigelius to the levator anguli oris. See Levator anguli oris.

Abducent nerves. See Nervi abducentes. Abducent Muscles. See Abductor.

Abbuttio. (From abduco, to draw away.) A species of fracture, when a bone is divided transversely near a joint, so that each part recedes from the other. In Cœlius Aurelianus it signifies a strain; and is mentioned as one of the causes of ischiadic and psoadic pains.

Appecton. (From abduco, to draw away.) Abducens. A name given to those muscles whose office is to pull back or draw the member to which it is affixed from some other, as the abductor pollicis draws the thumb from the fingers. The antagonists are called adductores, or adductors.

Abductor auricularis. See Posterior auris. Abductor auris. See Posterior auris.

Abductor brevis alter. See Abductor pollicis manas.

ABDUCTOR INDICIS MANUS. Abductor of Douglas. Semi-interesseus indicis of Winslow. Adductor indicis of Cow-

per.

An internal interosseous muscle of the fore-finger, situated on the hand. It arises from the superior part of the metacarpal bone, and the os trapezium, on its inside, by a fleshy beginning, runs towards the metacarpal bone of the fore-finger, adheres to it, and is connected by a broad tendon to the superior part of the first phalanx of the fore-finger. Sometimes it arises by a

double tendon. Its use is to draw the fore-finger from the rest, towards the thumb, and to bend it somewhat towards the palm.

ABDUCTOR INDICIS PEDIS. An internal interosseous muscle of the fore-toe, which arises tendinous and fleshy, by two origins, from the root of the inside of the metatarsal bone of the fore-toe, from the outside of the root of the metatarsal bone of the great-toe, and from the os cuneiforme internum, and is inserted tendinous into the inside of the root of the first joint of the fore-toe. Its use is to pull the fore-toe inwards, from the rest of the small toes.

Abductor longus pollicis manas. See Extensor ossis metacarpi pollicis manas.

ABDUCTOR MEDII DIGITI PEDIS. An interosseous muscle of the foot, which arises tendinous and fleshy, from the inside of the root of the metatarsal bone of the middle toe internally, and is inserted tendinous into the inside of the root of the first joint of the middle toe. Its use is to pull the middle toe inwards.

ABDUCTOR MINIMI DIGITI MA-NUS. Carpo-phalangien du petit doigt of Dumas. Extensor tertii internodii minimi digiti of Douglas. Hypothenar minor of

Winslow.

A muscle of the little finger, situated on the hand. It arises fleshy from the pisiform bone, and from that part of the ligamentum carpi annulare next it, and is inserted, tendinous, into the inner side of the upper end of the first bone of the little finger. Its use is to draw the little finger from the rest.

ABDUCTOR MINIMI DIGITI PEDIS. Calcaneo-phalangien du petit doigt of Dumas. Adductor of Douglas, Parathenar major of Winslow, by whom this muscle is divided into two, Parathenar major and metutarsens. Adductor minimi digiti of

Cowper.

A muscle of the little toe, which arises tendinous and fleshy, from the semicircular edge of a cavity on the inferior part of the protuberance of the os calcis, and from the rest of the metatarsal bone of the little toe, and is inserted into the root of the first joint of the little toe externally. Its use is to bend the little toe, and its metatarsal bone, downwards, and to draw the little toe from the rest.

ABRUCTOR OCULI. Adductor of Donglas and Winslow. Orbito-intus-scleroticien, orbito-extus scleroticien of Dumas. Rectus Adducens oculi of Albinus. Indignatorius, or the scornful muscle. Adducens Iracundus. See Rectus externus oculi.

ABDUCTOR POLLICIS MANUS. Scaphosns-pholanginien du pouce of Dumas. Adductor pollicis manûs, and Adductor brevis alter of Albinus. Adductor thenar Riolani of Douglas, (the adductor brevis alter of Albinus is the inner portion of this muscle.) Adductor pollicis of Cowper.

A muscle of the thumb situated on the hand. It arises by a broad tendinous and fleshy beginning, from the ligamentum carpi annulare, and from the os trupezium, and is inserted tendinous into the outer side of the root of the first bone of the thumb. Its use is to draw the thumb from the fin-

ABI

ABDUCTOR POLLICIS PEDIS. Calcanes phalangien du pouce of Dumas. Abductor of Douglas. Thenar of Winslow. Abductor

policis of Cowper.

A muscle of the great toe, situated on the foot It arises fleshy, from the inside of the root of the protuberance of the os calcis, where it forms the heel, and tendinous from the same bone, where it joins the os naviculare; and is inserted tendinous into the internal sesamoid bone and root of the first joint of the great toe Its use is to pull the great toe from the rest.

ABDUCTOR TERTII DIGITI PEDIS. An interesseous muscle of the foot, that arises tendinous and fleshy from the inside and the inferior part of the root of the me-tatarsal bone of the third toe; and is inserted tendinous into the inside of the root of the first joint of the third toe. Its use is to pull

the third toe inwards.

ABEBÆOS. (From a, neg. and Bauos firm.) Abebæus Weak, infirm, unsteady A term made use of by Hippocrates de Signis.

ABEBRUS. See Abebros.

ABELMOSCHUS (Arabian.) Granum moschi. Moschus Arabum. Ægyptia moschata. Bamia moschata Alcea, Alcea Indica Alcea Ægyttaca villosa. Abrette. Abelmosch. Abelmusk. The seeds of a plant called the musk mallow, which have the flavour of musk. The plant Hibiscus abelmoschus of Linnæus, is indigenous in Egypt, and in many parts of both the Indies. The best comes from Martinico. By the Arabians the seeds are esteemed cordial, and are mixed with their coffee, to which they impart their fragrance. In this country they are used by the perfu-

Abelmosch. See Abelmoschus.

Abelmusk, See Abelmoschus.

ABERRATIO. (From ab and erro, to wander from.) Lusus nature. Dislocation.

ABESSI. (Arabian.) Filth. The alvine excrements.

ABESUM. Quick lime.

ABEVACUATIO, (From ab, dim. and evaevacuation of the peccant humours, either

naturally or by art.

ABIES. (From abeo, to proceed, because it rises to a great height; or from artis, a wild pear, the fruit of which its cones something resemble.) Elate Theteia. The An evergreen tree. Linnæus includes the abies in the genus Pinus. Botanists have chumerated several species: the four which follow, are the principal that afford materials for medicinal use.

1. Pinus Picea, the silver fir-tree, which affords the common turpentine.

2. Pinus abies alba, the Norway spruce firstree, which vields the Burgundy pitch.

- 3. Pinus larix, the common white larchtree, from which is obtained the Venice turpentine.
- 4. Pinus sylvestris, the Scotch fir, which yields the pix liquida.

ABIES CANADENSIS, See Balsamum Canadense

ABIGEATUS. See Abactus.

ABIOTOS. (From α, neg. and βιω, to live.) A name given to hemlock, from its dead qualities. See Conium.

ABLACTATIO. (From ab, from, and lac, milk.) Ablactation. The weaning of a child

from the breast.

Ablatio. (From affero, to take away.) The taking away from the body whatever is useless or hurtful; it comprehends all kinds of evacuations. Sometimes it signifies the subtraction of a part of the diet, with a medical view; and sometimes it expresses the interval betwixt two fits of a fever, or the time of remission.

Chymical ablation is the removal of any thing that is either finished or else no longer

necessary in a process.

ABLUENTIA (Abluentia, sc. medicamenta, from abluo, to wash away.) Abstergents.
Abluents. Medicines which were formerly supposed to purify or cleanse the blood.

ABLUTION. (From ublue, to wash off.) A washing or cleansing either of the body or

the intestines.

In chemistry it signifies the purifying of a body, by repeated effusions of a proper liquor.

ABOIT. An obsolete term of Arabic ex-

traction for white lead.

ABOLITIO. (From aboleo, to destroy.) The separation or destruction of diseased parts. ABORTION. (Abortio, from aborior, to

be steril.) Aborsus. Amblosis. Diaphthora. Ectrosis. Exambloma. Examblosis. Apo-

pallesis. Apopalsis Apophthora.

Miscarriage, or the expulsion of the fætus from the uterus, before the seventh month. after which it is called premature labour. It most commonly occurs between the eighth and eleventh weeks of pregnancy, but may happen at a later period. In early gestation, the ovum sometimes comes off entire; sometimes the fœtus is first expelled, and the placenta afterwards. It is preceded by flooding, pains in the back, loins, and lower part of the abdomen, evacuation of the water, shiverings, palpitation of the heart, nausea, anxiety, syncope, subsiding of the breasts and belly, pain in the inside of the thighs, opening and moisture of the os

Anontives. ( Abortiva, sc. medicamenta ; from aborior, to be steril.) Amblotica. Ecbo-

Medicines capable of occasioning an

abortion, or miscarriage, in pregnant women. It is now generally believed, that the medicines which produce a miscarriage, effect it by their violent action on the system, and not by any specific action on the womb.

ABRASA. (From abrado, to shave off.) Ulcers attended with abrasion of part of

their substance.

ABRASION. (Abrasio, from abrado, to tear off.) This word is generally employed to signify the destruction of the natural mucus of any part, as the stomach, intestines, urinary bladder, &c. It is also applied to any part slightly torn away by attrition, as the skin, &c.

ABRATHAN. Corrupted from abrotanum, southernwood. See Abrotanum.

ABRETTE. See Abelmoschus.

Abric. An absolete Arabic term for sulphur.

ABROMA. (From a, neg. et βςωμα, food; i. e. not fit to be eaten.) A tree of New South Wales, which yields a gum

ABROTANUM. (Αδζοτανον, from α, neg. and βξοτος, mortal; because it never decays: or from αδζος, soft, and τονος, extension; from the delicacy of its texture.) Common southernwood. Abrotanum mas.

Artemisia fruticosa, of Linnæus:—foliis setaceis ramosissimis. Class, Syngenesia. Order, Polygamia superflua. A plant possessed of a strong and, to most people, an agreeable smell; a pungent, bitter, and somewhat nauseous taste. It is supposed to stimulate the whole system, but more particularly the uterus. It is very rarely used unless by way of fomentation, with which intention the leaves are directed.

ABROTANUM MAS. See abrotanum.

ABROTONITES. (From abrotanum.) A wine mentioned by Dioscorides, impregnated with abrotanum, or southernwood, in the proportion of about one hundred ounces of the dried leaves, to about seven gallons of must.

Abscepentia. (From abscedo, to separate.) Decayed parts of the body, which, in a morbid state, are separated from the sound.

bound.

ABSCESS. (From abscedo, to depart; because parts, which were before contiguous, become separated, or depart from each other.) Abscessio Abscessus. Imposthuma.

A collection of pus in the cellular membrane, or in the viscera, or in bones, prece-

ded by inflammation.

Abscission. (Abscissio; from ab, and scindo, to cut.) Apocope. The taking away some morbid, or other part, by an edged instrument. The abscission of the prepnce makes what we call circumcision. Abscission is sometimes used by medical writers to denote the sudden termination of a disease in death, before it arrives at its decline. Celsus frequently uses the term abscissation to express a loss of voice.

ABSINTHIUM. (Αψνθιον, from α, neg. and ψινθος, pleasant: so called from the disagreeableness of the taste.) A genus of plants in the Linnæan system. Class, Syngenesia. Order, Polygamia superflua. Wormwood.

Absinthium comment. Set Absinthium vulsare

Absinthium maritimum. Sea wormwood, falsely called in our markets, Roman wormwood. Artemisia maritima.

Absinthium Ponticum of Linnæus :- foliis multipartitis, tomentosis racemis cernuis flosreculis famineis ternis. This plant grows plentifully about the sea-shore, and in salt marshes. The specific differences between it and the common wormwood, absinthium vulgare, are very evident. Its taste and smell are considerably less unpleasant than those of the common wormwood, and even the essential oil, which contains the whole of its flavour concentrated, is somewhat less ungrateful, and the watery extract somewhat less bitter than those of the common wormwood. Hence it is preferred, in those cases where the Artemisia absinthium is supposed to be too unpleasant for the stomach. A conserve of the tops of this plant is directed by the London Pharmacopœia.

ABSINTHIUM PONTICUM. See Absinthium

Maritimum.

ABSINTHIUM VULGARE. Common worm-wood. Falsely called in our markets Absinthium Romanum, or Roman wormwood. Absinthium Ponticum of Discorides and Pliny. Murray.

Artemisia Absinthium of Linnaus:-foliis compositis multifidis, floribus subglobosis pendulis : receptaculo villoso. Class, Syngenum. Order, Polygamia superflua. This plant is a native of Britain, and grows about rub-bish, rocks, and sides of roads. The leaves of wormwood have a strong disagreeable smell: their taste is nauseous, and so in-tensely bitter as to be proverbial. The flowers are more aromatic and less bitter than the leaves, and the roots discover an aromatic warmth, without bitterness. This species of wormwood may be considered the principal of the herbaceous bitters. Its virtus, in the words of Bergius, is antiputredinosa, antacida, anthelminthica, resolvens, tonica, spasmodica. And although it is now chiefly employed with a view to the two last-mentioned qualities, yet we are told of its good effects in a great variety of diseases, as intermittent fevers, hypochondriasis, obstructions of the liver and spleen, gout, calculi, scurvy, dropsy, worms, &c. See Woodville's Medical Botany. Cullen thinks it is possessed of a narcotic power, and that there is in every bitter, when largely employed, a power of destroying the sensibility and irritability of the nervous power.

Externally, wormwood is used in discu-

tient and antiseptic fomentations. This plant may be taken in powder, but it is more commonly preferred in infusion. The Edinburgh Pharmacopæia directs a tincture of the flowers, which is, in the opinion of Dr. Cullen, a light and agreeable bitter, and, at the same time, a strong impregnation of the wormwood.

Absorbing vessels. Sec Absorbents. ABSORBENTS. Absorbentia.

1. Small, delicate, transparent vessels, which take up any fluid from the surface of the body, or of any cavity in it, and carry it to the thoracic duct, to be mixed with the blood. They are denominated according to the liquids which they convey, lacteals and lymphatics. See Lacteals and Lymphatics.

2. Medicines are so termed, which have no acrimony in themselves, and destroy acidities in the stomach and bowels; such are calcined magnesia, prepared chalk,

oyster-shells, crab's claws, &c.
ABSORPTION. (From absorbeo, to suck up.) A function in an animated body, arranged by physiologists under the head of natural actions. It signifies the taking up of substances applied to the mouths of absorbing vessels: thus the nutritious part of the food is absorbed from the intestinal canal by the lacteals: thus mercury is taken into the system by the lymphatics of the skin, &c. The principle by which this function takes place, is a power inherent in the mouths of the absorbents, a vis insita, dependent on the degree of irritability of their internal membrane by which they contract and propel their contents forwards.

ABSTENTIO. Calius Aurelianus uses this word, to express a suppression, or retention. Thus, abstentio stercorum, a retention of the excrements, which he mentions as a symptom very frequent in a satyriasis. a sense somewhat different, he uses the word abstenta, applying it to the pleura, where he seems to mean, that the humour of the inflamed pleura is prevented, by the adjacent bones, from extending itself.

ABSTERGENTS. (Abstergentia, scilicèt medicamenta; from abstergo, to cleanse away.) Lotions, or any application that cleanses or clears away foulness. The term is seldom employed by modern writers.

Abstraction. (From abstraho, to draw away.) A term employed by chymists in the process of humid distillation, to signify that the fluid body is again drawn off from the solid, which it had dissolved.

ABSTRACTITIUS. (From abstraho, to draw away.) Native spirit, not produced by fermentation.

Absvs. An obsolete term for the Egyptian lotus.

ABVACUATIO. (From abvacuo, to empty.) Local or morbid discharge. A large evacuation of any fluid, as of blood from a plethoric person.

Acaca. (From a, neg. and zazos, bad.) Diseases which are rather troublesome than

ACACIA. (Axaxia, from axaça, to sharpen.) The name of a genus of plants in the Linnxan system. The Egyptian thorn.

ACACIA GERMANICA. Acacia nostras. German acacia, or the German black-thorn or sloe-tree. Acacia nostras. Succus pruni sylvestris. The inspissated juice of the German wild sloe, prunus spinosa, or prunus sylvestris spinosa of Linnæus; now fallen into disuse.

ACACIE GUMMI. Gummi acanthinum. Gummi thebaicum. Gummi scorpionis. Gum-lumac. Gummi senega, or seni-Acacia gum, or gum-arabic. The gum

of the Egyptian thorn.

Acacia vera, of Willdenow: -spinis stipularibus patentibus, foliis bipinnatis; partialibus extimis glandula intertinctis, spicis globosis pedunculatis. Cairo and Alexandria were the principal marts for gum-arabic, till the Dutch introduced the gum from Senegal into Europe, about the beginning of the seventeenth century, and which now supplies the greater part of the vast con-sumption of this article.

The tree which yields the Senegal gum, grows abundantly on the sands, long the while of the Barbary coast, and particularly about the river Senegal. There are several species, some of which yield a red astringent juice, but others afford only a pure, nearly colourless, insipid gam, which is the great article of commerce. These trees are from eighteen to twenty feet high, with thorny branches. The gum makes its appearance about the middle of November, when the soil has been thoroughly saturated with periodical rains. The gummy juice is seen to ooze through the trunk and branches, and, in about a fortnight, it hardens into roundish drops, of a yellowish white, which are beautifully brilliant where they are broken off, and entirely so when held in the mouth for a short time, to dissolve the outer surface. No clefts are made, nor any artificial means used by the Moors, to solicit the flow of the The lumps of gum-senegal are usually about the size of partridge eggs, and the harvest continues about six weeks. This gum is a very wholesome and nutritious food; thousands of the Moors supporting themselves entirely upon it during the time of harvest. About six ounces is sufficient to support a man for a day; and it is besides, mixed with milk, animal broths, and other victuals.

The gum-arabic, or that which comes directly from Egypt and the Levant, only differs from the gum-senegal in being of a lighter colour, and in smaller lumps; and it is also somewhat more brittle. In all other respects, the two resemble each other perfectly.

Gum-arabic is neither soluble in spirit nor

in oil; but, in twice its quantity of water, it dissolves into a mucilaginous fluid, of the consistence of a thick syrup, and in this state answers many useful pharmaceutical purposes, by rendering oily, resinous, and pinguious substances miscible with water. The glutinous quality of gum-arabic renders it preferable to other gums and mucilages as a demulcent in coughs, hoarsenesses, and other catarrhal affections. It is also very generally employed in ardor urina, diarrheas, and calculous complaints.

Acacia Indica See Tamarindus Indica. Acacia Nostras. See Acacia Germanica. Acacia Vera. Accacia veravel. Succus

acaciæ veræ.

1. The expressed juice of the immature pods of the tree called Acacia vera by Willdenow, and Mimosa Nilotica by Linnaus. This inspissated juice is brought from Egypt in roundish masses, wrapped up in thin bladders. It is considered as a mild astringent medicine. The Egyptians give it, in spitting of blood, in the quantity of a drachm, dissolved in any convenient liquor, and repeat this dose occasionally. They likewise employ it in collyria, for strengthening the eyes, and in gargles, for quincies. It is now seldom used as a medicine, being superseded by the use of catechu, or terra japonica.

The inspissated juice of the unripe sloe is usually sold for the Egyptian acacia.

2. The systematic name of the true acacia or Egyptian thorn: the tree which affords the gum-arabic. See Acacia gummi.

ACACIA VERAVEL. See Acacia vera.
ACACIA ZEYLONICA. Logwood. See

Lignum Campechianum.

ACALAI. (Arab.) Common salt, or muriate of soda.

ACALCUM. Tin.

Acamatos (From a, neg. and za μοω, to weary.) A perfect rest of the muscles.

Acantha. (Acantha, from an a point.)
A thorn, or any thing pointed, as the skin,

or spina dorsi.

ACANTHABOLUS. (From ακανθα, a thorn and επλλω to east out.) An instrument, or forceps, for taking out or removing thorns or whatever may stick in the flesh. Paulus Ægineta.

ACANTHE. The name of the artichoke in

ancient authors.

Acanthinum. (From απανθα, a thorn.) Gum-arabic was so called because it is pro-

duced from a thorny tree.

ACANTHULUS. (From ακανθα, a thorn.) A surgical instrument to draw out thorns or splinters, or to remove any extraneous matter from wounds.

ACANTHUS. (Anarbos, from anarba a thorn; so named from being rough and prickly.) The name of a genus of plants in the Linnwan system. Class, Didynamia.

Order, Ingiospermia. Bear's breech. Brank-ursine.

ACANTIUS MOLLIS. (Axavθot, from axavθa, a thorn; so nained from its rough and prickly surface. (Bear's-breech or Branckursine. Acanthus mollis, foliis sinuatis incrmibus of Linnaus. Branca ursina of the shops. The leaves and root abound with a mucilage, which is readily extracted by boiling or infusion. The roots are the most mucilaginous. Where this plant is common, it is employed for the same purposes to which althaa and other vegetables possessing similar qualities are applied among us. It is fallen into disuse. The herbwomen too often sell the leaves of helleboraster or bear's foot and of spondylium or cow's parsnip for the bear's breech.

ACAPNON. (From α, priv. and καπνος, smoke) Common wild marjoram. Un-

smoked honey.

Acanus. (From anagu small.) An insect

which breeds in the skin.

Acatalersia. (From α, neg. and καταλαμόζανω, to apprehend) Uncertainty in the prognostication or judgment of diseases.

Acatalis. (From a, neg. and xarea, to want.) The juniper, named from the abun-

dance of its seeds.

ACATAPOSIS From α, neg. and καταπινω to swallow.) Difficult deglutition.

ACASTATOS. (From α, neg. and καθιζαμι, to determine.) Inconstant.

1. Fevers are so called which are anomalous in their appearance and irregular in their paroxysms.

Turbid urine without sediment.

ACAZDIR. Tin

ACCELERATOR URINÆ. (From accelero, to hasten or propel.) Ejaculator Seminis. Bulbo-syndesmo caverneux of Dumas. Bulbo-cavernosus of Winslow.

A muscle of the penis. It arises fleshy from the sphincter ani and membranous part of the urethra, and tendinous from the crns, near as far forwards as the beginning of the corpus cavernosum penis; the inferior fibres run more transversely, and the superior descend in an oblique direction. It is inserted into a line in the middle of the bulbous part of the urethra, where each joins with its fellow; by which the bulb is completely closed. The use of these muscles is to drive the urine or semen forward, and by grasping the bulbous part of the urethra, to push the blood towards its corpus cavernosum, and the glands by which they are distended.

Accession (From accedo, to approach.)
The approach or commencement of a disease. A term mostly applied to a fever which has paroxysms or exacerbations: thus the accession of fever, means the commencement or approach of the pyrexial period.

ACCESSOREI OF WILLIS. (Accessorii, sc. nervi, from accedo, to approach;

having connection with by contact or approach; so called from the course they take.) The name given by Willis to two nerves which ascend, one on each side from the second, fourth, and fifth cervical pairs of nerves, through the great foramen of the occipital bone, and pass out again from the cranium through the foramina lucera, with the par vagum, to be distributed on the trapezius muscle.

Access Rius. Being connected by con-

tact or approach.

Accessorius Lumbalis. A muscle of the loins. See Sacro-lumbalis.

Accib. An obsolete term for lead.

Accipiter. (From accipio, to take.) 1. The hawk; named from its rapacity.

A bandage which was put over the nose; so called from its likeness to the claw of a hawk, or from the tightness of its grasp.

Accipionina. (From accipiter, the hawk.) The herb hawk weed, which Piny says was so called because hawks are used to scratch it, and apply the juice to their eyes to prevent blindness.

Accurves. A muscle of the belly, so named from the oblique ascent of its fibres.

Sec Obliquus ascendens abdominis.

Accordieur. A midwife.

Accor CHMENT. The act of delivery.

Accaerton. (From ad, and cresco, to increase.) Nutrition, growth.

The growing together of the fingers or

ACCUBATIO. [From accumbo, to recline.)

Childbed. Reclining. Acedia. From a. priv. and unfos, care Carelessness, neglect in the application of medicines. Hippocrates sometimes uses this word, in his Treatise on the Glands, to

signify fatigue or trouble.

ACEPHALUS. (Ausqualos, from a. priv. and REPARM, a head.) A term applied to

monsters born without heads.

ACER (Acer, sharp: because of the sbarpness of its juice.) The name of a genus of plants in the Linnaan system. Class, Polygamia. Order, Monoecia

ACER PSEUDOPLATANUS. The maple-tree, falsely called sycamore. It is also called Platanus traga. This tree is common in England, though not much used in medicine. The juice, if drank whilst fresh, is said to be a good antiscorbutic. All its parts con-tain a saccharine fluid; and if the root or branches are wounded in the spring, a large quantity of liquor is discharged, which when inspissated, yields a brown sort of sugar and syrup like molasses. Large quantities of this sugar are obtained from the trees in New England and Canada, and is much used in France, where it is commonly known by the name of Saccharum Canadense or Saccharum Acernum, maple sugar. It has been supposed that all Europe might be supplied from the maples of America, but the sugar is coarse and ill tasted.

Aceratos. (From α, neg. and κεραω, or κεξαννυμι, to mix.) Unmixed, uncorrupted. Is applied sometimes to the humours of the body by Hippocrates. Paulus Ægineta mentions a plaster of this name.

ACERB. (Acerbus, from acer, sharp.) A species of taste which consists in a degree of acidity, with an addition of roughness; properties common to many immature

fruits.

ACERBITAS. Acidity. Sourness.

Acerides. (From a, priv. and ungos, wax.) Soft plasters made without wax,

ACESCENT. Substances which readily run into the acid formemation.

Acesis. (From aneomai, to cure.)

1. A remedy or cure.

2 The herb water-sage, so called from its supposed healing qualities.

Acesta. (From axequal, to cure.) Dis-

tempers which are easily cured.

Acestis. Borax. See Boras soda. Acestoris. (From axeomas, to cure.) It strictly signifies a female physician, and is used for a midwife.

Acestribes. A midwife.

ACETABULUM. (From acetum, vinegar; so called because it resembles the acetabulum, or old saucer, in which vinegar was held for the use of the table.) A name given by Latin writers to the cup-like cavity of the os innominatum, which receives the head of the thigh-bone

ACETARIA. (From acetum, vinegar; because they are mostly made with vinc-

gar.) Sallads or pickles.

A salt is so ACETAS. An acetate. called in the new chemical nomenclature and pharmacopæias, which is formed by the union of the acetic acid, with an earthy metallic or alkaline base. Those used in medicine are the acetat of ammonia, lead, zinc, and potash.

ACETAS POTASSE. Acetated vegetable alkali, Kali acetatum. Sal Diureticus. Terra foliata tartari. Sal Sennerti.

Take of subcarbonnate of potash, a pound and a nalf. Acetic acid, a gallon. Mix them together in a large glass vessel, and having evaporated the solution to half, over the fire, add gradually as much more acetic acid as may be necessary for perfect saturation. Let the solution be further reduced to one half by evaporation, and strain it: then by means of a water-bath evaporate it, so that on being removed " from the fire, it shall crystallize.

The acetate of potash is esteemed as a saline diuretic and deobstruent. It is given in the dose of from gr. x to 538, three times a day in any appropriate vehicle against dropsies, hepatic obstructions, and the like.

ACETAS AMMONIÆ. Aceta of ammonia. A salt composed of ammonia and acetic acid. It is so deliquescent, that it is alway kept in the fluid state. See Liquor ammonice acetatis.

ACETAS PLUMBI. Acetate of lead. A metallic salt composed of lead and acetic

acid. See Liquor plumbi acetatis.

ACETAS ZINCI. A metallic salt composed of zinc and acetic acid. It is used by some as an astringent against inflammation of the eyes, urethra, and vagina, diluted in the same proportion as the sulphate of zinc.

Acetated vegetable Alkali. See Acetas po-

tassæ

Acetated volatile Alkali. See Liquor acetatis ammoniæ.

Acetic Acid. See Acetum.

ACETIFICATION. A term used by some chymists to denote the action or operation by which vinegar is made.

Acetat of Potash See Acetas potassæ. Acetat of Ammonia. See Liquor ammoniæ

acetatis

Acetat of Zinc. See Acetas Zinci.

ACETOSA. (From acesco, to be sour.) Sorrel. A genus of plants in some systems of botany.

Acerosa vulgaris. Acetosa pratensis. Acetosa arvensis. Sorrel; sour-dock.

Rumex acetosus of Linnæus:—foliis oblongis sagittatis, floribus diaceis. Class, Hexandria. Order, Tryginia. The leaves of this plant are sour, but not the root, which is bitter. It grows in the meadows and common fields.

Acetosa Romana. Acetosa rotundifolia hortensis. Roman or garden sorrel.

Rumex scutatus or helveti rus:—foliis cordato hastatis, ramis divergentibus, floribus hermaphroditis, of Linnxus. It is common in our gardens and in many places is known by the culinary name of Green-sauce.

ACETOSELLA. (From acetosa, sorrel; from the acidity of its leaves.) Lujula.

Alleluja. Wood-sorrel.

Oxalis acetocella, of Linnaus:-foliis ternatis, scapo unifloro, flore albo, capsulis pentagonis elasticis, radice squamoso-articulata. Class, Decandria. Order, Pentagynia .-This plant grows wild in the woods, and flowers in April and May. The leaves are shaped like a heart, standing three together on one stalk. The acetocella is totally inodorous, but has a grateful acid taste, on which account it is used in sallads. Its taste is more agreeable than the common sorrel, and approaches nearly to that of the juice of lemons, or the acid of tartar, with which it corresponds in a great measure in its medical effects, being esteemed refrigerant, antiscorbutic, and diuretic. It is recommended by Bergius; in inflammatory, bilious, and putrid fevers. The principal use however of the acetosella is to allay inordinate heat and to quench thirst; for this purpose, a pleasant whey may be formed by boiling the plant in milk, which under certain circumstances may be preferable to the conserve directed by the London College, though an extremely grateful and useful medicine. Many have employed

the root of Lujula, probably on account of its beautiful red colour rather than for its superior efficacy. An essential salt is prepared from this plant, known by the name of essential salt of lemons, and commonly used for taking ink-stains out of linen. What is sold under the name of essential salt of lemons in this country, is said by some to consist of cream of tartar, with the addition of a small quantity of suphuric acid. The leaves of sorrel when employed externally in the form of poultices, are powerful suppurants, particularly in indolent scrofulous humours.

Acetons Acid. Distilled vinegar. See

Acetum.

Acetous fermentation. See Fermentation. ACETUM. (From acer, sour.) Vinegar. A sour liquor obtained from many vegetable substances dissolved in boiling water, and from fermented and spiritous liquors, by exposing them to heat and contact with air; under which circumstances they undergo the acid fermentation, (see Fermentation,) and afford the liquor called vinegar.

Wine vinegar .—Let any quantity of vinous liquor be mixed with the acid and austere stalks of the vegetable from which wine was prepared. The whole must be frequently stirred and either exposed to the sun, or deposited in a warm place: after standing a few days it will ferment, become sour and in a fortnight it will be converted into vinegar.

Cyder vinegar, may be made by fermenting new cyder with the must of apples, in a warm room, or in the open air, where it should be exposed to the sun, and in the course of a week or nine days it will be fit

for use.

Another method of preparing vinegar is that published by M. Heber: it consists in exposing a mixture of 72 parts of water, and 4 of rectified malt spirit in a temperature of from 70 to 80° of Farenheit, for about two months, at the expiration of which the acetous process will be effected.

Tarragon vinegar is manufactured by infusing one pound of the leaves of that vegetable (which has been gathered a short time before it flowers) in one gallon of the best vinegar, for the space of 14 days; when it should be strained through a flannel bag; and a drachm of isingless dissolved in cyder must then be added, the whole be carefully mixed and decanted into bottles for a month. Thus the liquor will acquire a most exquisite flavour; it will become remarkably fine and almost colourless.

The utility of vinegar as a condiment for preserving and seasoning both animal and vegetable substances in various articles of food, is very generally known. It affords an agreeable beaerage, when combined with water in the proportion of a table-spoonful of the former to half pint of the

latter. It is often employed as a medicine in inflammatory and putrid diseases, when more active remedies cannot be procured. Relief has likewise been obtained in hypochondrical and hysteric affections, in vomiting, fainting, and hiccough, by the application of vinegar to the mouth. If this fluid be poured into vessels and placed over the gentle heat of a lamp in the apartments of the sick, it greatly contributes to disperse foul or mephitic vapours, and conse-

quently to purify the air. Also as an external application, vinegar proves highly efficacious when joined with farinaceons substances, and applied as a cataplasm to sprained joints; it also forms an eligible lotion for inflammations of the surface, when mixed with ricohol and water in about equal proportions. Applied to burns, and scalds, vinegar is said to be highly serviceable whether there is a loss of substance or not, and to quicken the exfoliation of carious bone (Gloucester In firmary.) Mixed with an infusion of sage, or with water, it forms a popular and excellent gargie for an inflamed throat, also for an injection to inciderate the fluor albus. Applied cold to the nose in cases of hamorrhage, also to the loins and abdomen in meterrhagia, particularly the profluvia after parturition, it is said to be very serviceable. An imprudent use of vinegar internally is not without considerable inconvemences. Large and frequent doses injure the stomach, coagulate the chyle, and produce not only leanness, but an atrophy. When taken to excess by females, to reduce a corpulent habit, tubercles in the lungs and a consumption have been the conse-

Common vinegar consists of acetic acid combined with a large portion of water, and with this are in solution portions of gluten, mucilage, sugar, and attractive matter from which it derives its colour, and frequently some of the vegetable acids, particularly the malic and the tartaric.

Distilled with a gentle fire, in glass vessels, so long as the drops fall free from empyreuma, it affords the

ACIDUM ACETICUM.

Take of vincgar, a gallon.

Distil the acetic acid in a sand bath, from a glass retort into a receiver also of glass, and kept cold; throw away the first pint, and keep for use the six succeeding pints, which are distilled over.

In this distillation, the liquor should be kept moderately boiling, and the heat should not be urged too far, otherwise the dis illed acid will have an empyreumatic smell and taste, which it ought not to possess. If the acid be prepared correctly, it will be colourless, and of a grateful, pungent, peculiar acid taste. One fluid-ounce ought to dissolve at least ten grains of carbonate of lime (white marble.) This liquor is the aceium distillarum; the acidum acetosum of the Landon P armacopæra of 1787, and the acidum aceticum of the last (1809.)

When the acid of vinegar is greatly con centrated, that 15, deprived of its water, it becomes the rad cat vinegar, or

CONCENTRATED ACID OF VINEGAR.

Distilled vinegar may be concentrated by freezing: the congelation takes place at a temperature below 28 degrees, more or less, according to its strength; and the congealed part is merely ice, leaving, of course, a stronger acid. If it be exposed to a very intense cold, equal to 38 degrees, it shoots into crystals; when the fluid part is withdrawn, the crystals liquefy, when the temperature rises, and the liquid is limpid as water, extremely strong, and has a highly pungent acctous odour. This is the pure pungent acctous odour. acid of the viregar, any foreign matter remaining in the uncongealed liquid.

Other methods are likewise employed to obtain the pure and concentrated acid. The process of Westendorf, which has been often tollowed, is to saturate soda with distilled vinegar, obtain the accuate by crystalization; and pour upon it, in a retort, half its weight of sulphuric acid. By applying heat, the acetic acid is distilled over; and, should there be any reason to suspect the presence of any sulphuric acid, it may be distilled a second time, from a little acctate of soda. According to Lowitz, the best way of obtaining this pure, is to mex three parts of the acetate of soda with eight of supersulphate of potass; both salts being perfectly dry, and in fine powder, and to distil from this mixture in a retort, with gentle heat.

It may also be obtained by distilling the verdigris of commerce, with a gentle heat. The concentrated acid procured by these processes, was supposed to differ materially from the acetous acid obtained by distilling vinegar; the two acids were regarded as differing in their degree of oxygenizement, and were afterwards distinguished by the names of acetous and acetic acids. The acid disulled from verdigris was supposed to derive a quantity of oxygen from the oxide of copper, from which it was expelled. The experiments of Adet have, however, proved the two acids to be identical; the acetous acid, therefore, only differs from the acetic acid in containing more water, rendering it a weaker acid, and of a less active nature.

There exists, therefore, only one acid of vinegar, which is the acetic; and its compounds must be termed acetates; and the salts called acetites have no existence.

Acetic acid, when concentrated, has a fragrant and, at the same time, very penetrating smell, irritating the nostrils strongly. It is also so caustic, as to inflame the skin. Its acid taste is strong, even when

diluted with water; it is colourless, and has a specific gr.vity of 1,0626. The acid is capable of congelation; when it forms foliated arborescent crystals it is very volatile; its odour is diffused through the atmosphere, and, when exposed to it, gradually becomes weaker. By a moderate heat, it is converted into vapour; this vapour adily catches fire on the approach of a lighted taper. It combines with water in every proportion; and it combines readily with earthy, metallic, and alkaline bases, forming salts, which are acetates.

The compounds of the acid of vinegar, directed to be used by the new London Pharmacopoia, are acetum colchici, acetum scilla, ceratum plumbi superacetatis, liquor ammonia acetatis, liquor plumbi acetatis dilutus, oxymel, oxymel scillae, potassa acetas, and the liquor ammo-

niæ acetatis.

ACETUM AROMATICUM. Aromatic vinegar. A preparation of the Edinburgh pharmacopæia, thought to be an improvement of what has been named thieves vinegar.

"Take of the dried tops of rosemary;
The dried leaves of sage, of each four

ounces.

Dried lavender flowers, two ounces.

Cloves, two dracams;

Distilled vinegar, eight pounds.

Macerate for seven days, and strain the expressed juice through paper." Its virtues are antiseptic, and it is a useful composition to smell at in crowded courts of justice, hospitals, &c. where the air is offensive.

ACETUM DISTILATUM. See acetum.

ACETUM SCILLE. Lond. Pharm. Vinegar of squills. B. Squills recently dried, one pound; vinegar, six pints; proof spirit, half a pint. Macerate the squills with the vinegar in a glass vessel, with a gentle heat for twenty-four hours; then express the liquor and set it aside until the faces subside. To the decanted siquor add the spirit. This preparation of squills is employed as an attenuant. expectorant, and diuretic, gutt. xv. to IX.

ACHEIR. Without hands.

Acutionum. By this word Cælius Aurelianus, Acut. lib. iii. cap. 17. expresses the fornix, tholus, or sudatorium of the ancient baths, which was a hot room where they used to sweat.

ACHILLÆA, (Αχιλληια, from Achilles, who is said to have made his tents with it, or to have cured Telaphus with it.) The name of a genus of plants in the Linnæan system. Class Syngenesia. Order, Polygamia superflua. Milfoil.

ACHILLE AGERATUM. Balsamita famina. Eupatorium Mesues. Maudlin of the shops, is described by Linnæus as Achillea foliis lanceolatis, obtusis, acutoser-

ratis. It is esteemed in some countries as anthelminthic and alterative, and is given in hepatic obstructions. It possesses the virtues of tansey.

Achillea foliis pinnatis. See Genipi verum.
ACHILLÆA MILLEFOLIUM. The systematic name of the milfoil. See Millefolium.

ACHILLEA PTARMICA. The systematic name of the successort. See Ptarmica.

ACHILLIS TENDO. (So called, because, as fable reports, Theus, the mother of Achilles, held him by that part when she dipped him in the river Styx, to make him invulnerable. Homer describes this tendon, and some writers suppose it was thus named by the ancients, from their custom of calling every thing Achillean, that had any ex raordinary strength or vir-Others say it was named from its action in conducing to swiftness of pace, the The strong term importing so much ) and powerful tendon which is formed by the junction of the gastrochemius and soleus muscles, and which extends along the posterior part of the tibia from the calf to the heel. When this tendon is unfortunately cut or ruptured, as it may be in consequence of a violent exertion, or spasm of the muscles, of which it is a continuation, takes place, the use of the leg is immediately lost, and unless the part be afterwards successfully united, the patient must remain a cripple for life. When the tendon has been cut, the division of the skin allows the accident to be seen. When the tendon has been ruptured, the patient hears a sound like that of the smack of a whip, at the moment of the occurrence. In whatever way the tendon has been divided, there is a sudden incapacity, or at least an extreme difficulty, either of standing or walking. Hence the patient falls down, and cannot get up again. Besides these symptoms there is a very palpable depression between the ends of the tendon: which depression is increased when the foot is bent and diminished, or even quite remove when the foot is extend-The patient can spontaneously bend his foot, none of the flexor muscles being interested. The power of extending the foot is still possible, as the peronei muscles, the tibialis posticus, and long flexors, remain perfect and may perform this motion. The indications are to bring the ends of the divided parts together, and to keep them so, until they have become firmly united. The first object is easily fulfilled by putting the foot into a state of complete extension; the second, namely, that of keeping the ends of the tendon in contact, is more difficult. It seems unnecessary to enumerate the various plans devised to accomplish these ends. The following is Desault's method: After the ends of the tendon had been brought into contact by moderate flexion of the knee,

and complete extension of the foot, he used to fill up the hollows on each side of the tendon with soft lint and compresses. The roller applied to the limb, made as much pressure on these compresses as on the tendon, and hence this part could not be depressed too much against the subjacent parts. Desault next took a compress about two inches broad, and long enough to reach from the toes to the middle of the thigh, and placed it under the foot, over the back of the leg and lower part of the thigh. He then began to apply a few circles of a roller round the end of the foot, so as to fix the lower extremity of the longitudinal compress: after covering the whole foot with the roller, he used to make the bandage describe the figure of 8, passing it under the foot and across the place where the tendon was ruptured, and the method was finished by encircling the limb upward with the roller as far as the upper end of the longitudinal compress.

Achlys. (Αχλυς) Dirkness, cloudiness. It is generally applied to a close, foggy air,

or a mist,

Hippocrates, De Morbis Mulicrum, lib. ii. signifies by this word condensed air in the womb.

Galen interprets it of those, who, during sickness, lose that usual lustre and loveliness observed about the pupil of the eye, during health.

Others express it by an ulcer on the pupil of the eye, or the scar left there by an

ulcer.

It means also an opacity of the cornea; the same as the caligo cornea of Dr. Cullen.

ACHMADIUM. Antimony.

Acmella. Achamella. ACHMELLA. The herb and seeds of this plant, Spilanthus achmella of Linuxus, are employed in cases of calculus of the kindeys and urinary bladder. The plant is very glutinous and bitter, and is given in infusion.

Acune. Chaff, scum or froth of the sea. A white mucus in the fauces, thrown up from the lungs, like froth; also a whitish mucilage in the eyes of those who have fevers, according to Hippocrates. It signifies

also lint.

ACHOR. (αχως, qn. αχνως, from αχνη bran; according to Blanchard it is derived from a, priv. and xugos space, as occupying but a small compass.) Lactumen: abas: acores: cerion: favus. Crusta lactea of authors. The scald-head; so called from the branny scales thrown off it. A disease which attacks the hairy scalp of the head, for the most part of young children, forming soft and scaly eruptions. Dr. Willan, in his description of different kinds of pustules, defines the achor, a pustule of intermediate size between the phly zacium and psydacium which contains a straw-coloured fluid, having the appearance of and nearly the con-

sistence of strained honey. It appears most frequently about the head, and is succeeded by a dull white or yellowish scab. Pustules of this kind, when so large as nearly to equal the size of phlyzacia, are termed ceria or favi, being succeeded by a yellow, semi-transparent, and sometimes, cellular scab, like a honey comb. The achor differs from the favus and tinea only in the degree, of virulence. It is called favns when the perforations are large; and tinca when they are like those which are made by moths in cloth: but generally by tinea is understood a dry scab on the hairy scalp of children, with thick scales and an offen-sive smell. When this di-order affects the face, it is called crusta lactea or milk scab. Mr. Bell, in his treatise on Ulcers, reduces the tinea capitis and crusta lactca to the same species of herpes, viz. the herpes pustulosus, differing only in situation.
Acnoristos. Inseparable. It is under-

stood of accidents, symptoms, or signs, which are inseparable from the particular. things. Thus, a pungent pain in the side is an inseparable symptom of the pleurisy.

ACHREION Useless. It is applied by Hippocrates to the limbs which, through weakness, are become useless.

ACHROIA, A paleness.
ACHYLUS. Deficient in bile.

Action, (axugov.) This properly significs bran or chaff, or straw.

Hippocrates, de Morbis Mulierum, most probably means by this word, bran. A. chyron also signifies a straw, hair, or any thing that sticks upon a wall.

Acia, (From axa, a point.) A needle with thread in it for chirurgical operations.

Aciers. It signifies weak, infirm, or faint, and in this sense it is used by Hippocrates, De Morb. lib. iv.

ACID. That which impresses upon the organs of taste a sharp or sour sensation. Acids are defined by modern chymists to be salts of a sour taste, changing the blue colour of various vegetable pigments to a red. The word sour, which is usually employed to denote the simple impression, or lively and sharp sensation produced on the tongue by certain bodies, may be regarded as synonymous to the word atid. The only difference which can be established between them is, that the one denotes a weak sensation, whereas the other comprehends all the degrees of force from the least perceptible to the greatest degree of causticity: thus we say that verjuice, gooseberries, or lemons, are sour; but we use the word acid to express the impression which the nitric, sulphuric, or muriatic acids make upon the tongue. The vegetable pigments usually employed to ascertain the presence of acids are tincture of turnsole or limus, and syrup of violets. Acids readily combine with alkalis, earths, and metals, and form neutral salts. The characteristics, therefore, of an acid. are.

1. A peculiar taste termed acid.

2. Its changing blue vegetable juices

3. Combining with alkalis, earths, and metals.

Acids, according to the kingdom of nature in which they are found, are divided into mineral, vegetable, and animal.

The mineral acids as yet known, are the sulphuric or vitriolic, the nitric, muriatic, carbonic, boracic, fluoric, succinic, arsenic, molybdic, tungstic, and chromic.

The vegetable acids are, the acetic, oxalic, tartareous, pyrotartareous, gallic, citric, mallic, benzoic, pyroligneous, the succinic, pyromucous, camphric, and cor-

Of the animal acids there are eight, viz. the phosphoric, lactic, saccholactic, fornic, sebacic, prussic, bombic, and lithic, or

Experiment proves that every acid consists of a peculiar body combined with the basis of oxygen gas: hence the origin of the word oxygen, which signifies the generation of acid, it being regarded as the acidifying basis or principle of acidity. The bodies which form the other constituents of acids, are regarded as the ucidifiable basis; thus the principles of phosphoric acid are phosphorus and oxygen; those of carbonic acid, radical carbon and

If an acid basis be perfectly saturated with oxygen, the acid, thus produced, is said to be perfect; but if the basis predominare, the acid is considered as imperfect. Modern chymists distinguish the former in Latin by the syllables ICUM, in English IC, and the latter in Latin by osum, and in English by ous: thus the perfect acid of nitre is called accidum nitricum, or nitric acid; the imperfect acid of nitre, acidum nitrosum, or nitrous acid. There are some cases where an acid is capable of combining with an excess or oxygen, in which case it is said to be oxygenated; and sometime: super-oxygenated. If the acidifiable basis be comb ned with oxygen, yet without showing any of the properties of an acid, the produce is then called an oxyd or oxyde: thus iron exposed to the air or water attracts the oxygen, and an oxyd of iron, the rust, is formed. The various acids employed medicinally are, the acetic, benzoic, tartarie, carbonie, citric, muriatic, oxygenated muriatic, nitric, nitrous, sulphuric and phosphoric.

Acid aerial. See Carbonic acid. Acid acetic.

See Acetum.

For the other Acids look to the word

Acidifable base. See Acid.

Acidifying base. See Acid.
ACIDIFICATION. The formation of an acid; also the impregnating of any thing with acid properties.

ACIDITY. Aciditas. Sourness.

Acros, ANIMAL. Those which are obtained from animals. See Acid.

Acros Dulcified. These are now called See Æther.

ACIDS IMPERFECT. Those acids are so called in the chymical nomenclature, which are not fully saturated with oxygen. Their names are ended in Latin by osum, and in English by ous : e. g. acidum nitrosum, or nitrous acid.

ACIDS, MINERAL. Those acids which are found to exist in minerals, as the sulphu-

ric, the nitric, &c. See Acid.

Acins, perfect. An acid is termed perfect in the chymical nomenclature, when it is completely saturated with oxygen. Their names are ended in Latin by icum, and in English by ic: e. g. acidum nitricum, or nitric acid.

ACIDS, VEGETABLE. Those which are found in the vegetable kingdom, as the citric, mallic, acetic, &c. See Acid.

ACIDULOUS WATER. Mineral waters, which contain so great a quantity of carbonic acid gas, as to render them acidulous, or gently tart to the taste. See Mineral waters.

ACIDUM ACETICUM. See Acetum.

ACIDUM ACETOSUM. See Acetum.

ACIDUM ETHEREUM. The sulphuric acid. ACIDUM ALUMINOSUM. The sulphuric acid.

ACIDUM ARSENICUM. See Arsenic.

ACIDUM BENZOICUM. See Benzoes.

ACIDUM BORACICUM. See Boracic acid. ACIDUM CARBONICUM. See Carbonic acid. ACIDUM CATHOLICON. The acid of sulphur.

ACIDUM CITRICUM. See Citric acid. ACIDUM MURIATCUM. See Muriatic acid.

ACIDUM NITRICUM. See Nitric acid.

ACIDUM NITROSUM. Spiritus nitri fu-mans, of the shops. The nitrous acid possesses the same properties as the nitric, but in a much inferior degree.

ACIDUM NITROSUM DILUTUM. This is the common aqua fortis. Diluted nitrous acid possesses the same properties as the nitric acid, but in an inferior degree.

ACIDUM PHOSPHORICUM. See Phosphoric acid.

ACIDUM PRIMOGENIUM. The sulphuric acid. ACIDUM SUCCINICUM. See Succinic acid.

ACIDUM SULPHUREUM. The acid of sul-

ACIDUM SULPHURICUM. See Sulphuric

ACIDUM SULPHURICUM DILUTUM. dum vitriolicum dinutum. Spiritus vitrioli tenuis.

ACIDUM TERTARICUM. See Tartaric acid.

ACIDUM VITRIOLICUM. See Sulphuric acid.

Acidum vitriolicum dilutum. See Acidum sulphuricum dilutum.

Take of sulphuric acid, a fluidounce and half.

Distilled water, fourteen fluidonness and half. Add the water to the acid gradually, and mix.

ACIES. Steel

Acini bilios. (Acinus, a grape-stone; so called from their supposed resemblance.)
The small glandsform bodies of the liver, which separate the bile from the blood were formerly so called; they are now.

which separate the bile from the blood were formerly so called: they are now, however, more properly termed penicilli. See Liver.

Activition Tunie, Tunica acinosa. The

cost of the eye called the wrea, because the ancients, who dissected brutes, observed that, in them, it was usually of the colour of an unipe grape.

ACINUS. (A grape.) The glands which grow together in clusters are called by some

acini glandulosi.

Acmasticos. A species of synochus, wherein the febrile heat continues of the same tenour to the end. Actuarius.

Acme. (From ακμη a point.) The height or crisis of a disease. A term applied by physicians to that period or state of a disease in which it is at height. The ancients distinguished diseases into four stages:

1. the arche, the beginning or first attack.

2. Anabasis, he growth.

3. The acme, the height.

4. Paracme, or the decline of the disease.

ACMELLA. See Achmella.

Acne. Acna, arvn. A small pimple, or hard tubercle on the face. Fæsius says, that it is a small pustule or pimple, which arrises usually about the time that the body is in full vigour.

Ackertis. (From a, priv. and wraw, to scratch.) That part of the spine of the back, which reaches from the metaphrenon, which is the part betwirt the shoulder-blades, to the loins. This part seems to have been originally called so in quadrupeds only, because they cannot reach it to scratch.

ACOE. (AROV) The sense of hearing ACOELIOS. (From a priv. and RODACS, the belly.) Without belly. It is applied to those who are so wasted, as to appear as if they had no belly. Galen.

Acourus. (Axourus) An epithet for lioney, mentioned by Pliny: because it has

no sediment, which is called xourn.

Aconion. (Annua) A particular form of medicine among the ancient physicians, made of powders levigated, and probably like collyria for the disorders of the eyes.

ACONIUM. A little mortar.

ACONI I UM. (Of this plant various derivations are given by etymologists; as, axonn a whetstone or rock, because it is usually found in barren and rocky places: a, neg. and xons, dust; because it grows without earth or on barren situations: axonza, to sharpen; because it was used in medicines intended to quicken the sight; axan, a dart; because they poison darts therewith: or. axonfonza, to accelerate; for it hastens death.) Acontte. WoiPsbane. Monk's-hood.

1. A genus or plants in the Linnxan sys-

tem. Class, Polyandria, Trigynia.

2. The pharmacopetal name of the common, or blue, wolr's-bate. Monk's-hood. Aconite. Camarum. Canicida. Cynococtanum.

Aconitum napellus of Linnæus:-foliorum laciniis linearibus supernè latioribus, linea

exaratis.

The aconite is cultivated in our gardens as an ornament, but is spontaneously produced in Germany, and some other northern parts of Europe. Every part of the plant is strongly poisonous, but the root is unquestionably the most powerful; and when first cnewed, imparts a slight sensation of acrimony, but afterwards, an insensibility or stupor at the, apex of the tongue and a pungent heat of the lips, gums, palate, and fauces are perceived, followed with a general tremor and sensation of chilliness. The juice applied to a wound, seemed to affect the whose nervous system; even by keeping it long in the hand, or on the bo-som, we are told, unpleasant symptoms have been produced. The fatal symptoms brought on by this poison are, convulsions, giddiness, insanity, violent purgings, both upwards and downwards, faintings, cold sweats, and death itself. Dr Stoerk ap-pears to be the first who gave the wolf'sbane internally, as a medicine; and since his experiments were published, 1762, it has been generally and successfully employed in Germany and the northern parts of Europe, particularly as a remedy for obstinate rheumatisms; and many cases are related where this disease was of several years duration, and had withstood the efficacy of other powerful medicines, as mercury, opium, antimony, cicuta, &c. yet, in a short time, were entirely cured by the aconitum. Instances are also given us of its good effects in gout, scrophulous swellings, venereal nodes, amaurosis, intermittent fevers, paralysis, ulceration, and scirrhus. This plant has been generally prepared as an extract or inspissated juice, after the manner directed in the Edinburgh and many of the foreign pharmacopæias: its efficacy is much diminished on being long kept. Like all virulent medicines, it should first be administered in

small doses. Stoerk recommends two grains of the extract to be rubbed into a powder, with two drams of sugar, and to begin with ten grains of this powder, two or three times a day. We find, however, that the extract is often given from one grain to ten for a dose; and Stoll, Scherekbecker, and others, increased this quantity considerably. Instead of the extract, a tincture has been made of the dried leaves, maccrated in six times their weight of spirits of wine, and forty drops given for a Some writers say that the napellus is not poisonous in Sweden, Poland, &c. but it should be noted that the napellus which is not poisonous, is the Aconitum lycoctonum of Linnaus.

Acoron. (From α, priv. and κοπου, weariness.) It signifies originally whatever is a remedy against weariness, and is used in this sense by Hippocrates. Apl. viii. lib. ii. But in time, the word was applied to

certain ointments.

Acora. According to Galen and Paulus Ægineta, the Acopa Pharmaca are remedies for indispositions of body which are caused by long or vehement motion. So are medicines against lassitudes.

Acor. Acidity. It is sometimes used to express that sourness in the stomach contracted by indigestion, and from whence flatulencies and acid belching arise.

ACORDINA. An obsolete term for Indian

tutty.

Aconta. (From a, priv. and rogew to satiate.) Insatiability. In Hippocrates, it means a good appetite and digestion.

Acorites vinum. (From acopou, galangal.) A wine mentioned by Dioscorides, made with galangal, liquorice, &c. infused

ACORN. The fruit of the oak. Acorns were the food of the first ages; but when corn was cultivated, acorns were neglected. They are of little use with us, except for fattening hogs and other cattle and poultry. Among the Spaniards, the acorn, or glans iberica, is said to have long remained a delicacy, and to have been served up in the form of a dessert. In dearths, acorns have been sometimes dried, ground into meal, and baked as bread. Bartholin relates that they are used in Norway for this purpose. The inhabitants of Chio held out a long siege without any other food; and in a time of scarcity in France, A. D. 1709, they recurred to this food. But they are said to be hard of digestion, and to occasion headaches, flatulency, and colics In Smoland, however, many instances occur, in which they have supplied a salutary and nutritious food. With this view they are previously boiled in water and separated from their husks, and then dried and ground; and the powder is

mixed with about one half, or one third of corn flour. A decoction of acorns is reputed good against dysenteries and colics; and a pessary of them is said to be useful in immoderate fluxes of the menses. Some have recommended the powder of acorns in intermitent fever; and in Brunswick, they mix it with warm ale, and administer it for producing a sweat in cases of erysipelas. Acorns roasted and bruised have restrained a violent diarrbæa. For other medical uses to which they have been applied, see Murray's Appar. Medic. vol. i.

page 100.

From some late reports of the Academy of Sciences, at Petersburgh, we learn that acoms are the best substitute to coffee that has been hitherto known. To communicate to them the oily properties of coffee, the following process is recommended. When the acoms have been toasted brown, add fresh butter in small pieces to them, while hot in the ladle, and stir them with care, or cover the ladle and shake it, that the whole may be well mixed. The acoms of the Holm oak are formed at Venice into cups about one inch and an half in diameter, and somewhat less in depth. They are used for dressing leather and instead of galls for dyeing woollen cloth black.

Acortinus. A lopin.

ACORUS. (Anopop, from nopn, the pupil; because it was esteemed good for disorders of the eyes.) The name of a genus of plants in the Linnaan system. Class, Hexandria. Order, Digynia. Sweet-flag. Sweet-rush.

Aconus calamus. The systematic name for the calamus aromaticus. See Calamus aromaticus.

· Aconus palustris. See Iris palustris. Aconus venus. See Calamus aromaticus.

Acorus vulgaris. See Iris palustris.
Acos. (From amount, to heal.) A remedy or cure.

Acosmia. (From a, neg. and noopnos, beautiful.) Baldness; ill health; irregularity, particularly of the critical days of fevers.

Acoste. (From axorn, barley.) An ancient food made of barley.

ACOUSTICA. (Acoustica, sc. medicamenta; axoughx from axough to hear.) Remedies which are employed with a view to restore the sense of hearing, when wanting or diminished. No internal remedies of this kind are known to produce any uniform effect.

Acoustic nerves. See Auditory nerves.

Acoustic duct. The external pussage of the ear.

ACOUSTICS. That branch of general science which treats on the origin, propagation, and perception of sound.

Acna. (Arab.) Acrai nymphomania. Ex.

cessive venercal appetite. The time of incustruation.

Acraela. (From a, priv. and apares, strength.) Acrasia. Acratua, Debility, or impotence, from relaxation or lost tone of the parts. Hippocrates.

ACRAIPALA. (From a, neg. and apairtakna, surfeit.) Acrapalos. Remedies for the ef-

fects of a debauch.

ACRATISMA. (From angalov, unmixed wine.) A breakfast among the old Greeks, consisting of a morsel of bread, soaked in pure unmixed wine. The derivation of this word is the same as Acrasia, because the wine used on this occasion was not mixed with water.

ACHATOMELI. (From expelor, pure wine; and ushi, honcy.) Mulsum, or wine mixed with honey.

ACRE. (From angos, extreme.) The ex-

tremity of the nose

Achea. (From angos, extreme.) Acroteria. The extremities, i. e. the legs, arms, nose, and cars.

ACREPALOS. See Acraipala.

ACREBEIA. (From axpiens, accurate.) An exact and accurate description and diag nosis, or distinction of diseases.

ACRID (Acris.) A term employed in medicine to express a taste, the characteristic of which is pungency joined with heat.

ACRIMONY. (Acrimonia, from acris, acrid.) This term is used to express a quality in substances by which they irritate, corrode, or dissolve others. It has been supposed until very lately, there were acid and alkaline acrimonics in the blood, which produced certain diseases; and although the humoral pathology is nearly exploded, the term venereal acrimony and some others are still and must be retained.

Acris. Any fractured extremity.

Acrisia. (From a, priv. and a zwa, to judge or separate.) A turbulent state of a disease, which will scarcely suffer any judgment to be formed thereof.

ACRITUS. (From a, neg. and xewa, to judge.) Disease without regular crisis, the event of which is hazardons to judge.

ACROBYSTIA. (From akgos, extreme, and Gra, to cover.) The extremity of the

prepuce.

Acrochetria. (From angos, extreme, and xug a hand.) An exercise among the an-Probably a species of wrestling, where they only held by the hands.

Acrochetresis. (From augos, extreme, and xug, a hand.) Gorræus says, it signifies the arm from the elbow to the ends of the fingers; xug signifying the arm, from

the scapula to the fingers' end.

Acrochondon. (From axeos, extreme, and xogon, a string.) Galen describes it as a round excrescence on the skin, with a slender base; and that it hath its name because of its situation on the surface of the skin. The Greeks call that excrescence an achrochordon, where something hard concretes under the skin, which is rather rough, of the same colour as the skin, slender at the base, and broader above. Their size rarely exceeds that of a bean.

Acrocolia. (From augos, extreme, and xanov, a limb.) These are the extremities of animals, which are used in food, as the feet of calves, swine, sheep, oxen, or lambs, and of the broths of which, jellies are frequently made. Castellus from Budæus adds, that the internal parts of animals are also called by this name; in English giblets.

AcunoLenion. Castellus says it is the same as Olicranon

ACROMANIA. (From angos, extreme, and Total or incurable madmadness.) ness.

Acromion. (From angor, extremity, and apos, the shoulder.) A process of the scapula or shoulder-blade. See Scapula.

ACROMPHALIUM. (Angompanor, from angos, extreme, and ομφαλος, the navel.) Acromphaton. The tip of the navel.

ACROMPHALON. See Acromphalium.

Acronia. (From argor, the extremity.) The amputation of any extremity, as a finger or toe.

Acropathos. (From angos, extreme, and audos, a disease.) Acropathus. It signifies literally a disease at the top or superior part. Hippocrates in his treatise D. Superfectatione applies it to the internal orifice of the uterus; and in Prædict. lib. ii. to cancers, which appear on the surface of the body.

ACROPATHUS See Acropathos.

Acrops .. (Fr in angov, the extremity, and of, the voice.) Imperfect articulation, from a fault in the torque.

ACROPOSTRIA (From angos, extreme, and woodn, the prepuce.) The extremity of the prepuce; or that part which is cut off in circumcision.

Acropsiton. (From exgos, extreme, and twos, naked.) The extremity of the de-

nuded glans penis.

Acrospelos (From augo, the extremity, and assoc, black) Acrospelus. The bromus Dioscoridis, or wild oat grass; so called because its ears, or tops, are often of a blackish colour.

Achospelus. See Acrospelos.

ACROTERIA. (From angos, extreme.) The extreme parts of the body, as the hands, feet, nose, &c.

(From angwingia, ex-Acroteriasmus. tremities, and this from axgos, summus.)

The amputation of an extremity.

ACROTHEMION. (From angos, extreme, and Dopos, thyme.) Acrothymia. Acrothy. mium. A sort of wart, described by Celsus, as hard, rough, with a narrow basis, and broad top; the top is of the colour of

thyme; it easily splits and bleeds. This tumour is also called Thymus.

ACTEA. (From aya, to break.) Acte. The elder-tree, so called from its being ea-

sily broken. See Sambucus.
ACTINE. The herb Bunias or Napus.

ACTINOBOLISMUS (From andia, a ray, and βαλλω, to cast out.) Irradiation. It is applied to the spirits, conveying the inclinations of the mind to the body: it is also called Diradiatio.

ACTION (From ago, to act.) Any fa-culty, power, or function of the body, which, by physiologists are usually divided into vital, animal, or natural. The vital into vital, animal, or natural. functions, or actions, are those which are absolutely necessary to life, and without which animals cannot exist; as the action of the heart, lungs, and arteries. The natural functions are those which are instrumental in repairing the several losses which the body sustains: digestion, and the formation of chyle, &c fall under this head. The animal actions are those which we perform at will, as muscular motion, and all the voluntary motions of the body. Each part of the body is also said to have an action peculiar to itself.

A purging water ACTON WATER. procured from Acton, a village near London, where is a well that affords it. This don, where is a weil that affords it. is one of the strongest purging waters near London: and has been drank in the quantity of from one to three pints in a morning, against scorbutic and cutaneous affections. This medical spring is no longer resorted

to by the public.

ACTUAL. This word is applied to any thing endued with a property or virtue which acts by an immediate power inherent in it: it is the reverse of potential; thus, a red-hot iron or fire is called an actual cautery, in contradistinction from caustics, which are called potential cauteries. Boiling water is actually hot; brandy, producing heat in the body, is potentially hot, though of itself cold.

Actuation. (From ago, to act.) That change wrought on a medicine, or any thing taken into the body, by the vital heat, which is necessary, in order to make it act and have its effect, is called its actua-

tion.

Acuitas. Acrimony.

Acurrio. (From acuo, to sharpen.) The sharpening an acid medicine by an addition of something more acid; or in general, the increasing the force of any medicine, by an addition of something that hath the same sort of operation in a greater de-

(From α, neg. and κυλοω, to Aculon. roll round: so called because its fruit is not involved in a cup, or sheath, like others.) Acules The fruit or acorn of the ilex, or

scarlet oak.

Aculos. See Aculon.

Acumen. A point. The extremity of a

ACUPUNCTURA. (From acus, a needle, and punctura, a prick.) Acupuncture; bleeding performed by making many small punctures.

Plumbum, or lead. ACUREB.

Acuron. (From a, neg. and xuga, to happen.) A name of the Ausma: so called because it produces no effect if taken internally.

Acuspastoris. A name of the Scandix anthriscus, the shepherd's needle, or Ve-

nus's comb. See Scandix.

A disease Morbus acutus. ACUTE. which is attended with violent symptoms, terminates in a few days, and is attended with danger. It is opposed to a chronic disease, which is slow in its progress, and not so generally dangerous.

Acutenaculum, (From acus, a needle, and tenaculum, a handle.) Heister calls the portaiguille by this name. It is the handle for a needle, to make it penetrate

easily when st ching a wound.

Acrisis. (From a, neg. and xva, to conceive.) In Vogel's nosology it signifies a defect of conception, or barrenness in women.

Acreus. (From a, priv and augos, authority; so named from its little note in medicine.) The Arnica montana, or German

leopard's-bane See Arnica.

ADEMONIA. (From a, priv. and Saspar, a genius or fortune.) The restlessness and anxiety felt in acute tevers.

ADAIGES. Sal-animoniac, or muriate of ammonia. See Murias ammoniæ.

ADAMAS. (From a, neg. and Sauaw, to conquer; as not being easily broken.) The adamant or diamond, the most precious of all stones, and which was formerly supposed to contain extraordinary cordial vir-

Adamitum. ADAMITTA. A hard stone in the bladder.

Adam's Apple. See Pomun Adami.

ADAM'S NEEDLE. Yucca gloriosa of Lin-næus. The roots of this plant are thick and tuberous, and are used by the Indians instead of bread; being first reduced into a coarse meal. This, however, is only in times of scarcity.

ADARCES. (From a, neg. and Segne, to see.) A saltish concretion found about the reeds and grass in marshy grounds in Galatia, and so called because it hides them. It is used to clear the skin with, in leprosies, tetters, &c. Dr. Plott gives an account of this production in his Natural History of Oxfordshire. It was formerly in repute for cleansing the skin from freckles.

ADARIGES. An ammoniacal salt.

Adarneck. Auripigmentum, or orpi-

Adarticulation See Arthrodia.

ADDEPHAGIA. (From αδων, abundantly, and φαγων, to eat.) Insatiability. A voracious appetite. See Bulimia.

A term formerly employed as synonymous with epiphysis, but now only applied to two portions of sutures of the skull. See

Lambdoidal and Squamous Sutures.

ADDITAMENTUM COLL. See Appendicu-

la caci vermiformis.

ADDUCTOR. (From ad, and duco, to draw.) A drawer or contractor. A name given to several muscles, whose office is to bring forwards or draw together those parts of the body to which they are annexed.

ADDUCTOR BREVIS FEMORIS. Adductor femoris secundus of Douglas. Triceles secundus of Winslow. A muscle, which, with the adductor longus and magnus femoris forms the triceles adductor femoris. It is situated on the posterior part of the thigh, arising tendinous from the os pubis near its joining with the opposite os pubis near its

Anduetor femoris primus. See Adductor longus femoris.

Adductor Femoris Secundus. See Adductor brevis femoris.

ADDUCTOR FEMORIS TERTIUS. See Adductor magnus femoris.

ADDUCTOR FEMORIS QUARTUS. See Ad-

ductor magnus femoris.

ADDUCTOR INDICIS PEDIS. An external interosseous muscle of the forc-toe, which arises, tendinous and fleshy, by two origins, from the root of the inside of the metatarsal bone of the fore-toe, from the outside of the root of the metatarsal bone of the great-toe, and from the os cune-iforme internum. It is inserted, tendinous, into the inside of the root of the first joint of the fore-toe. Its use is to pull the fore-toe inwards from the rest of the small toes.

ADDUCTOR LONGUS FEMORIS. Adductor femoris primus of Douglas. Triceps minus of Winslow. A muscle situated on the posterior part of the thigh, which, with the adductor brevis, and magnus femoris, forms the triceps adductor femoris. It arises by a pretty strong roundish tendon, from the upper and interior part of the os pubis, and ligament of its synchondrosis, on the inner side of the pectineus, and is inserted along the middle part of the linea aspera. See Triceps adductor femoris.

ADDUCTOR MAGNUS FEMORIS.
Adductor femoris tertus et quartns of Douglas. Triceps magnus of Winslow. A muscle which, with the adductor brevis femoris, and the adductor longus femoris, forms the Triceps adductor femoris. It arises from the symphysis pubis, and all along the flat edge of the thyroid foramen, from whence it goes to be inserted into the linea aspera throughout its whole length. See Triceps adductor femoris.

Triceps adductor femoris.

ADDUCTOR MINIMI DIGITI PEDIS.
An internal interosseous muscle of the foot. It arises, tendinous and fleshy, from the inside of the root of the metatarsal bone of the little-toe. It is inserted, tendinous, into the inside of the root of the first joint of the little-toe. Its use is to pull the little-toe inwards.

ADDUCTOR OCULI. See Rectus internus oculi.

ADDUCTOR POLLICIS. See Adductor polli-

ADDUCTOR POLLICIS MANUS. Adductor pollicis. Adductor ad minimum digitum. A muscle of the thumb, situated on the hand, which arises, fleshy, from almost the whole length of the metacarpal bone that sustains the middle finger; from thence its fibres are collected together. It is inserted, tendinous, into the inner part of the root of the first bone of the thumb. Its use is to pull the thumb towards the fingers.

ADDUCTOR POLLICIS PEDIS. Antithenar of Winslow. A muscle of the great toe, situated on the foot: it arises, by along thin tendon, from the os ealeis, from the os cuboides, from the os cuboides, from the root of the metatarsal bone of the second toe. It is inserted into the external os sesamoideum, and root of the metatarsal bone of the great toe. Its use is to bring this toe nearer to the rest.

ADDUCTOR PROSTATE. A name given by Sanctorini to a muscle which he also calls Levater prostatie, and which Winslow calls Prostaticus superior. Albinus, from its office, had very properly called it compressor prosetatie. See Compressor prostatie.

ADDUCTOR TERTH DIGITI PEDIS. An internal interosseous muscle of the foot that arises, tendinous and fleshy, from the roots of the metatarsal bones of the third and little toe. It is inserted, tendinous, into the outside of the root of the first joint of the third toe. Its use is to pull the third toe outward.

ADEC. Sour milk, or butter-milk.

ADECIA. See . Idectos.

Anecros. Adecia. (From α, priv. and δακτω, to bite.) An epithet of those medicanes which relieve from pain, by removing the uneasy situation caused by the stimulus of acrimonious medicines.

ADELPHIA, ('Aδελφια, a relation.) Hippoerates calls diseases by this name that

resemble each other.

ADEMONIA. (From a, priv. and Saucar, a genus or divinity or fortune.) Hippocrates uses this word for uneasiness, restlessness,

or anxiety felt in acute diseases, and some hysteric fits.

ADEN. (Ad nv, a gland.) A gland.

bubo. See Gland.

ADENIFORM. (Adeniformis; from as nv, a gland, and forma, resemblance.) Glandiform, or resembling a gland. A term sometimes applied to the prostate gland.

ADENDENTIS. An epithet applied to ulcers which eat and destroy the glands.

ADENOGRAPHY (From adni, a gland, and reapw, to write.) A treatise on the glands. See Gland.

ADENOIDES. Glandiform: resembling a An epithet applied also to the

prostate gland.

ADENOLOGY. (From as nv, a gland, and xoyos, a treatise.) The doctrine of the glands. See Gland.

ADENOUS ABSCESS. (Abscessus adenosus : from as m, a gland.) A hard glandular ab-

scess, which suppurates slowly.

ADEPHAGIA. (From adny, abundantly, and payer, to eat.) Insatiate appetite. See Bulimia.

ADEPS. Fat. An oily secretion from the blood into the cells of the cellular membrane. See Fat.

ADEPS ANSERINUS. Goose-grease.

ADEPS SUILLÆ. Hog's-lard.

ADEPTA MEDICINA. So Paracelsus calls that which treats of the diseases that are contracted by celestial operations, or communicated from heaven.

ADEPTA PHILOSOPHIA. Adept philosophy. It is that philosophy, whose end is the transmutation of minerals, and a uni-

versal remedy.

ADEPTS. (From adipiscor, to obtain.) Skilful alchymists. Such are called so as pretend to some extraordinary skill in chymistry; but these have too often proved either enthusiasts or impostors. The professors of the Adepta Philosophia are also called Adepts.

A blast: a kind of erysipe-ADFLATUS.

ADHATODA, The Malabar nut-tree, which is a species of Justicia. It is used in India for expelling the dead fætus in an abortion, which it is said is the meaning of the word in the Zeylandic language.

ADHÆSION. (From adhæreo, to stick to.) The growing together of parts.

ADHÆSIVE INFLAMMATION. term lately introduced into Surgery, to express that species of inflammation which terminates by an adhæsion of the inflamed surfaces.

ADDAESIVE PLASTER. A plaster made of common litharge plaster and resin, is so called because it is used for its adhesive properties. See Emplastrum resinæ.

ADIACHYTOS. (From a, neg. and Suzzum, to diffuse, scatter, or be profuse.) Decent in point of dress. Hippocrates thinks the dress of a fop derogatory from the physician; though thereby he hides his ignorance, and obtains the good opinion of his patients.

(as iavior, ADIANTHUM. Adiantum. from a, neg. and Javo, to grow wet; so called because its leaves are not easily made wet.) Maidenhair. The name of a genus of plants in the Linnzan system. Class, Cryptogamia. Order, Filices.

ADIANTHUM CAPILLUS VENERIS. Maiden-hair. The leaves of this plant are somewhat sweet and austere to the palate. and possess mucifagmous qualities. rop, the syrop de capillaire is prepared from them, which is much esteemed in Orange-flower water and a pro-France. portion of honey, it is said, are usually added. It acts chiefly as a demulcent, sheathing the inflamed sides of the glottis.

ADIANTHUM AUREUM. The Polytrichum commune of Linnæus. It possesses, in an inferior degree, astringent virtues : and was formerly given in diseases of the lungs, and

calculous complaints.

A term which implies ADIAPHOROUS. the same with neutral; and is particularly used of some spirits and salts, which are neither of an acid nor alkaline

ADIALNEUSTIA. (From the privative particle a, and διαπνεω, perspiro. minution or obstruction of natural perspiration, and that in which the ancients chiefly placed the cause of fevers.

ADIARRHŒA. (From a, priv. and Siappea, to flow out or through.) A total suppression of all the necessary evacuations from

the bowels.

ADIATHOROSUS. A spirit distilled from tartar.

ADIBAT. Mercury.

ADICE. (Adian.) A nettle. ADIPOCIRE. (From adeps, fat, and cera, wax.) A substance that resembles soap, formed by a conversion of animal matter, placed under certain circumstances. Whole bodies have been found converted into this substance.

ADIPOSE MEMBRANE. (Membrana adiposa, from adeps, fat.) The fat collected in the cells of the cellular membrane.

So the Greeks called medi-ADIPSAN. cines, &c. which abate thirst. Hippocrates

applied this word to oxymel.

(From a, neg. and Sita, ADIPSIA. thirst.) A want of thirst. A genns of disease in the class locales, and oader dysorexia of Cullen's Nosology. It is mostly symptomatic of some disease of the brain.

Appross. So the Greeks called the Egyptian palm-tree, whose fruit is said to be the The tree is called adipsos, Myrobalans. because its fruit quencheth thirst. Theophrastus calls this tree Balanos. is also a name for liquorice.

ADIRIVE. Ammoniacal salt.

ADJUTORIUM. (From ad and juvo, to help.) A name of the humerus, from its usefulness in lifting up the fore-arm.

ADJUVANTIA. Whatever assists in obvi-

ating disease.

ADNATA TUNICA. (Adnata, from adnascor, to grow to.) Albuginea oculi. Tunica albuginea oculi. This membrane is mostly confounded with the conjunctiva. It is, however, thus formed: five of the muscles which move the eye, take their origin from the bottom of the orbit, and the sixth arises from the edge of it; they are all inserted, by a tendinous expansion, into the anterior part of the tunica sclerotica; which expansion gives the whiteness peculiar to the fore-part of the eye. It lies betwixt the sclerotica and conjunctiva.

ADOC. Milk.

ADONION. (From Adams the youth from whose blood it was feigned to have sprung.)

. Idonium. Southernwood.

ADOPTER. Tubus intermedius. A chymical instrument used to combine retorts to the cucurbits or matrasses in distillation, with retorts instead of receivers.

Apon. A sort of corn, called also spelta. Avos. Water in which red hot iron is ex-

tinguished.

An pondus omnium. The weight of the whole. These words are inserted in pharmaceutical preparations, or prescriptions, when the last ingredient ought to weigh as much as all the others put together.

ADRA RHIZA. Blaucard says the root of

the Aristolochia is thus named.

ADRACHNE. The strawberry bay-tree. A species of Arbutus.

ADRAM. Fossil salt.

ADRARAGI. (Indian.) Garden-saffron. Adroboton. (From aδgos large, and βωλος, a globe, bole, or mass.) Indian bdel-

lium, which is coarser than the Arabian.

Adstriction. Costiveness.

ADSTRINGENTS. See Astringents.

Augstion. An inflammation about the brain, and its membrane, with a hollowness of the eyes, a pale colour, and a dry

In Surgery, adustion signifies the same as cauterization, and means the application of any substance to the animal body, which acts like fire. The ancient surgcons, especially the Arabians, were remarkably fond of having recourse to adustion in local diseases: but the use of actual heat is very rarely admitted by the moderns.

ADVENTITIOUS. Any thing that accidentally, and not in the common course of natural causes, happens to make a part of another; as the glands in strumous cases are said to be adventitions glands, in distinction from those which are naturally produced. It is also used in opposition to hereditary; thus gout and scrofula are sometimes hereditary, and very often adventitious, they having never before been known in the

family.

Abanga. The palm of the island Any. Abanga. The palm of the island of St. Thomas, from which is prepared Thernel's restorative.

ADYNAMIA. (Aδυναμια: from a, priv. and Sovapus, power.) A defect of vital power.
ADYNAMIE. The second order of the

class neuroses of Cullen's Nosology; it comprehends snycope, dyspepsia, and hypochondriasis.

ADYNAMON (From a, neg. and Suvapis, strength.) Adynamum. Among ancient physicians, it signified a kind of weak factitious wine, prepared from must, boiled down with water; to be given to patients to whom pure or genuine wine might be hurtful.

Enoia. (From αιδως, modesty; or from a, neg. and es a, to see; as not being decent to the sight.) The pudenda, or parts

of generation.

EDOPSOPHIA. (From aid oix, pudenda, n ψοφεω, to break wind.) A term used by Sauvages and Sagar, to signify a flatus from the bladder, or from the womb, making its escape through the vagina.

ÆGAGROPILUS. (From arangos, a wild

goat, and pila, a ball.) Ægagrophila.

1. A ball found in the stomach of deer, goats, hogs, horned cattle, as cows, &c. It consists of hairs which they have swallowed from licking themselves. They are of different degrees of hardness, but have no medicinal virtues. Some rank these balls among the Bezoars. Hieronymus Velschius wrote a treatise on the virtues of this.

2. A species of conferva found in Wallenfenmoor, from its resembling these concre-

tions, is also so named.

ÆGIAS. A white speck on the pupil of the eye, which occasions a dimness of sight.

Ægines, Aglia. A disorder of the eyes mentioned by Hippocrates. Fæsius thinks the disease consists of small cicatrices in the eye, caused by an afflux of corrosive humours upon the part. But in one passage of Hippocrates, Fœsius says it signifies small white concretions of humours which stick upon the pupil, and obscure the

Ægipion. A collyrium or ointment for inflammations and defluxions of the eyes.

ÆGILOPS. Wild fescue grass. This plant is called agilops from its supposed virtue in curing the disorder named Ægylops. It is a species of Bromus in the Linnaan sys-

ÆGINETIA. Malabrian broom rape. A species of Orobanche.

Ægis. Achlys. A film on the eye.

ÆGOCERAS. (From aig, a goat, and Regas, a horn: so called, because the pods were supposed to resemble the horns of a goat.) Fænugreek. See Trigonella Fænum-græcum, and Bouceras.

ÆGOLETHRON. (From αιξ, a goat, and ολεβρος, destruction; so named from the opinion of its being poisonous to goats.) Tournefort says it is the Chanarododendron; now the Azelea pontica of Linnaus.

ÆGONYCHON. (From  $at\xi$ , a goat, and  $avv\xi$ , a hoof; because of the hardness of the seed.) Cromwell. See *Lithospermum*.

ÆGOPODIUM. (From  $a\xi$ , a goat, and  $x^{\xi}$ , a foot; from its supposed resemblance to a goat's foot.) Goatweed. A genus of plants in the Linnzan system. Class, Pen-

tandria Order, Digynia.

ÆGOPODIUM. PODAGRAHIA. (Podagraria, from its use in curing the podagra, or gout.) Goatweed. This plant is sedative, and was formerly applied to mitigate pains of gout, and to relieve piles, but not now employed. In its earlier state it is tender and esculent.

Ægoprosofon. (From αιξ, a goat, and περοσωπον, a face; so called because goats are subject to defects in the eyes, or from having in it some ingredients named after the goat.) A name of a lotion for the eyes, when inflamed.

ÆGYLOPS. From α<sub>i</sub>ξ, a goat, and αψ, an eye.) A disease so named from the supposition that goats were very subject to it.

The term means a sore just under the inner angle of the eye. The best modern surgeons seem to consider the ægylops only as a stage of the fistula lachrymalis. Paulus Ægineta calls it anchylops, before it bursts, and ægilops after. When the skin covering the lachrymal sac has been for some time inflamed, or subject to frequent returning inflamed, or subject to frequent returning inflammations, it most commonly happens that the puncta lachrymalia are affected by it; and the fluid, not having an opportunity of passing off by them, distends the inflamed skin, so that at last it becomes sloughy, and bursts externally. This is that state of the disease which is called perfect aigylops, or ægylops.

ÆGYPTIA MUSCATA. See Hibiscus abel-

moscnus.

ÆGYPTIACUM. A name given to different unguents of the detergent or corrosive kind. We meet with a black, a red, a white, a simple, a compound, and a magistral Ægyptiacum. The simple Ægyptiacum, which is that usually found in our shops, is a composition of verdigris, vinegar, and honey, boiled to a consistence. It is usually supposed to take its name from its dark colour, wherein it resembles that of the natives of Egypt. It is improperly called an unguent, as there is no oil, or rather fat, in it.

EGYPTIUM PHARMACUM AD AURES. Ætius speaks of this as excellent for deterging fætid ulcers of the ears, which he says it cures, though the patient were born with a

tnem.

Æigluces. (From αει, always and γλυκυς, sweet.) Λ sweetish wine, or must.

ÆIPATHEIA. (From αυ, always, and σπαθυς, a disease.) Any disease of long duration.

ÆNEA. (From as, brass, so called because it was formerly made of brass.) A catheter.

Æon. The spinal marrow.

ÆONESIS. Fermentation. Sprinkling of the whole body.

Æonion. The sedum majus, or common house-leek

ÆORA. (From αιωρεω, to lift up, to suspend on high.) Exercise without muscular action; as swinging. A species of exercise used by the aucients, and of which Aëtius gives the following account. Gestation, while it exercises the body, the body seems to be at rest. Of the motion there are several kinds. First, swinging in a hammock, which, at the decline of a fever, is beneficial. Secondly, being carried in a litter, in which the patient either sits, or lies along. It is useful when the gout, stone, or such other disorder, attends, as does not admit of violent motions. Thirdly, riding in a chariot, which is of service in most chronical disorders; especially before the more violent exercises can be admitted. Fourthly, sailing in a ship, or boat. This produces various effects, according to the different agitation of the waters, and, in many tedious chronical disorders, is efficacious beyond what is observed from the most skilful administration of drugs. These are instances of a passive exercise.

Æque. Equally. The same as ana. AER. The fluid which surrounds the

globe. See Air and Atmosphere.

ÆPOS An excrescence, or protuberance.

Æra. Darnel, or lolium.

ÆRITIS The Anagallis, or pimpernell. AEROLOGIA. (Απρολογια: from ang, the air, and λογος, a discourse.) Aerologice. Aerology. That part of medicine which treats of the nature and properties of air.

AEHOLOGICE. See Aerologia.

Aeromeli Honey, dew; also a name for manna.

Aerophobi. (From ang, air, and φεως, fear) According to Calius Aurelianus, some phrenetic patients are afraid of a lucid and others of an obscure air: and these he calls aerophobi.

AEROPHOBIA. Fear of air, or wind. A symptom of the phrenitis; also a name

of Hydrophobia.

AEROSIS. The aerial vital spirit of the ancients.

ÆROSSUS LAPIS. So Pliny calls the Lapis Calaminaris, upon the supposition that it was a copper ore.

Enuca. Verdigris.

ÆRUGO. (From æs, copper.) Azagor.

1. The rust of any metal, particularly of copper.

2. Verdigrise. See Verdigrise.

ERUGO PREPARATA. See Subacetas cupri

ÆSCHROMYTHESIS. The obscene lan-

guage of the delirions.

ASCULUS. (Esculus, from esca, food.)
Horse-chestnut. The name of a genus of plants in the Linnaun system. Class, Heptandria. Order, Monogynia.

The sys-ÆSCULUS HIPPOCASTANUM. tem tic name for the hippocastanum. See

Hippocastanum.

ÆSECAVUM. Auricalcum, or briss.

ÆSTATES. Freckles in the face; sunburnings.

ESTPHARA. Incineration, or burning of the flesh, or any other part of the body.

ESTUARIUM. A stove for conveying heat to all parts of the body at once. kind of vapour bath. A vapour bath Ambrose Parey calls an instrument thus, which he describes for conveying heat to any particular part. Palmarius, de morbis, contagiosis, gives a contrivance under this name, for sweating the whole body.

ÆSTUATIO. The boiling up, or rather the fermenting of liquors when mixed.

ÆSTUS VOLATICUS. (From astus, heat, and volo, to fly.) According to Vogel, synonymous with phlogosis. Sudden heat, or scorching, which soon goes off, but which for a time reddens the face.

(Aithing, a supposed fine subtile ÆTHER. Liquor athereus. Ether. Æther sulphuricus, nitrosus, muriaticus, according to the acid from which it is formed combined with alcohol. A volatile liquor, obtained, by distillation, form a mixture of al-

cohol and a concentrated acid.

The medical properties of ather, when taken internally, are antispasmodic, cordial, and stimulant. Against nervous and ty-phoid fevers, all nervous diseases, but especially tetanic affections, soporose diseases from debility, asthma, palsy, spasmodic colic, hysteria, &c. it always enjoys some share of reputation. Regular practitioners seldom give so much as empirics, who sometimes venture upon large quantities, with incredible benefit. Applied externally, it is of service in the headach, toothach, and other painful affections. Thus employed, it is capable of producing two very opposite effects, according to its management; for, if it be prevented from evaporating, by covering the place to which it is applied closely with the hand, it proves a powerful stimulant and rubefacient, and excites a sensation of burning heat, as is the case with solutions of camphor in alcohol, or turpentine. In this way it is frequently used for removing pains in the head or teeth. On the contrary, if it be dropped on any part of the body, exposed freely to the air, its rapid evaporation produces an intense degree of cold; and as this is attended with a proportional diminution of bulk in the part

applied, in this way it has frequently contributed to the reduction of the intestine, in cases of strangulated hernia.

ÆTHEREA HERBA. The Eryngium was

so called.

ÆTHEREAL OIL. An animal or vegetable oil, highly rectified, partaking, as it were, of the nature of ather.

ÆTHER SULPHURICUS. Naptha vitri-Æther Vitriolicus. Sulphuric ether.

Take of rectified spirit,

Sulphuric acid, of each, by weight, a pound and a half.

Pour the spirit into a glass retort, then gradually add to it the acid, shaking it after each addition, and taking care that their temperature, during the mixture, may not exceed 120 degrees. Immerse the retort very cautionsly to a sand bath, previously heated to 200 degrees, so that the liquor may boil as speedily as possible, and let the ather pass over into a tubulated receiver. to the tubulure of which another receiver is applied, and kept coid by immersion in ice. or water. Distil the liquor until a heavier part also begins to pass over, and appear under the ather in the bottom of the re-To the liquor which remains in the retort, pour on twelve fluidounces more of alcohol, and repeat the distillation in the same manner.

It is mostly employed as an excitant, nervine, antispasmodic, and dirretic, in cases of spasms, cardialgia, enteralgia, fevers, liysteria, cephalagia, and spasmodic asthma. The dose is from gt. xx to Zij. Externally it cures toothach, and violent pains in the

head. See Ether.

ÆTHER RECTIFICATUS. Æther vitriolicus.

Take of sulphuric ather, fourteen fluid-

Fused potash, half an ounce,

Distilled water, two fluidonnces.

Dissolve the potash in the water, and add thereto the æther, shaking them well together, until they are mixed. Lastly, by means of a temperature about 200 degrees, distil over twelve onnces of rectified ather, from a large retort into a cooled receiver.

Sulphuric ather is impregnated with some sulphuric acid, as is evident in the smell, and with some ætherial oil: and these require a second process to separate them. Potash unites to the acid, and requires to be added in a state of solution, and in sufficient quantities, for the purpose of neutralizing it; and it also forms a soap with the oil. It is advantageous also to use a less quantity of water than exists in the ordinary solution of potash: and therefore the above directions are adopted in the last London Pharmacopæia. For its virtues, see Æther.

ETHOPS. A term applied formerly to several preparations, because the powder becomes of a black colour, like the skin of an Æthiopian.

ÆTHIOPS ANTIMONAILIS. A preparation of antimony and mercury, once in high repute, and still employed by some practi-tioners in cutaneous diseases. A few grains are to be given at first, and the quantity increased as the stomach can bear it.

ÆTHIOPS MARTIALIS. A preparation of iron, formerly in repute, but now neglected.

ÆTHIOPS MINERAL. The substance heretofore known by this name, is called, by the London College, Hydrargyrus cum sulphure; by the Edinburgh, Sulphuretum Hydrargyri nigrum; and by that of Dublin, Hydrargyrum sulphuratum nigrum.

Athmoid artery. See Ethmoid artery.

Athmoid bone. See Ethmoid bone.

ÆTHNA. A chymical furnace.

ÆTHOCES. Ætholices. Superficial pustules in the skin, raised by heat, as boils, fiery pustules.

(From aidsoa, beggarly.) ÆTHUSA. The name of a genus of plants of the Linnæan system. Class, Pentandria. Order, Digynia.

ÆTHUSA MEUM. The systematic name of the meum of the Pharmacopæias. Meum Athamanticum.

ÆTHYA. A mortar.

Eagle veins. ÆTIOI PHLEBES. veins which pass through the temples to the head, were so called formerly by Rufus Ephesius.

ÆΤΙΟLOGY. (Αιτιολογια: from ailia, a cause, and λογος, a discourse.) The doctrine of the causes of diseases.

ÆTOCION. Ætolium. The granume nidium.

ÆTONYCHIUM. See Lithospermum.

AFFECTION. (This is expressed in Greek by walos: hence pathema, passio.) This term indicates any existing disorder of the whole body, or a part of it, as hysterics, colic, leprosy. Thus by adding a descriptive epithet to the term affection, most distempers may be expressed. We say febrile affection, cutaneous affection, &c. using the word affection synonymously with disease.

AFFINITY. (Affinitas, a proximity of relationship.) The term affinity is used indifferently with attraction. See Attrac-

Affinity of Aggregation. See Attraction of Aggregation.

Affinity of Composition. See Attraction,

chymical.

Affinity, compound. When three or more bodies, on account of their mutual affinity, unite and form one homogeneous body, then the affinity is termed compound affinity or attraction: thus, if to a solution of sugar and water be added spirits of wine, these three bodies will form a homogeneous liquid by compound affinity. See Attraction.

. Affinity, double. Double elective attraction. When two bodies, each consisting of

two elementary parts, come into contact, and are decomposed, so that their elements become reciprocally united, and produce two new compound bodies, the decomposition is then termed, decomposition by double affinity: thus, if we add common salt, which consists of muriatic acid and soda, to nitrate of silver, which is composed of nitric acid and silver, these two bodies will be decompounded; for the nitric acid unites with the soda, and the silver with the muriatic acid, and thus may be obtained two new bodies. The common salt and nitrate of silver therefore mutually decompose each other by what is called double affinity. See Attraction.

Affinity, intermediate. Appropriate affinity. Affinity of an intermedium-is, when two substances of different kinds, that show to one another no component affinity, do, by the assistance of a third, combine, and unite into a homogeneous whole: thus, oil and water are substances of different kinds, which, by means of alkali, combine and unite into an homogeneous substance: hence the theory of lixiviums, of washing, &c.

See Attraction.

Affinity, quiescent. Mr. Kirwan employs the term Quiescent affinity to mark that, by virtue of which, the principle of each compound of two bodies, decomposed by double affinity, adhere to each other; and Divellert affinity, to distinguish that by which the principles of one body unite and change order with those of the other: thus sulphate of potash or vitriolated tartar is not completely decomposed by the nitric acid or by lime, when either of these principles is separately presented; but if the nitric acid be combined with lime, this nitrate of lime will decompose the sulphate of potash. In this last case the affinity of the sulphuric acid with the alkali is weakened by its affinity to the lime. This acid, therefore, is subject to two affinities, the one which retains it to the alkali, called quiescent, and the other which attracts it towards the lime, called divellent affinity.

Affinity, divellent. See Affinity quiescent. Affinity reciprocal. When a compound of two bodies is decomposed by a third; the separated principle being in its turn capable of decomposing the new combina-

tion.

Affinity, simple. Single elective Attraction. If a body consisting of two component parts, be decomposed on the approach of a third, which has a greater affinity with one of those component parts than with the other, then the decomposition is termed decomposition by simple affinity; for instance, if pure potash be added to a combination of mitric acid and lime, the union which existed between these two bodies will cease, because the potash combines with the nitric acid, and the lime being

disengaged is precipitated. The reason is, that the nitric acid has a greater affinity for the pure potash than for the lime, therefore it deserts the lime, to combine with the potash. When two bodies only enter into chymical union, the affinity, which was the cause of it, is also termed simple or single elective attraction; thus the solution of sugar and water is produced by simple affinity, because there are but two bodies. See Attraction.

Affion. Affium. An Arabic name for opium.

Afflatus. (From ad and flare, to blow.) A vapour or blast. A species of erysipelas, which attacks people suddenly, so named upon the erroneous supposition that it was produced by some unwholesome wind blowing on the part.

Affusio. Pouring a liquor upon something; but sometimes it means the same as

suffusio, a cataract.

After-birth. See Placenta.

AFFLIUM. An Arabic name for opium.

AGA CHETENSIUM. The small Spanish milk-thistle.

AGALACTATIO. See Agalactia.

AGALACTIA. (Ayananlia: from a, priv. and yana, milk.) Agalaxis, Agalactic. Agaluctatio. A defect of milk in childbirth.

AGALACTOS. (From α, priv. and γαλα, milk.) An epithet given to women who have no milk when they lie in.

AGALACTOS. See Agaluctia. AGALAXIS. See Agalactia.

AGALLOCHI VERI LIGNUM. See Lignum

AGALLUGE. Agallugum. A name of the agallochum or aromatic aloe.

Agaric. See Agaricus.

AGARACOIDES. A species of agaricus or fungus.

AGARICUS. (Ayaginos: from Agaria, a town in Asia; or from Agarus, a river in Sarmatia, now Malowouda.) Agaric. The name of a genus of plants in the Linnzan system. Class, Cryptogamia. Order, Fungi.

AGARICUS CHINURGORUM. Agaricus quer-Fungus igniarius. Boletus igniarius. Agaric of the oak. Touchwood boletus. Female agaric. This fungus Boletus igniarius of Linnæus :- acaulis pulvinatus levis, poris tennissimus, has been much used by surgeons as an external styptic. Though still employed on the Continent, the surgeons in this country have not much confidence in it.

AGARICUS ALBUS. The plant known by this name in the pharmacopæias, is the Boletus laricis of Linnæus; so called from its being met with on old larch trees, in different parts of Europe. Several preparations, as troches, an extract, and pills, are ordered to be made with it in foreign pliarmacopæias, which are administered against phthisical complaints.

AGAILUGUM. See Agallugi.

AGARICUS CAMPESTRIS. See Mushroom.

AGARICUS CHATARELLUS. A species of fungus, esteemed a delicacy by the French. Broiled with salt and pepper, it has much the flavour of a roasted cockle.

AGARICUS CINNAMOMEUS. Brown Mushroom. A species of agaricus, of a pleasant When broiled, it gives a good

flavour.

AGARICUS DELICIOSUS. This fungus well seasoned and then broiled has the exact flavour of a roasted muscle. It is in season

in September.

AGARICUS MUSCARIUS. Bug Agaric, so called from its known virtue in destroying bugs. This reddish fungus is the Agaricus muscarius of Linnæns :- stipitatus, lamellis dimidiatis solitariis, stipite volvato, apice di-latato, basi ovato. The use of this vegeta-ble is not much known in this country. Haller relates that six persons of Lithuania perished at one time, by eating this kind of mushroom, and that in others it has caused delirium. It is employed externally to strumous, phagedenic, and fistulous ulcers, as an escharotic.

Agaricus piperatus. The plant thus named by Linnæus, is the pepper musliroom, also called pepper agaric. It is the Fungus piperatus albus, lacteo-succo turgens of Ray. Fungus albus acris. When freely taken, fatal consequences are related by several writers to have been the result. When this vegetable has even lost its acrid juice by drying, its caustic quality still

AGARICUS PRATENSIS. The Champignion of Hudson's Flora Anglica. This plant has but little smell, and is rather dry, yet when broiled and stewed, communicates a good flavour.

AGARICUS VIOLACEUS. Violet mushroom. This fungus requires much broiling, but when sufficiently done and seasoned, it is as delicious as an oyster. Hudson's bul-

bosus is only a variety of this.

AGE. The ancients reckoned six stages of life: pueritia, childhood, which is to the fifth year of our age ;-adolescentia, youth, reckoned to the eighteenth, and youth properly so called, to the twenty-fifth year;juventus, reckoned from the twenty-fifth to the thirty-fifth year ;-virilis atas, manhood, from the thirty-fifth to the fiftieth year;senectus, old age, from fifty to sixty ;-crepita ætus, decrepid age, which ends in death.

AGENESIA. (Azumora: from a, neg. and respect, to beget.) Impotency in man. A term employed by Vogel. It is synonymous with anaphrodisia and dyspermatismus.

Agen. The common earth or soil.

Ager NATURE. The wonib.

AGENATUS LAPIS. (Ageratus common.) A stone used by cobblers. It is ridiculously said to be discutient and gently astringent

If it possess any such virtues, it probably contains iron; a supposition countenanced by its being used in dyeing.

AGENATUM. (Apsgalov: from a, priv. and pages, senectus; never old, ever green; because its flowers preserve their beauty a long time) See Achillea agenatum.

long time) See Achillea ageratum.

AGES. (From αγms, wicked; so called because it is generally the instrument of wicked acts.) The palm or hollow of the hand.

AGEUSTIA. (From 2, neg. and γευμοαι, gusto, to taste.) Agheustia, Apoguestia,

Apogeusis.

A defect or loss of taste. Cullen ranks this as a genus of disease in the class locales and order dysesthesiae. The causes are fever or palsy, whence he forms two species: the latter he calls organic, arising from some affection in the membrane of the tongue, by which relishing things, or those which have some taste, are prevented from coming into contact with the nerves: the other atonic, arising without any affection of the tongue.

AGGLUTINANTIA. Adhesive medicines which heal by causing the parts to stick

together

AGGLUTINATIO. Agglutination. The adhesive union or sticking together of substances.

AGGLUTITIO. Obstruction in the œsophagus, or a difficulty in swallowing.

AGGREGATE GLANDS. (From aggrego, to assemble together.) An assemblage of glands, as those of the intestines.

Aggregation, affinity of. See Attraction.

AGHEUSTIA. See Ageustia.

Agis. The thigh or femur.

AGITATORIA.' Convulsive diseases, or those called clonic.

AGLACTATIO. Defect of milk.

AGLAXIS. See Ægides.

AGLIA. Aglium. A slining tubercle or pustule on the face. White specks on the eye.

AGMA. Agme. A fracture.

AGNACAL. A tree, which, according to Ray, grows about the isthmus of Darien, and resembles a pear-tree, whose fruit is a great provocative to venery.

AGNATA. See Adnata tunica.

AGNINA MEMBRANA. (From appros, a lamb, and membrana, a membrane.) Actius calls one of the membranes which involve the fætus by this name, which he derives from its tenderness. See Amnios.

AGNOIA. (From α, priv and γινωσκα, to know.) Forgetfulness; a symptomatic af-

fection in fevers.

AGNUS CASTUS. (From aprior, a lamb; so called from the down upon its surface, which resembles that upon a lamb's skin; and castus, because the chaste matrons, at the feasts of Ceres, strewed them upon their beds, and lay upon them.) The plant bear-

ing this name in the pharmacopæias is the Vitex agnus castus of Linnæus:—foliis digitatis, serratis, spicis verticillatis. The seeds are the medicinal part, which have, when fresh, a fragrant smell and an acrid aromatic taste. Formerly they were celebrated as antaphrodisiacs; but experience does not discover in them any degree of such virtue, and some have ascribed to them an opposite one. They are now fallen into distuse.

Agoge. The deduction or reasoning

AGGGE. The deduction or reasoning upon diseases from their symptoms and appearances. The order, state, or tenour

of a disease or body.

AGONE. (Apoin: from a, neg. and points, offspring.) Hyoscyanius or Henbane; so called because it was supposed to cause barrenness.

AGONIA. Sterility, impotence, agony. AGONISTICUM. (Aywighton, from ay white, to struggle.) A term used by ancient physicians to signify water extremely cold, which was directed to be given in large quantities, in acute crysipelatous fevers, with a view of overpowering or struggling with the febrile heat of the blood.

Agonos. (From a, priv. and 2000s, or 2000, an offspring; barren.) Hippocrates calls those women so who have not children, though they might have if the impe-

diment were removed.

Agostos. (From  $\alpha_7 \alpha$ , to bring, or lead.) That part of the arm from the elbow to the fingers; also the palm or holfow of the hand.

Agreeta. ( $A_7 \rho a_7$ , wild.) Verjuice,

which is made from the wild apple. The

immature fruit of the vine.

AGRESTEA. A name for the common tartar.

AGRESTIS. In the works of some old writers it expresses an ungovernable malignity in a disease.

AGRIA. Holly. A malignant pustule, of which, the ancient surgeons describe two sorts; one which has been so called, is small, and casts a roughness or redness over the skin, slightly corroding it, smooth about its centre, spreads slowly, and is of a round figure; this sort is cured by rubbing it with the fasting spittle. The second ulcerates, with a violent redness and corrosion, so as to make the hair fall off; it is of an unequal form, and turns leprous; it is cured, by the application of pellitory of the wall in the manner of a poultice.

AGRIAMPELOS. (From αγριος, wild, and αμπελος, a vine.) The wild vine, or white

bryony. See Bryonia.

AGRIFLEA. (From agrees, wild, and exact, the olive-tree.)
The oleaster, or wild olive.
AGRIFOLIUM. (From aug, a prickle, and

φυλλον, a leaf.) Aquifolium, or holly tree. It should rather be called acifolium from its prickly leaves.

AGRIMONIA. (A) pipuwin: from a) pos, a

field, and mover, alone: so named from its being the chief of all wild herbs.) Agri-

1. The name of a genus of plants in the

Linnæan system.

2. The pharmacopæial name of a plant; the common agrimony. . Agrimonia Eupatoria of Linnaus :- foliis caulinis pinnatis, foliolis undique serratis, omnibus minutis in-

terstinctis, fructibus hispidis.

This plant is common in fields about hedges and shady places, flowering in June and July. It has been principally regarded in the character of a mild astringent and corroborant, and many authors recommend it as a deobstruent, especially in hepatic and other visceral obstructions. Chomel relates two instances of its successful use in cases where the liver was much enlarged and indurated. It has been used with advantage in hæmorrhagic affections, and to give tone to a lax and weak state of the solids. In cutaneous disorders, particularly in scabies, we have been told that it manifests great efficacy; for this purpose it was given infused with liquorice in the form of tea; but according to Alston it should be always exhibited in the state of powder. It is best used while fresh, and the tops, before the flowers are formed, possess the most virtue. Cullen observes that the agrimony has some astringent powers, but they are feeble; and pays little attention to what has been said in its favour.

AGRIMONIA EUPATORIA. (Called Eupatorai; from Eupator, its inventor; or quasi hepatorium, ηπατορίον; from ηπας, the liver; because it is uscful in disease of the liver.) The systematic name for the Agrimonia of the pharmacopoias. See Agrimonia.
Agrimony, hemp. The Bidens tripartia

of Linnæus.

AGRIOCARDAMUM. (From appros, wild, and καρδαμον, the nasturtium.)

cresses, or wild garden cress.

AGRIOCASTANUM. (From ayeus, wild, and was avov, the chesnut.) Earth-nut or pig-nut. AGRICCINARA (From appies, wild, and

ніуара, articlioke.) See Cinara.

AGRICCOCCIMELA.

(From ayeros, wild, нонкос, a berry, and милья, an apple-tree.) The prunus sylvestris.

AGRIOMELA. The crab apple.

Agriophyllon. The peucedanum silaus, or hog's fennel, or sulphur wort. AGRIOPHYLLON. See Agrion.

AGRIOPASTINACA. (From applos, wild, and pastinaca, a carrot.) Wild carrot, or

AGRIORIGANUM. (From appros, wild, and. operavor, marjorom.) Wild marjoram. See Origanum.

AGRIOSELINUM. (From appros, wild, and σελίνον, parsley.) Wild-parsley. See Η:ρφο-

salinum.

AGRIOSTARI. (From appros, wild, and sais, wild wheat.) A species of field corn called Triticum creticum.

AGRIPALMA. (From appros, wild, and тания, a palm tree.) Agripalma gallis. The herb mother-wort, or wild palm.

AGRIPALMA GALLIS. See Agripalma.

Those children which are born with their feet foremost, are so called, because that was said to be the case with Agrippa the Roman, who was named ab agro partu, from his difficult birth. These births, though reckoned preter-natural, are often more safe and easy than the natural.

AGRIUM. An impure sort of natron, or soda. The purer sort was called halmyrhaga.

AGROM. A disease of the tongue peculiar to the Indians, in which it becomes extremely rough and chopped.

AGRUMINA. Leeks, wild onions.

AGRYPVIA. (From a, priv. and unvos, sleep.) Warchfulness: want of sleep.

AGRYPNOCOMA. (From 2) purves, without sleep, and xoua, a lethargy.) A lethargio kind of watchf itness, in which the patient is stupidly drowsy, and yet cannot alcep. A species of coma

Ague. See Febris Intermittens.

AGUE CAKE. The popular name for a hard tumour on the left side of the belly, lower than the false ribs in the region of the spleen, said to be the effect of intermittent fevers. However frequent it might have been formerly, it is now very rare, and although then said to be owing to the use of bark, it is now less frequent since the bark has been generally employed.

AGUE DROPS. This is a medicine sold

for the cure of agues, composed of arseniate

of potash in solution in water.

AGUE-FREE. A name given by some to sassafras on account of its supposed febrifuge virtue.

AGUE TREE. See Laurus.

Aguia. (From a, priv. and your, a member.) Paralytic debility. Where the use of the members is defective or lost.

Agul. (Arab.) Alhagi. The thorn. The leaves are purgative. The Syrian

AGUSTINE. A new earth discovered in the Saxon Beryl, or Beryl, of Georgien Stadt, a stone greatly resembling the Beryl of Siberia, by professor Tromsdorff of Erfurth in Germany, to which he has given the name of agustine on account of the property of forming salts which are nearly destitute of taste.

This earth is white and insipid; when moistened with water, it is somewhat ductile, but is not soluble in that fluid. Exposed to a violent heat, it becomes extremely hard, but acquires no taste. It combines with acids, forming salts, which have little or no taste. It does not combine r in the humid or dry way with alkalies,

\* E

or with their carbonates. It retains carbonic acid but feebly. It dissolves in acids equally well after having been hardened, by exposure to heat, as when newly precipitated. With sulphuric acid it forms a salt which is insipid, and scarcely soluble, but an excess of acid renders it soluble, and capable of crystallizing in stars. With an excess of phosphoric acid it forms a very soluble salt. With nitrous acid it forms a salt scarcely soluble.

AGUTIGUEPOOBI BRAZILIENSIS. (An Indian term.) Arrow-root: dartwort. Esculent and vulnerary, and used by the Indians to cure wounds made by arrows.

AGYION. See Aguia.

AGYRTE (From ayuguv a crowd of people or a mob; or from ayugu, to gather together.) It formerly expressed certain strollers who pretended to strange things from supernatual assistances; but of late it is applied to all quack and illiterate dabblers in medicine.

Ahalotu. The Hebrew name of lignum aloes.

AHAMELLA. See Johnella.

Ahovai Theveticlush. A chesnut-like fruit of Brazil of a poisonous nature.

AHUSAL. Orpiment.

AJURAZAT. Lead.

AILMAD. An Arabian name for anti-

AIMATEIA. A black bilious and bloody discharge from the bowels.

AIMORRHOIS. See Hamorrhois. AIMORRHOEA. See Hamorrhagia.

AIFATHEIA. (From au always, and σαθος, a disease.) A disease of long continuance.

AIFI. Aipima coxera. Aipipoca. Indian words for Cassada. A poisonous root of India

AIR. Common air. Atmospherical air. The word air seems to have been used at first to have denoted the atmosphere in general; but philosophers afterwards restricted it to the elastic fluid, which constitutes the greatest and the most important part of the atmosphere, excluding the water and the other foreign bodies which are occasionally found mixed with it. See Atmosphere.

Air is an elastic fluid, invisible indeed, but easily recognised by its properties. Its specific gravity, according to the experiments of Sir George Shuckburgh, when the barometer is at 30 inches, and the thermometer between 50 and 60 deg. is 0 0012, or 816 times lighter than water. One hundred cubic inches of air weigh 31 grains troy. But as air is an elastic fluid, and compressed at the surface of the earth by the whole weight of the incumbent atmosphere, its destiny diminishes according to its height above the surface of the earth. From the experiments of Paschal, Deluc,

General Roy, &c. is has been ascertained that the density diminishes in the ratio of the compression. Consequently the density decreases in a geometrical progression, while the heights increase in an arithmetical progression. Bouguer had suspected, from his observations made on the Andes, that at considerable heights the density of the air is no longer proportional to the compressing force; but the experiments of Saussure junior, made upon Mount Rose, have demonstrated the contrary.

Air is dilated by heat. From the experiments of General Roy and Sir George Shuckburgh, compared with those of Trembley, &c. it appears, that at the temperature of 60 deg. every degree of temperature increases the bulk of air about 1-82d

part.

The specific caloric of air, according to the experiments of Dr. Crawford, is 1.79.

Although the sky is well known to have a blue colour, yet it cannot be doubted that air itself is altogether colourless and invi-The blue colour of the sky is occasioned by the vapours which are always mixed with the air, and which have the property of reflecting the blue rays more copiously than any other. This has been proved by the experiments which Saussure made with his cyanometer at different heights above the surface of the earth. This consisted of a circular band of paper, divided into 51 parts, each of which were painted with a different shade of blue; beginning with the deepest mixed with black, to the lightest mixed with white. found that the colour of the sky always corresponds with a deeper shade of blue, the higher the observer is placed above the surface; consequently, at a certain height, the blue will disappear altogether, and the sky appear black; that is to say, will reflect no light at all. The colour becomes always lighter in proportion to the vapours mixed with the air. Hence it is evidently owing to them.

The property which the air has of supporting combustion, and the necessity of it for respiration, are too well known to re-

quire any description.

For many ages, air was considered as an element, or simple substance. For the knowledge of its component parts, we are indebted to the labours of those philosophers in whose hands chymistry advanced with such rapidity during the last forty years of the eighteenth century.

Air is a compound of oxygen and nitrogen; but it becomes a question of considerable consequence to determine the proportion of these two ingredients, and to ascertain whether that proportion is in every case the same. Since nitrogen gas,

one of the component parts of that fluid, cannot be separated by any substance with which chymists are acquainted, the analysis of air can only be attempted by exposing it to the action of those bodies which have the property of absorbing its oxygen. By these bodies the oxygen gas is separated, and nitrogen gas is left behind, and the proportion of oxygen may be ascertained by the diminution of bulk; which, once known, it is easy to ascertain the proportion of nitrogen gas, and thus to determine the exact relative quantity of the component parts.

After the composition of the atmosphere was known to philosophers, it was taken for granted that the proportion of its oxygen varies in different times and in different places; and that upon this variation the purity or noxious qualities of air depended. Hence it became an object of the greatest importance to be in possession of a method of determining readily the quantity of oxygen in a given portion of air. Accordingly various methods were proposed, all of them depending upon the property which a variety of bodies possesses of absorbing the oxygen of the air, without acting upon its azot. These bodies were mixed with a certain known quantity of atmospheric air, in graduated glass vessels inverted over water, and the proportion of oxygen was determined by the diminution of bulk. These instruments received the name of eudiometers, because they were considered as measures of the purity of air. See Eudiometer.

It is considered as established by experiment, that air is composed of 0.22 of oxygen gas, and 0.78 of nitrogen gas by bulk. But as the weight of these two gases is not exactly the same, the proportion of the component parts by weight will differ a little: for as the specific gravity of oxygen gas is to that of nitrogen gas as 135: 115, it follows that 100 parts of air are composed by weight of about 74 nitrogen gas

26 oxygen gas.

## 100

Having thus ascertained the nature and the proportion of the component parts of air, it remains only to inquire in what manner these component parts are united. Are they merely mixed together mechanically, or are they combined chymically? Is air a mechanical mixture, or a chymical compound? Philosophers seem at first to have adopted the former of these opinions, if we except Scheele, who always considered air as a chymical compound. But the supposition that air is a mechanical mixture, by no means agrees with the phenomena which it exhibits. If the two gases were only mixed together, as their specific gravity is different, it is scarcely possible that they would be uniformly mixed in every part of the atmosphere. Even Mr. Dalton's ingenous supposition, that they neither at-

tract nor repel each other, would not account for this equal distribution; for undoubtedly, on that supposition, they would arrange themselves according to their specific gravity. Since, therefore, air is in all places composed of the same ingredients, exactly in the same proportions, it follows that its component parts are not only mixed, but actually combined. When substances differing in specific gravity combine together, the specific gravity of the compound is usually greater than the mean. This holds also with respect to air. specific gravity, by calculation, amounts only to 0.00119, whereas it actually is 0.0012; a difference by no means inconsiderable. But perhaps the specific gravity of nitrogen and oxygen gas can scarcely be considered as known with such precision as to entitle us to draw any consequence from this difference.

The difference between air and a mere mixture of its two component parts, has been demonstrated by the experiments of Morozzo and Humbolt. The artificial mixture is much more diminished by nitrous gas than air, even when the mixture contains less oxygen. It supports flame better and longer, and animals do not live in it the same time that they do in an equal portion

of air, but longer.

The air is, therefore, to be considered as a chymical compound. Hence the reason that it is in all cases the same, notwithstanding the numerous decomposing processes to which it is subjected. The breathing of animals, combustion, and a thousand other operations, are constantly abstracting its oxygen, and decomposing it. The air thus decomposed or vitiated no doubt ascends in the atmosphere, and is again, by some unknown process or other, reconverted into atmospherical air. But the nature of these changes is at present concealed under an impenetrable veil. Thompson.

Air, atmospherical. See Air.
Air, azotic. See Nitrogen gus.
Air, fixed. See Carbonic acid gas.
Air, fluoric. See Fluoric acid gas.
Air, hepatic. See Sulphuretted hydrogen

Air, alkaline. See Ammonia.

as.
Air, inflammable. See Hydrogen gas.
Air, marine. See Muniatic acid gas.

Air, marine. See Muviatic acid gas.
Air, nitrous See Nitrous Oxyds.
Air, phlogisticated. See Nitrogen gas.
Air, phosphoric. See Phosphoric acid gas.
Air, sulphureous. See Sulphuretted hydro-

gen gas.
Air, vital. See Oxygen gas.

AISTHETERIUM. (From aiobaroma, to perceive.) The sensorium commune, or common sensory, or seat, or origin of sensation. Cartesius and others say, it is the pineal gland; Willis says it is where the nerves of the external senses are terminated, which is about the beginning of the medulla ob-

longata, (or top of the spinal marrow,) in the corpus striatum.

Antimony. AITMAD.

AIX LA CHAPELLE. Called Aken by the Germans. Thermæ Aquis-granensis. A town in the south of France, where there is a sulphureous water, the most striking feature of which, and which is almost peculiar to it, is the unusual quantity of sulphur it contains; the whole, however, is so far united to a gascous basis, as to be entirely volatilized by heat; so that none is left in the residuum after evaporation. In colour it is pellucid, in smell sulphurcous, and in taste saline, bitterish, and rather alkaline. The temperature of these waters varies considerably, according to the distance from the source and the spring itself. In the well of the hottest bath, it is according to Lucas 1360, Monet 146°; at the fountain where it is drank, it is 112°. This thermal water is much resorted to on the Continent, for a variety of complaints. It is found essentially serviceable in the numerous symptoms of disorders in the stomach and biliary organs, that follow a life of high indulgence in the luxuries of the table; in nephritic cases, which produce pain in the loins, and thick mucous urine with difficult micturition. As the heating qualities of this water are as decided as in any of the mineral springs, it should be avoided in cases of a general inflammatory tendency, in hectic fever and ulceration of the lungs: and in a disposition to active hamorrhagy. As a hot bath, this water is even more valuable and more extensively employed than as an internal remedy. The baths of Aix la Chapelle may be said to be more particularly medicated than any other that we are acquainted with. They possess both temperature of any degree that can be borne, and a strong impregnation with sulphur in its most active forms, and a quantity of alkali which is sufficient to give it a very soft soapy feel, and to render it more detergent than common water. From these circumstances these baths will be found of particular service in stiffness and rigidity of the joints and ligaments, which is left by the inflammation of gout and rheumatism, and in the debility of palsy, where the highest degree of heat which the skin can bear is required. The sulphureous ingredient renders it highly active in almost every cutaneous eruption, and in general in every foulness of the skin; and here the internal use of the water should attend that of the bath. These waters are also much employed in the distressing debility which follows a long course of mercury and excessive salivation. Aken water is one of the few natural springs, that are hot enough to be employed as a vapour bath, without the addition of artificial heat. It is employed both in cases in which the hot bath is used, and is found to be a remarkably powerful auxiliary in curing some of the worst

species of cutaneous disorders. With regard to the dose of this water to be begun with, or the degree of heat to bathe in, it is in all cases best to begin with small quantities and low degrees of heat, and gradually increase them, agreeably to the effects and constitution of the patient. The usual time of the year for drinking these waters, is from the beginning of May to the middle of June, or from the middle of August to the latter end of September.

AIZOON. (From as always, and Zue to live.) Arzoum. An evergreen aquatic plant, like the aloe said to posess antiscorbutic

AJAVA. (Indian.) A said used in the East

Indies as a remedy for the cholic.

AL. The Arabian article which signifies the; it is applied to a word by way of eminence, as the Greek ois. The Easterns express the supe lative by adding God thereto, as the mountain of God, for the highest mountain; and it is probable that Al relates to the word Alla, God: so alchemy may he the chymistry of God, or the most exalted perfection of chymical science. .

ALA. A wing. The arm pit, so called because it answers to the pit under the wing

of a bird.

ALABARI. Lead.

ALEFORMIS. Any thing like a wing ALE AURIS. The upper part of the external ear.

ALE NASI. Two cartilages of the nose which form the nostrils.

That part of ALM VESPERTILIONUM. the ligaments of the womb, which lies between the tubes and the ovaria; so called from its resemblance to the wing of

ALE IXTERNÆ MINORES. See Num. phæ.

ALAFI. Alafor. Alafort. Alkaline.

ALLA PHTHISIS. (From anaios, blind, and φθισις, a wasting.) A consumption from a flux of humours from the head.

ALAMAD. Alamed. Antimony.

ALAMBIC. Mercury.

ALANDAHLA. (Arab. bitter.) The bit-

ter apple, or colocynth.

ALANFUTA. (Arab.) A vein between the chin and lower lip, which was formerly opened to prevent fæted breath.

Alapouti. See Bilimbi.

ALARE EXTERNUM. A name of the external pterygoid muscle; so called because it takes its rise from the wing-like process of the sphænoid bone.

ALARIA OSSA. The wing-like processes

of the sphænoid bone.

ALARIS VENA. The innermost of the three veins in the bend of the arm.

ALASALET Alaset. Ammoniacum. ALASI. Alafor. An alkaline salt, ALASTROB. Lead.

ALATAN. Litharge.

ALATERNUS. A species of rhamnus.

ALATI. Those who have prominent scapulæ like the wings of birds.

ALAURAT. Nitre.

ALBADAL. An Arabic name for the sesamoid bone of the first joint of the great

ALBAGENZI. Albagiazi. An Arabic name

for the os sacrum.

ALBAGRAS NIGRA. So Avicenna names the lepra ichthyoeis. Others call it lepra Græcorum.

ALBAMENTUM. (From albus, white.) The

white of an egg.

Urinous salt. ALBANUM.

ALBARA. (Chald.) The white leprosy. ALBARAS. Arsenic. A white pustulc.

ALBATIO. (From albea, to whiten.) Al-The calcination or whitening of metals.

ALBERAS. (Arab.) White pustules on the face: also staphisagria, because its juice was said to remove these pustules.

ALBESTORE. Quick lime.

ALHETAD. Galbanum.

ALIII SUBLIMATI. Muriated mercury.

ALBICANTIA CORPORA. (From albeo, to grow white.) The glands of a white colour which are usually called Willis's glands in the brain.

ALBIMENT. Orpiment. See Auripigmen-

11/11.

ALBINUM. See Gnaphalium.

ALBOR. Urinc.

Albora. A sort of itch; or rather of leprosy. Paracelsus says, it is a complication of the morphew, serpigo, and leprosy. When cicatrices appear in the face like the scrpigo, and then turn to small blisters of the nature of the morphew, it is the albora. It terminates without ulceration, but by fetid evacuations in the mouth and nostrils; it is also seated in the root of the tongue.

ALBOREA. Quicksilver.

ALBOT. A crucible.

Turpentine. ALBOTAL.

Turpentine. ALHOTAR.

White lead. ALBOTAT.

Turpentine. ALHOTIM.

A cutaneous phlegmon or ALBOTIS.

ALBUGINEA OCULI. (From albue, white.) See Adnata tunica.

ALBUGINEA TESTIS. (Albuginea; from albus, white; so called on account of its white colour.) Tumica albuginea testis. The innermost coat of the testicle. It is a strong, white, and dense membrane, immediately covering the body or substance of the testicle. On its outer surface it is smooth, but rough and uneven on the inner.

ALBUGINOUS HUMOUR. The aqueous hu-

mour of the cye.

ALBUGO OCULORUM. A white opacity of the cornea of the eyes The Greeks named it leucoma; the Latins, albugo, nebula and nubecula; some ancient writers have called it pterugium, janua oculi, onyx, unguis, and

agides. It is a variety of Cullen's Caligo Cornea.

ALHUHAR. White lead.

ALBUM BALSAMUM. The balsam of copaivi. The white dung of ALBUM GRÆCUM. dogs. It was formerly applied as a discutient, to the inside of the throat, in quinsies, being first mixed with honey; medicines of this kind have long since justly sunk into disuse.

ALBUM OLUS. Lamb's lettuce, or cornsalad. The Valeriana locusta of Linnæus.

ALBUMEN. Albumena Albuminous matter. Coagulable lymph. Albumen is very abundant in the animal kingdom. It is the principal constituent part of the scrum of the blood, and the lymphatic fluid. forms the cheese in milk, and makes up the greater part of the white of eggs. It is composed of carbon, hydrogen, azot, oxygen, phosphorus, and somewhat of calcareous earth.

ALBUMEN OVI. Alougo ovi. Albumen. albor ovi, ovi albus liquor, ovi candidum, albamentum, clareta. The white of an egg.

ALCAHEST. An Arabic word to express an universal dissolvent, which was protended to by Paracelsus and Helmont. Some say that Paracelsus first used this word, and that it is derived from the German words al and geest, i. e. all spirit. Van Helmont borrowed the word, and applied it to his invention, which he called the universal dissolvent.

ALCAOL. The solvent for the preparation of the philosopher's stone.

ALCALI. (Arab.) See Alkali.

ALCALIZATION. The impregnating any spiritous fluid with an alkali.

ALCEA INDICA. See See Hibiscus abelmoschus. ALCEA ÆGYPTIACA VILLOSA. See Hibiscus abelmoschus.

ALCHA ROSEA. The systematic name for the malva arborea. See Malva.

ALCAA. (From ann, strength.) The name of a genus of plants in the Linnæan system. Class, Monadelphia. Order Polyandria. Hollyhock.

Sal almoniac, or muriat of ALLCAB. ammonia.

ALCANNA. (Indian word.) See Alkanna. ALCEBAR. See Agallochum.

ALCEBRIS VIVUM. See Sulphur vivum.

ALCHABRIC. Sulphur vivuin.

Rosemary. ALCHACHIL.

Alcharith. Quicksilver. ALCHIEN. This word occurs in the Theatrum Chemicum, and seems to signify that power in nature by which all corruption and

generation are effected.

ALCHEMILLA. (So called because it was celebrated by the old alchemists.) Ladies' mantle.

1. The name of a genus of plants in the Linnæan system. Class Tetrandria. Order. Monogynia.

The parmacopæial name of a plant

called lady's mantle. Alchemilla vulgaris; foliis lobatis of Linnaus. It was formerly esteemed as a powerful adstringent in hæmorrhages, fluor albus, &c. given internally.

ALCHIMELEC. (Heb.) The Egyptian

melilot.

ALCHEMY. Alchemia. Alchimia. Alkima. That branch of chymistry which relates to the transmutation of metals into gold; the forming a panacea or universal remedy; an alkahest, or universal menstrum; a universal ferment; and many other absurdities.

ALCHIBRIC. See Alkibric.

Alchimilla. See Alchemilla.

Alchitron. Oil of juniper; also the name of a dentifrice of Messue.

ALCHUTE. See Morum.

ALCHEMY. Alchemy.
ALCHEMS. A speck on the pupil of the eye, somewhat obscuring vision.

ALCIMAD. Antimony.

ALCOB. Sal-ammoniac, or muriat of ammonia.

Alcocalum. (Perhaps Indian.) Artichoke, or cinara.

ALCOFOL. Antimony.

ALCOHOL. See Alkohol.

ALCOLA. (Heb.) The aphthæ, or thrush. Paracelsus gives this name to tartar, or excrement of urine, whether it appears as

sand, mucilage, &c.
ALCOLITA. Urine. ACLONE. Brass. Æs ustum.

ALCTE. It is the name of a plant mentioned by Hippocrates. Fæsius thinks it is the elder.

ALCUBRITH. Sulphur.

ALCYONIUM. Bastard sponge, spongy plant-like substance, which is met with on the sea shore: it is of different shapes end colours. It is difficult to say what the Greeks called by this name. Dioscorides They are calcispeaks of five sorts of it. ned with a litle salt, as dentifrice, and are used to remove spots on the skin.

Alder-tree. See Alnus and Frangula . Alderbery bearing. See Praugula.

ALDER WINE. When well fermented, and having a proper addition of raisins in it, in its composition is frequently a rich and strong liquor; it keeps better than many of the other made wines, for a number of years, and was formerly supposed to possess many medical virtues; but these, experience does not seem to sanction: and the virtues of the alder, like those of many other simples formerly prized, have sunk into oblivion.

ALE. Cerevisia. Liquor cereris. Vinum hordeaceum. Barley wine. A fermented liquor made from malt and hops, and chiefly distinguished from beer, made from the same ingredients, by the quantity of hops used therein; which is greater in beer, and therefore renders the liquor more bitter, and fitter for keeping. Ale, when well ferment-

ed, is a wholesome beverage, and seems only to disagree with those subject to asthma, or any disorder of the respiration or irregularity in the digestive organs. The old dispensatories enumerate several medicated ales, such as cerevisia oxydorica, for the eyes; cerexisia antiarthritica, against the gout; cephalica, epileptica, &c.

ALEARA. A cucurbit.

ALEBRIA. (Fsom alo, to nourish.) Nouishing foods, or medicines.

ALEC. Alech. Vitriol. ALECHARITH. Mercury.

ALEIMA. (From areifus to anoint.) ointment.

ALEION. ('AAROV, copious.) Hippocrates uses this word as an epithet for water.

to anoint.)

(From αλειφα, ALEIPHH. Any medicated oil.

ALELION. (From anc, salt, and enator. oil.) Oil beat up with salt, to apply to tumours. Galen frequently used it.

ALEMA. (From a priv. and Aluos, hunger. Meat, food, or any thing that satisfies

the appetite.

(Some derive it from the ALEMBIC. Arabian particle al, and aucie, from aucano to ascend. Avicenna declares it to be Arab.) Moorshead. A chymical utensil made of glass, metal, or earthen-ware, and adapted to receive volatile products from retorts. It consists of a body, to which is fitted a conical head, and out of this head descends laterally a beak to be inserted into the receiver.

ALEMBROTH. A chaldee word, importing the key of art. Some explained it by sal mercurii, or sal philosophorum and artis; others say it is named alembrot and sal fusionis, or sal fixionis. Alembroth desiccatum is said to be the sal tartari; hence this word seems to sifinify alkaline salt, which opens the bodies of metals by destroying their sulphurs, and promoting their separation from the ores. From analogy, it is supposed to have the same effect in conquering obstructions and attenuating viscid fluids in the human body. A peculiar earth, probably containing a fixed alkali, found in the island of Cyprus, has also this appellation; and a solution of the corrosive sublimate, to which the muriat of ammonia has been added, is called sal alembroth.

ALENZADAR. Crude sal ammoniac, or

muriat of ammonia.

ALEMZADAT. Crude sal ammoniac, or muriat of ammonia.

ALEPENSIS A species of ash-tree which produces manna.

ALES. (From, ale, salt.) The name of a compound salt.

ALEURON. (From alew, to grind.) Meal, ALEXANDERS, COMMON. This plant, Smyrnium olustram of Linnæus, was formerly cultivated for sallads. It is now superseded by celery.

ALEXANDERS, ROUND LEAVED. um perfoliatum of Linnaus. The blanched stalks of this species are far preferable to those of common alexanders, and are esteemed as stomachic and nerving.

ALEXANDRIA. Alexandrina. The bay-

tree, or laurel, of Alexandria.

ALEXANDRIUM. Emplastrum viride. A plaster described by Celsus, made with wax, alum, &c.

ALEXICACA. (From αλέξω, to drive away, and κακον, evil. (Alexicacum. An antidote,

or amulet, to resist poison.

A LEXIPHARMICS. (Alexipharmica, sc. medicamenta, from angle, to expel, and pagnazer, a poison.) Intipharmica. Caco-alexiteria. Medicines supposed to preserve the body against the power of poisons, or to correct or expel those taken. The ancients attributed this property to some vegetables, and even waters distilled from them. The term, however, is now disused.

ALEXIPTRETICUM. (From αλέξω, to drive away, and συρθος, fever.) A febrifuge. A

remedy for fever.

ALEXIPPHETOS. Alexipyretum. The same as alexipyreticum.

ALEXIR. An elixir.

ALEXITERIA. Preservatives from con-

tagion.

ALEXITERIUM. (From ango, to expel, and tuges, to preserve.) A prescruative medicine against poison, or contagion.

ALFACTA. Distillation.

ALFATIDE. Muriat of ammonia.

Alfasara. Alphesara. Arabic terms for the vine.

ALFADAS. Alfides. Cerusse. ALFOL. Muriet of ammonia.

Alfusa. Tutty.

ALGALI. A catheter. Also nitre.

ALGARAH. See Anchilops.

ALGAROTH. (So called from Victorius Agaroth, a physician of Verone, end its inventor.) Algarot. Algarothi. Mercurius vita. Pulvis Algarothi. The antimonial part of the butter of antimony, separated from some of its acid by washing it in water. It is violently emctic in doses of two or three grains, and is preferred by many for making the emetic tartar.

Algeno. (From αλγος, pain.) A violent pain about the anus, perinæum, testes, urethra, and bladder, arising from the sudden stoppage of a virulent gonorrhæa. A

term very seldom used.

Algemates. (From algematodes. Uneasiness, pain

of any kind.

ALGERTH. Algirie. Lime. ALGEROTH. See Algaroth.

Alginic. Sulphur vivum.
Algon. A sudden chilness or rigor.
A term met with in Sauvage's and Sagar's
Nosology.

ALGOSAREL. The Arabian term for the

Daucus sylvestris, or carrot.

ALGUADA. A white leprous eruption.

ALHAGI. (Arab.) A species of *Hedysarum*. The leaves are hot and pungent, the flowers purgative.

ALHANDALA. An Arabian name for co-

locynth, or bitter apple.

ALHASER. (Arab.) Alhasaf. A sort of fætid pustule, called also Hydroa.

ALIA SQUILLA (From αλιος, belonging to the sea, and σκιλλα, a shrimp.) A prawn.

ALICA. (From alo, to nourish.) In general signification, a grain, a sort of food, admired by the ancients; it is not certain whether it is a grain or a preparation of some kind thereof.

ALICES. (From aniza, to sprinkle.) Little red spots in the skin, which precede the eruption of pustules in the small pox.

ALIENATIO MENTIS. (From alieno, to estrange.) Delirium. Estrangement of the

mind.

Altrormes Musculi. Muscles so called from their supposed resemblance to wings.

See Pterygoidans.

ALIMENTARY CANAL. Alimentary duct. A name given to the whole of those passages which the food passes through from the mouth to the anus. This duct may be said to be the true characteristic of an animal; there being no animal without it, and whatever has it, being properly ranged under the class of animals. Plants receive their nourishment by the numerous fibres of their roots, but have no common receptacle for digesting the food received, or for carrying off the excrements. But in all, even the lowest degree of animal life, we may observe a stomach and intestines, even where we cannot perceive the least formation of any organs of the senses, unless that common one of feeling, as in oysters.

ALIMENTARY DUCT. The alimentary

ALIMENTARY DUCT. The alimentary canal. The thoracic duct is sometimes so

called.

ALIMOS. Common liquorice.

ALIMUM. Ser Arum.

ALINDESIS. ('Αλυδησις, from αλυδεμι, to be turned about.) A bodily exercise, which seems to be rolling on the ground, or rather in the dust, after being annointed with oil. Hippocrates says it hath nearly the same effect as wrestling.

ALIPENOS. (From a, neg. and Mirara, to be fat.) Alipanum. Alipantos. An external remedy, without fat or moisture.

ALIPASMA. (From αλωςα, to annoint.) An ointment rubbed upon the body, to prevent sweating.

ALIPE. Remedies for wounds in the

cheek, to prevent inflammation.

ALIPOW. A species of tureth, found near Mount Ceti, in Languedoc. It is a powerful purgative, used instead of senna, but much more active.

ALIPTE. (From αλειφα, to annoint.) Servants who anointed the persons after bath-

ing.

Alisanders. See Smyrnium.

ALISMA. (From als, the sea.) Water plantain. The name of a genus of plants in the Linnzan system. Class, Hexandria. Order, Polygynia.

ALISTELIS. (From axe, the sea.) MII-

riat of ammonia.

ALITT. Alith. Asafætida.

ALKAFIAL. Antimony.
ALKAHEST. An imaginary universal menstruum, or solvent.

ALKAHEST GLAUBERI. Alkaline salts. See

ALKALIAT GLAUBERI. An alkali.

ALKALI. Alkali, in Arabic, signifies burnt; or from al and kali, i. e. the essence, or the whole of kali, the plant from which it was originally prepared, though now derived from plants of every kind.) Alcali, alafi, alafor, alafort, calcadis. A term given to substances which possess the following properties: They are incombustible, and soluble in water; they possession aerid, nrinous taste. When mixed with silieeous substances, and exposed to an intense heat, they form a more or less perfect glass. They unite with another class of bodies called acids, and form new compounds, in which both the acid and alkaline properties are more or less lost. They render oils misci-ble with water. They change various blue vegetable pigments to green; red to violet, or blue, and yellow to brown. Blue pigments, that have been turned red with acids, are again restored by alkalies to their primitive colours. They emit light on the affusion of the dense acids when freed from water. They attract water and carbonic acid from the atmosphere. They unite to sulphur by fusion, and by means of water. They exert a great solvent power on the cellular membrane and animal fibre. They also corrode woollen cloth, and, if sufficiently concentrated, convert it into a sort of jelly.

They are only three kinds of alkalis at

present known:

1. The mineral, called soda, in the new chymical nomenclature. See Soda.

2. The vegetable, called potassa, in the new chymical nomenclature. See Potassa.

3. Ammonia, or the caustic volatile alkali,

is the third. See Ammonia.

To these, some clymists add barytes, and

some other earths.

Alkalis are either fixed, that is, they are not reduced to the state of gas, by the most intense heat; or they are volatile, i. e. the common temperature is almost sufficient to change their state of aggregation; potash and soda are of the former kind; and, of the latter, ammonia is the only one known.

ALKALESCENT. Slightly alkaline.

ALKALI, CAUSTIC. An alkali is so called when deprived of the carbonic acid it

contains for it then becomes more caustic and more violent in its action.

Those alkalis are so ALKALI FIXUM. called that emit no characteristic smell, and cannot be volatilized, but with the greatest difficulty. Two kinds of fixed alkalis have only hitherto been known, namely, potash and soda. See Potash and Soda. Alkali, fossile. See Soda.

Alkali, mineral. (So called because it forms the basis of marine salts.) See Soda.

Alkali, vegetable. (So called because it abounds in many vegetables.) See Pot-

Alkali, volatile. (So called because it is volatile in opposition to the other alkalis,

which are fixed ) See xmmonia. ALKALINA. A class of substances de-

scribed by Cullen as comprehending the substances otherwise termed antacida. They consist of alkalis, and also of substances, into which they enter in combination. The principal alkalines in use, are the carbonates and subcarbonates of soda, potash, and ammonia.

(Alcalizatio, onis, f.) ALKALIZATION. Alkalization. The impregnating any thing with an alkaline salt, as spirit of wine, &c.

ALKANET. (Alkanah, a reed.

Radix anchusæ.

ALKANNA. See Anchusa.

ALKANNA VERA. Alkauna Orientalis. An Oriental plant; the Lawsonia inermis, ramis inermibus, of Linnæus; principally employed in its native place, as a dye. The root is the officinal part; which, however, is rarely met with in the shops. It possesses adstringent properties, and may be used as a substitute for the anchusa.

ALKASA. Alksoal. A crucible.

ALCANTHUM. Arsenic. ALKANT ... Quicksilver.

ALKEKENGI. (Alkekengi, Arab.) Halicabaidro. Winter cherry. This plant, Physalis alkekengi of Linnæus:-foliis geminis integris acutis, caule herbaceo, infernè subramoso, is cultivated in our gar-The berries are recommended as a diuretic, from six to twelve for a dose, in dropsicial and calculous diseases.

ALKERMES. A term borrowed from the Arabs, denoting a celebrated remedy, of the form and consistence of a confection, whereof the kermes is the basis.

Kermes.

ALKERVA. (Arab.) Castor oil.

ALKOHOL. (An Arabian word, which signifies antimony: so called from the usage of the Eastern ladies to paint their eyebrows with antimony, reduced to a most subtile powder; which at last came to signify any thing exalted to its highest perfection.) Alcohol. Alkol. Spiritus vinosus rectificatns. Spiritus vini rectsficatus. Spiritus vini concentratus, Spiritus vini rectificatissi-

Alcohol is highly rectified spirit of mus. wine, freed from all those aqueous particles which are not essential to it by duly performing rect.fication. In its purest state, it is quite colourless, and clear, of a strong and penetrating smell and taste; capable of being set on fire without a wick, and burning with a flame, without leaving a residue, and without smoke and soot. Alcohol is miscible with water in all proportions. It does not freeze in any degree of coldness. It is the direct menstruum or solvent of resins. It dissolves, also, the natural balsams. The resinous and various other parts of plants are also soluble in alcohol, hence it is made use of for extracting those parts, and for making the preparations called elixirs, tinctures, essences, &c. In England, alcohol is pro-cured by distillation from molasses; in Scotland and Ireland, from an infusion of This last, before its rectification, is termed whiskey. In the East-Indies, arrack is distilled from rice; in the West-Indies, rum from the sugar cane; and in France and Spain, brandy from wine; all these afford alcohol by distillation. On the human solids, alcohol acts as a most violent corrugator and stimulus.

Alkoson. Camphire.

ALKI PLUMBI. Supposed to be acetat

ALKYMIA. Powder of basilisk.

ALLABOR. Lead.

ALLANTOIDES MEMBRANA. (Allantoides; from annos, a hog's pudding, and usos, likeness; because, in some brute animals, it is long and thick.) A membrane of the fœtus, peculiar to brutes, which contains the urine discharged from the bladder.

ALLELUIA. (Heb. Praise the Lord.) The acetosa, or wood-sorrel; so named from

its many virtues. See Acetocella.
ALL-GOOD. English mercury. The vulgar name for the Chenopodium bonus Henricus of Linnæus; a plant which may be boiled for spinach, and which is in no degree inferior to it.

.All-heal. See Heraclium and Stachys.

ALLIARIA. (From allium, garlick; from its smell resembling garlick.) Jack of the hedge. Sauce-alone, or stinking hedge-mustard. The plant to which this name is given, in the Pharmacopæias, is the Erysis mum alliaria ; foliis cordatis of Linnæus; it is sometimes exhibited in humid asthma and dyspnæa, with success. Its virtues are powerfully diaphoretic, diuretic, and antiscorbutic.

ALLICAR. Vinegar.

ALLICOA. Petroleum.

ALLIGATURA. A ligature, or bandage. ALLIOTICUM. (From anxiow, to alter, or vary.) An alterative medicine, consisting of various antiscorbutics. Gulen.

ALLIUM. (From oleo, to smell, because it stinks; or from axen, to avoid, as being unpleasant to most people ) Garlick.

1. The name of a genus of plants in the Linnæan system. Class, Hexandria. Order,

Monogynia. Garlick. 2. The Pharmacopæial name of garlick. Theriaca rusticorum. Allium sativum of Linnæus:—caule planifolio bulbifero, bulbo composito, staminibus tricuspidatis. This species of garlick, according to Linnæus, grows spontaneously in Sicily; but, as it is much employed for culinary and medicinal purposes, it has been long very generally cultivated in gardens. Every part of the plant, but more especially the root, has a pungent acrimonious taste, and a peculiarly offensive strong smell. This odour is extremely penetrating and diffusive; for, on the root being taken into the stomach, the alliaceous scent impregnates the whole system, and is discoverable in the various excretions, as in the urine, perspiration, milk, &c. Garlick is generally allied to the onion, from which it seems only to differ in being more powerful in its effects, and in its active matter, being in a more fixed state. By stimulating the stomach they both far your digestion, and, as a stimulus, are readily diffused over the system. They may, therefore, be considered as useful condiments with the food of phlegmatic people, or those whose circulation is languid and secretions interrupted; but with those subject to inflammatory complaints, or where great irritability prevails, these roots, in their acrid state, may prove very hurtful. The medicinal uses of garlick are various; it has been long in estimation as an expectorant in petuitous asthmas, and other pulmonary affections, unattended with inflammation. In hot bilious constitutions, therefore, garlick is improper: for it frequently produces flatulence, head-ach, thirst, heat, and other inflammatory symptoms. A free use of it is said to promote the piles in habits disposed to this complaint. Its utillity as a diuretic in dropsies is attested by unquestionable authorities; and its febrifuge power has not only been experienced in preventing the paroxysms of intermittents, (Bergius says quartans have been cured by it; and he begins by giving one bulb, or clove, morning and evening, adding every day one more, till four or five cloves be taken at a dose: if the fever then vanishes, the dose is to be diminished, and it will be sufficient to take one, or even two cloves, twice a day, for some weeks;) but even in subduing the plague. Another virtue of garlick is that of an anthelminthic. It has likewise been found of great advantage in scorbutic cases, and in calculous disorders, acting in these, not only as a diuretic, but, in several instances, mainfesting a lithrontriptic power. the juice of alliaceous plants in general, has considerable effects upon human calculi, is to be inferred by the experiments of Lobb; and we are abundantly warranted in as-

serting, that a decoction of the beards of

leeks, taken liberally, and its use persevered in for a length of time, has been found remarkably successful in calculous and gravelly complaints." The penetrating and diffusive acrimony of garlick, renders its external application useful in many disorders, as a rubefacient, and more especially as applied to the soles of the feet, to cause a revulsion from the head or breast, as was successfully practised and recommended by Sydenham. As soon as an inflammation appears, the garlick cataplasm should be removed, and one of bread and milk be applied, to obviate excessive pain. Garlick has also been variously employed externally, to tumours and cutaneous diseases; and, in certain cases of deafness, a clove, or small bulb of this root, wrapt in gauze or muslin, and introduced into the meatus auditorius, has been found an efficacious remedy. Garlick may be administered in different forms; swallowing the clove entire, after being dipped in oil, is recommended as the most effectual, or, where this cannot be done, by cutting it into pieces without bruising it, may be found to answer equally well, producing thereby no uneasiness in the fauces. On being beaten up, and formed into pills, the active parts of this medicine soon evaporate; this Dr. Woodville, in his Medical Botany, notices, on the authority of Cullen, who thinks that Lewis has fallen into a gross error, in supposing dried garlick more active than fresh. The syrup and oxymel of garlick, which formerly had a place in the British Pharmacopæias, are now expunged. It may be necessary to notice that, by some, the cloves of garlick are bruised and applied to the wrists, to cure agues, and to the bend of the arm, to cure the tooth-ache: when held in the hand, they are said to relieve hiccough; when beat with common oil into a poultice, they resolve sluggish humours; and, if laid on the navels of children, they are supposed to destroy

worms in the intestines. ALLIUM CEPA. The systematic name for the Cepa of the shops. See Cepa.

ALLIUM PORRUM. The systematic name for the Porrum of the pharmacopæias. See Porrum.

ALLIUM SATIVUM. The systematic name

for Allium. See Allium.

ALLIUM VICTORIALIS. The systematic name for the Victoralis longa of the pharmacopœias. See Victoralis longa.

Allochoos. (From αλλος, another, and ληω, to speak.) Hippocrates uses this word

to mean delirious.

Alloesis. (From annos, another.) teration in the state of a disease.

ALLOETICA. (From anaos, another.) Al-Medicines which change the appearance of the disease.

Allognosis (From αλλος, another, and γνοω, to know.) Delirium; perversion of the judgment; incapability of distinguishing persons.

ALLOPHASIS. (From and another, and φαω, to speak,) According to Hippocrates, a delirium, where the patient is not able to

distinguish one thing from another.

Allotriophagia. (From αλλοθείος, foreign, and φαγω, to eat.) A synonym of pica. See Pica. In Vogel's Nosology it signifies the greedily eating unusual things

for food.

ALLOYS. By this word, chymists and artificers commonly understand any portion of base metal, or metalic mixture, which is added to combine metals by fusion into one seemingly homogeneous mass.

Allspice. See Pimento.

ALMA. Water; and the first motion of a fætus to free itself from its confinement.

ALMABRI. A stone-like amber.

Almagra. Bolum cuprum.

1. Red earth, or other, used by the ancients as an astringent.

2. Rulandus says it is the same as Lotio. 3. In the Theatrum Chymicum it is a name for the white sulphur of the al-

chymists.

Almaranda. Almakis. Litharge.

Almanda cathartica. A plant growing on the shores of Cayenne and Surinam, used by the inhabitants as a remedy for the colic; supposed to be cathartic.

ALMARCAB. (Arab.) Litharge of silver. ALMACARIDA. Litharge of silver.

ALMARGEN. Almarago. Coral.

ALMARKASITA. Mercury. Almartak. Powder of litharge.

AMATATICA. Copper.

ALMECASITE. Almechasite. Copper.

ALMEAILETU. A word used by Avicenna, to express a preternatural heat less than that of fever, and which may continue after a fever.

Almene. Sal lucidum, or sal gemmæ. Almisa. Musk.

Almizabin. Verdigris, or muriat of ammonia.

Almizadar. Muriat of Ammonia. Almond, bitter. See Amygdala. Almond, common. See Amygdala. Almond, sweet. See Amygdala.

ALMONDS OF THE EARS. A popular name for the tonsils, which have been so called from their resemblance to an almond in shape. See Tonsils.

ALMONDS OF THE THROAT. name for the tonsils.

ALNABATI. In Avicenna and Scorpion, this word means the siliquadulcis, a gentle

ALNEC. Stannum, or tin.

ALNEIUC. Sulphur vivum.

ALNUS. (Alno, Ital.) The alder.

The pharmacopæial name of two plants, sometimes used in medicine, though rarely employed in the present practice.

Alnus rotundifolio; glutinosa; viridis; the common alder tree, called amendanus.

Alnus nigra, vel frangula; the rhamnus

frangula of Linnæus. The black alder, called also aunus,

All the parts of these trees are astringent and bitter. The bark is most astringent; a decoction of it has cured agues, and is often used to repel inflammatory tumours of the throat, by way of gargle. The inner yellow bark of the trunk, or root, given to 3ij., vomits, purges, and gripes; but, joined with aromatics, it operates more agreea-An infusion or decoction in water inspissated to an extract, act yet more mildly than these. The berries of alder are purgative. They are not in use under their own name, but are often substituted for buck-thorn berries; to discover which, it should be observed, that the berries of the black alder have a black skin, a blue juice, and two seeds in each of them; whereas the buckthorn berries have a green juice, and commonly four seeds. The substitution of one for the other is not of material consequence, as the plants belong to the same genus, and the berries do not differ greatly.

Dr. Murray, of Göttingen, recommends from his own experience, the leaves of alder chopped in small pieces, and heated over the fire, as the best remedy with which he is acquainted for dispersing milk in the breasts.

Aloe. See Aloes.

ALOEDARIA. (From αλοπ, the aloe.) Compound purging medicines so called from having aloes as the chief ingredient.

ALOEPHANGINA. Medicines formed by a combination of aloes and aromatics.

ALOES. (From ahlah, a Hebrew word, signifying growing near the sea.) The Aloe.

A genus of plants of the Linnaan system. Class, Hexandria. Order, Monogynia.
 The pharinacopaid name of the in-

spissated juice of some of the aloe plants. Fel nature, nature's gall; so named from its intense bitterness. Aloes are distinguished into three species, socotorine, hepatic, and cabaline; of which the two first are directed for officinal use in our pharmacopæias.

The 1st. Aloes Succotorina vel Zocotorina. Succotorine aloes, is obtained from the Aloe perfoliata of Linnæus:-foliis caulinis dentatis, amplexicanlibus vaginantibus, floribus corymbosis, cernuis, pedunculatis, subcylindricis: it is brought over wrapt in skins, and is of a bright surface and in some degree pellucid; in the lump, of a yellowish red colour, with a purplish cast; when reduced into powder, it is of a golden colour. It is hard and friable in very cold weather; but in summer it softens very easily betwixt the fingers. It is extremely bitter and also accompanied with an aromatic flavour, but not so much as to cover its disagrecable taste. Its scent, though bitter, is rather agreeable, being somewhat similar to that of myrrh.

2. Aloes hepatica, vel Barbadensis: the common or Barbadoes or hepatic aloes. Noe perfoliata of Linixus:—floribus pedun-

culatis, cernuis corymbosis, subcylindricis, foliis spinosis, confertis, dentatis, vaginantibus,
planis, maculatis. The best is brought from
Barbadoes in large gourd shells; an inferior
sort in pots, and the worst in casks. It is
darker coloured than the socotorine, and not
so bright; it is also drier and more compact, though sometimes the sort in casks is
soft and clammy. To the taste it is intensely
bitter and nauseous, being almost wholly
without that aroma which is observed in the
socotorine. To the smell it is strong and
disagreeable.

3. Aloes caballina vel Guineensis; Horsealoes. This is easily distinguished from both the foregoing by its strong rank smell; in other respects it agrees pretty much with the hepatic, and is now not unfrequently sold in its place. Sometimes it is prepared so pure and bright as scarcely to be distinguishable by the eye, even from the socotorine, but its offensive smell betrays it; and if this also should be dissipated by art, its wanting the aromatic flavour of the finer aloes will be a sufficient criterion. This aloe is not admitted into the materia medica, and is not employed chiefly by farriers.

The general nature of these three kinds is nearly the same. Their particular differences only consist in the different proportions of gum to their resin, and in their flavour. The smell and taste reside principally in the gum, as do the principal virtues of the aloes. Twelve ounces of Barbadoes aloes yields nearly 4 ounces of resin, and 8 of gummy extract. The same quantity of socotorine aloes yields 3 ounces of

resin and 9 of gummy extract.

Alocs is a well known stimulating purgative, a property which it possesses not only when taken internally, but also by external application. The cathartic quality of aloes does not reside in the resinous part of the drug, but in the gum, for the pure resin has little or no purgative power. Its medium dose is from 5 to 15 grains, nor does a larger quantity operate more effectually. Its operation is exerted on the large intestines, principally on the rectum. In small doses long continued, it often produces much heat, and irritation, particu-larly about the anus, from which it sometimes occasions a bloody discharge; therefore, to those who are subject to piles, or of an hæmorrhagic diathesis, or even in a state of pregnancy, its exhibition has been productive of considerable mischief; but on the contrary, by those of a phlegmatic constitution, or those suffering by uterine obstructions (for the stimulant action of aloes, it has been supposed, may be extended to the uterus,) and in some cases of dyspepsia, palsy, gout, and worms, aloes may be employed as a laxative with peculiar advantage. In all diseases of the bilious tribe, aloes is the strongest purge, and the best preparations for this purpose are the

pilula ex aloe cum myrrhâ, the tinctura aloes, or extractum colocynthidis compositum. Its efficacy in jaundice is very considerable, as it proves a succedaneum to the bile, which in that disease is defective either in quantity or quality. Aloes therefore may be considered as injurious where inflammation or irritation exist in the bowels or neighbouring parts, in pregnancy, or in habits disposed to piles, but highly serviceable in all hypochondriac affections, cachectic habits, and persons labouring under oppression of the stomach caused by irregularity: Aromatics correct the offensive qualities of aloes the most perfectly. The canella alba answers tolerably, and without any inconvenience; but some rather prefer the essential oils for this purpose. Dr. Cullen says, "If any medicine be entitled to the appellation of a stomach purge, it is certainly aloes. It is remarkable with regard to it, that it operates almost to as good a purpose in a small as in a large dose; that 5 grains will produce one considerable dejection, and 20 grains will do no more, except it be that in the last dose the operation will be attended with gripes, &c. Its chief use is to render the peristaltic motion regular, and it is one of the best cures in habitual costiveness. There is a difficulty we meet with in the exhibition of purgatives viz. that they will not act but in their full dose, and will not produce half their effect if given in half the dose. For this purpose we are chiefly confined to aloes. Neutral salts in half their dose will not have half their effect; although even from these, by large dilution, we may obtain this property; but besides them and our present medicine, I know no other which has any title to it except sulphur. Aloes sometimes cannot be employed. It has the effect of stimulating the rectum more than other purges, and with justice has been accused of exciting hæmorrhoidal swellings, so that we ought to abstain from it in such cases, except when we want to promote them. Aloes has the effect of rarefying the blood and disposing to hamorrhagy, and hence it is not recommended in uterine fluxes. Fætid gums are of the same nature in producing hamorrhagy, and perhaps this is the foundation of their emmenagogue power." Aloes is administered either simply in powders, which is too nauseous, or else in composition: -1. With purgatives, as soap, scammony, colocynth, or rhubarb. 2. With aromatics, as canella, ginger, or essential oils. 3. With bitters, as gentian. 4. With emmenagogues, as iron, myrrh, wine, &c. It may be exhibited in pills as the most convenient form, or else dissolved in wine, or diluted alcohol. The officinal preparations of aloes are the following-Pilula Aloes. Pilula Aloes cum Assafætidå. Pil. Al. cum Colocynth. Al. cum Myrrh. T. Aloes. T. Al. Æth. T. Al. cum Myrrh. Vin. Aloes Soc. Pil.

Aloes comp. Pulv. Aloes cum Canell. Pulv. Al. cum Guaiac. Pulv. Al. cum Ferro. Tinct. Aloes comp. Ext. Colocynth. comp. Tinct. Benzoes, comp. and some others.

ALOETICS. Medicines wherein aloes is

the chief or fundamental ingredient.

ALOGOTROPHIA. (From axeyes, dispraportionate, and τεεφω, to nourish.) Unequal nourishment, as in the rickets.

ALOHAB. (Arab.) Alohoc. Mercury. ALOES LIGNUM. See Lignum Aloes.

ALOMBA. (Arab.) Alooc. Plumbum, or

ALOPECES. (From αλαπηξ, the fox.) The psoa muscles are so called, by Fallopius and Vesalius, because in the fax they are particularly strong.

ALOPECIA. (from αλωπήξ, a fox; because the fox is subject to a distemper that resembles it: or, as some say, because the fox's urine will occasion baldness.) Athrix depilis. Phalacrotis. Baldness, or the falling off of the hair; when on the sinciput, calvities, calvitium.

Alosa. (From αλισκω, to take; because it is a ravenous fish.) The chad, Clupea alosa of Linnæus, whose flesh is by some commended as a restorative.

ALOSAT. Alosohoc. Quicksilver.

Alosantho. (From aλs, salt, and aνθος, a flower.) Alosanthum. Flowers of salt.

ALPHABETICUM CHYMICUM. Raymond Lully hath given the world this alphabet. but to what end is difficult to say:

A significat Deum. B — Mercurium C — Salis Petram. D - Vitriolum. E - Menstruale. F \_\_\_\_ Janam claram. G - Mercurium nostrum. H - Salem purum. 1 - Compositium Luna. K - Compositum Solis. L - Terran compositi Luna.

L — Terran compositi Lunæ.

M — Aquam compositi Lunæ.

N — Ærem compositi Lunæ.

O — Terram compositi Solis.

P — Aquam compositi Solis.

R — Ignem compositi Solis.

S — Lapidem Album

T — Medicinam corporis rubel.

U — Calorem fumi secreti.

X — Jenem sicrum cinario.

X - Ignem siccum cineris.

Y — Calorem balnei.

Z — Separationem liquorum. Z — Alembicum cum cucurbita. Alphanic. Alphenic. An Arabian

word (signifying tender) for barley-sugar, or sugar-candy.

Alphita. (Alphita, the plural of αλφίτον, the meal of barley in general.) By Hippocrates this term is applied to barley-meal either toasted or fried. Galen says that xeruva is coarse meal, axeopov is fine meal. and anoura is a middling sort. .

ALPHITIDON. Alphitidum. It is when a bone is broken into small fragments like

Alphita, i. e. bran.

ALPHONSIN. The name of an instrument for extracting balls. It is so called from the name of its inventor Alphonso Ferricr, a Neapolitan physician. It consists of three branches, which separate from each other by their clasticity, but are capable of being closed by means of a tube in which they are included.

ALPHUS. (αλφος, from αλφαινώ, to change; because it changes the colour of the skin.) Vitiligo alba. Morphea alba. Lepra maculosa alba. A species of leprosy, called by the ancients vitiligo, and which they divided into alphus, melas, and leuce. It is produced by a peculiar miasma, which is endemial to Arabia. See Lepra.

ALPINI BALSAMUM. Balm of Gilead.

ALRACHAS. Lead.

ALRATICA. A word used by Albueasis, to signify a partial or a total imperforation of the vagina. It is an Arabic word.

An Arabie name for the ALSAMACH.

great hole in the os petrosum.

ALSINE. (From alkos, a grove; so called because it grows in great abundance in woods and shady places.) The name of a genus of plants in the Linnaan system. Class, Pentandria. Order, Trigynia. Chiekweed.

ALSINE MEDIA. Morsus gallinæ cen-tunculus. The name for the plant, called chickweed, which, if boiled tender, may be caten like spinaeli, and forms also an excellent emollient poultice.

ALTAFOR. Campliire.

ALTERATIVES. (Alterantia, sc. medicamenta: from altero, to change.) Those remedies are so called, which are given with a view to re-establish the healthy functions of the animal oconomy, without producing any sensible evacuation.

ALTHÆA. (From αλθεω, to lieal; 50 called from its supposed qualities in heal-

ing.) Marsh-mallow.

1. The name of a genus of plants of the Linnæan system. Class, Monadelphia. Or-

der, Polyandria.

2. The pharmaeopæial name of the marsh-mallow. Althea officinalis of Linnæus:-foliis simplicibus tomentosis.

mon marsh-mallow.

The mucilaginous 'matter with which this plant abounds, is the medicinal part of the plant: it is commonly employed for its emollicat and demulcent qualities in tickling coughs, hoarseness, and catarrhs, in dysentery, and difficulty and heat of urine. It relaxes the passages in nephritic complaints, in which last ease a decoction is the Two or three ounces of best preparation. the fresh roots may be boiled in a sufficient quantity of water to a quart, to which one ouce of gum-arabic may be added. following is given where it is required that

large quantities should be used. An ounce of the dried roots is to be boiled in water enough to leave two or three pints to be poured off for use: if more of the root be used, the liquor will be disagreeably slimy. If swectened, by adding a little more of the root of liquorice, it will be very palatable. The root had formerly a place in many of the compounds in the pharmacopæias, but now it is only directed in the form of syrup.

ALTHEA OFFICINALIS. The systematic name of the marsh-mallow. See Althou, ALTHANACA. Althanacha. Orpiment.

ALTHEBEGIUM. An Arabian name for a sort of swelling, such as is observed in eachectic and leuco-phlegmatic habits.

(From albew, to cure, or ALTHEXIS. Hippocrates often uses this word to

signify the cure of a distemper.

So Avicenna ealls the Laser. ALTIHIT. pitium of the ancients.

ALUD. (Arab.) Alocs.

Alunels. Hollow spheres of stone, glass, or earthen-ware, with a short neek projecting at each end, by means of which one globe might be set upon the other. The uppermost has no opening at the top. They were used in former times for the sublimation of several substances.

Alum. See Alumen.

ALUMEN. (Alum. Arab.) Assos, azub, Sulphas elumina acidulus, aseb, elanula. cum potassâ. Super-sulphas aluminæ et po-

tassæ. Argilla vitriolata. Alum.

A neutral salt, formed by the combination of the carth called alumine, or pure clay, with sulphurie acid, and a little pot-

ash.

The alum of commerce, and that presented for medicinal purposes, is afforded by ores which are dug out of the earth for this purpose, and manufactured by first decomposing the ore, then lixiviating it, cvaporating the lixiviums, and then crystallizing the alum, which affects the form of tetrahedral pyramids, applied to each other base to base; sometimes the angles are truncated.

The following kinds of alum are met with

in the shops:

1. Ice or rock alum. Alumen commune: alumen crystallinum, rupeum, factitium. Common alum; fictitious alum: English alum. This is always in very large transparent masses, and derives its name from Roeca in Syria, now called Edessa, in which the earliest manufactory of this salt was established; or from the hardness and size the masses. This species is not very pure.

2. Roman alum. Alumen Romanum: alumen rubrum rutilum, rochi Gallis. Called rock alum by the French. This species, which is prepared in the territory of Civita-Vecelia, comes in lumps of the size of eggs, covered with a reddish efflorescence.

Alum, when first tasted, imparts a sweetness, but is soon felt to be strongly astringent; on account of which virtue it is of very extensive use in medicine and sur-

Internally it is used as a powerful astringent in cases of passive hamorrhages from the womb, intestines, nose, and sometimes lungs. In bleedings of an active nature, i. e. attended with fever, and a plethoric state of the system, it is highly improper. Percival recommends it in the colica pictonum and other chronic disorders of the bowels, attended with obstinate constipa-tion. See Percival's Essays. The dose advised in these cases, is from 5 to 20 grains, to be repeated every four, eight, or twelve hours. When duly persisted in, this remedy proves gently laxitive, and mitigates the

Alum is also powerfully tonic, and is given with this view in 10 grains of alum made into a bolus three times a day, in such cases as require powerful tonic and astringent remedies. Another mode of administering it, is in the form of whey made by boiling a drachm of powdered alum in a pint of milk, for a few minutes, and to be taken in the quantity of a tea-cup full three times a day. Dr. Cullen thinks it ought to be employed with other astringents in diarrhœas. In active hæmorrhagies, as was observed, it is not useful, though a powerful medicine in those which are passive. It should be given in small doses, and gradually increased. It has been tried in the diabetes without success; though, joined with nutmeg, it has been more successful in intermittents given in a large dose, an hour or a little longer, before the approach of the paroxysm. In gargles, in relaxation of the uvula, and other swellings of the mucous membrane of the fauces, divested of acute inflammation, it has been used with advantage; also in every state of the cynanche tonsillaris. Externally alum is much employed by surgeons as a lotion for the eyes, and is said to be preferable to white vitriol, or acetated ceruse in the ophthalmia membranarum. From two to five grains dissolved in an ounce of rose water, forms a proper collyrium. It is also applied as a styptic to bleeding vessels, and to ulcers, where there is too copious a secretion of pus. It has proved successful in inflammation of the eyes, in the form of cataplasm, which is made by stirring or shaking a lump of alum in the whites of two eggs, till they form a coagulum, which is applied to the eye between two pieces of thin linen rag. This substance is also employed in the form of injection in cases of gleet or fluor albus.

When deprived of its humidity by exposure to the fire, by placing it in an earthen pan over a gentle fire, till it ceases to bubble, it is termed burnt alum, alumen ustrum, and is sometimes employed by surgeons to destroy fungous flesh, and is a principle ingredient in most styptic powders. is also applied to many purposes of life; in

this country, bakers mix a quantity with the bread, to render it white; this mixture makes the bread better adapted for weak and relaxed bowels; but in opposite states of the alimentary canal, this practice is highly pernicious. The officinal preparations of alum are: Alumen purificatum. Lond. Sulphas aluminis exsiccata. Soluti sulphat. cupri ammon. Eding. Aq. alum. comp. Lond. ALUMEN CATINUM. A name of potash.

ALMEN USTRUM. See Alumen. Earth of alum, ALUMINE. Alumina.

Pure clay.

Aluminous earth derives its name from alum, of which it forms the base. It constitutes the lower strata of mountains and plains. It arrests the waters, and causes them to rise in springs to the surface of the earth. It enters into the natural composition of the schistus, and all these stones and earths called argillaceous, such as potter's-clay, fuller's-earth, lepidolite, mica, corundum, &c. Hitherto it has not been found pure any where, except in the garden of the public schools at Halle in Germany.

Properties of pure Alumine.-Alumine is white, and soft to the touch. It is insipid, adheres to the tongue, and occasions a sense of dryness in the mouth. When moistened with a small quantity of water, it forms a tenacious, ductile, kneadable paste. When heated to redness, it shrinks considerably in bulk, and at last becomes so hard as to strike fire with flint. After being ignited, it is no longer capable of being kneaded with water into a ductile It recovers however this property by solution in an acid and precipitation. Alcalies dissolve it in the humid way, and form compounds decomposable by acids. It dissolves slowly in all acids. It possesses a powerful attraction for lime. most intense heat of our furnaces is not able to melt it, but it becomes fusible when lime is added. Lavoisier has proved that it is capable of entering into a kind of fusion like paste, by the action of oxygen gas; it then cuts glass and resists the file. It absorbs water and carbonic acid from the atmosphere. By its mixture with water and silex it acquires great solidity. It does not unite with any combustible substance, but it becomes fused into coloured frits with metallic oxyds. Its specific gravity is 2. It is employed in a multitude of arts.

Method of obtaining pure alumine. - Take any quantity of alum of commerce, dissolve it in six parts of boiling distilled water, and add to this solution, when cold, liquid ammonia, till no further precipitate ensues. Then heat the whole nearly to the boiling point for a few minutes, and transfer it on a filter. In proportion as the fluid passes off, pour more water over the precipitate, until it passes tasteless. Let the precipitate obtained, while yet in a pasty state,

be transferred into a glass or Wedgwood's bason, and add to it muriatic acid in small quantitities at a time, until the whole is dissolved. Then evaporate the solution, till a drop of it, when suffered to cool on a plate of glass, yields minute crystals: on letting it now cool, crystals of alum will be deposited. Remove these crystals by decanting the fluid, and renew the evaporation, until, on further cooling, no more crystals are formed. Nothing now but pure alumine remains in the solution; the fluid may therefore be decomposed by adding to it gradually liquid ammonia till no further precipitate ensues. The precipitate thus obtained, when well washed and dried, is pure alumine.

The process recommended in general by systematic writers for obtaining alumine, differs from this; it consists in decomposing a solution of alum of commerce by an excess of a carbonated alkali, washing the obtained precipitate, and exposing it to a sufficient heat to drive off the carbonic This method however is imperfect, for if the alumine thus obtained be heated with charcoal, and a diluted acid is added to the mixture, sulphurated hydrogen gas will be liberated. It adheres to the tongue, and emits a peculiar odour when breathed upon. Sure signs that it is not pure.

It must be obvious that alumine cannot he obtained absolutely pure in this manner. For alum is a triple compound, consisting of alumine, potash, and sulphuric acid in excess. When this excess of acid is saturated, by adding to the solution an alkali, or even pure alumine, a highly insoluble salt (sulphate of alumine) is produced, differing from alum only in the proportion of its base. When we therefore gradually add to a solution of alum, a carbonated alkali, the first effect of the alkali is, to saturate the excess of the sulphuric acid, and the precipitate consists principally of the salt which is insoluble in water. A further quantity of the alkali effects instantly a decomposition of part of the salt, which, in proportion as it takes place, becomes mixed with the alumine: and it is thus covered from the further action of the alkali. This being the case, it is obvious that no subsequent washing can do more than separate the sulphate of potash, and therefore the residuum, instead of being pure alumine, contains also a variable proportion of true sulphate of alumine; the sulphuric acid of which becoming decomposed on heating it in contact with charcoal, accounts for the sulphurated hidrog n gas produced by the affusion of an acid. With the seids it is known to form more than twenty species of neutral salts. Of these only one is used in medicine and surgery, called alum, or aluminous, sulphata. See Alumen.

ALUMINOUS WATERS. Waters impreg-

nated with particles of alum.

ALUSAR. Manua.

ALVEARIUM. (From alveare, a beehive.) That part of the meatus auditorius externus is so called, which contains the wax of the ear.

(From alveare, a bee-hive; ALVEOLI. from their resemblance to its cells.) trion, bothrion; frena, mortariolum. sockets of the teeth. There are usually sixteen of these alveoli, or sockets, in each jaw.

ALVEUS COMMUNIS. The common duct, or communication of the ampullæ of the membranaceous semicircular canals in the internal ear, is so termed by Scarpa.

ALVEUS AMPULEASCENS. Part of the duct conveying the chyle to the subclavian vein. ALVIDUCA. (From alvus, the belly, and

duco, to draw.) Purging medicines.

ALVIFLUXUS. (From alvns, and fluo, to

flow.) A diarrhea, or purging.

ALVUS. The belly, stomach and entrails.

Asyce. (From αλυω, to be anxious.) That anxiety which is attendant on low fevers.

Λεγρια. (From a, neg. and λυπη, pain.) A gentle purgation of the humours without

ALYPIAS. Alypum. A species of spurge, so called because it purges gently and with-

ALYSMUS. (From axva, to be restless.) Restlessness.

ALYSSUM. (From a, neg. and Ausoa, the bite of a mad dog: so called because it was foolishly thought to be a specific in the cure of the bite of a mad dog.) Mad-wort. The Marrnbium alysson of Linnaus, supposed by some to be diaphoretio.

ALYSSUM GALENI. The marrubium.

ALYSSUM PLINII. The mollugo. ALYSSUM VERTICILLATUM. The marrie-

bium verticillatum. ALZEMAFOR. Cinnabar.

ALZUM. Aldum. Aldrum. The name of the tree which produces gum bdellium according to some ancient authors,

AMA. Together. A word used in composition.

AMALGAM. (From aua, and yaues, to marry.) A substance produced by mixing mercury with a metal, the two being thereby incorporated.

(From aux, and ushex, an AMAMELIS. apple.) The bastard medlar of Hippo-

AMANITE. (From a, priv. and maria, madness; so called, because they are eatable and not poisonous, like some others.) A tribe of fungus productions, called mushrooms, truffles, and morells, and by the French, champignions.

AMARA (Amura, sc. medicamenta: from

amarus, bitter.) Bitters.

The principal bitters used medicinally are: the pure bitters, gentiana lutea; humulus lupulus; and quassia amara: stypic bitters, cinchona officinalis; croton cascarilla: quassia

simarouba: and aromatic bitters, artimesia absynthium; anthemis nobilis: hyssopus, &c.

AMARA DULCIS. See Dulcemara.

AMARACUS. (From a, neg. and paparow to decay; because it keeps its virtues a long time.) Marjoram.

AMARANTHUS. (From the same.) The

herb goldilocks.

AMARANTH ESCULENT. The leaves of the amaranthus oleraceous of Linnæus, and several other species, are eaten in Iudia the same as cabbage is here.

AMARANTHUS ÓLERACEUS. See Amaranth.

esculent.

AMATORIA FEBRIS. (From amo, to love.) See Chlorosis.

AMATORIA VENEFICA. (From amo, to love, and veneficium, witchcraft.) Philters. Love-powders.

(Amatorii, sc. musculi.) AMATORII. term given to the muscles of the eye, by which that organ is moved in ogling.

AMATZQUITL. (Indian.) Unedo papyracea. The arbutus unedo of Linnæus. decoction of the bark of the root of this

plant is commended in fevers.

AMAUROSIS. (Αμαυρωσις: from αμαυροω, to darken or obscure.) Gutta serena. Amblyopia. A total loss of sight without any visible injury to the eye, the pupil mostly dilated and immoveable. A genus of disease in the class locales, and order dysæsthesix of Cullen. It arises generally from compression of the optic nerves; amaurosis compressionis; from debility, amaurosis atonica; from spasm, amaurosis spasmodica; or from poisons, amaurosis venenata. also Gutta serena.

Amber seed. See Hibiscus abelmoschus.

AMBE. (Auch, the edge of a rock; from ausauw, to ascend.) An old chirurgical machine for reducing dislocations of the shoulder, and so called, because its extremity projects like the prominence of a rock. Its invention is imputed to Hippocrates. The ambe is the most ancient mechanical contrivance for the above purpose, but is not at present employed.

Ambela. (Arab) The cornered hazlenut, the bark of which is purgative.

AMBER. Succinum. A beautiful bituminous substance, of a yellow or brown colour, either transparent or opake, which takes a good polish, and, after a slight rubbing, becomes so electric, as to attract straws and small bodies; hence it was called electrum by the ancients, and hence the word electricity. When powdered, it emits an agreeable smell. It is dug out of the earth at various depths, and often contains insects in high preservation; a circumstance which proves that it has been liquid. Amber is also found floating on the shores of the Baltic, and is met with in Italy, Sicily, Poland, Sweden, &c. From its colour or opacity it has been variously distinguished; thus white, orange, golden,

cloudy amber, &c. An oil is obtained from it, which, as well as its other preparations, is occasionally used in medicine against spasmodic diseases.

AMBERGRIS. (Ambragrisea.) A concrete, bituminous substance, of a soft and tenacious consistence, marked with black and yellow spots, and of an agreeable and strong smell when heated or rubbed. It is found in very irregular masses, floating on the sea near the Molucca Islands, Madagascar, Sumatra, on the coast of Coromandel, Brazil, America, China, and Japan. ral American fishermen assured Dr. Schwediawer, that they often found this substance, either among the excrements of the Physeter macrocephalus, a species of whale, or in its stomach, or in a vessel near the sto-The medical qualities of ambergris are stomachic, cordial, and antispasmodic. It is very seldom used in this country.

Amblosis. (Αμέλωσις: from αμέλοω, to

cause abortion.) A miscarriage.

Amblotica, (Amblotica, sc. medicamenta, αμβλοτικα: from αμβλοω, to cause abortion.) Medicines which were supposed to occasion abortion.

AMBLYOPIA. (From augaus, dull, and ω, the eye.) Hippocrates means by this word, dimness, of sight to which old people are subject. Paulus Actuarius, and the best modern writers, seem to think that amblyopia means the same thing as the incomplete amaurosis. See Gutta serena and Amaurosis.

Amblyosmus. Amblytes. The same.

Ambo. (Indian.) The mango.

(From aucaira, to ascend.) Celsus uses this term to signify, the margin or tip of the sockets in which the heads of the large bones are lodged.

AMBONE. The same as ambe.

AMBRA. Amber. Also an aromatic gum. AMBILA CINRACEA. (From cineraceus, of the colour of ashes.) Ambergris and grey amber.

AMBRA GRISEA. Ambergris.

AMBRAM. Amber.

AMBRETTE. See Abelmoschus.

Ambulativa. (From ambulo, to walk.) A species of herpes; so called because it walks or creeps as it were about the body

Ambulo. (From αμβαλλω, to cast forth.) Flatus furiosus. A periodical flatulent disease, caused, according to Michalis, by vapours shooting through various parts of the body.

AMBUSTIO. (From amburo, to burn.) Ambustiem. A burn or scald.

AMELIA. The same as achmella.

AMENORRHŒA. (From a, priv. and μην, a month, and ρεω, to flow ) A partial or total obstruction of the menses in women from other causes than pregnancy and old age. That this excrementitious discharge should be regular as to quantity and quality, and that it should observe the monthly period, is essential to health. When it is obstructed, nature makes her efforts to obtain for it some other outlet. When these efforts of nature fail, the consequence may be pyrexia, pulmonic diaeases, spasmodic affections, hysteria, epilepsia, mana, apoplexia, chlorosis, according to the general habit and disposition of the patient. Dr. Cullen places this genus in the class locales, and order epischeses. His species are, 1. Eman-sio mencium: that is, when the meases do not appear so early as is usually expected. See Chlorosis. 2. Suppressio mensium, when, after the menses appearing and continuing as usual for some time, they coise without pregnancy, occuring. 3. Amenorrhaa dificilis, vel Menorrhagia difficilis, who no tins flux is too small in quantity, and attended with great pain, &c.

AMENTIA. (From a, priv. and mens, the mind.) Imbeculity of intellect, by which the relations of things are either not perceived, or not recollected. A disease in the class neurous, and order vesanize of Cullen. When it originates at birth, it is called amentia congenita, natural studistic; when from the infirmities of age, amentia senills, dotage or child liness; and when from some accidental cause, amentia ac-

quisita.

American Balsam. See Balsamum Peruvianum.

America tuberose root. The potato. An America tuberose root.

AMETRYSTA PHARMACA. (From α, neg. and μεθυ, wine) Medicines which were said either to prevent or remove the effects of wine. Galen.

AMETHYSTUS. (From α, neg. and μεθυσκω, to be inebriated.) The amethyst. A precious stone, so called, because in former times, according to Plutrach, it was thought to prevent drunkenness. Ruland in Lex.Chem.

AMICULUM. A little short cloak. It is the same as the amnios, but anciently meant a covering for the pubes of boys, when they exercised in the gymnasium. Rhodius.

Amm. (A $\mu\mu$ ): from a $\mu\mu$ os, sand; from its likeness to little gravel-stones.) The herb bishop's-weed, of which there are two sorts, the anumi verum and vulgare.

Anmi walus. The systematic name for the ammi vulgare of the shops. See Ammi

pulgare.

AMMI VERUM. The seeds of this plant, Sison ammi of Linneus;—foliis tripinnatis, radicalibus linearibus, canlinis setaceis, stipilaribus longitoribus, have a grateful smell, somewhat like that of origanum, and were formerly administered as a carminative.

Ammi VULGARE. The seeds of this

AMMI VULGAIR. The seeds of this plant, Ammi majus, of Lunaeus;—foliis inferioribus pinnatis, lanceolatis, serratis; superioribus multifidis, linearibus, are less powerful than those of the Sison ammi, but were exhibited with the same views.

AMIDUM. See Amylum.

AMINEUM. A wine produced in Ami-

næa, formerly a province of Italy; called also Salernum. Also a strong wine vinegr. Galen mentions Aminæum Neapoltanum, and Aminæum Siculum.

AMMION. Ammium. Cinnabar.

Ammochosia. (From αμμος, sand, and χεω, to pour.) A remedy for drying the body by sprankling it with hot sand. On-housing

AMMONIA ACETATA. See Liquor . Immonie ace'atia.

AMMONIA MURIATA. See Muriate of announia.

AMMONIA PREPARATA. See Curbonas ammonie.

AMMONIA. Ammonia-gas. The substance so called, is an aeriform or gaseous body.

Pure ammonia was long supposed to be a compound of hydrogen and nitrogen, rendered gaseous by the addition of caioric; but from the experiments of Mr. Davy on the alkalis, it appears to be a metallic oxyd.

Ammonia-gas has a strong and very pungent odour. It extinguishes flame, yet it increases the magnitude of the flame of a taper before extinction, producing a pule yellow colour round its edge. Animals cannot breathe it without death ensuing. It is lighter than atmospheric air, in the proportion of three to five. It tinges yellow vegetable colours brown, and blue ones green. It is rapidly absorbed by cold water; by ardent spirit, essential oils, ether, charcoal, sponge, bits of linen cloth, and all porous bodies.

When a piece of ice is brought in contact with this gas, it melts and absorbs the gas, while at the same time its temperature is diminished. It has no effect upon oxygen gas while cold; but when made to pass with it through an ignited tube, it detonates and becomes decomposed. The same is the case with common air. It is also decomposed by phosphorus at high temperatures.

It does not explode when mixed with hydrogen gas. Nitrogen gas has no effect upon it. Atmospheric air does not combine with it at common temperatures, but only mixes with and dilutes it. When made to pass through ignited charcoal, it forms with it a substance called prussic acid. If brought into contact with acid gases, both gases lose their gaseous form, and become It has no sensible action on concrete. earths, or on the salino-terrene substances. It combines readily with acids, and unites to sulphur, when both are in a state of vapour. It reduces oxyds of metals to their inetalic state, and is decomposed by them It is all o decomposed by electrization, and by oxygenated muriatic acid gas, &c .--When exposed to the temperature of 46 degrees, it crystallizes, and when suddenly cooled down to 68 degrees, it assumes a gelatinous appearance, and has scargely any odour.

G

Methods of obtaining Ammonia.—1. Mix together equal quantities of muriate of ammonia and quick-lime, separately powdered; introduce them into a gas-bottle or retort, apply the heat of a lamp, and receive

the gas over mercury.

Explanation.—Muriate of ammonia consists of muriatic acid and ammonia; on adding lime to it, a decomposition takes place, the mariatic acid quits the ammonia and unites to the lame, in order to form muriate of lime, which remains in the retort, and the ammonia flies off in the state of gas.

Remark.—In order to obtain the gas in a state of purity, it is essentially necessary that a considerable quantity of the gas first disengaged, be suffered to escape, on account of the common air contained in the distilling vessel, and in the interstices of the

ingredients.

2. Ammonia may likewise be obtained by heating the liquid aumonia of the shops (liquor of pure ammonia, Pharm. Lond) in a retort placed in communication with the mercurial pneumotic trough.

In this process the ammonia contained in this Lquid combines with caloric, assumes the form of ammonia-gas, and parts with the

water to which it was united.

Remark.—The temperature of the fluid must not be carried so high as to cause the water to be converted into vapour, or, if this cannot well be avoided, a small vessel should be interposed between the retort and the receiver, which, when kept cool, may serve to condense the aqueous vapour which is formed, and cause the ammonia gas to pass in a very pure and dry state.

Ammonia is likewise produced during the spontaneous decomposition of animal and vegetable substances; in these cases it did not pre exist in them ready formed, but is generated by the union of the hydrogen and nitrogen contained in them.

In combination with water, this alkali forms a solution of, or liquid ammonia, which is called, in the London pharmacopeia,

LIQUOR AMMONIE.

Take of muriate of ammonia,

Lime newly prepared, of each two pounds.

Water, a pint and a half.

Reflect the number of ammonia and the line into powder separately; then nix them, and introduce them into a large glass retort, into which a pint of water has been previously poured. Having placed the retort in a sand bath, lute on a tubulated receiver, through which the ammonia may pass on into a third vessel containing half a pint of the water, and cooled. Then at first apply a gentle heat, and increase it by degrees, until the retort becomes red.

Great care and attention are necessary in every part of this process; the two salts are to be powdered separately, before they are mixed; for, if they be triturated toge-

ther, ammonia will be extricated, which should be prevened, until the means for its collection are adopted. The salts are to be shaken well together, rather than rubbed, and added to the water in the report cold produced by the solution of the salt, will counteract the heat produced by the slacking of the lime, and a charge so made will be manageable until the receiver is fitted on, and the heat of the sand-bath applied. This heat need not be greater than 300 degrees, and should be very cantion ly and slowly ra sed, to prevent the rapid ebullition and expansion during the exprication from gas of a charge of such density; and for the same reason, a large retort is di-The ammonia ri-es immediately rected. in the form of gas, and a portion of the water is therefore placed in a situation to condense it; in the subsequent stages, water will arise from the charge in the retort. The third vessel directed in the formula, may be either a common bottle, fitting moderately (for no great pressure is necessary,) to a straight tube ssning from the bottom of the receiver, and dipping below the surface of the water it contains; or Woulf-'s apparatus may be used; but, with moderate attention, the simpler means will answer better, perhaps, than the more complex. In either case, the receiving-bottle must be kept cold by wet cloths, or ice; for the lower the temperature of the water, the greater quantity of ammonia-gas it will condense, and the condensation is accompanied by an increase of its heat. If two bottles, each containing half the quantity of water directed, be used, they will be most manageable, as they may be changed alternately, so as to prevent either from being overheated, and the contents of both may be mixed together at last. This preparation is colourless and transparent, with a strong poculiar smell; it parts with the ammonia in the form of gas, if heated to 130 degrees, and requires to be kept, with a cautious exclusion of atmospherical air, with the carbonic acid of which it readily unites : on this latter account, the propriety of keeping it small bottles instead of a large one, has been suggested. Water saturated with ammonia gas, has a less specific gravity than common water.

This is the aqua ammonie pura of the shop, and the alkali volatile causicum.

The preparations of amm nia in use are, 1. The corbonate of ammonia. See Carbonas ammonia, and Liquor carbonatis ammonia.

2. The acetate of ammonia. See Liquor acetatis ammoniæ.

3. The muriate of ammonia. See Mu-

4. Ferrum ammoniatum.

5. Several tinctures and spirits, holding carbonate of ammonia in solution.

AMMONIACUM. (Approviance: so called

from Ammonia, whence it was brought.) Gum-ammoniac. A concrete gummy-resinous juice, composed of little lumps, or tears, of a strong and somewhat ungraveful smell, and nauscous taste, followed by a bitterness. There has intherto, been no information had concerning the plant which affords this dring. It is imported here from Turkey, and from the East-Indies. Gumammoniacum is priscipally employed as an expectorant, and is ir quently prescribed in asthma and chronic caterrh. Its dose is from 10 to 30 grams. It is given in the form of a pill, or diffused in water, and is frequently combined with squill, or tardite of antimony. In large doses, it proves purgative. Ex emally, it is applied as a discutient, under the form o plaster, to white swellings of the knee, and to indolent tu-mours. The official preparations are: Ammoniacum punficatum: En plastrum ex ammoniaco cum hydragyro: Mistura am-

AMMONIÆ CARBONAS. See Carbonas ammoniæ.

Ammonie Murias. See Muriate of am-

Ammoniov. (From appec, sand.) Ætius uses this term to denote a collyrium of great virtue in many diseases of the eye, which was said to remove sand or gravel from the eves.

AMMONIUM. The metal which with oxygen torms the alkali called ammonia, See Ammonia.

AMNESIA. (From a, priv. and punge, memory.) Amnestia. Forgetfulness; mostly a symptomatic affection.

AMNESTIA. See Amnesia.

AMNIOS. Amnion. (From apros, a lamb, or lamb's skin ) The soft internal membrane which surrounds the fœtus. It is very thin and pellucid in the early stage of pregnancy, but acquires considerable thickness and strength in the latter months. The amnios contains a thin watery fluid, in which the factus is suspended. In the abortion of the early months, we find the quantity of this fluid very great, in proportion to the whole ovum, and the amnios forms a delicate and almost gelatinous substance, and is a provisio for the regular presentation of the head of the child; for now, the fætns being suspended in the fluid, and hanging by the umbilious, and the head and upper part of the body greatly preponderating, it takes that position with the head presenting to the orifice of the womb, which is recessary to natural and safe labour, the for us being prevented from shifting, in he latter months, by the closer embracing of the child with the uterus.

AMNIOTIC ACID Vauquelin and

Bun va have discovere l'a peculiar acid in the liquor of the amnios of the cow, to which they have given the name of ammotic

It exists in the form of a white pulverulent powder. It is slightly acid, but sensibly reddens vegetable blues. It is difficultly soluble in cold, but readily soluble in boiling water, and in alcohol. When exposed to a strong heat, it exhales a odour of ammonia and of prussic acid. Ass sted by he .t, it decomposes carbonate of po ash, soda, and ammonia. It produces no change in the solutions of silver, lead, or mercury, in hitric acid. Exposed to heat, it yields, ammonia and prussic acid.

Amniotic acid may be obtained by evaporating the liquor of the amnios of the cow to a fourth part, and suffering it to cool; crystals of amuiotic acid will be ob-

tained in considerable quantity.

Whether this acid exists in the liquor of the amnios of other animals, is not vet

Anomom. (From an Arabian word, signifying a pigeon, whose foot it was thought to resemble.) The fenit of the amomum verum, True stone parsley. It is about the size of a grape, of a strong and grateful aromatic taste and penetrating smell. The seeds have been given as a carminative.

Amonum cardamonum The systematic name for the curdamomum minus. See

Cardamomum minus

AMOMUM GRANUM PARADISI. The systematic name of the plant which affords the grains of paradise. See Grana paradisi.

AMOMUM ZINGIBER. The systematic name of the plant which affords ginger. See Zingiber. Amonge. See Amurca.

Ampelosagria. (From αμπέλος, a vinc.) Sec Bryonia.

AMPHUMERINOS. (From auqi, about, nusga, a day.) Amphemerina. A quotidian

fever. A species of ague.

AMPHARTHROSIS. (Αμφιαεθεωσις: from appa, both and aggass, an articulation; so called from its partaking both of diarthrosis and synar hresis.) A mixed species of connexion of bones, which admits of an obscure motion, as is observed in the metacarpal and metatarsal bones, and the vertebræ.

Amphibious. (From apple, ambo, and βus, vita.) Animals are thus called, that live both on land and in the water. The amphibious animals, according to Linnaus, are a class whose heart is furnished with one ventricle and one auricle, in which respiration is in a considerable degree voluntary.

AMPHIRLESTROIDES. (From ampliansgor, a net, and woo, a resemblance.) The retina,

or net-like coat of the eye.

Americana (From augi, about, and Egy xia, the jaws ) The fauces or parts about the tonsils, according to Hippocrates and Fasius.

AMPHICAUSTIS. (From appl, about, and xoobes, pudendum muliebre.) A sort of wild barley growing about ditches. Enstachius uses it to express the private parts of a woman.

AMPHIDEON. (From  $\alpha\mu\phi^i$ , on both sides, and  $\delta_{\alpha\mu\rho}$ , to divided.) Amphibeum. Amphitium. The ostimest, or mouth of the womb, which opens both ways, was so called by the ancients.

AMPHIDIARTHROSIS. The same as am-

phiarthrosis.

AMPHIMERINA. (From αμφι, about, and ωμεζα, a day.) An intermitting fever of the quistidian kind.

AMPHIMETHION. (From αμφι, about, and μηζα, the womb) Amphimetrium. The parts about the womb. Hippocrates.

AMPHIPLEX. (From αμφι, about, and προμίο, to connect.) According to Rufus Ephesius, the part situated between the scrotum and anus, and which is connected with the thighs.

AMPHIFNEUMA. (From αμφι, about, and ωνωμα, breath.) A difficulty of breath-

ing. Dyspnæa. Hippocrates.

AMPHIPOLOS. (From app, about, and workers, to administer.) Amphipolus. One who attends the bed of a sick person, and administers to him. Hippocrates.

Amphismila. (From αμφι, on both sides, and σμιλη, an incision-knife.) A dissecting knife, with an edge on both sides.

Galen.

AMPULLA. (αμβολλα: from αναβαλλω,

to swell out.) A bottle.

1. All belified vessels are so called in clymistry, as bolt-heads, receivers, cucurbits, &c.

2. In anatomy this term is applied by Scarpa to the dilated portions of the membranaceous semicircular canals, just within the vestibulum of the ear.

AMPULLESCENS. (From ampulla, a bottle) The most turnid part of Pecquet's duct is called alveus ampullescens.

AMPUTATIO. (From amputo, to cut off Ectome. A surgical operation, which consists in the removal of a limb or viscins; thus we say a leg, a finger, the penis, &c. when cut off, are amputated; but when speaking of a tumour, or excrescence, it is said to be dissected out or removed.

AMULETUM. (From αμμα, a bond; because it was tied round the person's neck; or rather from αμμνα, to defend. An anulet, or charm; by wearing which the person was supposed to be defended from the admission of all evil; in particular, an antidote against the plague.

AMORCA. (From autgro, to press out) Amorge. A small herb, whose expressed juice is used in dying. Also the sediment of the olive, after the oil has been pressed from it; recommended by Hippocrates and

Galen as an application to ulcers.

AMUTICA. (From αμυτίω, to scratch.) Medicines that, by vellicating or scratching as it were, the bronchia, stimulate it to the discharge of whatever is to be thrown off the lungs.

ANYCHE. (From approx, to scratch.)
A superficial faceration of exulceration of the skin; a slight wound. Hippocrates.—
Scarification. Galen.

Am yerica. (From αμυσσω, to vellicate.) Medicines which stimulate and vellicate the skin, according to Cælius Aurehanus.

AMYGDALA. (Apursano, from apuora, to laucmate; so called, because after the green husk is removed from the fruit, there appear upon the shell certain fissures, as it were lacerations.) The almond.

1. The name of a genus of plants in the Linnæan system. Class, Icosandria. Order,

Monogynia. The almond-tree.

2. The pharmacopæial name of the common almond. Amygdalus communis of Linnaus:—folits servatis infimis glendulosis, floribus sessilibus geminis.

The almond is a native of Barbary. same tree produces either bitter or sweet. Sweet almonds are more in use as food than med cine; but they are said to be difficult of digestion, unless extremely well comminuted, Their medicinal qualities depend upon the oil which they contain in the farinaceous matter, and which they afford on expression, nearly in proportion of half their weight. It is very similar to olive oil; perhaps rather purer, and is used for the same purposes. The oil thus obtained is more agreeable to the pulate than most of the other expressed oils, and is therefore preferred for internal use, being generally employed with a view to obtund acrid juices, and to soften and relax the solids, in tickling coughs, hoarseness, costiveness, nephritic pains, &c. externally it is applied against tension and rigidity of particular parts, The milky solutions of almonds in watery liquors, usually called emulsions, possess, in a certain degree, the emollient qualities of the oil, and have this advantage over pure oil, that they may be given in acute or inflammatory disorders, without danger of the ill effects which the oil might sometimes produce by turning rancid. officinal preparations of almonds, are the expressed oil and the emulsion; to the latter, the addition of gum-arabic is sometimes directed, which renders it a still more useful demulcent in catarrhal affections, stranguries, &c.

Bitter almonds yield a large quantity of oil, perfectly similar to that obtained from sweet almonds; but the matter remaining after the expression of the oil, is more powerfully bitter than the almond in its entire state. Great part of the bitter matter dissolves by the assistance of heat, both in water and rectified spirit; and a part arises also with both menstrua in distillation. Bitter almonds have been long known to be poisonous to various britte animals; and some authors have alleged that they are also deleterious to the human species; but the facts recorded upon this point appear to

want further proof. However, as the noxious quality seems to reside in that matter which gives it the bitterness and flavour, it is very probable, that when this is separated by distillation, and taken in a sufficiently concentrated state, it may prove a poison to man, as is the case with the common laurel, to which it appears extremely analogous Bergius tells us, that bitter almonds, in the form of emulsion, cured obstinate intermittents, after the bark had A simple water is distilled from bitter almonds, after the oil is pressed out, which posesses the same qualities, and in the same degree, as that drawn from cherry-stones. These afforded, tormerly, the now exploded aqua cerasorum nigrorum, or black-cherry-water.

AMYGDALE. The almonds of the ears; from their supposed resemblance to al-

monds.

AMYGDALE AMARE. See Amygdala. AMYGDALUS COMMUNIS. The systematic

name of the plant which affords both sweet and bitter almonds. See Amygdala.

AMYGDALE DULCES. See Amygdala. AMEGDALUS PERSICA. The systematic name of the common plum-tree.

Persica.

AMYLA. (From amylum, starch.) Any sort of chynnical facula, or highly pulverized residium.

AMYLUM. (Αμυλον: from a priv. and (AUXIII), a mill; because it was formerly made from wheat without the assistance of a mill.) Starch. The facula of wheat, or starch of wheat. The white substance which subsides from the water that is mixed with wheaten flour. The starch-makers suffer it to remain in the water for a time after it has become acil, which makes it very white and soft to the touch, and scareely sensible to the taste. As starch forms the greatest part of flour, it cannot be doubted but that it is the principal alimentary substance contained in our bread. In a medical point of view, it is to be considered as a demulcent; and, accordingly, it forms the principal ingredient of an officinal lozenge in catarrhs, and a mucilage prepared from it, often produces excellent effects, both taken by the mouth and in the form of a clyster, in dysenteries and diarrhoa, from irritation of the intestines. Milk and starch, with the addition of suct finely shred and incorporated by boiling, was the soup employed by Sir John Pringle, in dysenteries, where the mucous membrane of the intestines had been abraded. Externally, surgeons apply it as an absorbent in erysi-

ANYRIS ELEMIFERA. (From a, intensive, and μυζον, ointment, or balm; so called from its use, or smell. The systematic name of the control of the systematic name tic name of the plant from which it is supposed we obtain the resin called gumelemi. See Elemi.

AMYRIS OPOBALSAMUM. The systematic. name of the plant from which he balsan of Mecca is obtained. See Bals mum Gi-

AMYUM. (From a, priv. and µva, muscie.) A limb so emaciated that the muscles scarcely appear.

ANA. ā, crāā. In medical prescriptions it means " of each." See A.

Anabasis. (From avalatva, to ascend.) An ascension, augmentation, or increase of . a disease, or paroxysm. It is usually meant of fevers. Galen. It also signifies equise-

ANABATICA. (From avabatvo, to ascend.) An epithet formerly applied to the synochus, or continual fever, when it increases in malignity.

ANABEXIS. (From avalination to cough: An expectoration of matter by up.)

coughing.

ANABLEPSIS. (From ava and Brette, to see again. The recovery of sight after it has been lost.

ANABLYSIS. (From ava and Baula, to gush out again ) Ebullition or effervescence.

Anabole. (From avabaddo, to cast up.) The discharge of any thing by vomit; also dilatation, or extension. Galen.

ANABROCHESIS. (From ava and Egoxeo, to resorb.) The reabsorption of matter.

ANABROCHISMOS. (From αναθεοχεο, to reabsorb.) Anabrochismus. The taking up and removing the hair on the eye-lids, when they become troublesome. Galen. Ægineta, and others.

ANABROSIS. (From analecow, to devour.) A corrosion of the solid parts, by sharp

and biting humours. Galen.

ANACARDIUM OCCIDENTALE. (From ava. without, and azedia, a heart; without heart because the puip of the fruit, instead of having the seed enclosed, as is usually the case, has the nut growing out of the end of it.) The cashew-nut. The oil of this nut is an active eaustic, and employed as such in its native country; but neither it, nor any part of the fruit, is used medicinally in this country.

ANACARBIUM ORIENTALE. Anacardum or Malacca bean. The fruit, or nut, so called in the pharmacopæias, is of a shining black colour, heart-shaped, compressed, and about the size of the thumb-nail. It is the produce of the Avicennia tomentosa; folis cordato ovatis, subtus tomentosis, of Linnæus. It is now deservedly forgot in this country.

Anaeathansis. (From ara, and madaigonal, to purge up.) An expectoration of pus. It properly denotes a purgation by spitting, in which sense it stands contradistinguished from catharsis, or evacuation downwards. In this sense the word is used by Hippocrates and Galen. Blancard denotes, by this word, medicines which operate upwards, as vaniting &c.

ANACATHARTICA. (From avanabaigomai, to purge upwards.) Thoracia, Medicines which promote expectoration, or vomits which act upwards.

ANACHRON. Mineral alkali.

ANACLASIS. (From avaname, to bend back) A reflexion or recurvature of any of the members, according to Happocrates.

Anaclisis. (From avandina, to recline.)

A couch, or sick-bed. Hippocrates.

ANACCELIASMUS. (From ava, and xoula, the bowels.) A gentle purge, which was sometimes used to relieve the lungs.

ANACOCHE, (From anaxoxea, to retard.) Delay in the administration of medicines; also slowness in the progress of a disease.

Hippocrates.

Anacollema. (From ara, and κολλαω, to glue together.) A collyrium made of agglutinant substances, and stuck on the forehead Galen.

ANACONCHYLISMOS. (From avany, you'çu, to sound as a shell) A gargarism so called, because the noise made in the throat is like the sound of a shell. Galen.

ANECTESIS. (From availize, to renew.) Restoration of strength; recovery from

sickness. Hippocrates

ANACUPHISMA. (From ανακυσμέω, to lift up.) A kind of exercise mentioned by Hippocrates, which consists in lifting the body up and down, like our weigh-jolt.

Anacreesis. (From avanual, to mix.) The commixture of substances, or medicines, by pouring one upon another.

Anacycleon. (From ανακυκλοω, to wander about.) Anacycleus. A mountebank

or wandering quack.

ANACYRIOSIS. (From 2022, and 20212, authority) By this word, Hipp-scrates means that gravity and authority which physicians should preserve among sick people and their attendants.

Anadiplosis. (From αναδιστώω, to reduplicate.) A reduplication or frequent return of a paroxysm, or disease. Galen.

Anadosis. (From ανα, upwards, and δ εδαμαι, to give. A vomit, or the distribution of aliment all over the body; or digestion.

ANADROME. (From ανα, upwards, and δρεμα, to run.) A pain which runs from the lower extremities to the upper parts of the holy. Hitheorytee

the body. Hippocrates.

Anedes. (From a, priv. and adac, shame.) Shameless. Hippocrates uses this word metaphorically for without restraint, copious; and applies it to water rushing into the aspera arteria.

ANÆSTHESIA. (Αναισθησία: from a, priv. and αισθανομαι, to feel) Loss of the sense of touch. A genus of disease in the class locales, and order dysesthesic of Cullen.

ANAGALLIS. (From avayeram, to laugh; because, by curing the spleen, it disposes persons to be cheerful.) This plant Anagallis arvensis: foliis indivisis, caule procumbente, of Linnaus, is small and delicately formed, and does not appear to possess any particular properties.

ANAGALLIS ARVENSIS. The systematic name for the anagallis of the shops. See Anagallis.

Anagargalictum. (From ava, and pagpageon, the throat.) A gargarism, or wash for the throat.

A NAGARGARISTUM. The same.

ANAGLYPHE. (From αναγλυφω, to engrave.) A part of the fourth ventricle of the brain was formerly thus called, from its resemblance to a pen, or style.

Anagnosis. (From αναγίνωσκα, to know.) The persuasion, or certainty, by which medical men judge of a disease from its

symptoms. Hippocrates.

ANAGRAPHE. (From αναγεαφω, to

write.) A prescription, or receip.

ANALERSIA. (From and, and nameare, to take again.). A species of epilepsy, which proceeds from a disorder of the stomach, and with which the patient is apt to be seized very often and suddenly.

ANALENTIA. A fictitious term used by

Paracelsus for epilepsy.

Analersis. (From avanaubava, to restore) A recovery of strength after sickness. Galen.

ANALEPTICA. (From avanaucave, to recruit, or recover.) Analeptics. Restorative medicines; medicines, or food, which recover the strength which has been lost by sickness.

Analosis. (From avalitum, to consume.)

A consumption, or wasting.

ANALYSIS. (Αναλυσις. from αναλυω, to resolve.) The resolution by chymistry, of any matter into its primary and constituent parts. The processes and experiments which chymists have recourse to, are extremely numerous and diversified, yet they may be reduced to two species, which comprehend the whole art of chymistry. The first is, analysis, or decomposition; the second, synthesis, or composition. In analysis, the parts of which bodies are composed, are separated from each other: thus, if we reduce cinnabar, which is composed of sulphur and mercury, and exhibit these two bodies in a separate state, we say we have decomposed, or analyzed cinnabar. But, if, on the contrary, several bodies be mixed together, and a new substance be produced, the process is then termed chymical composition, or synthesis: thus, if by fusion and sublimation, we combine mercury with sulphur, and produce cinnabar, the operation is termed chymical composition, or composition by synthesis.

ANAMNESIS. (From αναμμανισκώ to remember.) Remembrance, or recollection of what has been done. Galen

Anamnestica. (From the same.) Re

medies for bad memory.

ANANAS. Called by the Brazilians yayama. The egg-shaped pine-apple. The plant which affords this fruit, is the Bromelia ananas folis ciliato-spinosus, mucronatis, spica comosa of Linnæus. It is used

principally as a delicacy for the table, and is also given with advantage as a refrigerant in fevers.

(From avayuaço, to compel.) ANANCE. Necessity. It is applied to any desperate operation. Hippocrates.

(From avaquadavtos, AVAPHALANTIASIS bald ) A tiningess of the hair upon the eye-brows Gorraus.

ANAPHORA. (From avapego, to bring up.) A person who spits blood. Gorraus. ANAPHORYXIS. (From αναφοευσσω, to grind down.) The reducing of any thing

to dust, or a very fine powder.

ANAPHRODISIA. (From a, priv. and Appolioua, he feast of Venus.) Impotence. A genus of disease in the class locales, and order dysorexia of Cullen. It either arises from paralysis, anaphrodisia paralitica; or from gonorrhæa, anaphrodisia gonorrhoica.

ANAPHRONELI. (From a, neg. apeos, froth, and men, honey) Clarified honey.

ANAPLASIS. (From αναπλασσω, to restore again ) A restoration of flesh where it has been lost; also the reuniting a fractured bone. Hippocrates.

ANAPLEROSIS. (From αναπληροω, to fill again.) The restitution, or filling up of

wasted parts Galen.

ANAPLEROTICA. (From the same.) Medicues renewing flesh: incarnatives, or such medicines as fill up a wound so as to restore it to its original shape. Galen.

Anapleusis. (From αναπλευω, to float upon.) The rotting of a bone, so that it drops off, and lies upon the flesh; exfoliation, or separation of a bone. Hippocrates, Ægineta, &c.

Anapheusis. (From αναπνευω, to respire.)

Respiration,

Anaphoe. The same.
Anapposis. (From aratiola, to fall back.) A relapse.

ANAPTYSIS. The same as Anacatharsis. ANARRHEGNIMIA. (From ava, and payvous, to break again.) . Inarrhexis. A fracture; the fresh opening of a wound.

ANABRHEA. (From ara, upwards, and pew, to flow.) A flux of humours from below upwards. Schneider de Catarrho.

ANARRHOPIA. (From ava, upwards, and pera, 10 cr ep) The same. Hippocrates.

ANAS DOMESTICA. (From 1600, to swim.) The tame duck. The flesh of this bird is difficult of digestion, and requires that warm and stimulating condiments be taken with it to enable the stomach to digest it.

ANASARCA. (From ava, through, and σαρέ, flesh.) A species of dropsy from a serous humour, spread between the skin and flesh, or rather a general accumulation of lymph in the ce'lular system. Dr. Cullen ranks this genus of disease, in the class Cachesia, and the order Intumescentia. He enumerates the following species, viz. 1.

Anasarca serosa, as when the due discharge of scrum is suppressed. &c. 2. Anasarca oppilata, as when the blood-vessels are considerably pressed, which happens to many pregnant women, &c. 3. Anasarcha exanthematica, this happens after ulcers, various cruptive disorders, and particularly after the erysipelas. 4. .Anasarca anæmia, happens when the blood is rendered extremely poor from considerable losses of it. 5. Anasarca debilium, as when feebleness is indu-

ced by long itlness, &c. This species of dropsy shews itself at first with a swelling of the feet and ankles, toward the evening, which, for a time, disappears again in the morning. The tumefaction is soft and inelastic, and, when pressed upon by the finger, retains its mark for some time, the skin becoming much paler than usual. By degrees the swelling ascends upwards, and occupies the trunk of the body; and at last, even the face and eyelids appear full and bloated; the breathing then becomes difficult, the urine is small in quantity, high coloured, and deposits a reddish sed ment; the belly is costive, the perspiration much obstructed, the countenance yellow, and a considera-ble degree of thirst, with emaciation of the whole body, prevails. To these symptoms succeed torpor, heaviness, a troublesome cough, and a slow fever. In some cases, the water oozes out, through the pores of the cuticle; in others, being too gross to pass by these, it raises the cuticle in small blisters; and sometimes the skin, not allowing the water to escape through it, is compressed and hardened, and is, at the same time, so much distended as to give the tumour a considerable degree of firmness.

(From ava, and σατω, to ANASPASIS. draw together.) Hippocrates uses this word to signify a contraction of the stomach.

Anassyros. (From ava, upwards, and σευομαι, to agitate.) Anassytus Driven forcibly upwards. Hippocrates applies this epithet to air rushing violently upwards, as in hysteric fits.

ANASTALTICA. (From avasshaw, to contract.) Styptic or refrigerating medicines.

Anastasis. (From avasvui. to cause to rise.) A recovery from sickness; a restoration of health. It likewise signifies a migration of humours, when expelled from one place and obliged to remove to another. Hippocrates.

ANASTOMOSIS. (From ava, through, and souz, a mouth.) The communication

of vessels with one another.

ANASTOMOTICA. (From ava, through, and sour, the mouth.) Medicines which open the pores and mouths of the vessels, as cathartics, diuretics, deobstruments, and sudorifics.

ANATES. (From nates, the buttocks.) A disease of the anus. Festus, &c.

ANATOMY. (Aratomus, or aratoms: from ara, and to-mus, to cut up.) Amerotomy. The dissection of the human body, to expose the structure, situation, and uses of every part.

ANATOMY, COMPARATIVE. Zootomy. The dissection of brutes, fishes, polypi, plants, &c. to illustrate, or compare them with the structure and functions of the human

body.

ANATRESIS. (From ατα, and τίθεαω, to perforate.) A perforation like that which is made upon the skull by trepanning. Galen

ANATRIBE. (From avalgiou, to rub.)

Friction all over the body.

ANATRIPSIS. The same. Moschion de Morb. Mulieb. and Galen.

ANATRIS. Antaris. Mercury. Ruland. ANATRON. (Arab. A lake in Egypt, where it was produced.) Soda, or fixed mineral alkali.

ANATROPE. (From ανατχεπμα, to subvert. Anatrophe. Anatropha. A relaxation, or subversion of the stomach, with loss of appetite and nausea. Vomiting. Indigestion. Galen.

ANATRUM. Soda.

ANAUDIA. (From a, priv. and awa, the speech.) Dumbness; privation of voice; catalepsia. Hippocrates

ANAXYRIS. (From avagues, the sole.) The herb sorrel; so callen because its leaf

is shaped like the sole of the shoe.

Ancha. (Arab. to press upon, as being the support of the body) The thigh. Ari-

ceana, Forestius, &c.

Anchilors. (From ayxi, near, and a\psi, the eye.) A disease in the inward corner of the eye, called also Ægilops. An incipient fistula lachrymalis.

ANCHYLE. See Ancyle.

Anchoralis processus. (Anchoralis; from αγκων, the elbow.) See Coracoid process.

Anchovy Pear. This fruit, the produce of the *Grias cantifora* of Linnxus, is eaten by the inhabitan's of Jamaica, as a pleasant and ref igerant fruit.

ANCHUSA. (From apxin, to strangle; from its supposed constringent quality; or, as others say, because its trangles serpents.)

Alkanet.

1. The name of a genus of plants in the Linnaan system, Class, Pentandria. Or-

der, Monogynia.

2. The name in some pharmacopæias for the alkanet root. The plant from which it is obtained, is the anchusa tinetoria of Linnæus, which grows wild in France, but is cultivated in our gardens. The root is externally of a deep purple coloni. To oil, wax, turpentine, and alcohol, it imparts a beautiful deep red colour, for which purpose it is used. Its medicinal properties are scarcely perceptible.

ANCHUSA OFFICINALIS. The systematic

name for the buglossum of the shops. See Buglossum.

Anchusa Tinctoria. The systematic name for the anchusa or alkanna of the

pharmacopæias. See Anchusa.

Anchylomenisma. (From αγχυλομαι, to bend.) Sagar uses this term to express a concretion, or growing together of the soft parts.

ANCHYLOSIS. (From a) χυλομαι, to hend.)

A stiff joint.

Ancı. Those who have a distorted elbow.

ANCIROMELE. See Ancyromele.

ANCINAR. Borax.

Ancon. (From apaz comm, to embrace; ano to aparabat steps of en to offer: because the bones meeting, and there uniting, are folded one into another.) The elbow.

ANCONEUS. (Anconeus, sc. musculus; from apace, the elbow.) Anconeus minor of Winslow. Anconeus vel cubitalis Riolani of Douglas. A small triangular muscle, situated on the back part of the elbow. It arises from the ridge and from the external condyle of the humerus, by a thick, strong, and short tendon: from this it becomes fleshy, and, after running about three inches obliquely backwards, it is inserted by its oblique fleshy fibres into the back part or ridge of the ulna. Its use is to extend the fore-arm.

ANCONEUS EXTERNUS. See Triceps extensor cubiti.

Anconeus intennus. See Triceps extensor cubiti.

Anconeus major. See Triceps extensor cubiti.

Anconeus minor. See Anconeus.

ANCONOID PROCESS. Processus anconoideus. (From ayraw, the elbow.) A process of the cubit. See Ulna.

Ancter. (Apxiling, a bond, or button.) A fibula, or button, by which the lips of wounds are held together. Gorraus.

ANCTERIASMUS. (From apriling a button.) The operation of closing the lips of wounds together by loops, or buttons. Galen.

Ancubirus. A disease of the eyes with a sensation of sand. Joh. Anglic. Res.

Ang.

ANCYLE (From αγκυλος, crooked.) A species of contraction, called a stiff joint Galen.

ANCYLOBLEPHARON. (From αγκυλί, a hook, and βλεφαξον, an eye-lid.) A disease of the eye, by which the eye-lids are closed together. Ætius.

ANCYLOGLOSSUM. (From αγκυλη, a hook, and γλασσα, the tongue.) Ancylion of Ægmeta. A contraction of the frantlum of the tongue. Tongue-tied.

Anorlomele (From ayaulos, crooked, and mala, a probe.) A crooked probe, or a probe with a hook. Galen, &c.

ANCYLOSIS See Anchylosis.

ANCYLOTOMUS. (From ayuuhn, a hook,

and τεμενω, to cut.) A crooked chirurgical knife, or bistomy. A knife for loosening the tongue. This instrument is no longer in use. Egineta, &c.

Anema (Agnoga, an anchor.) A chirurgical hook. Epicharmus uses this word for the membrum virile, according to Gor-

ANCYHOIDES. (From nyxuga, an anchor, and edos, a likeness.) A process of the scapula was so called, from its likeness to the beak of an anchor. It is the coracoid process. See Scapula.

ANCYHOMELE. See .Incylomele.

ANDRIA. A tree of Brazil, the fruit of which is bitter and astringent, and used as

a vermifuge.

Andranatomia. Andranatome. (From aving, a man, and recuve, to cut ) The dissection of the human body, particularly of the male. M. Aur. Severinus, Zootome Democrit.

ANDRAPODOCAPHILUS. (From and gomedon, a slave, and namnaos, a dealer.) A crimp. Galen calls by this name the person whose office it was to anoint and slighty to wipe the body, to cleanse the skin from foulness.

Andria. (From arng, a man.) An her-

maphrodue. Bonnet.

ANDROCETESIS (From avne, a man, and noilew, to cohabit with.) The venereal act; or the infamous act of sodomy. Moschion, &c

ANDROGENUS. (From arme, a man, and youn, a woman.) An effemmate person.

Hipp. An hermaphrodite.

ANDRONION. Andronium. A kind of plaster used by Ægineta for carbuncles, invented by Andron.

ANDROTOMIA. Androtome. Human dis-

section, particularly of the male.

ANEBIUM. (From avabatro, to ascend.) The herb alkanet, so called from its quick

"ANEILESIS. (From aveilew, to roll up) Aneilema An involution of the guts, such as is c. used by flatulence and gripes. Hippocrates.

ANEMIA. (From arspos, wind.) Flatu-

ANEMONE. (From avenues, wind; so named because it does not open its flowers till blown upon by the wind.) The wind flower. The name of a genus of plants in the Lamaan system. Class, Polyandria. Order, Polysima.

The systematic ANEMONE BEPATICA. name for the hepatica nobilis of the pitarmacepains. See Hepatica nobilis.

Anemone, meadow. See Pulsatilla nigri-

ANEMONE NEMOROSA. The systematic name o' the ranunculus albus of the pharmacopæias. See Ranunculus albus.

ANEMONE PRATENSIS. The systematic

name for the pulsatilla nigricans of the pharmacopæias. See Pulsatilla nigricane.

ANENCEPHALUS. (From α, priv and ερκεφαλος, the brain) A monster without branes. Foolish. Gulen de Hipp.

ANEOS. A loss of voice and reason. ANEPPTHYMIA. (From a, priv. and

επιθυμια, de-irc.) Liss of appetite.

ANERIC. Anerit. Sulphur vivum.

Anesis. (From armut, to relax.) A remission, or relaxation, of a disease, or symptom. Lius, &c.

ANESUM. See Anisum.

ANETHUM. (Arnbor: from areo, afar, and Jew, to run; so called because its roots run out a great way.) Fennel, di.l, anet.

1. The name of a genus of plants in the Limaxan system. Class, Pentandria. Or-

der Digynia.

2. The pharm copeial name of the com-

mon dill, or anct.

Anethum graveolens of Linnaus -fructibus compresses. This plant is a native of Spain, but cultivated in several parts of England. The seeds of dill are directed for use by the London and Edinburgh Pharmacopæias: they have a moderately warm, pungent taste, and an aromatic, but sickly smell There is an essential oil, and a distilled water, prepared from them, which are given in flatulent colics and dyspepsia. They are also said to promote the secretion of milk.

ANETHUM FIRNICULUM. The systematic name for the faniculum of the shops. See Faniculum.

ANETHUM GRAVEOLENS. The systematic name for the Anethum of the shops. See Anethum.

ANETICA. (From avinui, to relax.) Paregories; medicines which assuage pain, according to Andr. Tiraquell.

ANEURISMA. (Arenguruz, from arenguru, to dilate) An angurum. A preternatural tumour formed by the dil: tation of an artery. A genus of disease ranked by Cullen in the class locales, and order tumores. There are three species of aneurism: 1. The true aneurism, aneurisma verum, which is known by the presence of a pulsating tumour. The artery e-ther seems only enlarged at a small part of its tract, and the tumour has a determinate border, or it seems dilated for a considerable length, in which circumstance the swelling is oblong, and looses itself so gradually in the surrounding parts, that its margin cannot be exactly ascertained. The first, which is the most common, is termed circumscribed true aneurism; the last, the diffused true anenrism. The symptoms of the circumscribed true aneurism, take place as follows: the first thing the patient perceives, is an extraordinary throbbing in some particular si uation, and, on paying a little more attention, he discovers there a small pulsating tumour, which entirely dis-

11 \*

appears when compressed, but returns again as soon as the pressure is removed. It is commonly unattended with pain or change in the colour of the skin. When once the tumour has originated, it continually grows larger, and at length attains a very considerable size. In proportion as it becomes larger, its pulsa ion becomes weaker, and, indeed, it is almost quite lost, when the disease has acquired much magnitude. diminution of the pulsation has been ascribe I to the coats of the artery loosing their dilatable and elastic quality, in proportion as they are distended and indurated; and, consequently, the aneuresmal sac being no longer capable of an alternate distore and systole from the action of the heart. fact is also impused to the congulated blood, deposited on the inner surface of the sac, particularly in large aneurisms, in which some of the blood is always interrupted in its motion. In true aneurisms, however, the blood does not coagulate so soon, nor so of en as in false one. Immediately such coagulated blood lodges in the sac, pressure can only produce a partial disappearance of the swelling. In proportion is the aneurismal sac grows larger, the communication into the artery beyond the tumour is lessened. Hence, in this state, the pulse below the swelling becomes weak and smill, and the limb frequently cold and ædematous. On dissection, the lower continuation of the artery is found preternaturally small, and contracted. The pressure of the tumour on the adj cent parts, also produces a variety of symptoms, dicerations, caries, &c Smetimes an accidental contusion, or concussion, may detach a piece of coagnlum from the inner surface of the cyst, and the circulation through the sac be obstructed by it. The coagulum may possibly be implied quite into the artery below, so as to induce important changes. The danger of an aneurism arrives when it son the point of bursting, by which occurrence the patient usually bleeds to death; and this is sometimes in a few seconds. The fatal event may generally be foresean, as the part about to give way, becomes particularly tense, elevated, thin, soft, and of a dark purple colour. 2 The false or spurious aneurism, aneurisma spurium, is always owing to an aperture in the artery, from winch the blood gushes into the cellular sub-tance. It may arise from on artery being lacerated in violent exertions; but the most common occasional cause is a wound. This is particularly apt to occur at the bend of the arm, where the artery is exposed to be injured in attempting to bleed. When this happens, as soon as the puncture has been made, the blood gush-s out with unusual force, and in a bright scarlet, is regular, interrupted current. It flows out, however, in an even and less ra-

pid stream when pressure is applied higher up than the wound. These last are the most decis ve marks of the artery being opened; for blood often flows from a vein with great rapidity, and in a broken current, when the vessel is very turgid and situated immediately over the artery, which imparts its motion to it The surgeon endeavours precipitately to stop the hæmor. rhage by pressure; and commonly occasions a diffused false aneurism The external wound in the kin is closed, so that the blood canno escape from it but insinuates itself into the celluar substance. The swelling thus produced is uneven, often knotty, and extends upwards and downwards, along the tract of the vessel. skin is also usually of a dark purple colour. Its size increases as long as the internal hæmor hage continues, and, if this should proceed above a cer air pitch, mortification of the limb east s. 3. The varicose aneurism, aneurisma varicosum; this was first described by Dr. W. Hunter. pens when the brachial artery is punctured in opening a vein; the blood then rushes into the vem, which becomes varicose. Aneurisms mæy happen in any part of the body, except the latter species, which can only take place where a vem runs over an artery.

AXEURISMA SPURIUM. See Aneurisma.

\* ANEURISMA VARICOSUM. S. e Aneurisma.
ANEURISMA VERUM. See Aneurisma.
ANEXIS. (From ανεχω, to project.) A

swelling, or protuberance.

ANGERLOLOGIA (From appears, a vessel, and ropes, a discourse) A dissertation, or reasoning, upon the vessels of the body.

ANGEIOTOMY. (From appears, a vessel, and recure to cut.) The dissection of the blood-vessels of an animal body; also the opening of a vein, or an artery.

ANGEIOTISMUS. (From appear, a vessel, and reare, to cut.) A skilful dissector of

the vessels.

ANGELICA. (So called from its supposed angelic virtues) Angelica. 1 The number of a genus of plants in the Linguin system. Class, Pentandria. Order, Diggnia

2. The pharmacopoial name of the garden-angelica.

Angelica archangelica of Linnæus:—foliorum impari lobato. A plant, a native of Lapland, but cultivated in our gardens. The roots of angelica have a fragrant agreeable smell, and a bitterish, pungent taste. The stalk, leaves, and seeds, which are also directed in the pharmacopeas, possess the same qualities, though in an inferior degree. Their virtues are aromatic and carmmative. A sweetmeat is made, by the confec ioners, of this root, which is extremely agreeable to the stomach, and is surpassed only by that of ginger.

ANG '

Angelica Anguangelica. The systematic name for the angelica of the shops. See Angelica.

Angelica, Garden. See Angelica.

ANGELICA SATIVA. See Angelica sylves-

ANGELICA SYLVE TRIS. Angelica sativa. Wild angelica. Angelica sylvestris of Lianaus:—foliis aqualibus ovato lanceolatis serratis. This species of angel ca possesses similar properties to the garden species, but in a much inferior degree. It is only used when the latter cannot be obtained. The seeds, powdered and put into the hair, kill lice.

Angelica, wild See Angelica sylvestris.

ANGELINE CORTEX. The tree from which this bark is procured it a native of Grenada. It has been recommended as an anthelmintic for children.

ANGELOCACOS. Myrobalans, or purging

Indian plums.

And From anger, anguish; because of their pain) Buboes in the groin. Fallopius de Morbo Gallico.

Angiglossus. (From αγκυλη, a hook, and γλασσα, the tongue.) A person who

stammers

ANGINA. (From αγχα, to strangle; because it is often attended with a sense of strangulation) A soar throat. See Cynanche.

Angina Maliona See Cynanche maligna.
Angina parotinea. See Cynanche parotidea.

ANGINA PECTORIS. An acute constrictory pain at the lower end of the sternum, inclining rather to the left side, and extending up into the left arm, accompanied with great anxiety. Violent palpitations of the heart, laborious breathings, and a sense of suffocation, are the characteristic sympoms of this disease.-It is found to attack men much more frequently than women, particularly those who have short necks, who are inclinable to corpulency, and who, at the same time, lead an inactive and scdentary life. though it is sometimes met with in persons under the age of twenty, still it more frequently occurs in those who are between forty and fifty. In slight cases, and in the first stage of the disorder, the fit comes on by going up hill, up-stairs, or by walking at a quick pace after a hearty meal; but as the disease advances, or becomes more violent, the paroxysms are apt to be excited by certain passions of the mind; by slow walking, by riding on horseback, or in a carriage, or by sneezing, congling, speaking, or straining at stool. It some cases, they attack the patient from two to four in the morning, or whilst sitting or standing, without any previous exertion or obvious cause. On a sudden, he is seized with an acute pain in the breast, or rather at the extremity of the sternum, inclining to the left side, and extending up

into the arm, as far as the insertion of the deloid muscle, accompanied by a sense of suffication, great anxiely, and an idea that its continuance, or mcrease, would certainly be fatal. In the first stage of the di-ease, the uneasy sensation at the crid of the sternum, with the other unpleasant sympioms, which seemed to threaten a suspension of life by a perseverance in exertion, usually go off upon the person's standing will, or turning from the wind; but, in a more advanced stage, they do not so readily recede, and the paroxysms are much more violent. During the fit, the pulse sinks in a greater degree, and becomes irregular; the face and extremities are pale, and bathed in a cold sweat, and, for a while, the patient is perhaps deprived of the powers of sense and voluntary mo-The disease having recurred more or less frequently during the space of some years, a violent attack at last puts a sudden period to his existence. Angina pectoris is attended with a consider ble degree of danger; and it usually happens that the person is carried off suddenly. mostly depends upon an ossification of the coronary arteries, and then we can never expect to effect a radical cure. During the paroxysms, considerable rehef is to be obtained from fomentations, and administering powerful antispasmodies, such as opium and ather combined together. The application of a blister to the bread is likewise attended sometimes with a good effect. As the painful sensation at the extremity of the sternum often admits of a temporary relief, from an evacuation of wind by the mouth, it may be proper to give frequent doses of carminatives, such as peppermint, carraway, or cinnamon water. Where these fail in the desired effect, a few drops of ol. anisi, on a little sugar, may be substituted.

With the view of preventing the recurrences of the disorder, the patient should carefully guard against passion, or other emotions of the mind: he should use a light, generous diet, avoiding every thing of a heating nature; and he should take care never to overload the stomach, or to use any kind of exercise immediately after eating. Besid's these precautions, he should endeavour to counteract obesity, which has been considered as a predisposing cause; and this is to be effected most safely by a vegetable diet, moderate exercise at proper times, early rising, and keeping the body perfectly open. It has been observed that angina pectoris is a disease always attended with considerable danger, and, in most instances, has proved fatal under every mode of treatment. We are given, h wever, to understand, by Dr. Macbride, that of late, several cases of it have been treated with great success, and the disease readily removed, by inserting

These, therea large issue in each thigh. fore, should never be neglected case, with a view of correcting, or draining off the rritating fluid, he order-d, instead of issues, a mixture of lime-water with a little of the spiritus junipera comp. and an alterative proportion of Huxham's antimonial wine, together with a plain, light, perspirable diet. From this course the patient was soon apparently mended; but it was not until after the in ertion of a large issue in each thigh, that he was restored to perfect health.

Cynanche ANGINA TONSILLARIS. See

tonsillaris.

See Cynanche TRACHEALIS. ANGINA

trachealis.

ANGIOLOGIA. (From appelor, a vessel, and Aoyos, a discourse.) The doctrine of the vessels of the human body.

ANGLICUS SUDOR (From England, and sudor, sweat.) The sweating

sickness. Sennertus.

A very tall tree of Malabar. ANGOLAM.

possessing vermifuge powers.

ANGONE. (From ayxo, to strangle.) nervous sort of quinsey, or hysteric, suffocation, where the fances are contracted and stopped up without inflammation.

Angon. Intense bodily pain. Galen. Angos. (Apacs. a vessel.) A vessel;

a collection of humours.

Cortex cus-ANGUSTURÆ CORTEX parie. A bark imported from Augustura, in South America. Its external appearances vary considerably. The best is not ances vary considerably. The best is not filtrous, but hard, compact, and of a vel-lowish brown colour, and externally of of a whitish hue. When reduced in-to powder, it resembles that of Indian rhubarb. It is very generally employed as a febrifuge, tonic, and adstrugent. While some deny its virtue in curping intermittents, by many it is prefain. ring intermittents, by many it is preferred to the Peruvian bark; and has been found useful in diarrhæa, dyspepsia, and scrofula. It was thought to be the bark of the Brucea antidysenterica, or ferruginca. Wildenow suspected it to be the Magnalia plumieri; but Humbolt and Bonpland, the celebrated travellers in South America, have ascertained it to belong to a tree not before known, and which they promise to describe by the name of cusparia febrifuga.

Anneliatio. (From anhelo, to breathe with difficulty.) Anhelitus. Shortness of

breathing.

ANICETON. (From &, priv. and wan, vicfory.) A name of a plaister invented by Crito, and so called because it was thought an infallable or invincible remedy for acho-It was composed of res, or scald-head. litharge, alum, and turpentine, and is described by Galen.

ANIMA. The thinking principle. ANIMA ALORS. Refined aloes.

ANIMA ARTICULORUM. Hermodactylus.

ANIMA HEPATIS. Sal ma. tis. The soul of the ANIMA PULMONUM.

lui gs. A name given to saffron on account of its use in asthmas.

ANIMA RHABARBARI, The best rhubarb, A preparation of ANIMA SATURNI.

A preparation of cop? ANIMA VENERIS.

ANIMAL. An organized body endow-

ed with ofe and voluntary motion. Animal actions. Actiones animales.

Those actions, or functions, are so termed which are performed through the means of the mind. To this class belong the external and internal senses, the voluntary action of muscies, voice, speech, watching, and sleep.

ANIMAL HEAT. Heat is essentially necessary to life. That of a man in health is from about 94 deg. to 100 deg. of Fahrenheit. It appears to depend upon the decomposition of the air in the lungs. See

Respiration.

Oleum animale. ANIMAL OIL. pyreumatic oil, obtained from the bones of animals, recommended as an anodyne and

antispasmodic.

The substance which ANIME GUMMI. bears this name in the shops is a resin, the produce of the Hymexa courbaril of Linnæus. It is seldom ordered in the practice of the present day, and is only to be met with in the collections of the curious.

ANIMI DELIQUIUM (From animus, the Fainting. mind, and delinguo, to leave.)

See Syncope.

ANIMUS. This word is to be distinguished from anima; the former expresses the faculty of reasoning, and the latter the being in which that faculty resides.

ANINGA. A root which grows in the Antilla islands, and is used by sugar-ba-

kers for refining their sugar.

ANISCALPTOR. (From anus, the breech, and scalpo, to scratch.) The latissimus dorsi is so called, because it is the muscle chiefly instrumental in performing this office. Bartholin.

(From arross, unequal; ANISOTACHYS. and raxus, quick.) A quick snd unequal

pulse. Gorræus.

(From a, neg. and soos, ANISUM. equal.) Anise. Anisum vulgare. Pimpinella anisa of Linnaus; -foliis radicalibus trifidis incisis. A native of Egypt. Aniseseeds have an aromatic smell, and a pleasant, warm, and sweetish taste. essential oil and distilled water are prepare red from them, which are employed in flatulences and gripes, to which children are more especially subject; also in weakness of the stomach, diarrhoas, and loss of tone in the primæ viæ.

ANISUN SINENSE. See Anisum stellatum. ANISUM STELLATUM. Anisum sinense. Semen badian. The plant which affords these seeds is the Illicium anisatum of Linnxus. They are used with the same views as those of the Pimpinella anisum. The same tree is supposed to furnish the aromatic bark cailed cortex anisi stellati. or cortex lavola.

ANISUM VULGARE. See Anisum.

Annuentes. (From annuo, to nod.) Some muscles of the head were formerly so called, because they perform the office of nodding, or bending the head downwards. Coroper, &c.

ANNULAR. (Annularis.) Like a ring;

thus, annular bone, &c.

ANNULAR BONE. Circulus osseus. ring like bone placed before the cavity of

the tympanum in the fœtus.

Annular cartillages. See Cricoid cartilages. ANNULARIS DIGITUS. The ring-finger. The one between the little and middle fin-

ANYULATIS PROCESSUS See Pons varolii. Ano. (Avw, upwards; in opposition to

κατω, downwards.) Upwards.

ANOCATHARTICA. (From ανω, upwards, and καθαιρω, to purge.) Emetics; medicines which purge upwards.

ANOCHELON. (From ava, upwards, and χαιλος the lip.) The upper lip.
Anonia. (From a, neg. and οδος, the way.) Il ppocrates uses this word for inaccuracy and irregularity in the description and treatment of a disease.

ANODYNA See Anodynes.

ANODYNES. (Anodyna, sc. medica-menta. From a, priv. and advin, pain.) Those medicines are so termed which ease pain and procure sleep. They are divided into three sorts; paregorics, or such as assuage pain; hypnotics, or such as relieve by procuring sleep; and nurnotics, or such as ease the patient by stupifying him.

Anodynum minerale. Sal prinella. Anodynum martiale. Ferrum ammoniacale precipitated from water by potash.

ANONALOUS. This term is often applied to those diseases whose symptoms do not appear with that regularity generally observed in diseases. A disease is also said to be anomalous, when the symptoms are so varied as not to bring it under the decription of any known affection.

Anomphalos (From a, priv. and outaoc, the navel.) Anomphalus. With-

ANONYMUS. (From a, priv. and ovu ma a mc.) Nameless. It was formerly ap-

ried to the cricoid muscle.

A NORCHIDES. (From a, priv. and opxis, The testicle.) Children are so termed which come into the world without testi-This is a very common occurrence. The testicles of many male infants at the time of birth are within the abdomen. The time of their descent is very uncertain, and

instances have occurred where they had not reached the scrotum at the age of ten and fife in

ANOREXIA. (From a, priv. and ofegue, appetite.) A want of appetite, without loathing of food. Cullen ranks this genus of disease in the class locales, and order dysorexia; he believes it to be generally symptomatic, but enumerates two species, viz. the anorexia humoralis and the anorexia atonica.

ANOSMIA (From α, neg. and οζω, to smell.) A loss of the sense of smelling. This genus of disease is arranged by Cullen in the class locales, and order dusæsthe. When it arises from a disease of the Schneiderian membrane, it is termed anosmia organica; and when from no manifest

cause, anosmia atonica.

ANSER DOMESTICUS. The tame The flesh of this bird is sometimes similar to that of the duck, and requires the assistance of spiritous and stimulating substances to enable the stomach to digest Both are very improper for weak stomachs.

ANSERINA. (From anser, a goose; so called, because geese eat it ) Argentia. Wild tansey, or goose grass. This herb, Potentilla anserina, folis dentatis serratis, caule repente, pedunculis unifloris of Linnæus, was formerly used as an astringent in laxity of the intestines and phthisical complaints, but is now fallen into disuse.

ANTACIDS. (Antacida, sc. medicamenta. From will against, and acidus, acid) Remedies which obviate scidity in the stomach. Their action is purely chymical, as they merely combine with the acid present, and neutralize it. They are only palliptives, the generation of acidity being to be prevented by restoring the tone of the stornach and its vessels. Dyspepsia and diarrhœa are the diseases in which they are employed. The principal antacids in use are the alka-Liquoris potassæ, gutt. xv. or from 5 to 15 gr. of carbonat of potash, or soda dissolved in water. The solution of soda called double soda-water, or potash supersaturated with carbonic acid, is more frequently used, as being more pleasant. Ammonia has been recommended as preferable to every other antacid, from 20 to 40 drops of the liquor ammoniæ in a cupful of water. The liquor calcis, or lime water, is likewise used to correct acidity, two or three ounces being taken occasionally. Creta præparata alone, or with the addition of a small quantity of any aromatic-chelæ cancrorum præparatæ, and magnesia also and its carbonate, are used for the same purpose.

Counteracting ANTAGONIST MUSCLES. muscles, or those muscles which have opposite functions. Such are flexor and extensor of any limb, the one of which contracts it, the other stretches it out; and also the abductors and adductors. Solitary muscles are

those without any antagonist, as the heart,

ANTALGICA. (From avil, against, and αλγος, pain ) Anodynes. Remedies which

relieve pain.

ANTALKALINES. (From all, against, and alkali, an alkali.) Medicines which possess the power of neutrlizing alkalis. All the acids are of this class.

ANTAPHRODISIACA. (From avl, against, and Apposin, Venus.) Anti-venereals, or medicines which extinguish amorous desires. Wedel, Amen. Med.

ANTAPHRODITICA. The same.

ANTAPODOSIS. (From avanced is were, to reciprocate.) A vicissitude, or return of the paroxysm of fevers. Hippocrates. Called by Galen epidosis.

Antarthrifica. (From αρι, against, and αρθερριε, the gout.) Medicines which re-

lieve or repel the gout.

ANTASTHMATICA. (From avl., against, and ασθμα, an asthma.) Remedies against asthma.

ANTATROPHICA. (From avl., against, and alροφιa, a consumption.) Medicines which

relieve or restore consumption

ANTECHESIS. (From avlexopas, to resist.) A violent stoppage in the bowels, which resists all efforts to remove it.

ANTELABIUM. (From ante, before, and labium, a lip. The extremity of the lip.

ANTEMBASIS. (From avl, mutually, and εμβανω, to enter.) A coalescence, or union of bone. Galen.

ANTEMETICA. (From avl, against, and εμεω, to vomit.) Medicines which stop

or prevent vomiting.

ANTENEASMUS. (From avl, against, and τεινεσμος, implacable.) That species of madness in which the patient endeavours to destroy himself.

ANTEPHIALTICA. (From avl, against. and souxlns, the night-mare.) Medicines

which prevent the night-mare.

ANTEPILEPTICA. (From avl, against, and sπιληψις, the epilepsy.) Remedies against the epilepsy, and other convulsive disorders.

ANTERIOR AURIS. One of the common muscles of the ear, situated before the external ear. It arises, thin and membraneous, near the posterior part of the zygoma, and is inserted into a small eminence on the back of the helix, opposite to the concha, which it draws a little forwards and upwards.

ANTERIOR INTERCOSTAL NERVE. Splanchic nerve. A branch of the great intercostal that is given off in the thorax.

ANTERIOR MALLEI. See Laxutor tympani.

Anthelix. See Antihelix.

(From avl, against, and ANTHELMIA. ελμινθος, a worm.) The herb Indian pink, or worm-grass, so called, because it was thought of great virtue in expelling worms. See Spigelia Marylanpica.

ANTHELMINTICS. (Anthelmintica, sc.

medicamenta; from avls, against, and sxμοθος, a worm.) Medicines which procure the evacuation of worms from the stomach and intestimis. The greater number of them act mechanically, dislodging the worms, by the sharpness or roughness of their particles, or by their cathartic opera-Some seem to have no other qualities than those of powerful bitters, by which they either prove noxious to these animals, or remove that debility of the digestive organs, by which the food is not properly assimilated, or the secreted fluids poured in the intestines are not properly prepared; circumstances from which it has been supposed the generation of worms may arise The principal medicines belonging to this class, are: Calomel, gamboge, Geoffræa mermis, tanasetum, polypodium filix mas, spigelia Marylandica, artimesia santonica, olea Eropæa, stannum pulverisatum, ferri limaturæ, and dolichos pruriens: which see under their respective heaps.

ANTHEMIS. (From avbew, floreo; because it bears an abundance of flowers.)

Chamomile.

1 The name of a genus of plants in the Lini an system. Class Syngenesia. der, Polygamia superflua.

2. The name in the last London Pharmacopœia for chamomile. See Chama melum.

ANTHEMIS COTULA. (Cotula, a dim. of cos, a whetstone; so called from its leaves resembling a whetstone.) The systematic name for the plant called Cotula fatida in the pharmacopæias. See Cotula fætida.

ANTHEIS NOBILMIS. (From aveos, flower.) The systematic name for the chamamelum of the shop . See Chamamelum.

ANTHEMIS PYRETHRUM. The plant is so called from which we obtain the pyrethrum of the pharmacopaias. See Purethrum. ANTHERA. (From avoos, a flower.)

1. A compound medicine used by the ancients; so called from its florid colour. Galen. Exineta

2. The male part of the fructification of plants.

ANTHOPHYLLI. (From arbos, a flower, and φυλλον, a leaf; so called from the fragrance of the flowers and the beauty of the leaves.) Cloves are so termed when they have been suffered to grow to maturity G. Bauhin Pin.

ANTHORA. (Quasi antithora, avlibopa from and, against, and Dopa, monk shood; so called because it is said to conneract the effects of the thora or monkshood.) A species of Wolfsbane. The root is the part of this plant (. Acoustum anthora : floribus pentagynis, foliorum laciniis linearibus of Linnæns,) which is employed medicinally. Its virtues are similar to those of the aconitum. See Aconitum.

AUTHOS FLORES. The flowers of the rosmarinus are so termed in some pharma-

concias.

ANTHRACIA. See Anthrax.
ANTHRAX (From arbeat, a burning coal.) Anthracia. Anthrocosia. Anthro-Carbunculus. A hard and circumscribed inflammatory tubercle like a boil, which sometimes forms on the cheek, neck, or back, and in a few days becomes highly gangrenous. It then discharges an extremely focial sanies from under the brack core, which, like a burning coal, continues destroying the surrounding parts. It is supposed to arise from a peculiar miasma, is most common in warm climates, and often attends the plague.

ANTHRACOSIS OCULI. A red, livid, burning, sloughy, very painful tumour, occur-

ring on the eye lids. Ægineta.

ANTHROP GRAPHIA. (From average, a man, and γραφω, to write.) Description of man's structure.

ANTHROPOLOGIA. (From average, a man, and xoyos, a discourse.) The de-

scription of man.

ANTHYPNOTICA. (From avl, against, and unvos, sleep.) Medicines which prevent

sleep or drowsiness.

ANTHYPOCHONDRIACA. (From against, and υποχονδρια, the hypochondra,) Mediames ad pted to cure low-spiritedness or disorders of the hypochondria.

ANTHYSTERICA. (From all, against, and users, the wonds.) Uterines or medicines which relive the hysteric passion Blanchard.

ANTI. (Avl., against.) There are many names compounded with this word, as antiasthmatics, antihysterics, antidysenteries, &c. which signify medicines against the asthma, hysterics, dysentery, &c.

ANTIADES. (From avliace, to meet ) The tonsils are so called, because they answer one another. The namps. Nic Piso.

ANTIAGRA. (From 201125, a tonsil, and 2792, a prey) Antiagri. A tumour of the tonsils. Ulpian, Rioland, &c.

ANTIARTHRITICA. Se Antathritica.

ANTICACHECTICA. (From avl., against, and xafszia, a cachexy.) Medicines against

cachexy, or bad habit of body.

ANTICARDIUM. (From avli, against, or opposite, and napolia, the heart.) The hollow at the bottom of the breast, commonly called scrobiculus cordis, or pit of the sto-

ANTICATARBHALIA. (From arl, against, and nalappos, a catarrh ) Medicines which

reli- ve a cararrh.

ANTICAUSOTICA. (From avli, against, and xxvoor, a burning fever) Remedies against burni g fevers. We read, in Corp. Pharm. of Junken, of a syrupus anticausoticus.

ANTICHEIR. (From arl., against, and  $\chi_{SP}$ , the hand.) The thumb. Galen.
ANTICNHON. (From arl., against, or

opposite, and xvn un, the calf of the leg.) That part of the tibia which is hare of flesh, and opposite the culf of the leg. The shin-bone. Galen.

ANTICOLICA. (From avl, against, and

κωλικη, the cholic.) Remedies against the

ANTIDIASTOLE. (From avil, against, and διασελλώ, to distinguish.) An exact and accurate distinction of one disease or symptom, from another.

ANTIDINICA. (From avl, against, and Swood circumgyration.) Medicines against a vertigo, or giddiness. Bluncard.

ANTIDOTARIUM. (From artifolos, an antidote.) A term used by former writers, for what we now call a dispensatory; a place where antidotes are prescribed and prepared. There are antidotaries extant of several authors, as those of Nicholaus, Meuses, Myrepsus, &c.

ANTIDOTUS. (From avl., against, and Sidupi, to give) A preservative against

sickness. A remedy. Galen.

(From avl, against, ANTIDTSENTERICA. Medicines against a and Surevlepiz, a flux.) dysentery, or flux.

ANTIFEBRILIA. (From avl., against, and febris, a tever.) A febrifuge, a remedy

against fever.

ANTIHECTICA. [From avl, against, and extinos, a hectic fever.) Remedies against a hectic fever.

ANTIHECTICUM POTERII. Antimonium diaphoreticum Joviale. A medicine invented by Poterius, formerly extolled as effectual in hectic fevers, but now disregarded. It is an oxyd of tin and chalybeated regulus of antimony, in consequence of their defla-

gration with nitre.

ANTIHELIX. (From 2071, against, and est, the helix.) The inner circle of the auricle, so called from its opposition to the

outer circuit called the helix.

ANTHELMINTICA. See Anthelmintica. ANTIHYSTERICA (From arli, against, and urepika, hysterics.) Medicines which pre-

vent or relieve hysterics.

ANTILEPSIS. (From affixaubara, to take hold of.) The securing of bandages or ligatures from slipping. Hippocrates,

ANTILOBIUM. (From avl., opposite, and 2060s, the bottom of the ear.) The tragus, or that part of the ear which is opposite the

ANTILOIMICA. (From avil, against, and λοιμος, the plague.) Remedies or preven-

tive against the plague.
Antilopus. The antelope. An African beast resembling a deer, whose hoofs and horns were formerly given in hysteric and ep.leptic cases.

ANTILYS, US. (From avls, against, and λυσσα, the bite of a mad d g.) A medione or remedy og inst the bite of a mad dog.

. Intimonial powder. See Pulvis antimo-

Antimoniale. (From antimonium.) An antimonal, or composition in which antimony is a chief ingradient. A preparation of

ANTIMONII OXYDUM. See Oxydum antimonii.

Antimonii sulphuretum præcipitatum. Precipitated sulphuret of antimony. This preparation of antimony appears to have rendered that called Kerme's mineral unnecessury. It is made thus:—

Take of sulphuret of antimony, in powder, two pounds:—of the solution of potash, four pints:—of distilled water, three pints.

Mix and boil the mixture over a slow fire, for three hours, stirring it well, and occasionally adding distilled water, so that the same measure may be preserved. Strain the solution forthwith through a double linen cloth; and while it is yet hot, drop in, gradually, as much sulphuric acid as may be required to precipitate the powder; then wash away the sulphate of potash, by hot water; dry the precipitated sulphuret of antimony, and reduce it to powder.

As an alterative and sudorific, it is in high estimation, and given in diseases of the skin and glands; and joined with calomel, it is one of the most powerful and penetrating learning was a property of

alteratives we are in possession of.

ANTIMONIUM. See Antimony.

ANTIMONIUM CALCINATUM. See Oxy dum antimonii.

Antimonium biapuoreticum. An old name for oxyd of antimony.

ANTIMONIUM TARTARISATUM. Tartarus emeticus. Tartarum emeticum. Tartarus antimonialis. Tartris antimonia cum potassâ. Tartarum stibiatum. Tartar emetic is obtained by boiling an oxyd of antimony with acidulous tartrite of potash; the excess of tartarous acid dissolves the oxyd and a triple salt is obtained by crystallization. The London Pharmacop cia directs thus:

Take of oxyd of antimony, two ounces: of supertartrite of potash, powdered, three ounces:—of distilled water, eighteen fluid-

ounces.

To the water, whilst boiling in a glass vessel, add gradually the antimony and superturtrite of potash, previously mixed together, and continue to boil for half an hour; then filter the solution through paper, and evaporate it in a gentle heat, so that whilst it cools slowly, crystals may form.

Tartar emetic is the most useful of all the antimonial preparations. Its action is not dependent on the state of the stomach, and, being soluble in water, its dose is easily managed, while it also operates more

peeddy.

In doses of from one to three, four, or five grains, it generally acts powerfully as an emetic, and is employed whenever we wish to obtain the effects which result from full vometing. As patients are differently affected by this medicine, the safest mode of exhibiting it is: 3. Antimonii tartarisati, gr. iii. Aque distillata. 3. N. Misce et cola. Dosis 3. quadrante quâque horâ, donec supervenent vomitus.

For children, emetic tertar is not so safe an emetic as ipecacuanha powder: when great debility of the system is present, even a small dose has been known to prove fatal to children. Sometimes it proves cathartic.

In smaller doses it excites nausea, and proves a powerful diaphoretic and expectorant. As an emetic it is chiefly given in the beginning of fevers and febrile diseases, when great debility is present, and in the advanced stages of typhoid fever its use is improper and even sometimes fatal. diaphoretic, it is given in small doses, of from an eighth to a quarter of a grain : and as an expectorant, in doses still smaller. Emetic tartar in small doses, combined with calomel, has been found a powerful yet safe alterative in obstinate eruptio is of the skin. & Antimonii tartarisatı gr. iv. Hydrargyvi submuriatis, gr. xvi Confectionis Rosa gallice, q. s. Divide in pil. xxiv. Capiat i. mane nocteque ex thea sassafrass.

In the form of powder, or dissolved in water, it is applied by a pencil to warts and obstinate ulcers: it is also given in the form of clyster, with a view to produce irritation in soporose diseases, apoplexy, iteus, and hernia incarcerata. The powder mixed with any fluid, and rubbed on the scrobiculus cordis, excites vomiting. Another property which tartar emetic has, when rubbed on the skin, is that of producing a crop of pustules very like to the small-pox, and with this view it is used against rheumatic pains, white, and other obstinate swe lings. The best antidot against the bad effects of too large a quantity of this and other antimonial preparations, is a decoction of the bark of cinchona.

ANTIMONIUM VITRIFACTUM. Glass of antimony. An oxyd of antimony, with a little sulphur.

(Avlipoviov. The origin ANTIMONY, of this word is very obscure. received etymology is, from arls, against, and mores, a monk; because Valentine, by an injudicious adu inistration of it, poisoned his brother monks ) Antimonium um. A metal found native, but very rarely; it has, in that state, a metallic lustre, and is found in masses of different slapes; its colour is white, be ween those of tin and silver. It generally cout ins a small portion of arsenic. It is I kewise met with in the state of an oxyd, antimonial othre. The most abundant ore of it is that in which it is combined with sulpi ur, the grey ore of antimony, or sulphuret of antimony. colour of this ore is blicith, or sice grey, of a metallic lustre, and often extremely beautifully variega ed les texture is cither compact, foliated, or streated. striated is found both crystal ized, mas ive, and disseminated: there are many virieties of this ore

Properties of Antimony.—Antimony is a met i of a greysh with having a slight blocksh shade, and very bolliant 1 stexture is lamelited, and calibi s plates crossing each other in every direction. Its surface

with herbarizations and foilage. Its specific gravity is 6.702. It is sufficiently har I to scratch all the soft metals. It is very brittle, easity broken and putverizable. It fuses at 810° Fahr. It can be voluilized, and burns by a strong heat. When perfectly fused, and suffered to cool gradually, it crystallizes in octahedra. It is ites with surphur and phosphorus, it decomposes water strongly. It is soluble in atkatine suspaurets. Sulphuric acid, boiled upon antimony, is feebly decomposed. Nitric ac d dissolves it in the cold. Muriatic acid scarcely acts upon it. The oxygenated muriatic acid gas infl mes i, and the liquid acid dissolves it with facility. Arsenie-head dissolves it by heat with difficulty. It unit s, by fusion, with gold and renders it p le and brittie. Platina, silver, lead, bismuth, mekel, copp. r, arsenic, iron, cobalt, tin, and zinc, unite with antimony by fusion, and form with it compounds, more or less brittle. Mercury does not alloy with it easily. We are little acquainted with the action of alkalies upon it. Nurate of potash is decomposed by it. It fulminates by percussion with oxygenated muriate of potaslı.

Methods of obtaining antimony -1. To obtain antimony, heat 32 parts of filings of iron to redness, and project on them, by degrees, 100 parts of antimony; when the whole is in fusion, throw on it, by degrees, 20 parts of nitrate of potash, and after a few minutes quiet fusion, pour it into an iron melting cone, previously heated and greased.

2. It may also be obtained by melting eight parts of the ore mixed with six of nitrate of potash, and three of acidulous tartrite of potash, gradually projected into

a red-hot crucible, and fused.

To obtain perfectly pure antimony, Margraaf melted some pounds of the sulphurated ore in a luted crucible, and thus scorified any metals it might contain. Of the antimony thus purified, which lay at the bottom, he took sixteen ounces, which he oxidated cautiously, first with a slow, and afterwards with a strong heat, until it ceases to smell of sulphur, and acquired a grayish white colour. Of this gray powder he took four ounces, mixed them with six drachnis of acidulous tartrite of potash, and three of charcoal, and kept them in fusion in a well covered and luted crucible, for one hour, and thus obtained a metallic button that weighed one ounce, seven drachms, and twenty grains.

The metal, thus obtained, he mixed with half its weight of desiccated carbonate of soda, and covered the mixture with the same quantity of the carbonate. He then melted it in a well covered and luted crucible, in a very strong heat, for half an hour, and thus obtained a button which weighed one ounce, six draclims, and seven grains, much whiter and more beautiful than the

former. This he again treated with one and a half onoce of carbonate of soda, and obtianed a button, weighing one ounce, five drachms, and six grains. The button was still purer than the foregoing. Repeating these fusions with equal weights of carbonate of soda three times more, and an hour and a half each time, no at last obtained a button so pure as to amalgamate with mercury with ease, very hard, and in some d g ee malleable; the scoriz formed in the last fusion were transparent, which indicated that they contained no sulphur, and hence it is the obstinate adherance of the sulphur that renders the purification of this metal so difficult.

The preparations of antimony formerly in use were very many: those now direct-

ed to be kept are:-

1. Sulphuretum antimonii.

2. Oxydum antimonii.

Surphuretum antimonii præcipitatum.

4. Antimonium tartarisatum.

5: Pulvis antimonialis.

6. Liquor antimonii tartarisati.

ANTIMORIS. (From and, against, and μορος, death, or disease.) A medicine to prolong life.

ANTINEPHRITICA. (From avil, against, and veopelis, a disease of the kidneys.) Remedies against disorders of the kidneys.

Antiodontalgicus. An insect described by Gerbi in a small work published at Florence 1794, so called from its property of allaying the tooth-ach. It is a kind of curculo found on a species of thistle, carduns spinosissimus. If twelve or fifteen of these insects in the state of larvæ, or when come to perfection, be bruised and rubbed slowly between the fore-finger and thumb until they have lost their moisture; and if the painful tooth where it is hollow, be touched with that finger, the pain ceases sometimes instantaneously. A piece of shamov leather will answer the same purpose with the finger. If the gums are inflamed the remedy is of no avail. Other insects possess the property of curing the tooth-ach; such as the scarabeus ferrugineus of Fabricius; the coccinella septempunctata, or lady-bird; the chrysomela populi, and the chrysomela sanguinolenta. This property belongs to several kinds of the coleoptera.

ANTIPARALYTICA. (Erom of, against, and wapahuois, the palsy) Medicines against the palsy.

ANTIPATHEIA. (From avli, against, and @αθος, an affection.) Antipathy. An aversion to particular objects.

Antiperistratice (From ant, against, and aspisedda, to contract.) Whatsoever obstructs the peristaltic motion of the intestines.

(From avle, against. ANTIPERISTASIS. and maismus, to press.) A compression on all sides. Theophrastus de igna

ANTIPHARMACA. (From arl, against, and φαρμάκον, a poison.) The same as alexipharmaca. Remedies or preservatives

against poison. Dioscorides.

ANTIPHLOGISTICA. (From against, and φλεγα, to burn.) Antiphlogistics. A term applied to those medicines, plans of diet, and other circumstances, which tend to oppose inflammation, or which in other words, weaken the system by diminishing the activity of the vital power.

ANTIPHTHISICA. (From avl., against, and φθισις, a consumption.) Remedies against

a consumption.

ANTIPHTHORA. (From ail, against, and φθορα, corruption.) A species of woolfsbane

which resists corruption.

ANTIPHYSICA. (From avl, against, and φυσαω, to blow.) Carminatives or reniedies

against wind.

ANTIPLEURITICA. (From avl, against, and whevelles, pleurisy.) Remedies against

ANTIPODAGRICA. (From avil, against, and wodaypa, the gout.) Medicines which

relieve or remove the gout.

ANTIPRAXIA. (From arl, against, and σρασσω, to work.) A contrariety of functions and temperaments in divers parts. Contrariety of symptoms.

ANTIPYRETICA. (From ail, against, and wupelos, fever ) Antifebrile. Remedies against

ANTIQUARTANARIA. (From avl, against, and quartanum, a quartan lever.) Remedies against quartan agues.

ANTIQUARTICUM. The same as Anti-

quartanaria.

ANTIRRHINUM. (AvTepparov: from art, against, and pic, the nose; so called because it represents the nose of a calf.) Snap-dragon, or call's-snout. The name of a genus of plants in the Linnaan system. Class, Didynamia. Order, Angiospermia.

ANTIRUEINOM LINAMIA. The systematic

name for the linaria of the pharmacopæias.

See Linaria.

ANTISCOLICA. (From and, against, and σκωληξ, a worm. Remedies against worms.

Anthilmintics.

ANTISCORBUTICS. (Antiscorbuticas sc. medicamenta; from avli, against, and scorbutus, the scurvy.) Medicines which

cure the scurvy.

ANTISEPTICS. (Antiseptica. sc. medicamenta; from avli, against, and σηπω, to putrefy.) Those medicines which possess a power of preventing animal substances from passing into a state of putrelaction, and of obviating putrefaction when already begun. This class of medicine comprehends four orders.

1. Tonic antiseptics, as cinchona, angusturæ cortex, chamæmelum, &c. which are suited for every condition of body, and are, in general, preferable to other antiseptics, for those with relaxed habits.

2. Refrigerating antiseptics, vs acids, which are principally adapted for the young, vigorous, and plethoric.

3. Sumulating antiseptics, as wine and alcohol, best adapted for the old and debi-

4. Antispasmodic antiseptics, as camphora and assaforida, which are to be selected for irritable and hysterical habits.

ANTISPASIS. (From ω/h, against, ard σπαω, to draw.) A revulsion. The turning the course of the humours, whilst they

are actually in motion. Galen.

ANTISPASMODICS. (Antispasmodica, sc. medicamenta; from and, agamst, and σπασμος, a spasm.) Medicines which possess the power of allaying, or removing inordinate motions in the system, particularly those involuntary contr. ctions which take place in muscles, naturally subject to the command of the will. Spasnimay arise from various causes. One of the most frequent is a strong irritation, continually applied; such as demitton, or worms. In these cases, natcotics prove useful, by dimunishing irritability and sensibility. Sometimes spasni arises from mere debility; and the obvious means of removing this is by the use of tomes. Both narcotics and tonics, therefore, are occasionally useful as antispasmodics, such as opium, camphor, and ether, in the one class, and zinc, mercury, and Peruvian bark, in the other. But there are farther, several other substances, which cannot be with propriety referred to either of these classes; and to these, the title of antispasmodics is more exclusively appropriated. The principal antispasmodics, properly so called, are moschus, castereum, oleum aniniale empyreumaticum, petroleum, ammonia, assafœtida, sagapenum, galbanum, valeriana, crocus, melaleuca leucadendron.

The narcotics, used as antispasmodics,

are ether, opium, camphor.

Tonics used as antispasmodic, 'are cuprum, zincum, hydraigyrus, cinchona.

ANTITHENAR. (From and, against, and Swag, the palm of the hand.) A muscle of the foot. See Adductor pollicis pedis.

ANTITRAGICUS. Antitragus, (Antitragicus, sc. musculus.) One of the proper muscles of the ear, whose use is to turn up the tip of the antitragus a little outwards, and to depress the extremity of the antithelix towards it.

ANTITRAGUS. (Antitrugus, i. m. from anlı, and τεαγος, the tragus.) An eminence of the outer ear, opposite to the tragus.

Antivenerea. (From aft, against, and venerens, venereal.) Medicines against the lues venerea.

Antonii Sancti ignis. (So called because St. Anthony was supposed to ore it miraculously. In the Roman Missal, St. Anthony is implored as being the preserver from all sort f fire.) St. Anthony's fit See Erysipeias ..

Antisphyllion. (From avy, against, and quakey, a leaf; so called because its leaves are opposite.) The male caryophyl-

ANTHUM OF HIGHMORE. (From the name of an anatomist, who gave the first accurate description of it.) Antrum .latrum genæ Sinns Ilis hmorianum maxillaris piturtarius. Antrum maxilla su-Maxillary sinus. A large cavity in the middle of each superior maxillary bone, between the eye and the root of the mouth, lined by the mucous membrane of the nose.

One or both antra are liable to several morbid affections. Sometimes their membranous lining inflames, and secretes pus. At other times, in consequence of inflammation, or other causes, various excressences and fungi are produced in them. Their bony parietes are occasionally affected with exostosis, or caries. Extraneous bodies may be lodged in them, and it is even asserted that insects may be generated in them, and cause for many years, afflicting pains. Abscesses in the antrum are by far the most common. Violent blows on the cheek, inflammatory affections of the adjacent parts, and especially of the piturtary membrane lining the nostrils, exposure to cold and damp, and, above all things, bad teeth, may induce inflammation and suppuration in the antrum. The first symptom is a pain, at first imagined to be a tooth-ach, particularly if there should be a carious tooth at this part of the jaw. This pain, however, extends more into the nose than that usually does which arises from a decayed tooth; it also affects, more or less, the eye, the orbit, and the situation of the frontal sinuses. But even such symptoms are insufficient to characterize the disease, the nature of which is not unequivocally evinced till a much later period. The complaint is, in general, of much longer duration than one entirely depend to on a caries of the tooth, and its violence increases more and more, until at last a hard tumour becomes perceptible below the cheek-bone. The swelling by degrees extends over the whole check; but it afterwards rises to a point, and forms a very circumscribed hardness, which may be felt above the back-grinders. The symptom is accompanied by redness, and sometimes by inflammation and suppuration of the external parts. It is not uncommon also, for the outward abscess to communicate with that within the antrum. The circumscr.bed elevation of the tumour, however, does not occur in all cases. There are instances in which the matter makes its way towards the palate, causing the bones of the part to swell, and at length rendering them carious,

unless timely assistance be given. There are other cases, in which the matter escapes between the tangs and sockets of the teeth. Lastly, there are other examples, in which matter, formed in the antrum, makes its exit at the nostril or the same side, when the patient is lying with his head on the opposite one, in a low position. If this mode of evacuation should be frequently repeated, it prevents the tumour both from pointing externally, and bursting, as it would do if the purulent matter could find no other vent. This evacuation of the pus from the nostril is not very common
ANTRUM BUCCINOSUM. The cochlea of

ANTRUM PYLORI. The great concavity of the stomach approaching the pylorus. ANTRUM MAXILLARE. See. Antrum of Highmore.

Ants, acid of. See Formic acid.

ANTYLION. (From Antyllus, its inventor.) An astringent application, recommended by Paulus Ægineta.

ANUS. (Quasi onns; as carrying the

burden of the bowels.)

1. The fundament; the lower extremity of the great intestine, named the rectum, is so called; and its office is to form an outlet for the faces. The anus is furnished with muscles which are peculiar to it, viz. the sphincter, which forms a broad circular band of fibres, and keeps it habitually closed, and the levatores ani, which serve to dilate and draw it up to its natural situation, after the expulsion of the faces. It is also surrounded, as well as the whole of the neighbouring intestine, with muscular fibres, and a very loose sort of cellular substance. The anus is subject to various diseases, especially piles, ulceration, abscesses, excressences, prolapsus, imperforation in new-born infants.

2. The term anus is also applied to a small opening of the third ventricle of the

brain, which leads into the fourth.

ANU, ARTIFICIAL. An accidental opening in the parietes of the abdomen, to which opening some part of the intestinal canal leads, and through which the faces are either wholly or in part discharged. When a strangulated hernia occurs, in which the intestine is simply pinched, and this event is nnknown; when it has not been relieved by the usual means; or when the necessary operation has not been practised in time; the protruded part becomes gangrenous, and the faces escape. But if the patient should be at last operated upon, his faces are discharged through the wound, and the intestines are more easily emptied. both cases, the excrement continues to be discharged from the artificial opening. In this way an artificial anus is formed through which the excrement is evacuated during life.

ANYDRION. (From a, priv. and vdage

water; so called, because they who eat of it become thirsty.) A speces of night-

shade, according to Blancard.

Anyrettenenos. (From a, neg. and υπευθυνος, hurtful.) Hippocrates, in his Precepts, uses this word to signify an accidental event, which cannot be charged on the physician, and for which he is not accountable.

AORTA. (From ang, air, and the to keep; so called because the ancients supposed that only air was contained in it.) The great artery of the body, which arises from the left ventricle of the heart, forms a curvature in the chest, and descends into the abdomen. See Artery.

APALACHINE GALLIS. (From απαλακώ, to repel, because it is supposed to repel in-

fection.) See Cassine.

APARTHROSIS. (From ano and agegor, a

joint) Articulation.

"APARINE. (From gun, a file; because its bank is rough, and rusps like a file.) Philanthropus. Ampelocarpus. Omphalocarpus Ixus. Asparine. Asperula. Goosegrass and cleaver's bees. Cleaver's. Gooseshare. Havriff. This plant, which is common in our hedges and duches, is the Galium aparine of Linnaus:-foliis octonis lanceolatis carinatis scabrts retrorsum aculeatis, geniculis venosis, fructu hispido. The expressed juice has been given with advantage as an aperient and diuretic in insipient dropsics; But the character in which it has of late been chiefly noticed, is that of a remedy against cancer. A tea-cup full internally, gradually increases to half a pint, two or thr e times a day, and the herb applied, in cataplasm, externally, has been said to cure cancers. Such beneficial results are not confirmed by the experience of others.

APPLEA. (From a, priv. and pellis, skin.) Shortness of the prepuce. Galen gives this name to all whose prepuce, either through disease, section, or otherwise, will not cover the glans.

APETIENS PALPEBRARUM RECTUS. Se

Lavator palpebre superioris.

APERIENTS. (Aperientia, sc. medicamenta; from aperio, to open.) Laxatives. Medicines which gently open the howels.

APERISTATUS. (From a, neg. and offerent, to surround.) Aperistaton. An epithet used by Galen, of an ulcer which is not dangerous, nor surrounded by inflammation.

Arenistation. See Aperistatus.

Arenton ocum. See Levater palpebra superioris.

....

Appension. (Apopsia, a, f. arefix: from a priv. and arefix, to digest.) Indigestion. See Dyspepsia.

Areurnremenus. (From ano and evene, straight.) A name formerly given to the intestinum rectum, or straight gut.

APEX. The extremity of a part; as the apex of the tongue, apex of the nose, &c.

APHANISMUS. (From αφανίζω, to remove from the sight.) The removal, or gradual

decay of a disorder.

APHERESIS. (From αφαιρεα, to remove.) This term was formerly much used in the schools of surgery, to signify that part of the art which consists in taking off any diseased or preternatural part of the body.

APHEPSEMA. (From ano, and eta, to

boil.) A decoction.

APHESIS. (From apinus, to remit.) The remission or termination of a disorder.

Applistes is. (From apishui, to draw from An abscess.

Apanons. (From 270, and 660s, departure) Excrement. The dejection of the body.

APHONIA. (Αφανια: from α, priv. and φανιη, the voice) A suppression of the voice, without either syncope or coma. A genus of disease in the class locales, and order disections of Cullen.

When it takes place from a tumour of the fluces, or about the glottis, it is

termed aphonia gutturalis;

When from a disease of the trachea,

aphonia trachealis;

And when from a paralysis, or want of nervous energy, aphonia atonica;
APHORISM. (Aphorismus; from αφος-

iza, to distinguish.) A maxim, or principle, comprehended in a short sentence.

Armodisia. (From Aggodita, Venus.)
An immoderate desire of venery.

APHRODISIACS. (Aphrodisiaca, sc. medicamenta, apgolistata; from apgolista, venery.) Medicines which excite a desire for venery.

Aphrodistasticon. (From αφςος, froth.) A troch so called by Galen, because it was given in dysenteries, where the stools were frothy.

APHRODIDIUS MORBUS. (From Aggidith,

Vonus.) The venereal disease.

APHTHA. See Aphtha. APHTHE. (Appear: from andw, to inflame.) The thrush. Frog, or sore mouth. Aphtha lactucimen of Souvages. Ulcera serpentia oris, or spreading ulcers in the mouth, of Celsus. Pustula oris. Alcola. Vesicule gingivarum. Acacos Aphtha infantum. A disease to which children are very subject. It appears in small white ulcers upon the tongue, gums, and around the mouth and palate, resembling small particles of curdled milk. When the disease is mild, it is confined to these parts; but when it is violent and of long standing, it is apt to extend through the whole course of the alimentary canal, from the month down to the anus; and so to excite severe purgings, flatulencies, and other disagreeable symptoms. The discase, when recent and confined to the mouth, mry in general be easily removed; but when of long standing, and extending down to the stomach and intestines, it very

frequently proves fatal.

The thrush sometimes occurs, as a chronic disease, but in warm climates and in those Northern countries where the cold is combined with a considerable degree of moisture, or where the soil is of a very marshy nature It may in some cases, be considered as an idiopathic affection; but it is more usually symptomatic. It shews itself, at first, by an uneasy sensation, or burning heat in the stomach, which comes on by slow degrees, and increases gradually in violence. After some time, small pimples, of about the size of a pin's head, snew themselves on the tip and edges of the tongue; and these, at length, spread over the whole inside of the mouth, and occasion such a tenderness and rawness, that the patient cannot take any food of a solid nature; neither can he receive any vinous or spirituous liquor into his mouth, without great pungency and pain being excited; little febrile heat attends, with dry skin, pale countenance, small pulse, and cold extrinities. These symptoms will probably continue for some weeks, the general health being sometimes better, and sometimes worse, and then the patient will be attacked with acid eructations, or severe purging, which greatly exhausts his strength, and produces considerable emaciation of the whole body. After a little time, these symptoms cease, and he again enjoys better health; but, sooner or lafer, the acrid matter shews itself once more in the month, with greater virulence than before, and makes frequent translations to the stomach and intestines, and so from these to the mouth again, until at last, the patient is reduced to a perefect skeleton. Elderly people, and persons with a shattered constitution, are more liable to its attacks. It is ranked by Cullen in the class pyrexiæ, and order exanthemata.

APIUM (From nπιος, Dorice, ατιος, mild; or from apes, bees; because they

are fond of it.

1. The name of a genus of plants in the Linnwan system. Class, Pentandria. Or-

der, Digynia.

2. The pharmacopoial name of the herb small-age. The root, seeds, and fresh plant: Apinm graveolens, foliolis caulinis, cuneiformibus, umbellus, sessilibus, of Linnaus, are aperient and carminative.

AFIUM GRAVEOLENS. The systematic name for the apium of the pharmacopoias.

See Apium.

AFTUM PETROSELINUM. The systematic name for the petroselinum of the pharmacopoias. See Petroselinum.

Apneustia. (From a, neg. and arvea, to

breathe.) A defect or difficulty of respiration, such as happens in a cold, &c. Fasius.

APNOEA. The same. Galen.

APOCAPNISMUS. (From ano, and kanvos, smoke) A funnigation.

Agocatharsis. (From ano, and sabatega, to purge.) An evacuation of humours; a discharge downward; but sometimes applied, with little discrimination, to vomiting.

Apocaulizesis. (From αποκαυλίζω, to break transversely) A transverse frac-

ture. Hippocrates.

APOCENOSIS. (From απο, and κενοω, to evacuate.) A superabundant flux of Llood, or other finid, without pyrexia. The name of an order in the class locales of Cullen.

APOCOPE. (From a ro. and restlor, to cut from ) Abscission, or the removal of a part

by cuiting it off.

Apoenisis. (From απο, and κεινα, to secrete from.) A secretion of superabundant

humours. Hippocrates.

Apocrustinum. Apocrusticon. (From αποκεβώ, to repel.) An astringent or repellent medicine. Galen.

APOCRUSTICON. See Apocrustinum.

Apocresis. (From \$a\tau\_0\$, and \$uu\_0\$, to bring forth.) Parturition, or the bringing forth of a child. Galen.

APODACRYTICA. (From 270, and 3228, a tear.) Medicines which, by exciting tears, remove superfluous humours from the eyes, as onions, &c. Plum.

APOGEUSIA. See Agheustia. Apogeusia. See Agheustia.

Apogensis. See Agheustia.

Apogenomesis. (From απογινομαι, to be

absent.) The remission or absence of a disease. Hippocrates.

Apoglaucosis. (From ano, and pausos, sky-coloured; so called because of its bineish appearance.) Glaucoma. A cataract of the eye. Dioscovides.

Apogonum. (From ano, and propar, to beget.) A living feetus in the womb. Hip-

pocrates.

Apolersis. (From απο, and λαμθανα, to take from.) An interception, suppression, or retention of trime, or any other natural evacuation. Hippocrates.

Apolinosis. (From απο, and λμον, flax.) The method of curing a fistula, according to Ægineta, by the application of raw

flax.

Apolysis. (From απο, and λυα, to release.) The solution or termination of a disease. The removal of a bandage. Erotianus.

ADMAGMA. (From are, and uarla, to cleanse from.) Any thing used to cleanse and wipe away filth from sores, as a sponge, &c. Hippocrates.

Aromathema. (From ατο, neg. and μανθανα, to learn.) Hippocrates expresses,

by this term, a forgetfulness of all that has

APOMELI. (From and, from, and men, honey) An oxymel, or decoction, made

with honey.

APONEUROSIS. (From arro, and vevgor, a nerve; from an erroneous supposition of the ancients, that it was formed by the expansion of a nerve.) A tendinous expansion. See Muscle.

Aponia. (From a, priv. and woves, pain.)

Freedom from pain.

APONITROSIS. (From ano, and virgov, nitre.) The sprinkling an ulcer over with

APOPALLESIS. (From αποπαλλω, to throw off hastily.) An abortion, or premature expulsion of a focus. Hippocrates.

Apopedassis. (From are, and madaw, to

jump from.) A luxation.

APOPHLEGMASIA (From απο, and φλεγμα, phlegm.) A discharge of phlegin, or mucus.

APOPHLEGMATICA. (From ano, and φλεγμα, phlegm.) Apophligmatizantia. Apophligmatizonta. Medicines which excite the secretion of mucus from the mouth and nose. Masticatories.

Apophraxis. (From απο, and φεασσω, to interrupt. A suppression of the men-

strual discharge. APOPHTHARMA. (From are, and obugue, to corrupt.) A medicine to procure abor-

tion. (From αποφθειζω, to be APOPHTHORA.

abortive.) An abortion. APOPHYAS. (From αποφυώ, to proceed from.) Any thing which grows or adheres to another, as a wart to the finger.

The ramifications of the APOPILY ADES.

veins and arteries. Hippocrates. .

APOPHYSIS. (From αποφυώ, to proceed from.) Appendix. Probole. Echphysis. Processus. Productio. Projectura. Protuberantia. A process, projection, or protuberance, of a bone beyond a plain surface; as the nasal apophysis of the frontal bone, &cc.

APOPHTHEGMA. (From атофверуоция, to speak eloquently.) A short maxim, or

axiom; a rule.

APOPLECTA. A name formerly applied to the internal jugular vein; so called because, in apoplexies, it appears full and turgid. Bartholin.

(From αποπληξια, APOPLECTICA. Medicines against an apoapoplexy.)

plexy.

APOPLEXIA. (From ano, and wanoow, to strike or knock down; because persons, when seized with this disease, fall down suddenly.) Apoplexy. A sudden abolition, in some degree, of the powers of sense and motion, with sleep, and sometimes snoring; the respiration and motion

of the heart remaining. Cullen arranges it in the class neuroses, and order comata.

When it takes place from a congestion of blood, it is termed apoplexia sanguinea.

2. When there is an abundance of serum, as in persons of a cold temperament, apoplexia serosa.

3. If it arise from water in the ventricles of the brain, it is called Apopleaia hydroce.

phalica.

4. If from a wound, apoplexia traumatica.

5. If from poisons, apoplexia venenata.

6. If from the action of suffocating exhalations, apoplexia saffocata.

7. If from passions of the mind, apoplexia mentalis.

8. And when it is joined with catalensy. apoplexia cataleptica.

Apoplexy makes its attack chiefly at an advanced period of life; and most usually on those who are of a corpulent habit, with a short neck, and large head, and who lead an inactive life, make use of a full diet, or drink to excess. The immediate cause of apoplexy, is a compression on the brain, produced either by an accumulation of blood in the vessels of the head, and distending them to such a degree, as to compress the medullary portion of the brain; or by an effusion of blood from the red vessels, or of serum from the exhalants: which fluids are accumulated in such a quantity as to occasion compression. The former of these is called a sangumeous and the latter a serous apoplexy. These states, of over distinction and of effusion, may be brought on by whatever increases the afflux and impetus of the blood in the arteries of the nead; such as violent fits of passion, great exertions of muscular strength, severe exercise, excess in venery, stooping down for any length of time, wearing any thing too tight about the neck, overloading the stomach, long exposure to excessive cold, or a verticle sun, the sudden suppression of any long-accustomed evacuation, the application of the fumes of certain narcotic and metallic substances, such as opium, alcohol, charcoal, mercury, &c. and by blows, wounds, and other external injuries: in short, apoplexy may be produced by whatever determines too great a flow of blood to the brain, or prevents its free return to

The young, and those of a full plethoric habit, are most liable to attacks of the sanguineous apoplexy; and those of a phlegmatic constitution, or who are much advanced in life, to the serous. Apoplexy is sometimes preceded by headach, giddiness, dimness of sight, loss of memory, faltering of the tongue in speaking, numbness in the extremities, drowsiness, stupor, and night-mare, all denoting an affection of the brain; but it more usually happens that,

without much previous indisposition, the person falls down suddenly, the counte-nance becomes florid, the face appears swelled and puffed up, the vessels of the head, particularly of the neck and temples, seem turgid and distended with blood; the eyes are prominent and fixed, the breathing is difficult, and performed with a snorting noise, and the pulse is strong and full. Although the whole body is affected with the loss of sense and motion, it nevertheless takes place often more upon one side than the other, which is called hemiplagia, and in this case, the side least affected with palsy is somewhat convulsed.

In forming an opinion as to the event, we must be guided by the violence of the symptoms. If the fit is of long duration, the respiration laborious and stertorous, and the person much advanced in years, the disease, in all probability, will terminate fatally. In some cases, it goes off entirely; but it more frequently leaves a state of mental imbeculity behind it, or terminates in a hemiplegia, or in death. Even when an attack is recovered from, it most frequently returns again, after a short period of time, and in the end proves fatal. In dissections of apoplexy, blood is often found effused on the surface and in the cavities of the brain; and in other instances, a turgidity and distention of the blood-vessels are to be observed. In some cases, tumours have been found attached to different parts of the substance of the brain, and in others, no traces of any real affection of it could be observed.

APOUNIXIS. (From αποπνιγω, to suffo-

cate.) A suffocation. Moschion.

Aporsophesis. (From are, and Jopew, to emit wind.) The emission of wind by the anus or uterus, according to Hippocrates.

Aporsycuia. (From are, from, and ψυχη, the mind.) The highest degree of deliquium, or fainting, according to Galen.

(From αποπιπτω, to fall APOPTOSIS. down.) A prolapsus, or falling down of any part, through relaxation. Erotian.

Aponexis. (From απο, and οgeγω, to stretch out.) A play with balls, in the

gymnastic exercises.

Arons. (From a, priv. and wegoe, a duct. Restlessness, uneasiness, occasioned by the interruption of perspiration, or any stoppage of the natural secretions.

Aphonhipsis. (From απορριπτω, to cast off.) Hippocrates uses this word to signify that kind of insanity where the patient tears off his clothes, and casts them from

APOSKEPARNISMUS. (From and from, and σκεπαςνεζω, to strike with a hatchet.) Deasciatio. A species of fracture, when part of a bone is chipped off. Gorraus.

Aposchasus. Aposchasuus. (From arc.

and  $\sigma \chi \alpha \zeta \alpha$ , to scarify.) A scarification.

Venescetion. Hippocrates.

APOSITIA. Apositios. (From απο, from, and σιτος, food.) A loathing of food. Galen.

APOSPASMA. (From ωποσπαω, to tear off.) A violent, irregular fracture of a ten-

don, ligament, &c. Galen.
Aposphacelisis. (From απο, and σφαkelos, a mortification.) Hippocrates uses this word to denote a mortification of the flesh in wounds, or fractures, caused by too tight a bandage.

Apostasis. (From aro, and isnui, to re-

cede from )

1. an abscess, or collection of matter.

2. The coming away of a fragment of bone, by fracture.

3. When a distemper passes away by some outlet, Hippocrates calls it an abostasis by excretion.

4. When the morbific matter, by its own weight, falls and settles on any part, an apostasis by settlement.

5. When one disease turns to another,

an apostasis by metastasis.

Apostaxis. (From αποςαζω, to distil from.) Hippocrates uses this word to express the defluxion or distillation of any humour, or fluid: as blood from the nose.

APOSTEMA. (From apishui, to recede.) The term given by the ancients to abscesses in general. See Abscessus.

APOSTEMATIAI. Those who, from an inward abscess, void pus downwards, are thus called by Aretæus.

Aposterigma. (From arooneica, fulsio.) Galen uses this word to denote a rest of a diseased part, a cushion.

APOSTOLORUM UNGUENTUM. αποςολος, an apostle.) Dodecapharmacum. The apostles' ointment; so called because it has twelve ingredients in it, exclusive of the oil and vinegar.

APOSTROPHE. (From and seepe, to turn from.) Thus Paulus Egineta expresses

an aversion for food.

APOSYRINGESIS. (From and and over) E, a fistula.) The degeneracy of a sore into a fistula. Hippocrates.

APOSYRMA. (From and over, to rub off.) An abrasion or desquamation of the bone, or skin. Hippocrates.

APOTANEUSIS. (From a To and Terro, to extend.) An extension, or elongation, of any member or substance.

APOTELMESIS. (From a to and TEXMA, a bog.) An expurgation of filth, or faces.

APOTHECA. (Απεθακα: from αποιθακμι, to reposite.) A shop, or vessel, where medicines are sold or deposited.

APOTHECARIUS. (From are, and τιθημι, pono, to put; so called from his employ being to prepare, and keep in readiness, the various articles in the Materia Medica, and to compound there for

the physician's use; or from arobnan, a shop.) An apothecary. In every European country, except Great B i ain, the apothecary is the same as, in England, we name the druggist and chymist.

APOTHERAPLIA. (From are and Sepaπευω, to cure.) A perfect cure, according

to Hippocr tes.

APOTHERAPEUTICA. (From αποθεραπευω, to heal ) Therapeutics; that part of medicine which teaches the art of curing dis-

APOTHERMUM. (From and Seemin, heat.) An acrimonious pickle, with mustard, vinegar, and oil. Galen.

Aporthesis. (From απο and τιθημι, to replace.) The reduction of a dislocated

bone, according to H procrates.

Apothlimmi. (From are and Inco to press from.) The dregs of expressed juice of a plant.

APOTHRAUSIS. (Firm and and Seave to break.) Apocope. The taking away the

splinters of a broken bone.

Aporocus. (From απο and τουτω, to bring forth ) Abortive; premature. Ihppocrates.

Apotrecsis. (From απο and τεετω, to turn from ) A resolution or reversion of a

suppurating tumour.

APOTROPEA. (From aποτρεπω, to avert.) An amulet, or charm, to avert diseases.

Apozema. (From and and APOZEM.

ζεω, to boil ) A decoction.
ΑροΖΕυΧΙS. (From απο and ζευγνυμι, to separate ) The separation or removal of morbid parts. Hippocrates.

ΑρυχχΜος. (From απο and ζυμη, fer-

ment ) Fermented.

APPARATUS. (From appareo, to appear, or be ready at hand.) This term implies the preparation and arrangement of every thing necessary in the performance of an operation, or in the application of dressings. The apparatus varies according to circumstances. Instruments, machines, bandages, tapes, compresses, pledgets, dossils of lint, tents, &c. are parts of the apparatus, as well as any medical substances used. It is a rule in surgery to have the apparatus ready before beginning an operation. All preparations of this kind should not be made in the patient's room, when they can be avoided, nor any where in his presence, as it would agitate him, and render him timid and more restless in the operation.

APPARATUS MINOR. See Lithotomy. APPARATUS MAJOR. See Lithotomy. APPARATUS ALTUS. See Lithotomy.

APPENDICULA CECI VERMIFORMIS vermicular process, about four inches in length, and the size of a goose-quill, which liangs to the intestinum cacum of the human body.

APPENDICULE EPIPLOICE. Appendices

coli adipose. The small appendices of the colon and rectum, which are filled with adipose substance. See Omentum.
Apple, thorn. See Stramonium.

APPLE. The common crab-tree, fyrus malus of Lin-zus, is the parent of all the vast variety of apples at present cultivated. Apples, in gen ral, when ripe, afford a pleasant and easily digestible truit for the table; but, when the stomach is weak, they are very apt to remain unaltered for some days, and to produce dyspepsia. Sour fruits are to be considered as unwholsome, except when boiled or baked, and rendered soft and mellow by the addition of sugar.

APRICOT. The fruit of the Prunus armeniaca of Linnaus. When ripe, they are easily digested, and are considered as a

pleasant and nutritious delicacy.

APYREXIA. (From a, priv. and wvgegia, a f ver.) Apyrexy. Without fever. intermission of feveri-h heat.

AQUA. See Water.

AQUA AERIS FIXI. Water impregnated with fixed air. This is liquid carbonic acid, or water impregnated with carbonic acid; it sparkles in the glass, has a pleasant acidulous taste, and forms an excellent beverage. It diminishes thirst, lessens the morbid heat of the body, and acts as a powerful diuretic. It is also an excellent remedy in increasing irritability of the stomach, as in advanced pregnancy, and it is one of the best anti-emetics which we possess.

AQUA ALUMINIS COMPOSITA. Compound solution of alum, formerly called aqua aluminosa bateana. See Liquor aluminis com-

AQUA AMMONIE ACETATE. See Liquor ammonia acetatis.

AQUA AMMONIÆ PURÆ. See Liquor ummania.

AQUA ANETHI. See Anethum.

AQUA CALCIS. See Liquor calcis.

AQUA CELESTIS. A preparation of cu-

AQUA CARUI. See Carui.

Aqua cinnamomi. See Cinnamomum.

AQUA CUFRI AMMONIATI. See Liquor cupri ammoniati.

AQUA CUPRI VITRIOLATI COMPOSITA-This preparation of the Edinburgh Pharmacopæia, is used externally, to stop hæmorrhages of the nose, and other parts. It is made thus:

y. Cupri vitriolati, aluminis, sing. Zss. Aquæ puræ, Ziv. Acidi vitriolici, Zij

Boil the salts in water until they are dissolved; then filter the liquor, and add the acid.

AQUA DISTILLATA. Distilled water. This is made by distilling water in clean vessels, until about two thirds have come over. In nature, no water is found perfectly pure. Spring or river water always contains a portion of saline matter, principally sulphate of lime; and, from this impregnation, is unfit for a number of pharmaceutic preparations. By distillation, a perfectly pure water is obtained. The London College directs ten gallous of common water : of which, first distil four pints, which are to be thrown away; then distil four gallons. This distilled water is to be kept in glass vessels. See Water.

AQUA FŒNICULI. See Funiculum. AQUA FORTIS. See Acidum nitrosum di-

lutum.

AQUA KALI PRÆPARATI. See Liquor subcarbonatis potassæ.

AQUA KALI PURI. See Liquor potassæ. AQUA LITHARGYRI ACETATI. quor acetatis plumbi.

AQUA LITHARGYRI ACETATI COMPOSITA. See Liquor plumbi acetatis dilutus.

AQUA MENTHÆ PIPERITÆ. See Mentha

AQUA MENTHÆ SATIVÆ. See Mentha

AQUA MENTHÆ VIRIDIS. See Mentha

AQUA PIMENTÆ, See Pimenta.

AQUA PULEGII. See Pulegium.

AQUA REGIA. Aqua regulis The acid now called the nitro-muriatic, was formerly called aqua regalis, because it was, at that time, the only acid that could dissolve gold. See Nitro-muriatic acid.

AQUA ROSÆ. See Rosa centifolia.

AQUA STYPTICA. A name formerly given to a combination of powerful astringents, viz. sulphate of copper, sulphate of alum, and sulphuric acid. It has been applied topically to check hæmorrhage, and largely diluted with water, as a wash in puruleut ophthalmia.

AQUA ZINCI VITRIOLATI CUM CAMPHO-BA. Otherwise named Aqua vitriolica camphorata. This, when properly diluted, is a useful collyrium for inflammations of the eyes, in which there is a weakness of the parts. Externally it is applied by surgeons to scorbutic and phagedenic ulcerations.

Distilled waters. AQUE DISTILLATE. These are made by introducing vegetables, as mint, penny-royal, &c. into a still with water; and drawing off as much as is found to possess the properties of the plants. The London College orders the waters to be distilled from dried herbs, because fresh are not ready at all times of the year. Whenever the fresh are used, the weights are to be increased. But, whether the fresh or dried herbs are employed, the operator may vary the weight according to the season in which they have been produced and collected. Herbs and seeds, kept beyond the space of a year, are improper for the distillation of waters. To every gallon of these waters, five ounces, by measure, of proof spirit are to be added.

AQUE MINERALES. See Waters, mineral. AQUE STILLATITIE SIMPLICES. distilled waters.

AQUE STILLATITIE SPIRITUOSE. rituous distilled waters, now called only

spiritus, as spiritus pulegii. AQUEDUCT OF FALLOPIUS. A canal

in the petrous portion of the temporal bone, first accurately described by Fallo-

Aquatic nut. See Tribulus aqualicus.

Aqueous humoun of the eye. The very limpid watery fluid, which fills both

chambers of the eye. See Eye.

The name of a liquid poison. AQUETTA. made use of by the Roman women, under the Pontificate of Alexander VII. prepared, and sold in drops, by Tophania, or Toffania, an infamous woman who resided at Palermo, and afterwards at Naples. From her, these drops obtained the name of Aqua Toffania, Aqua della Toffana, and also Aqua di Napoli. This poison is said, by some, to be a composition of arsenic, and by others opium and cantharides.

Aquifolium. (From acus, a needle, and folium, a leaf; so called on account of its The leaves of this plant, prickly leaf.) Ilex aquifolium; foliis ovatis acutis spinosis, of Linnæus, have been known to cure intermittent fevers; and an infusion of the leaves, drank as tea, is said to be a pre-

ventive against the gout.

Aquila. A chymical name formerly used for sal-ammoniac, mercurius pracipitatus, arsenic, sulphur, and the philosoplier's stone.

AQUILA ALBA. One of the names given to calomel by the ancients. See Submurias hydrargyri.

Aquila Alba Philosophonum. Aque alba ganymedis. Sublimed Sal-ammoniac. Aqua

Aquila collestis. A panacea, or cure for all diseases; a preparation of mercury.

Aquila veneris. A preparation of the ancients, made with verdigrise and sublimed sal-ammoniac.

Aquila, among the ancients, had many other epithets joined with it, as rubra, salutifera, volans, &c.

Aquilæ venæ. (From aquila, an eagle.) Branches of the jugular veins, which are particularly prominent in the eagle.

AQUILE LIGNUM. Eagle-wood. generally sold for the agalochum.

AQUILEGIA. (From aqua, water, and lego, to gather; so called from the shape of its leaves, which retain water.) The herb

1. The name of a genus of plants in the Linnwan system. Class, Polyandria. Order, Pentagynia.

2. The name, in the Pharmacopæia, for the columbine.

The seeds, flowers, and the whole plant, Aquilegia vulgaris; nectariis incurvis, of Linnaus, have been used medicinally,

the first in exanthematous diseases, the lat-Though ter chiefly is an antiscorbutic. retained in several foreign pharmacopæias, their utility seems to be not allowed in this

country.

(Diminutive of aqua.) AQUULA. small quantity of very fine and limpid wa-This term is applied to the pellucid water, which distends the capsule, of the cristalline lens, and the lens itself. Paulus Ægineta uses it to denote a tumour consisting of a fatty substance under the skin of the eyelid.

Arabic gum. See Acacia gummi.

ARACALAN. Amulets.

Araca MIRI. (Indian.) A shrub growing in the Brazils, whose roots are diuretic and antidysenteric.

ARACHNE. (From arag, Heb. to weave; or from agazym, a spider.) The spider.

ARACHNOID MEMBRANE. apayin, a spider, and edos, likeness; so named from its resemblance to a spider's A thin membrane of the brain, without vessels and nerves, situated between the dura and pia mater, and surrounding the cerebrum, cerebellum, medulla oblongata, and medulla spinalis. The term is also applied by some writers to the tunic of the crystalline lens and vitreous humour of the eye.

(Indian.) ARACK. An Indian spirituous liquor, prepared in many ways, often from rice; sometimes from sugar, fermented with the juice of cocoa-nuts; frequently from toddy, the juice which flows from the cocoa-nut tree by incision, and from other

substances.

ARADOS. From agadesw, to be turbulent.) Hippocrates uses this term to signify a commotion in the stomach, occasioned by the fermentation of its con-

ARETICA. (From aganou, to rarefy.) Things which rarefy the fluids of the body.

ARALIA. (From ara, a band in the sea; so called because it grows upon banks, near the sea.) The berry-bearing angelica. Of the several species of this tree, the roots of the nudicaulis, or naked-stalked, were brought over from North America, where it grows, and sold here for sarsaparilla.

ARANEA. (From agaw, to knit together.)

The spider.

ARBOR VITÆ. The tree of life.

1. The cortical substance of the cerebellum is so disposed, that, when cut traversely, it appears ramified like a tree, from which circumstauce it is termed arbor vita.

2. The name of a tree, the leaves and wood of which were formerly in high estimation as resolvents, sudorifics, and expectorants, and were given in phthisical affections intermittent fevers, and dropsies. It is the Thuya occidentalis; strobilis levibus, squamis obtusis, of Linnæus.

ARBUTUS. The name of a genus of

plants in the Linnæan system. Class, De-Order, Monogynia. candria. berry tree.

The systematic ARBUTUS UVA URSI. name for the officinal trailing arbutus. See

ARCA ARCANORUM. The mercury of the philosophers. The pericardium.

ARCA CORDIS. ARCANUM. (A secret.) A medicine whose preparation, or efficacy, is kept from the world, to enhance its value. With the chymists, it is a thing secret and incorporeal; it can only be known by experience, for it is the virtue of every thing, which operates a thousand times more than the thing itself.

ARCANUM CATHOLICUM. Bezoar, plan-

tain, and colchium.

ARCANUM DUPLEX. Arcanum duplicatum. A name formerly given to the combination of potash and sulphuric acid, more coinmonly called vitriolated tartar, and now sulphat of potash.

ARCANUM TARTARI. The acetate of pot-

ARCERTHOS. Juniper.

ARCHE. Agxn, the beginning.)

first stage or attack of a disease.

ARCHEUS. The universal archæus, or principle of Van Helmont, was the active principle of the material world; it means good health also.

Arche. (From agan, the beginning.)

The earliest stage of a disease.

ARCHENDA. (Arab.) A powder made of the leaves of the ligustrum, to check the fetid odour of the feet. Detergent.

ARCHEOSTIS. White briony.

ARCHIMAGIA. (From agxn, the chief, and maga, Arab. meditation.) Chymistry, as being the chief of sciences.

ARCHITHOLUS. (From agxn, the chief, and Joxos, a chamber. The sudatorium, or principal room of the ancient baths.

ARCHOS. (From agxos, an arch.)

anus; so called from its shape. ARCHOPTOMA. (From agxos, the anus, and wirlw, to fall down.) A bearing down

of the rectum, or prolapsus ani. ARCTATIO. (From arcto, to make nar-

row.) Arctitudo. Narrowness.

1. A constipation of the intestines, from inflammation.

2. A preternatural straitness of the pu-

dendum muliebre,

ARCTIUM. (From apxlos, a bear; 50 called from its roughness.) The name of a genus of plants in the Linnæan system. Class, Syngenesia. Order, Polygamia aqua-The burdock.

ARCTIUM LAPPA. (Lappa; ano To ha. Car, from its seizing the garments of passengers.) The herb clotbur, or burdock. The systematic name for the bardana. See Bardana.

ARCTURA. (From arcto, to straiten.)

67

An inflammation of the finger, or toe, from a curvature of the nail.

Augualia. (From arcus, a bow.) Arcualis. The satura coronalis is so named, from its bow-like shape; and, for the same reason, the bones of the sinciput are called arcualia ossia. Bartholin.

ARCUATIO. (From arcus, a bow.) gibbosity of the fore-parts, with a curva-

vertebræ. Avicenna.

ARCULE. A dim. of arca, a chest.) The orbits or sockets of the eyes.

ARDAS. (From agdvw, to defile.) excrement, or refuse. Hippocrates. Ardent Spirit. See Alcohol.

ARDOR FEBRILIS. Feverish heat.

ARDOR URINÆ Dysuria. Scalding of the urine. Difficulty and pain in making water, attended with a sense of heat in the urethra. It is a symptom of gonorrhea, and some other affections.

ARDOR VENTRICULI. Heartburn.

AREA. An empty space. That kind of baldness where the crown of the head is left naked, like the tonsure of a monk.

An inferior kind of ARECA INDICA.

nutmeg.

(From agny w, to help.) AREGON. resolvent ointment; so called from its valuable qualities.

Cinnabar. AREMAROS.

ARENA. Sand, or gravel.

ARENAMEL. (From arena, sand; so called because it was said to be procured from sandy places.) Arenamen. Bole-arme-

ARENATIO. (From arena, sand.) Saburation, or the sprinkling of hot sand upon the bodies of patients. Andr. Baccius de

ARENTES. (From area, to dry up.) A sort of ancient cupping-glasses, used with-

out scarifying.
ARFOLA. (A dim. of area, a void space.) A small brown circle, which surrounds the nipples of females. During and after pregnancy, it becomes considerably

ARETE. (Agern, virtue.) Hippocrates uses this word to mean corporeal or mental vigour.

ARETENOIDES. See Arytenoides.

AREUS. A pessary, invented by Ægineta.

Aufan. Arsag. Arsenic. Ruland, &c. ARGAL. Argol. Crude tartar, in the state in which it is taken from the inside of winevessels, is known in the shops by this

Augasyllis. (From Agyos, a serpent: which it is said to resemble.) The plant which was supposed to produce gum-am-

ARGEMA. (From Agree, white.) Argemon. A small white ulcer of the globe of the eve. Erotianus, Galen, &c.

ARGENTI NITRAS. See Nitras argenti. ARGENTUM. Silver. See Silver.

ARGENTUM NITRATUM. See Nitras argenti.

ARGENTUM VIVUM. It was formerly, by some, cailed argentum mobile, and argentum fusum. See Hydrargyrus.

Anges. (From agyos, white.) A serpent, with a whitish skin, deemed by Hippocrates exceedingly venomous.

Argilla. (From zeros, white.) White clay; argil; potter's earth.

ARGILLA VITRIOLATA.

ARGYRITIS. (From agyugos, silver.) tharge, or spume of silver. A kind of earth was formerly so named, which is taken from silver mines, and is bespangled with many particles of silver.

ARGYROCOME. (From agyugos silver, and кома, hair.) A sort of cudweed, or gnaphalium, was so named, from its white sil-

very floscules.

Argynolibanos. The white olibanum. ARGYROPHORA. An antidote, in the com-

position of which there is silver.

ARGYROTROPHENA. (From αργος white, and τροφημα, food.) A white cooling food, made with milk. Milk diet. Galen.

(From a, neg. and ARHEUMATISTOS. ρευματιζω, to be afflicted with rheums.) Not being afflicted with gouty rheums.

ARICYMON. (From aga and now, to be quickly impregnated ) A woman who conceives quickly and often.

ARISTALTHEA. (From agusos, best, and axθam, the althæa.) Althæa, or common marsh-mallow.

ARISTOLOCHIA. (From agio70s, good and λοχια, or λοχια, parturition; so called because it was supposed to be of sovereign use in disorders incident to child-birth.) 1. The name of a genus of plants in the Linnæan system. Class, Gynandria, Order, Hexanaria. Birthwort.

2. The pharmacopæial name of the long-

rooted birthwort.

Aristolochia longa of Linnæus:-foliis cordatis, petiolatis, integarrimis, obtusiusculis; caule infirmo, floribus solitariis. The root of this plant only is in use; it possesses a somewhat aromatic smell, and a warm bitterish taste, accompanied with a slight degree of pungency. The virtues ascribed to this root by the ancients were very considerable; and it was frequently employed in various diseases, but particularly in promoting the discharge of the lochia; hence its name. It is now very rarely used, except in gouty affections, as an aromatic stimulant.

ARISTOLOCHIA ANGUICIDA. Snake-

killing birthwort.

Aristolochia :- foliis cordatis, acuminatis; caule volubili, fruticoso; pedunculis solita-riis; stipulis cordatis, of Linnæus. The juice of the root of this plant has the property of so stupifying serpents, that they may be handled with impunity. One or two drops are sufficient; and if more be dropt into the mouth, they become convulsed. So ungrateful is the smell of the root to those reptiles, that it is said they immediately turn from it. The juice is also esteemed as a preventive against the effects usually produced by the bite of venomous serpents.

ARISTOLOHIA CLEMATITIS. (Clematitis, from manμα, a tendril; from its climbing up trees, or any thing it can fasten upon with its tendrils.) The systematic name of the Aristolochia vulgaris of some pharmaco-

pæias. See Aristolochia vulgaris

Anistolochia fabacea. The root of this plant, Fumaria bulbosu of Linnæus:—caule simplici. bracteis longitudine florum; was formerly given to restore suppressed menses, and as an anthelmintic.

Anistolochia Longa. The systematic name for the ristolochia of our pharma-

copæias. See Aristolochia.

ARISTOLOCHIA ROTUNDA. The root of this species of birthwort, Aristolochia rotunda of Linuxus:—foliis cordatis, subsescilibus, obtusis; caule infirmo; floribus solitariis; is used indiscriminately with that of the aristolochia longa. See Aristolochia.

ARISTOLOCHIA SERPENTARIA. The systematic name for the Serpentaria virginiana of the pharmacopæias. See Serpentaria

virginiana

ARISTOLOCHIA TENUIS. See Aristolochia

vulgaris.

ARISTOLOCHIA TRILOBATA. Three-lobed birthwort. The root, and every part of this plant, Aristolochia trilobuta of Linnæus:—foliis trilobis, canle volubili, floribus maximis; is diurctic, and is employed in America

against the bite of serpents.

ARISTOLOCHIA VULGARIS. Aristolochia tenuis. An extract is ordered from this species, Aristolochia clematitis of Linnus: foliis cordatis; caule erecto; floribus axillaribus confertis; by the Wirtemberg Pharmacopœia, and the plant is retained in that of Edinburgh. It is esteemed as possessing antipodagric virtues.

ARISTOPHANEION. (From Aristophanes, its inventor.) The name of an ancient emollient plaister composed of wax, or

pitch. Gorræus.

ARMATURA. Hardness. The amnios or internal membrane which surrounds the fætus.

ARME. (From  $\alpha \xi \omega$ , to adapt.) A junction of the lips of wounds; also the joining of the sutures of the head.

Armilla. (Dim. of armus, the arm.) The round ligaments which confine the tendons of the carpus.

ARMORACIA. (From Armorica, the country whence it was brought.) See Raphanus rusticanus.

ARMORACIÆ RADIX. Horse-radish root.

See Raphanus rusticanus.

ARNICA. (Agrica: from ags, a lamb; because of the likeness of the leaf of this plant to the coat of the lamb.) Leopard'sbane. Arnica.

1. The name of a genus of plants in the Linnaan system. Class, Syngenesia, Or-

der, Polygamia superflua.

2. The pharmacoposial name of the Doronicum Germanicum. Mountain arnica. Arnica montona of Linnæus:—foliis ovatis integris; caulinis geminis oppositis. The flowers of this plant are very generally employed on the Continent. Of the advantages derived from their use, in paralytic and other affections, depending upon a want of nervous energy, there are several proofs; and their extraordinary virtues, as a febrifuge and antiseptic, have been highly extolled by Dr. Colin, of Vienna. Much caution is necessary in regulating the dose, as it is a medicine very apt to produce vomiting and much uneasiness of the stomach.

Arnica montana. The systematic name for the arnica of the pharmacopæias.

See Arnica.

ARNIEA SUEDENSIS. See Conyza media ARNOTTO. (Spanish.) A curious shrub in Jamaica, the seeds of which are covered with a kind of wax, from which is made the Spanish arnotto.

AROMA. (From aga, intensely, and via, to smell.) Spiritus rector. Each plant has its characteristic smell. This odorant principle is called by the moderns, aroma. Water charged with aroma, is called the distilled water of the substance made use of; thus lavender and peppermint waters are water impregnated with the aroma of the lavender and peppermint.

AROMATICUS CORTEX. A name for ca-

nella alba.

AROMATICS. (Aromatica, sc. medicamenta; from ago, an odour.) A term applied to all medicines which have a grateful spicy scent, and an agreeable pungent taste, as cinnamon bark, cardamoms, &c. Their peculiar flavour appears to reside in their essential oil, and arises in distillation either with water or spirit.

AROMATOPOLA. (From agaμa, an odour and ωωλεω, to sell.) A druggist; a vender

of drugs and spiceries.

ARQUEBUSADE. (A French word, implying good for a gun shot wound.) Aqua sclopetaria. Aqua vulneraria. Aqua eata-pultarum. The name of a spirituous water, distilled from a farrago of aromatic plants.

ARRACK. A spirituons liquor distilled from rice, and drank, in the rice countries, as we do brandy in this Island. Its effects on the animal oconomy are the same.

ARRAPHUS. (From a, priv. and gaps, a suture.) Without suture. It is applied to the cranium when naturally without sutures.

Annua. (From a, neg. and fex, to

flow.) The suppression of any natural flux, as the menses, &c.

ARROWHEAD. The roots of this plant, Sagituaria sagitufolia of Linnzus, are said to be esculent, but it must be in times of very great scarcity.

Annow-noor. Indian arrow-root. See Maranta.

ARSENIAS. (From arsenicum, arsenic) An arseniate or arsenical salt. A salt formed by a combination of arsenic acid with different bases, as arseniate of ammonia, which is produced by the union of ammonia with arsenic acid. The only one used in medicine is the arseniate of potash. See Liquor arsenicalis.

ARSENIC. (From the Arabic term Arsunek; or from agon, for aggn, masculus; from its strong and deadly powers.) Arsenicum crystullinum, risagallum, aquala, arfar, aquila, zurnick, artaneck. These names were all formerly applied to white arse-

mc.

Arsenic is a metal scattered, in great abundance, over the mineral kingdom. It is found in black heavy masses of little brilliancy, called native arsenic, (testaceous arsenic.) This exists in different parts of Germany. Mineralized by sulphur, it forms sulphurized arsenic, or orpiment. This mineral is met with in Italy, about Mount Vesuvius .-There are two varieties of this ore, which differ from each other in colour, occasioned by the different proportions of its component parts. The one is called yellow sulphurised arsenic, or orpiment; the other, red sulphurized arsenic, or realgar, (ruby arsenic;) both are met with in Hungary and different parts of Germany. The colour of the first ore is a lemon yellow, inclining sometimes to a green; the colour of the latter is a ruby red; it is more transparent than the former, and found in compact solid masses, sometimes crystallized in bright needles. Arsenic united to oxygen, constitutes the ore called native oxide of arsenic. This ore is scarce; it is generally found of an earthy appearance, or as an efflorescence, coating native, or metallic arsenic; its colour is a whitish grey; it is rarely met with crystallized. Arsenic exists likewise alloyed with cobalt, antimony, tin, copper, lead, and various other metals.

Properties. Arsenic is a brittle metal, and in the recent fracture, of a lively bright colour, between tin-white and lead gray; but, on exposure to the air, it soon loses its metallic lustre, and turns prismatic, dull, and at last black. Its specific gravity is between 8.310 and 5.763 according to its texture. Its hardness surpasses that of copper; but its ductility is so little, and its brittleness so great, that it is readily converted into a powder by the hammer. It is entirely volatilized when heated to 3560 Fahr. It sublimes in close vessels, and then crystallizes in tetrahedra, or octahedra.

When heated with the access of air, it emits a strong smell of garlic, and burns with a blueish white flame. It combines with sulpliur by fusion. It unites to phosphorus, and combines with most of the metals. gives a white colour to copper, and renders many of the ductile metals brittle. When mixed with hyper-oxigenated muriate of potash, it detonates strongly by the stroke of a hammer. It is soluble in hydrogen gas by heat. It does not decompose water alone. It decomposes sulphuric acid by heat. The nitric and nitrous acids oxidate it rapidly. The muriatic acid attacks it with heat. The oxigenated muriatic acid when in a gaseous state, inflames it instant-It is nearly unalterable by the fluoric, boracic, phosphoric, and carbonic acids. It unites with alkaline sulphurets, and hydrosulphurets. It is a deadly poison.

Method of obtaining Arsenic. In order to obtain metallic arsenic, mix two parts of the white oxid of arsenic of commerce, with one of black flux (obtained by detonating one part of nitrate of potash, and put the mixture into a crucible, or melting-pot. Invert over this, another crucible, lute the two together with a little clay and sand, and apply gradually a red heat to the lower one. The oxid of arsenic will be reduced, and be found lining the upper crucible in small crystals of a metallic brilliancy.

The charcoal of the black flux takes in this process the oxigen from the white oxid, and forms carbonic acid gas; which flies off during the process, and the oxid becomes reduced to the metallic state. This reduction of the oxid is greatly facilitated by the alkali of the flux.

Remark.—In order to obtain arsenic in a state of absolute purity, the metal before obtained must be reduced to powder, dissolved by heat in nitro-muristic acid, and then precipitated by immersing into the solution a plate of zinc. The arsenic is thus precipitated in a fine powder, and may be reduced to its metallic state, by exposing it in a covered crucible to a moderate lieat.

If it he kept under water, its metallic brilliancy may be preserved. This effect is still better produced by alcohol.

Arsenic and its various preparations are the most active of all poisons. A nausea, sickness, and reaching, commonly ensue in half an hour after taking it, followed by violent vomitings, hiccups, and pains in the stomach and bowels; convulsions, and palsies of the limbs presently succeed, with intense heats, cold sweats, palpitations of the heart, extreme anxiety, prostration of strength, thirst and dryness of the mouth and throat; loss of reason, and at last death. If the quantity taken has been considerable, the stomach and intestines are often found, upon dissection, corroded.

or perforated; and the blood is fluid, though in general the patient expires before the action of the poison has proceeded to such a length. After death, the body runs into sudden putrefaction. When the quantity taken does not prove fatal, it occasions tremors, palsies, or lingering hectics, and in the end death. To detect the presence of arsenic, whether taken by design, the wickedness of others, or imprudence, it is necessary to throw on live coals, the contents of the stomach, when a garlicky smell is immediately obvious. On polished copper, if heated between its plates, a white spot is impressed, or in close vessels, the arsenic itself will be found sublimed in the upper parts. In the stomach, however, there are many substances, which may resemble or disguise the smell of arsenic, especially if the arsenic be in small quantities. We are therefore advised by Hahneman, to boil the contents of the stomach of the person supposed to be destroyed by this poison, in a large quantity of river water; to add to one third of the filtered liquor, hot and limpid lime-water; to another third, water saturated with hepatic gas; and to the remainder, a solution of copper, in pure aqua ammoniæ. Each fluid is rendered turbid, if the suspected contents contain arsenic, and the sediment, thrown on live coals, emits the odour of garlic. The sediment of the lime-water is again dissolved by a recent solution of arsenic; the orange-coloured sediment, from the hepatic gas thrown on the coals, takes fire, and the smell of sulphur is observed previous to that of the garlic; while the yellow-green sediment of the copper is soluble in pure ammonia, and acids of every kind. Arsenic, however, is a valuable internal remedy, in its appropriate dose, viz. about one-eighteenth part of a grain. Liquor arsenicalis.

ARSENIOUS ACID. White arsenic. Oxyd of arsenic. The earliest chymists were embarrassed in the determination of the nature of the poisonous white substance known in commerce by the name of white arsenic. Subsequent experiments have shewn that this substance is metallic arsenic oxygenated in the first degree. The name of arsenious acid is therefore given to it. It is sometimes found in nature in sublimed crystals, in volcanoes; and in masses, or in stalactites among the ores of arsenic, cobalt, bismuth, and nickel.

It possesses a weak sub-acid taste, which slowly manifests itself. Though of but a feeble acidity, it sensibly reddens the tine-ture of cabbage and litmus. If placed on burning coals, or on a red-hot iron, it is volatilized in the form of a white vapour, which has a strong smell of garlic. It is slightly soluble in water. With phosphoric and boracic acids it fuses into glass. It decomposes the nitrates and the super-oxygenated muriate of potash. It unites with ma-

ny of the earths and alkalies, and forms sa-

line compounds. Methods of obtaining Arsenious Acid .- 1. Pulverize arsenic, and put as much of it into a Florence flask as will fill it about one half, or less. Introduce a little tow or cotton, into the neck of the flask, and apply the heat of a lamp. A dense white smoke will be formed, and become precipitated on the internal sides of the flask. process be kept up till all the arsenic be oxidated, (which may be known by introducing a wire into the flask for a moment, which will become covered with a white crust, if the sublimation be not completed,) and the heat be then gradually augmented, the sublimed arsenious acid undergoes a sort of fusion, and an opake white mass, similar to that met with in commerce, is obtained.

2. The arsenious acid of the shops (or white arsenic) is chiefly obtained from arsenical ores of cobalt. These ores are thrown into a furnace, resembling a baker's oven, with a long flue, or chimney, either horizontal or winding, into which the fumes pass, and are condensed into a greyish or blackish powder. This is refined by a second sublimation, in close vessels, with a little alkali to arrest the impurities. As the heat is considerable, it melts the sublimed arsenious acid into those opake crystalline masses which are known in commerce by the name of white arsenic.

Arsenious acid, united with different ba-

ses, forms salts called ARSENITES.

ARSENIC ACID. This is arsenic fully oxygenated. It is always a product of art. It is capable of existing in the solid state.

It appears in the form of a white pulverulent matter. It attracts humidity from the air. It is soluble in water. The solution possesses a considerable acid taste. It may be evaporated to dryness, and even converted into glass. It is decomposable by all combustible bodies, and by many oxyds. It is soluble in some acids, but without

change, or intimate combination.

Method of obtaining Arsenic Acid .- Take two ounces of white arsenic in powder, and put it into a tubulated retort; pour on it six or seven ounces of muriatic acid, and apply the heat of a lamp until the arsenious acid is dissolved. Then add three or four ounces of nitric acid, and heat it again gradually. An intestine motion now takes place, and much red vapour, or nitrous gas, is extricated. As soon as in the progress of the operation, the red vapours have ceased, an ounce of finely powdered arsenious acid is to be again added, and the solution effected as before, by a gentle ebullition; to this two ounces of nitric acid must be added, which will produce a second effervescence and discharge of red vapours: the distillation must now be continued to dryness, and the fire must be urged towards the end, to such a degree, as to make the residual mass thoroughly red-hot. This mass is arsenic acid, which may either be preserved in that form, or be dissolved in boiling distilled water.

Arsenic acid, united to different bases, forms saline compounds, called ARSE-The only one used in medicine NIATES. is the arseniate of potash. See Liquor ar-

senicalis.

ARSENICI OXYDUM PREPARATUM. pared arsenious acid. It is sometimes used as a caustic.

Ausenicum Album. White arsenic.

Rat's-bane. See Arsenious acid.

Ausenical caustic. A species of caustic said to possess useful properties, independent of those of destroying morbid parts to which it is applied. It is composed of two parts of levigated antimony to one of white arsenic. This is the caustic so extensively employed under the name of arsenical caustic, by the late Mr. Justamons, in his treatment of cancers.

Arsenical solution. See Liquor arsenicalis. ARTEMISIA. (From a queen of that name, who first used it; or from Αgτεμις, Diana; because it was formerly used in the diseases of women, over whom she presided.) The name of a genus of plants in the Linnæan system. Class, Syngenesia. Order, Polygamia superflua. Mugwort.
ARTEMISIA ABROTANUM. The systema-

tic name for the abrotanum of the pharma-

copæias. See Abrotanum.

The systema-ARTEMISIA ABSYNTHIUM. tic name for the Absynthium vulgare of the pharmacopæias. See Absynthium vulgare.

ARTEMISIA JUDIACA. The systematic name for the Santonicum of the pharmaco-

pæias. See Santonicum.

The systematic ARTEMISIA MARITIMA. name for the Absynthium maritimum of the See Absynthium maripharmacopæias.

ARTEMISIA PONTICA. The systematic name for the Absynthium ponticum. Absynthium Ponticum.

The systematic ARTEMISIA RUPESTRIS. name for the genipi album of the pharmaco-

pæias. See Genipi album.

ARTEMISIA VULGARIS. Mugwort. This plant, Artemisia, foliis pinnatifidis, planis, incisis, subtus tomentosis, racemis simplicimis recurvatis floribus radio quinquefloro of Linnæus, is slightly bitter, and, although in high esteem in former days, is now almost wholly forgotten. By beating and rubbing the dried tops of this plant, the Japanese prepare a soft substance, which they call moxa. See Moxa.

ARTEMONIUM. (From Artemon, its inventor.) A collyrium or wash for the eyes.

ARTERIA. See Artery.

ARTERIACA. (From aethera, an artery.) Medicines formerly used against disorders of the aspera arteria.

ARTERIÆ DIPOSÆ. The arteries which secrete the fat about the kidneys are so called. They are branches of the capsular and diaphragmatic, renal, and spermatic

ARTERIÆ VENOSÆ. The four pulmonary veins were so called by the ancients.

ARTERIOSUS DUCTUS. See Ductus arte-

ARTERIOTOMY. (From aglingia, an artery, and Timvo, to cut. The opening of an artery. This operation is only perform-

ed on the temporal artery.

ARTERY. (From ang, air, and These, to keep; so called because the ancients supposed that only air was contained in them.) Arteria. Arteries are membranous pulsating canals, which gradually become less as they proceed from the heart. They are composed of three membranes; a common or external, a muscular; and an internal one, which is very smooth. They originate from the heart; the pulmonary artery from the right ventricle, and the aorta from the left: the other arteries are all branches of the aorta. Their termination is either in the veins, or in capillary exhaling vessels, or they anastomose with one another. It is by their means that the blood is carried from the heart to every part of the body, for nutrition, preservation of life generation of heat, and the secretion of the different fluids. The action of the arteries, called the pulse, corresponds with that of the heart, and is effected by the contraction of their muscular, and great elasticity of their innermost, coat.

A Table of the Arteries.

All the arteries originate from the pul-

monary artery and the aorta.

The pulmonary artery emerges from the right ventricle of the heart, soon divides into a right and left branch, which are distributed by innumerable branches through the lungs.

The aorta arises from the left ventricle of the heart, and supplies every part of the body with blood, in the following order:

a. It first forms an arch;

b. It then descends along the spine, and

c. It divides into the two iliacs.

a. The ARCH OF THE AORTA gives off three branches.

I. The arteria innominata, which divides into the right carotid and right subclavian.

II. The left carotid.

III. The left subclavian.

- I. The carotids are divided into external and internal.
  - The external carotids give off
- 1. The thyroid,
- 2. The lingual,
- 3. The labial,
- 4. The inferior pharyngeal,
- 5. The occipital,
- 6. The posterior auris,
- 7. The internal maxillary, from which the

spinous artery of the dura mater, the lower maxillary, and several branches about the palate and orbit arise,

8. The temporal.

The internal carotid affords

1. The ophthalmic,

2. The middle cerebral,

- 3. The communicans, which innosculates with the vertebral.
- II. The subclavians give off the following branches:
- The internal mammary, from which the thymic, comes phrenici, pericardiac, and phrenico-pericardiac arteries arise,

2. The inferior thyroid, which gives off the tracheal, ascending thyroid, and transver-

salis humeri.

- 3. The vertebral, which proceeds within the vertebræ, and forms within the cranium the basilary artery, from which the anterior cerebelli, the posterior cerebri, and many branches about the brain are given off,
- 4. The cervicalis profunda,

5. The cervicalis superficialis, 6. The superior intercostal.

7. The supra-scapular.

As soon as the subclavian arrives at the arm-pit, it is called the uxillary artery; and when the latter reaches the arm, it is called the brachial.

The axillary artery gives off,

1. Four mammary arteries,

2. The sub-scapular,

3. The posterior circum flex,

4. The anterior circumflex, which ramify about the shoulder-joint.

The brachial artery gives off,

1. Many lateral branches,

2. The profunda humeri superior,

3. The profunda humeri inferior,

4. The great anastomosing artery, which ramifies about the elbow-joint;

The brachial artery then divides, about the bend of the arm, into the ulnur and radical arteries, which are ramified to the ends of the fingers.

The ulnar artery gives off,

1. Several recurrent branches,

2. The common interosseal, of which the dorsal, ulnar, the pulmaris profunda, the palmary arch, and the digitals, are branches.

The radial artery gives off,

1. The radial recurrent,

- 2. The superficialis vola, and then divides into the palmaris profunda and the digitals.
  - b. The descending Aorta gives off,

In the breast,

- 1. The bronchial, 2. The asophageal,
- 3. The intercostals,
- 4. The inferior diaphragmatic: Within the abdomen,
- 1. The caliac, which divides into three

1. The hepatic, from which are given

off, before it reaches the liver,

a. The duodeno-gustric, which sends off the right gastro-epiploic and the pancreatico-duodenal,

B. The pilorica superior hepitaca;

2. The coronaria ventriculi,

- 5. The splenic, which emits the great and small pancreatics, the posterior gastric, the left gastro-epiploic, and the vasa brevia;
- 2. The superior mesentric,

3. The emulgents,

4. The spermatics,

- The inferior mesentric, 6. The lumbar arteries,

7. The middle sacral.
c. The aorta then bifurcates into the ILIACS, each of which divides into external and internal.

The internal illac, called also hypogastric,

gives off.

1. The lateral sacrals,

2. The gluteal,

3. The ischiatic,

4. The pudical, from which the external hamorrhoidal, the perineal, and the arteriæ penis arise,

5. The obturatory. The external iliac gives off, in the groin,

1. The epigastric,

2. The circumflexa iliaca;

It then passes under Poupart's ligament, and is called the femoral artery; and sends

1. The profunda.

2. The ramus anastomoticus magnus, which runs about the knee-joint;

Having reached the ham, where it gives off some small branches, it is termed the popliteal. It then divides into the anterior and posterior tibial.

The tibialis antica gives off.

1. The recurrent,

- 2. The internal malleolar,
- 3. The external malleolar,
- 4. The tarseal,
- 5. The metatarseal,
- 6. The dorsales externa halices. The posterior tibial sends off.

1. The nutritia tibia,

2. Many small branches,

3. The internal plantar,

4. The external plantar, from which an arch is formed, that gives off the digitals of the toes.

ARTHANITA. (From aplos, bread; because it is the food of swine.) sow-bread. See Cyclamen.

ARTHEMBOLUS. (From agbeer, a joint,

εμεαλλω, to impel.) An instrument for reducing luxated bones.

ARTHRITICA. (From αεβειτικ, the gout.) 1. The herb ground-pine; so called because it was thought good against gouty disorders.

2. Remedies for the gout. ARTHRITIS.

(From apagos, a joint; because it is commonly confined to the

sology, gives it the name of podagra, because he considers the foot to be the seat of idiopathic gout. It is arranged in the class purexia and order phlegmasia, and is divided into four species, the regular, atomic, retrocedent, and misplaced. The gout is a very painful disease, preceded usually by flatulency and indigestion, and accompa-nied by fever, pains in the joints of the hands and feet, particularly in that of the great-toe, and which returns by paroxysms, occurring chiefly in the spring and beginning of winter. The only disorder for which it can possibly be mistaken, is the rheumatism; and cases may occur wherein there may be some difficulty in making a just discrimination; but the most certain way of distinguishing them will be, to give due consideration to the predisposition in the habit, the symptoms which have preceded, the parts affected, the recurrences of the disease, and its connexion with other parts of the system. Its attacks are much confined to the male sex, particularly those of a corpulent habit, and robust body; but every now and then we meet with instances of it in robust females. Those who are employed in constant bodily labour, or who live much upon vegetable food, as likewise those who make no use of wine, or other fermented liquors, are seldom afflicted with the gout. The disease seldom appears at an earlier period of life than from five-and-thirty to forty; and, when it does, it may be presumed to arise from an hereditary disposition. Indolence, inactivity, and too free a use of tartareous wines, fermented liquors, and animal food, are the principal causes which give rise to the gout; but it may likewise be brought on by great sensuality and excess in venery, intense and close application to study, long want of rest, grief, or uneasiness of mind, exposure to cold, too free a use of accidulated liquors, a sudden change from a full to a spare diet, the suppression of any accustomed discharge, or by excessive evacuations; and that it sometimes proceeds from an hereditary disposition, is beyond all doubt, as females who have been remarked for their great abstemiousness, and youths of a tender age, have been attacked with it.

1. Arthritis regularis. A paroxysm of regular gout sometimes comes on suddenly, without any previous warning; at other times it is preceded by an unusual coldness of the feet and legs, a suppression of perspiration in them, and numbress, or with a sense of prickling along the whole of the lower extremities; and with these symptoms the appetite is diminished, the stomach is troubled with flatuleucy and indigestion, a degree of torpor and languor is fettover the whole body, great lassitude and fatigue are experienced after the least ex-

croise, the body is costive and the urine patlid. On the night of the attack, the patient perhaps goes to bod in tolerable healt, and, after a few hours, is awakened by the severity of the pain, most commonly in the first joint of the great-toe; sometimes, however, it attacks other parts of the foot, the heel, calf of the leg, or perhaps the whole of the foot. The pain resembles that of a dislocated bone, and is attended with the sensation as if cold water was poured upon the part; and this pain becoming more violent, is succecded by rigors and other febrile symptoms, together with a severe throbbing and inflammation in the part. Sometimes both feet become swelled and inflamed so that neither of them can be put to the ground; nor can the patient endure the least motion, without suffering excruciating pain. Towards morning, he falls asleep, and a gentle sweat breaks out, and terminates the paroxysm, a number of which constitutes what is called a fit of the gout; the duration of the fit will be longer or shorter, according to the disposition of the body to the disease, the season of the year, and the age and strength of the patient. When a paroxysm has thus taken place, although there is an alleviation of pain at the expiration of some hours, still the patient is not entirely relieved from it; and, for some evenings successively, he has a return both of pain and fever, which continue with more or less violence, until morning. The paroxysms, however, prove usually more mild every day, till at length the disease goes off either by perspiration, urine, or some other evacuation; the parts which have been affected becoming itchy, the cuticle falling off in scales from them, and some slight degree of lameness remaining. At first, an attack of gout occurs, perhaps, only once in two or three years; it then probably comes on every year, and, at length, it becomes more frequent, and is more severe, and of longer duration, each succeeding fit. In the progress of the disease, various parts of the body are afficted, and translations take place from one joint, or limb, to another; and, after frequent attacks, the joints lose their strength and flexibility, and become so stiff as to be deprived of all motion. Concretions, of a chalky nature, are likewise formed upon the outside of the joints, and nephritic affections of the kidneys arise from a deposite of the same kind of matter in them which, although fluid at first, becomes dry and firm at last, and, when put into acids, is perfectly soluble

2. Arthritis atonica. Atonic gout. It sometimes happens that, although a gouty diathesis prevails in the system, yet, from of the joints is preduced; in which case, the storeigh becomes particularly affected, and

the patient is troubled with flatulency, indigestion, loss of appetite, eructations, nausea, vomiting, and severe pains; and these affections are often accompanied with much dejection of spirits, and other hypochondriacal symptoms. In some cases, the head is affected with pain and giddiness, and now and then with a tendency to apoplexy; and in other cases, the viscera of the thorax suffer from the disease, and palpitations, faintings, and asthma arise. This

is what is called atonic gout. 3. Arthritis retrograda. Retrocedent gout. It sometimes happens that, after the inflammation has occupied a joint, instead of its continuing the usual time, and so going off gradually, it ceases suddenly, and is translated to some internal part. The term of retrocedent gout is applied to occurrences of this nature. When it falls on the stomach, it occasions nausea, vomiting, anxiety, or great pain; when on the heart, it brings on syncope; when on the lungs, it produces an affection resembling asthma; and, when it occupies the head, it is apt to give rise to apoplexy, or palsy.

4. Arthritis aberrans, or misplaced gout, is when the gouty diathesis, instead of producing the inflammatory affection of the joints, occasions an inflammatory affec-tion of some internal part, and which ap-pears from the same symptoms that at-tend the inflammation of those parts from other causes. All occurrences of this nature, as well as of the two former, are to be regarded as attacks of irregular gont and are to be guarded against as much as

possible.

ARTHROCACE. (From agbeor, a joint.)

An ulcer of the cavity of the bone,

ARTHRODIA. (From abeca, to articulate.) A species of diarthrosis, or moveable connexion of bones, in which the head of one bone is received into the superficial cavity of another, so as to admit of motion in every direction, as the head of the humerus with the glenoid cavity of the scapula.

ARTHRODYNIA. (From aphpou, a joint, and adovn, pain.) Chronic pains in the joints. without pyrexia. It is one of the terminations of acute rhenmatism. See Rheuma-

tismus.

ARTHROPUOSIS. (From αρθρον, a joint, and wvev. pus.) Arthropyosis. A collection of pus in a joint. It is, however, frequently applied to other affections, as lumbago psoadica, &c.

(From agbeco to articu-ARTHROSIS. late, or join together.) Articulation.

See Cynara. Artichoke.

Artichoke, French. See Cynara.

ARTICHORE, JERUSALEM. Although formerly in estimation for the table, this plant Helianthus tuberosus of Linnaus, is now neglected, it being apt to produce flatulency and dyspepsia.

ARTICULARIS. A name given to a dis-

ease which more immediately infests the articuli, or joints. The morbus articularis is synonymous with the Greek word arthritis, and our gout. A branch of the basilic vein is called articularis vena, because it passes under the joint of the shoulder.

ARTICULATION. (From articulus, 2 The skeleton is composed of a great number of bones, which are all so admirably constructed, and with so much affinity to each other, that the extremity of every bone is perfectly adjusted to the end of the bone with which it is connected; and this connexion is termed their articulation. Anatomists distinguish three kinds of articulation: the first they name Diarthrosis; the second, Synarthrosis; and the third Amphiarthrosis; which see, under their respective heads.

ARTISCUS. (From agree, bread.) A troch; so called because they are made like little

loaves.

ARTOCREAS. (From agros, bread, and nagros, fruit.) A nourishing food, made of bread and various meats, boiled together. Galen.

(From agros, bread, and ARTOGALA. γαλα, milk.) A cooling food, made of bread and milk.) A positice.

(From agros, bread, and ARTOMELI. μελι, honey.) A cataplasm made of bread and honey. Galen.

ARUM. (From the Hebrew word jaron which signifies a dart, so named because its leaves are shaped like a dart; or from apa, injury.)

1. The name of a genus of plants in the Linnæan system. Class, Gynandria. Order, Polyandria. Arum, or wake robin.

2. The pharmacopoial name of the

common arum, or wake-robin.

Arum maculatum of Linnaus:-acaule foliis hastatis integerrimis, spadice clavato. The root is the medicinal part of this plant, which, when recent, is very acrimonious; and, upon being chewed, excites an intolerable sensation of burning and prickling in the tongue, which continues for several When cut in slices, and applied to the skin, it has been known to produce blisters. This acrimony, however, is gradually lost by drying, and may be so far dissipated by the application of heat, as to leave the root a bland farinaceous aliment. In this state, it has been made into a wholesome bread. It has also been prepared as starch. Its medicinal quality, therefore, resides wholly in the active volatile matter, and consequently the powdered root must lose much of its power, on being long kept. Arum is certainly a powerful stimulant, and, by promoting the secretions, may be advantageously em-ployed in cachetic and chlorotic cases, in rheumatic affections, and in various other complaints of phlegmatic and torpid

constitutions; but more especially in a weakened or relaxed state of the stomach, occasioned by the prevalence of viscid mucus. If this root is given in powder, great care should be taken that it be young and newly dried, when it may be used in the dose of a scruple, or more, twice a day; but in rheumatisms, and other disorders requiring the full effect of this medicine, the root should be given in a recent state; and, to cover the insupportable pungency it discovers on the tongue, Dr. Lewis advises us to administer it in the form of emulsion, with gum-arabic and spermaceti, increasing the dose from ten grains to upwards of a scruple, three or four times a day. In this way, it generally occasioned a s-nsation of slight warmth about the stomach, and afterwards, in the remoter parts, manifestly promoted perspiration, and frequently produced a plentiful sweat. veral obstinate rheumatic pains were removed by this medicine The root answers quite as well as garlic for cataplasms, to be applied on the feet in deliriums. The London College, in their pharmacopæia, 1788, ordered a conserve, in the proportion of half a pound of the fresh root to a pound and a half of double refined sugar, beat together in a mortar, which appears to be one of the best forms of exhibiting arum, as its virtues are destroyed by drying, and are not extracted by any menstruum. It may be given to adults in doses of a drachm.

ARUM MACULATUM. The systematic name for the arum of the pharmacopæias.

See Arum.

ARYTENO-EPIGLOTTIDEUS. Innes. Albinus, Aryteno-Epiglottici of Winslow. A muscle composed of a number of fibres running between the arytenoid cartilage and epiglottis. It pulls the side of the epiglottis towards the external opening of the glottis, and when both act, they pull it close upon the glottis.

ARYTÆNOID CARTILAGE. Cartilago arytenoidea. The name of two cartillages

of the larynx. See Larynx.

ARYTENOIDES. (From applaine, a funnel, and sides, shape.) The name of some parts, from their being funnel-shaped.

ARYTENOIDEUS MAJOR. See Arytenoi-

deus transversus.

ARTTENOIDEUS MINOR. See Arytæ-

noideus obliquus.

ARYTÆNOIDEUS OBLIQUUS. Innes. Albinus, and Winslow. Arytænoideus minor of Douglas. A muscle of the glottis, which arises from the base of one arytænoid cartilage, and crossing its fellow, is inserted near the tip of the other arytænoid cartilage. It is a muscle that is occasionally wanting; but when present, and both muscles act, their use is to pull the arytænoid cartilages towards each other.

ARYTENOIDEUS TRANSVERSUS, of Innes, Albinus, Winstow. Arytenoideus major of Douglas. An azygos, or single muscle of the glottis, that arises from the sideof one ary moud cartilage, from near its articulation with the cricoid to near its tip. The fib. es run across, and are inserted in the same manner into the other arytemoid cartilage. Its use is to shut the glotis, by bringing the two arytemoid cartilages, with their ligaments, nearer to each other.

ASAFŒTIDA. (From the Hebrew word asa, to heal.) Hingisch of the Persians, Altihi of the Arabians. By some thought to be the σιλρίο, vel, στος σιλρίο of Dioscorides, Theophratus, and Hippocrates. Laser et luserpitian of the Latins. Assaferida gum resin. The plant which affords this gum resin, is the Ferula assafetida of Linnaus:—folio alternatim sinuatis, obtusis. Class, Pentandria. Order, Digyna. It grows plentfully on the mountains in the provinces of Chorasaan and Laar in Persia.

The process of obtaining it is as tollows: the earth is cleared away from the top of the roots of the oldest plants; the leaves and stalks are then twisted away, and made into a covering, to screen the root from the sun; in this state the root is left for forty days, when the covering is removed, and the top of the root cut off transversely; it is then screened again from the sun for forty-eight hours, when the juice it exudes is scraped off, and exposed to the sun to harden. A second transverse section of the root is made, and the exudation suffered to continue for forty eight hours, and then scraped off. In this manner it is eight times repeatedly collected in a period of six weeks. The juice thus obtained has a bitter, acrid, pungent taste, and is well known by its peculiar nauseous smell, the strength of which is the surest test of its goodness. This odour is extremely volatile, and of course the drug loses much of its efficacy by keeping. It is brought to us in large irregular masses, composed of various little shining lumps, or grains, which are partly of a whitish colour, partly reddish, and partly of a violet hue. Those masses are accounted the best which are clear, of a pale reddish colour, and variegated with a great number of elegant white tears. This concrete juice consists of two-thirds of gum and one-third of resin, its taste and smell residing in the resinous part. It yields all its virtues to alcohol. Triturated with water, it forms a miky-like mixture, the resin being diffused by the medium of the gum. Distilled with water, it affords a small quantity of essential oil. It is the most powerful of all the fætid gums, and is a most valuable remedy. It is most commonly employed in hysteria, hypochondriasis, some symptoms of dyspepsia, flatulent

colics, and in most of those diseases termed nervous, but its chief use is derived from its antispasmodic effects; and it is thought to be the most powerful remedy we possess, for those peculiar convulsive and spasmodic affections, which often recur in the first of these diseases, both taken into the stomach and in the way of enema. It is also recommended as an emmenagogue, anthelmintic, antiasthmatic, and anodyne. Dr. Cullen prefers it as an expectorant to gum ammoniacum. Where we wish it to act immediately as an antispasmodic, it should be used in a fluid form, as that of tincture, from half a drachin to two drachms. When given in the form of a pill, or triturated with water, its usual dose is from 5 to 20 grs. When in the form of enema, two drachms are to be diffused in eight ounces of warm milk or water. It is sometimes applied externally as a plaster and stimulating remedy, and is much used in hysteria, hypochondriasis, dyspep-

Asaphatum. (From α, neg. and σαφες, clear.) An intercutaneous itch, generated in the pores, like worms with black heads: so called by reason of their minuteness: they are hardly visible.

ASAPHIA. (From α, neg. and σαφης, clear.) A defect in utterance or pronunciation

ASARABACCA. See Asarum.

Asari Folia. Asarabacca leaves. The leaves of the Asarum Europæum. See

ASARUM. (From  $\sigma$ , neg. and  $\sigma \alpha \mu \omega$ , to adorn, because it was not admitted into the ancient coronal wreaths.) Asarabacca.

1. The name of a genus of plants in the Linnaan system. Class, Dodecandria. Order, Monogynia.

2. The pharmacopæial name of the asarabacca.

rabacca.

Asarum Europeum of Linnxus, foliis reniformibus obtusis binis.

It is a native of England, but not very common. The leaves of this plant are extremely acrid, and are occasionally used, when powdered, as a sternutatory. For this purpose the leaves, as being less acrid than the roots, are preferred, and in moderate doses not exceeding a few grains, snuffed up the nose several evenings, produce a pretty large watery discharge, which continues for several days together, by which head-ache, tooth-ache, opthalmia, and some paralytic and soporific complaints have been effectually relieved.

Prior to the introduction of ipecacuanha, the leaves and root of this plant were frequently employed on account of their emetic power: the dose of the dried leaves was 20 grains; of the dried roots 10 grains. As they were occasionally violent in their operation, they have fallen into disuse.

ASARUM EUROPEUM. The systematic

name of the asarabacca of the shops. So Asarum.

Ascardes. The plural of ascaris. See Ascaris.

ASCARIS. (From uonico, to move about; so called from its continued troublesome motion.) There are several kinds of worms distinguished by this term; but those which claim a place here as belonging only to the human body, are:—

1. Ascaris vermicularis, the thread or maw worm, which is very small and slender, not exceeding half an inch in length:

they inhabit the rectum.

2. Ascaris lumbricoides, the long and round worm, which is a foot in length, and about the breadth of a goose-quill.

ASCENDENS OBLIQUUS. See Obliquus as-

cendeus.

Ascia. An axe or chissel. A simple bandage; so called from its shape in position. Galen.

ASCITES. (From 2020s, a sack, or bottle: so called from its bottle-like protuberancy.) Dropsy of the belly. A tense, but scarcely elastic, swelling of the abdomen from accumulation of water. Cullen ranks this genus of disease in the class cachexiae, and order intumescentiae. He enumerates two species:—

1 Ascites abdominalis, when the water is in the cavity of the peritonaum, which is known by the equal swelling of the parietes of the abdomen.

2. Ascites saccatus, or encysted dropsy, in which the water is encysted, as in the ovarium; the fluctuation is here less evident, and the swelling is at first partial.

Ascites is often preceded by loss of appetite, sluggishness, dryness of the skin, oppression at the chest, cough, diminution of the natural discharge of urine, and costiveness. Shortly after the appearance of these symptoms, a protuberance is perceived in the hypogastrium, which extends gradually, and keeps on increasing, until the whole abdomen becomes at length uniformly swelled and tense. The distension and sense of weight, although considerable, vary somewhat according to the posture of the body, the weight being felt the most on that side on which the patient lies, whilst at the same time, the distension becomes somewhat less on the opposite side. In general the practitioner may be sensible of the fluctuation of the water, by applying his left hand on one side of the abdomen, and then striking on the other side with his right. In some cases it will be obvious to the ear. As the collection of water becomes more considerable, the difficulty of breathing is much increased, the counte-nance exhibits a pale and bloated appearance, an immoderate thirst arises, the skin is dry and parched, and the urine is very scanty, thick, high coloured, and deposits a

lateritious sediment. With respect to the pulse, it is variable, being sometimes considerably quickened, and at other times, slower than natural. The principal difficulty which prevails in ascites, is the being able to distinguish with certainty, when the water is in the cavity of the abdomen, or when it is in the different states of encysted dropsy. To form a just judgment, we should attend to the following circumstances: When the preceding symptoms give suspicion of a general hydropic diathesis; when at the same time, some degree of dropsy appears in other parts of the body; and when from its first appearance the swelling has been equally diffused over the whole belly, we may generally presume that the water is in the cavity But when an ascites of the abdomen. has not been preceded by any remarkable cachectic state of the system, and when, at its beginning, the tumour and tension had appeared in one part of the belly more than another, there is reason to suspect an encysted dropsy. Even when the tension and tumour of the belly have become general, yet if the system or the body in general appear to be little affected; if the patient's strength be little impaired; if the appetite continue pretty entire, and the natural sleep be little interrupted; if the menses in females continue to flow as usual; if there be yet no anasarca, or though it may have already taken place, if it be still confined to the lower extremities, and there be no leucophlegmatic paleness or sallow colour in the countenance; if there be no fever, nor so much thirst and searcity of urine as occur in a more general affection: then according as more of these different circumstances take place, there will be the stronger grounds for supposing the ascites to be of the encysted kind.

Aser. A pustule like a millet seed.

Asegon. Asegon. Asegon. Dragon's blood. ASCLEPIAS. (From Asclepias, its discoverer; or from Asculapius, the god of medicine.) The herb swallow-wort. The name of a genus of plants in the Linnæan system. Class, Pentandria. Order, Digynia.

Ascleptas vinceroxicum. The systematic name for the vincetoxicum of the pharmaco-

paias. See l'incetoxicum.

Asclerios. (From Asclepias, its inventor.) A dried smegma and collyrium de-

scribed by Galen.

Ascoma. (From arms, a bottle.) The eminence of the pubes at the years of maturity; so called from its shape.

Ash. Sec Fraxinus.

Asones. (From afa, to nauseate.) A nausea or loathing, or a fever with much sense of heat and nausea. Areteus.

ASIATICUM BALSAMUM. Balm of Gilcad. ASINUS. The ass. Its milk is much esteemed in medicine. See Asses' milk.

ASININUM LAC. "Asses' milk.

Asiri. (From a, neg. and ourse, food.)

Asitia. Those are so called who take no food far want of appetite.

ASJOGAM. (Indian) A tree growing in Malahar and the East Todies, whose juice is used against the colic.

ASPADIALIS A suppression of urine

from an imperforated methra.

ASPALATHUM. The aromatic aloe.

ASPARAGUS. (Ασπαραχώ, a young shoot, before it unfolds its leaves.)

1. The name of a genus of plants in the Linnwan system. Class, Hexandria, Order,

Monogynia. Asparagus.
2. The pharmacopoulal name of the com-

mon sparage, or sparrow-grass.

Asparagus officinalis of Linnæus. The root has been esteemed as a diuretic. It is mostly employed as a food, but it contains very little nourishment.

Aspasia. (From α, for αμα, together, and σπαα, to draw.) A constrictive medicine for the pudendum muliebre. Capivac.

ASPERA ARTERIA. (So called from the inequality of its cartilages) Sec Trachea.

ASPERULA. (A diminutive of asper, the seeds being rough.) The name of a genus of plants in the Linnman system. Class, Tetrandria. Order, Monogynia. Woodroof.

ASPERULA OBORATA. The systematic name for the officinal matrisylva. See Matrisylva.

ASPHALITIS. A kind of trefoil: the last vertebra of the loins.

ASPHODELUS. (From αστικ, a serpent, and διιλες, fearful; because it destroys the venom of serpents; or from στοδιλος, ashes, because it was formerly sown upon the graves of the dead) Asphodel.

1. The name of a genus of plants in the Linnwan system. Class, Hexandria. Order,

Monogynia.

2. The pharmacopoial name of the daf-

fodil, or branched asphodel.

Aspholelus rannosus, of Linnæus:—caule nudo, foltis ensiformibus, carinatis, levibus. The plant was formerly supp sed to be efficacious in the cure of sordid ulcers. It is now wholly laid aside.

Asphonetus namosus, The systematic name for the officinal asphodelus. See As-

phodelus.

ASPHYXIA. (From α, priv. and σφυξε, a pulse.) The state of the body, during life, in which the pulsation of the heart and arteries cannot be perceived. There are several species of asphyxia enumerated by different authors. See Syncope,

Astidiscus. (From agric, a buckler.) The sphincter muscle of the anus was formerly so called from its shape. Calius

Aurelianus.

ASPLENIUM. (From a, priv. and others the spleen; because it was supposed to remove disorders of the spleen.) The herb spleen-wort.

The name of a genus of plants in the Lin-

næan system. Class, Cryptogamia. Order. Filicis.

ASPLENIUM RUTA MURARIA. The systematic name for the ruta muraria of the pharmacopæias. See Ruta muraria.

ASPLENIUM SCOLOPENDRIUM. The systematic name for the scolopendrium of the pharmacopæias. See Scolopendrium.

ASPLENIUM TRICHOMANES. tematic name for the trichomanes of the

pharmacopæias. See Trichomanes. A shrub found on the coast of Guinea, whose leaves are supposed to disperse buboes.

Assarctida. See Assofatida.

Assala. The nutmeg.

ASSANUS. A weight consisting of two drachms.

ASSANABACCA. See Asarum.

Assanium. A Roman measure of twelve ounces

See Articulation. ASSARTHROSIS.

Asse. A loathing of food, from a con-

flux of humours. Hippocrates.

Asses' Milk. This is preferred to cows' and other kinds of milk in phthis cal cases, and where the stomach is weak; as containing less desginous particles, and being more easily converted into chyle.

Assimplation. (Assimilatio, from ad, and similie, to make like to.) The conversion of the food into nuriment.

Assistentes. (From ad. and sisto, to stand near.) A name of the prostate gland; so called because it lies near the bradder.

(From acaomia, to nauseate, or from assare, to burn.) Asodes. A continual fever attended with a loathing of food. Sauvages cells it Tritæphya assodes; it is arranged by Cullen under the tertian remittents.

Assos. A name given formerly to alumen.

ASTACUS MARINUS. (From a, neg. and sala, to distil; so called from the hardness and dryness of its shell.) The lobeter. The black tips of the claws of this fish, and of the sea crab, and the stony concretions in the heads of the astacus fluviatill s, called crab's eyes, form some of the absorbent preparations of the shops

ASTACUS FLUVIATILIS. The officinal crab, crevis, or cray fish.

ASTAPIS. (From 7aque uva, passa) raisin.

ASTARZOF. The name of an ointment of litharge, house-leek, &c. Haracelsus.

ASTCHACHILOS A malignant ulcer, by some called araneus.

ASTEANTIUM. (From asup, a star.) tericum. The herb pellitory: so called from its star-like form.

ASTHENIA. (From α, priv. and σθενος, strength.) Extreme debility. The asthenic diseases form one great branch of the Brunonian hypothesis.

ASTHENOLOGY. (From a, priv. and ob: yes, strength, and royes, a treatise) The doctrine of diseases arising from debility disciples of the Brunonian school, as they denominate themselves, maintain peculiar opinions on this subject.

ASTHMA. (From ασθμαζω, to breathe with difficu.ty) Difficult respiration, returning at intervals, with a sense of stricture across the breast, and in the lungs; a wheezing, hard cough, at first, but more free towards the close of each paroxysm, with a discharge of mucus, followed by a remission. It is ranked by Cullen in the class neuroses, and order spasmi. are three species of asthma:-

1. Asthma spontaneum, when without

any manifest cause.

2. Asthma plethoricum, when it arises from plethora.

3. Asthma exanthematicum, originating from the repulsion of some acrid hu-

Asthma rarely appears before the age of puberty, and seems to attack men more frequently than women, particularly those of a full habit, in whom it never fails, by frequent repetition, to occasion some de-gree of emaciation. In some instances, it arises from an hereditary predisposition, and in many others, it seems to depend upon a particular constitution of the lungs. Dyspepsia always prevails, and appears to he a very prominent feature in the predisposition. Its attacks are most frequent during the heats of summer in the dogdays, and in general commence at midnight. On the evening preceding an attack of asthma the spirits are often much affected, and the person experiences a sense of fulness about the stomach, with lassitude, drowsiness, and a pain in the head. On the approach of the succeeding evening, he perceives a sense of tightness and stricture across the breast, and a sense of straitness in the lungs, impeding respiration. The difficulty of breathing continuing to increase for some length of time, both inspiration and expiration are performed slowly and with a wheezing noise; the speech becomes difficult and uneasy, a propensity to coughing succeeds, and the patient can no longer remain in a horizontal position, being as it were threatened with immediate suffocation. These symptoms usually continue till towards the approach of morning, and then a remission commonly takes place; the breathing becomes less laborious and more full, and the person speaks and coughs with greater ease. If the cough is attended with an expectoration of mucus he experiences much re-lief, and soon falls asleep. When he awakes in the morning, he still feels some degree of tightness across his breast, although his breatling is trobably more free and easy, and he cannot bear the least motion, without rendering this more difficult and uneasy; neither can he continue in bed, unless his head and shoulders are raised to a considerable height. Towards evening, he again becomes drowsy, is much troubled with flatuiency, in the stomach, and perceives a return of the difficulty of breathing, which continues to increase gradually, till it becomes as violent as on the night before. After some nights passed in thi. way, the fits at length moderate, and suffer more considerable remissions, particularly when they are attended by a copious expectoration in the mornings, and that this continues from time to time throughout the day; and the disease going off at last, the patient enjoys his usual rest by night, without further disturbance.

ASTITES. (From ad, and sto, to stand near.) A name given by the ancients to the prostate glands, because they are situa-

ted near the bladder.

ASTRAGALUS. (Asprazaus, a cockal, or die; because it is shaped like the die used in ancient games.) Ballisfæs os : aristrios : talus : quatrio : tetroros : cavicula

cavilla: diabebos: peza.

1. The name of a bone of the tarsus, upon which the tibia moves. Ancle-bone; also called the sling-bone, or first bone of the foot. It is placed posteriorly and superiorly in the tarsus, and is formed of two parts, one large, which is called its body, the other small, like a process. The part where these two unite is termed the neck.

2. The Linnard system. Class, Linnard system, Milk-vetch. 2. The name of a genus of plants in, the Class, Diadelphia.

ASTRAGALUS EXCAPUS. Stemless milk vetch. The root of this plant, Astragalus acaulis excapus leguminibus lunatis, foliis villosis of Linnæus, is said to cure confirmed syphilis, especially when in the form of nodes and nocturnal pains.

ASTRAGALUS TRAGACANTHA. The systematic name for the plant which affords the gum tragacanth. See Tragacantha.

ASTRANTIA VULGARIS. From astrum, a star; so called from the star-like shape of Astrantia nigra. The herb its flowers.) sanicle masterwort. A rustic purge.

ASTRAPE. (From a spanla, to corruscate.) Galen reckons it among the Lightning.

remote causes of epilepsy.

(From astringo, to bind.) ASTRICTA. When applied to the belly, it signifies costiveness; thus alvus astricta.

Astringents. See Adstringents.

ASTRONOMIA. (From asgov, a star, and romos, a law.) Astronomy, or the knowledge of the heavenly bodies. Hippocrates ranks this and astrology among the necessary studies of a physician,

ASUAR. Indian myrobalans, or purging

ASUGAR. Ærugo æris, or verdigrise. Asvoli. Fuligo, or soot, an antispasmodic. ATAC. Nitre.

(From a, neg. and rasou, to order.) Want of regularity in the symptoms of a disease, or of the functions of an animal body,

(Arab.) . A tenesmus : a dis-

ease of the eyes.

ATAXMIR. (Arab.) Removal of preternatural hairs growing under the natural ones on the eye-lids.

ATEBRAS. A chymical subliming vessel. ATECNIA. (From α, neg. and τικτω, to ing forth.) Venereal impotency: ina-Venereal impotency: inabring forth.) bility to procreate children.

ATHAMANTA CRETENSIS. The systematic name for the daucus creticus of the phar-

macopæias. See Daucus creticus.

ATHAMANTA OREOSELINUM. tematic name for the officinal oreoselinum.

See Oreoselinum,

ATHANASIA (From a, priv. and Javaros. death; so called because its flowers do not wither easily.) The immortal plant. A name given to tansey: because when stuffed up the nose of a dead corpse, it is See Tanacesaid to prevent putrefaction. tum. It means also immortality. The name of an antidote of Galen, and another of Oribasius: it is the name also of a collyrium described by Ætius, and of many other compositions.

A chymical di-ATHANOR. (Arab.)

gesting furnace.

ATHARA. (From αθηρ, corn.) A panada, or pap for children, made of bruised corn.

ATHENA. A plaster in much repute among the ancients.

ATHENATORIUM. A thick glass cover formerly used for chymical purposes.

ATHENIONIS CATAPOTIUM. The name of a pill in Celsus's writings.

ATHENIPPON. Athenippum. nes. The name of a collyrium.

ATHEROMA. (Abuquez, pulse, pap.) An encysted tumour that contains a soft substance of the consistence of a poultice.

ATHONOR. (Arab.) A chymical furnace. ATHYMIA. (From a, neg. and Suuos, urage.) Pusillanimity. Despondence courage.) synonymous with melancholia.

ATINCAR. (Arab.) Borax.
ATLAS. (From ατλαω, to sustain, because it sustains the head; or from the fable of Atlas, who was supposed to support the world upon his shoulders.) The name of the first cervical vertebra. This vertebra differs very much from the others. (See Vertebra.) It has no spinous process which would prevent the neck from being bent backwards, but in its place it has a small eminence. The great foramen of this is much larger than that of any other verte-Its body, which is small and thin, is nevertheless firm and hard. It is somewhat like a ring, and is distinguished into its great arch, which serves in the place of its body, and its small posterior arch. The atlas is joined superiorly to the head b.

ginglymus; and inferiorly, to the second all deliquescent salts, possess this cervical vertebra, by means of the inferior. The greater number of animal at oblique processes and the odontoid process by trochoides.

ATMOSPHERE. (From Δμος, vapour and σφαιμα, a globe. The elastic invisible fluid which surrounds the earth to an unknown height and encloses it on all sides.

Neither the properties nor the composition of the atmosphere seem to have occupied much the attention of the ancients,

Aristotle considered it as one of the four elements, situated between the regions of water and fire, and mingled with two exhalations, the dry and the moist: the first of which occasioned thunder, lightning, and wind; while the second produced rain, snow, and hail.

The opinions of the ancients were vague conjectures, until the matter was explained by the sagacity of Hales, and of those philosephers who followed his career.

Boyle proved beyond a doubt, that the atmosphere contained two distinct sub-

stances :-

1. An elastic fluid distinguished by the name of air.

2. Water in a state of vapour.

Besides these two bodies it was supposed that the atmosphere contained a great variety of other substances which were continually mixing with it from the earth, and which often altered its properties and rendered it noxious or fatal—Since the discovery of carbonic acid gas by Dr. Black, it has been ascertained that this elastic fluid always constitutes a part of the atmosphere.

The constituent parts of the atmosphere,

therefore, are :-

1. Air.

2. Water.

3. Carbonic acid gas.
4. Unknown bodies.

For the properties, composition and ac-

count of the first, See Air.

2. Water.—That the atmosphere contains water, has been always known. The rain and dew which so often precipitate from it, the clouds and fogs with which it is often obscured, and which deposit moisture on all bodies exposed to them, have demonstrated its existence in every age. Even when the atmosphere is perfectly transparent, water may be extracted from it in abundance by certain substances. Thus if concentrated sulphuric acid be exposed to air, it gradually attracts so much moisture, that its weight is increased more than three times: it is converted into diluted acid, from which the water may be separated by distillation. Substances which have the property of abstracting water from the atmosphere, have received the epithet of hygroscopic, because they point out the presence of that water. Sulphuric acid, the fixed alkalies, muriat of lime, nitrat of lime, and in general

all deliquescent salts, possess this property. The greater number of animal and vegeta-Many of them take water from moist air, but give it out again to the air when dry. These bodies augment in bulk when they receive moisture, and diminish again when they part with it. Hence some of them have been employed as hygrometers or measurers of the quantity of moisture contained in the air around them. This they do by means of the increase or diminution of their length, occasioned by the addition or abstraction of moisture. This change of length is precisely marked by means of an index The most ingenious and accurate hygrometers, are those of Saussure and Deluc. In the first, the substance employed to mark the moisture is a human hair, which by its contractions and dilatations is made to turn round an index. In the second, instead of a hair, a very fine thin slip of whalebone is employed. The scale is divided into 1000. The beginning of the scale indicates extreme dryness, the end of it indicaies extreme moisture. is graduated by placing it first in air made as dry as possible by means of salts, and afterwards in air saturated with moisture. This gives the extremes of the scale, and the interval between them is divided into 100 equal parts.

The water, which constitutes a component part of the atmosphere, is chymically combined with air; but it exists in two different states. A small portion is held in solution in the state of water, but by far the greater proportion is in the state of an elastic fluid, whose specific gravity is to that of air as 10 to 12, and chymically combined with air in the same manner as one gas is combined with another. As the quantity of the water contained in the atmosphere varies considerably, it is impossible to ascertain its amount with any degree

of accuracy.

3. Carbonic acid gas. - The existence of carbonic gas as a constituent part of the atmosphere, was observed by Dr. Black immediately after he had ascertained the nature of that peculiar fluid. If we expose a pure alkali or alkaline earth to the atmosphere, it is gradu: lly converted into a carbonat by the absorption of carbonic acid gas. This fact, which had been long known, rendered the inference that carbonic acid gas existed in the atmosphere unavoidable as soon as the difference between a pure alkali and its carbonat had been ascertained to depend upon that Not only alkalies and alkaline carths absorb carbonic acid when exposed to the air, but several of the metallic oxydes

Carbonic acid gas not only forms a constituent part of the atmosphere near the surface of the earth, but at the greatest beights which the industry of man has been able to penetrate. Saussure found it at the top of Mount Blanc, the highest point of the old continent; a point covered with eternal snow, and not exposed to the influence of vegetables or animals. Lime water diluted with its own weight of distilled water, formed a pellicle on its surface after an hour and three quarters exposure to the open air on that mountain; and slips of paper moistened with pure pot-ash, acquired the property of effervescing with acids after being exposed an hour and a half in the same place. This was at a height no less than 15,668 feet above the level of the sea. Humbolt has more lately ascertained the existence of this gas in air, brought by Mr. Garnerin from a height not less than 4280 feet above the surface of the earth, to which height he had risen in an airballoon. This fact is a sufficient proof that the presense of carbonic acid in air does not depend upon the vicinity of the earth.

Now as carbonic acid gas is considerably heavier than air, it could not rise to great heights in the atmosphere unless it entered into combination with the air. We are warranted, therefore, to conclude that carbonic acid is not merely mechanically mixed, but it is chymically combined with the other constituent parts of the atmosphere. It is to the affinity which exists between carbonic acid and air that we are to ascribe the rapidity with which it disperses itself through the atmosphere, notwithstanding its great specific gravity. Fontana mixed 20,00 cubic inches of carbonic acid gas with the air of a close room, and yet half an hour after he could not discover the traces of carbonic acid in that Water impregnated with carbonic acid, when exposed to the air, very soon loses the whole of the combined gas. And when a phial full of carbonic acid gas is left uncorked, the gas, as Bergman first ascertained, very soon disappears, and the phial is found filled with common air.

It is owing to this strong affinity between air and carbonic acid gas, that it is so difficult to detect the presence of that gas in air by the common tests. Atmospheric air does not render lime water turbid, though agitated with it ever so long, or made to pass through it in ever so great a quantity. Neither has it any effect upon the most delicate vegetable blues. The great quantity of air with which it is combined, envelopes it in such a manner that these bodies are not powerful enough to abstract it. We must employ for that purpose substances which have a very strong affinity for that acid, as the alkalies, milk of lime, &c. These substances detect its presence by acquiring the property of effervescing with acids.

The difficulty of separating this gas from air has hitherto prevented the possibility of

determining with accuracy the relative quantity of it in a given bulk of air; but from the experiments which have been made, we may conclude with some degree of confidence, that it is not very different from 0.01. From the experiments of Humbolt, it appears to vary from 0.005 to 0.01. This variation will by no means appear improbable, if we consider that immense quantities of carbonic acid gas must be constantly mixing with the atmosphere, as it is formed by the respiration of animals, by combustion, and several other processes which are going on continual-ly. The quantity, indeed, which is daily formed by these processes is so great, that at first sight it appears astonishing that it does not increase rapidly. The consequence of such an increase would be fatal, as air containing 0.1 of carbonic acid extinguishes light and is noxious to animals. But there is reason to conclude, that this gas is decomposed by vegetables as rapidly

4. Bodies found in the atmosphere.—From what has been advanced, it appears that the atmosphere consists chiefly of three distinct elastic fluids united together by chymical affinity; namely, air, vapour, and carbonic acid gas; differing in their proportions at different times and in different places; the average proportion of each is

98.6 air

1.0 carbonic acid 0.4 water

## 100.0

But besides these bodies which may be considered as the constituent parts of the atmosphere, the existence of several other bodies has been suspected in it. It is not meant in this place to include among those bodies electric matter, or the substance of clouds and fogs, and those other bodies which are considered as the active agents in the phenomena of meteorology, but merely those foreign bodies which have been occasionally found or suspected in air. Concerning these bodies, however, very little satisfactory is known at present, as we are not in possession, of instruments sufficiently delicate to ascertain their presence. We can indeed detect several of them actually mixing with air, but what becomes of them afterwards we are unable to say.

1. Hydrogen gas is said to have been found in air situated near the crater of volcanoes, and it is very possible that it may exist always in a very small proportion in the atmosphere; but this cannot be ascertained till some method of detecting the presence of hydrogen combined with a great proportion of air be discovered.

2. Carbonated hydrogen gas is often emitted by marshes in considerable quantities during hot weather. But its presence has never been detected in air; so that in all probability it is again decomposed by

some unknown process.

3. Oxygen gas is emitted abundantly by plants during the day. There is some reason to conclude that this is in consequence of the property which plants have, of absorbing and decomposing carbonic acid gas. Now as this carbonic acid gas is formed at the expense of the oxygen of the atmosphere, as this oxygen is again restored to the air by the decomposition of the acid, and as the nature of atmospheric air remains unaltered, it is clear that there must be an equilibrium between these two processes; that is to say, all the carbonic acid formed by combustion must be again decomposed, and all the oxygen abstracted must be again restored. The oxygen gas which is thus continually returning to the air, by combining with it, makes its component parts always to continue in the same

4. The smoke and other bodies which are continually carried into the air by evaporation, &c. are probably soon deposited again, and cannot therefore be considered with propriety as forming parts of the at-mosphere. But there is another set of bodies, which are occasionally combined with air, and which, on account of the powerful action which they produce on the human body, have attracted a great deal of attention. These are known by the name

of contagion.

That there is a difference between the atmosphere in different places, as far as respects its effects upon the human body, has been considered as an established point in all ages. Hence some places have been celebrated as healthy, and others avoided as pernicious, to the human constitution. It is well known that in pits and mines the air is often in such a state as to suffocate almost instantaneously those who attempt to breathe it. Some places are frequented by peculiar diseases. It is known that those who are much in the apartments of persons ill of certain maladies, are extremely apt to catch the infection; and in prisons and other places, where crowds of people are confined together, when diseases once commence, they are wont to make dreadful havoc. In all these cases it has been supposed that a certain noxious matter is dissolved by the air, and that it is the action of this matter which produces the mischief.

This noxious matter is in many cases readily distinguished by the peculiarly disagreeable smell which it communicates to No doubt this matter differs according to the diseases which it communicates, and the substance from which it has originated. Morveau lately attempted to ascertain its nature; but he soon found the chymical tests hitherto discovered al-

together insufficient for that purpose. He has put it beyond a doubt, however, that this contagious matter is of a compound nature, and that it is destroyed altogether by certain agents, particularly by those gaseons bodies which readily part with their oxygen. He exposed infected air to the action of various bodies, and he judged of the result by the effect which these bodies had in destroying the fetid smell of the air. The following is the result of his experiments.

1. Odorous bodies, such as benzoin, aromatic plants, &c. have no effect whatever.

2. Neither have the solutions of myrrh, benzoin, &c. in alkahol, though agitated in infected air. 3. Pyrolignous acid is equally inert. 4. Gunpowder, when fired in infected air, displaces a portion of it; but what remains still retains its fetid odour. 5. Sulphuric acid has no effect; sulphurous acid weakens the odour, but does not destroy it. 6. Acetous acid diminishes the odour, but its action is slow and incomplete. 7. Acetic acid acts instantly, and destroys the fetid odour of infected air completely. 8. The fumes of nitric acid, first employed by Dr. Carmichael Smith, are equally efficacious. atic acid gas, first pointed out as a proper agent by Morveau himself, is equally effectual. 10. But the most powerful agent is oxy-muriatic acid gas, first proposed by Mr. Cruickshanks, and now employed with the greatest success in the British navy and military hospitals.

Thus there are four substances which have the property of destroying contagious matter, and of purifying the air: but acetic acid cannot easily be obtained in sufficient quantity, and in a state of sufficient concentration to be employed with advantage. Nitric acid is attended with inconvenience, because it is almost always contaminated with nitrous gas. Muriatic acid and oxymuriatic acid are not attended with these inconveniences; the last deserves the preference, because it acts with greater energy and rapidity. All that is necessary is to mix together two parts of salt with one part of the black oxide of manganese, to place the mixture in an open vessel in the infected chamber, and to pour upon it two parts of sulphuric acid. The fumes of oxy-muriatic acid are immediately exhaled, fill the chamber, and destroy the conta-

Атосита. (From a, neg. and Toxos, offspring; from τικτω, to bring forth.) bility, to bring forth children. Difficult

ATONIC. Relaxed, diminution strength, weakness, debility.

ATONY. (From a, neg. and resva, to extend.) A defect of muscular power.

ATRABILIARIE CAPSULE. See Glandule renales.

ATRABILIS. Black bile, or melancholy. ATRACHELUS. (From α, priv. and τρα-χηλος, the neck.) Short-necked.

ATRAGENE. Viorna. Clematis arthra-gene of Theophrastus. The Clematis vitalba of Linnaus. The traveller's joy: a common shrub in our hedges. It is said to have caustic qualities and to raise a blister when applied to the skin.

ATRAMENTUM SUTORIUM. A name of

green vitriol.

ATRASIA. (From α, neg. and τιτραω, to perforate.) Atresia. Imperforation. disease where the anus or genitals have not their usual orifice.

ATRETARUM. (From a, neg. and TPAW, to perforate.) A suppression of urine from the menses being retained in the vagina.

ATRICES. (From a, priv. and Ing, hair.) Small tubercles about the anus upon which hairs will not grow. Vaselius.

ATRICI. Small sinuses in the rectum, which do not reach so far up as to perfo-

rate into its cavity.

ATRIPLEX FŒTIDA. Atriplex olida. Vulvaria. Garosmum. Raphex. Chanopodium fætidum. Blitum fætidum. ing orach. The very fetid smell of this plant, Chenopodium vulvaria: foliis integerrimis rhombeo-ovatis, floribus conglomeratis axilaribus, of Linnæus, induced physicians to exhibit it in hysterical diseases, It is now superseded by more active preparations,

ATRIPLEX HORTENSIS. The Systematic name for the atriplex sativa of the pharma-

copæias. See Arriplex sativa.

ATRIPLEX SATIVA. The herb and seed of this plant, Atriplex hortensis caule erecto herbaceo, foliis triangularibus, of Linnæus, have been exhibited medicinally as antiscorbutics, but the practice of the present day appears to have totally rejected them.

ATROPA. (From ATPOTOS, the goddess of Destiny; so called from its fatal effects.)

The deadly night-shade. The name of a genus of plants in the Linnæan system. Class, Pentandria.

der, Monogyniæ.

The systematic ATROPA BELLADONNA. name for the belladonna of the pharmaco-

pæias. See Belladonna.

ATROPA MANDRAGORA. The systematic name for the plant which affords the radix mandagoræ of the pharmacopæias. Mandragora.

ATROPHIA. Sec Atrophy.

ATROPHY. (From a, neg. and τρεφω, to nourish.) Atrophia. Marasmus. Nervous This disease is marked by consumption. a gradual wasting of the body, unaccompanied either by a difficulty of breathing, cough, or any evident fever, but usually attended with a loss of appetite and impaired digestion. It is arranged by Cullen in the class cachexia, and order macrores. There are four species :-

 When it takes place from too copious evacuations, it is termed atrophia inanitorum; by others called tabes nutricum; -sudatoria ;- à sanguifluxu, &c.

2. When from famine, atrophia famelico-

3. When from corrupted nutriment, atrophia cacochymica.

4. And when from an interruption in the digestive organs, atrophia debitium.

The atrophy of children, is called paidatropia. The causes which commonly give rise to atrophy, arc a poor diet, unwholesome air, excess in venery, fluor albus, severe evacuations, continuing to give suck too long, a free use of spirituous liquors, mental uneasiness, and worms; but it frequently comes on without any evident cause. Along with the loss of appetite and impaired digestion, there is a diminution of strength, the face is pale and bloated, the natural heat of the body is somewhat diminished, and the lower extremities are ædematous. Atrophy, arise from whatever cause it may, is usually very difficult to cure, and not unfrequently terminates in dropsy.

ATTENUANTS. (Attenuantia, sc. medicamenta; from attenuo, to make thin.) Diluents. Those substances are so termed, which possess a power of imparting to the blood a more thin and more fluid consistence than it had previous to their exhibition; such are, aqua, serum lactis, &c.

ATTOLLENS AUREM. (.Attollens ; from attollo, to lift up.) Attollens auriculæ of Albinus and Douglas; Superior auris of Winslow, and Attollens auriculan of Cowper. A common muscle of the ear, which arises, thin, broad, and tendinous, from the tendon of the occipito-frontalis, from which it is almost inseparable, where it covers the aponeurosis of the temporal muscle; and is inserted into the upper part of the ear, opposite to the antihelix. Its use is draw the ear upwards, and to make the parts into which it is inserted, tense.

ATTOLLENS OCULI. One of the secti-muscles which lie upon the upper part of the

globe and pulls up the eye.

ATTONITUS MORBUS. (From attono, to surprise; so called because the person falls down suddenly.) Attonitus stupor. The apoplexy and epilepsy.

ATTRACTION. (From attraho, to at-

Affinity.) tract.

The terms attraction, or affinity, and repulsion, in the language of modern philosophers, are employed merely as the expression of the general facts, that the masses or particles of matter have a tendency to approach to, or to recede from one another, and to unite to, or repel each other, under certain circumstanAll bodies have a tendency or power to attract each other more or less, and it is this power which is called attraction.

Attraction is mutual, it extends to indefinite distances. All bodies whatever, as well as their component elementary particles, are endued with it. It is not annihilated, at how great a distance soever we suppose them to be placed from each other; neither does it disappear though they be arranged ever so near each other.

The nature of this reciprocal attraction, or at least the cause which produces it, is altogether unknown to us. Whether it be inherent in all matter, or whether it be the consequence of some other agent, are questions beyond the reach of human understanding; but its existence is neverthe-

less certain.

Proofs of attraction.

That the power of attraction really exists is obvious from the slightest view of the phenomena of nature. It is proved with mathematical certainty that the celestial bodies, which constitute the solar system, are urged towards each other by a force which preserves them in their orbits. It is further proved beyond any doubt, that this planetary attraction is possessed not only by the heavenly bodies as wholes, but that it also extends to the smaller particles of which they are formed, as may be evinced by means of the following experiments.

First.—If we place two or more globules of mercury on a dry glass or earthen plate, and push them gently towards each other, the globules will attract each other, and form one mass or sphere greater in bulk but precisely the same in nature.

Secondly.—If a plate of clean glass, perfectly dry, be laid on a large globule of mercury, the globule, notwithstanding the pressure applied to it, continues to preserve its spherical form; if we gradually charge the plate with weights carefully, the globule will be depressed and become thinner and thinner; but if we again remove the weights from the plate, the mercury will instantly recover its globular figure and

push up the glass before it.

In both these experiments we see that there exists an attraction between the particles of mercury; in the first, the globules which are in contact with the plate of glass leave this substance completely, they attract each other and form a sphere greater in bulk. A mere inert fluid would in any case retain the figure it once possessed. It could not be endued with a globular form unless a real reciprocal attraction among its particles, took place, which in the latter experiment is still more striking, for it there is not only superior to gravitation, but actually overcomes an external force.

Thirdly.-If a glass tube of a fine bore

be immersed in water, contained in any vessel, the fluid will ascend to a certain height within the tube above its level, and its elevation in several tubes of different sizes will be reciprocally as the diameter of their bores.

This kind of attraction which takes place as well in vacuo as in the open air, has been called capillary attraction. It is this attraction which causes water to rise in sponge, cloth, sugar, sand, &c. for all these substances may be considered as fine

tubes in which the fluid ascends.

Remark.—The ascension of fluids in glass tubes of a fine bore succeeds best when the inside of the tube has been previously moistened, which may conveniently be done by blowing through it with the mouth. And if the water be coloured with a little red or black ink, its ascension will be more obvious, particularly if the tube be held

against a sheet of white paper.

Fourthly.—If two plates of glass previously wetted, be made to meet on one side, and be kept open at the other, at a small distance, by the interposition of a shilling, or any other thin substance, and then immersed in water, the fluid will ascend between the two plates unequally. Its upper surface will form a curve, in which the heights of the several points above the surface of the fluid will be to one another reciprocally, as their perpendicular distance from the line in which the plates meet. The ratio of this attraction is therefore as the squares of the increments with which the plates open.

Here then we have two other instances that an attraction prevails among the particles of bodies. For in both cases part of the fluid has left the contiguous mass, contrary to the laws of gravitation. It is drawn up as it were, or attracted by the

tube or plate of glass.

Fifthly.—If we immerse a piece of tin, lead, bismuth, silver, or gold, in mercury, and draw it out again immediately, the mercury will attract the metal, and the latter will carry with it a portion of the former which will stick to it so obstinately as to be inseparable by mere friction.

There exists therefore an attraction between the different metals brought in con-

tact with each other.

Sixthly—If a small stick be dipt in water or any other fluid, and drawn out again, a drop will be found hanging at the end of it of a spherical form. The drop is spherical, because each particle of the fluid exerts an equal force in every direction, drawing other particles towards it on every side as far as its power extends.

Thus the very formation of drops obviously demonstrates that there must exist a cause which produces that effect. This cannot be gravity, for agreeable to experience that is rather an obstacle to the formation of drops; since by the weight of the particles, large globules resting on solid bodies are flattened, and their regular

spherical form prevented.

To explain this phænomenon there remains only the power of attraction, acting between the particles of the liquid body; for if it is supposed that the particles of a substance reciprocally attract each other with equal force, and their aptitude for being moved upon one another be great enough to overcome any impediment to their motion, it follows by the principles of mechanics, that the equilibrium of the attractive forces can only take place when the mass has received a globular form.

Hence it is that all liquid bodies assume a spherical figure when suffered to fall

through the air, or form drops.

Division of attraction.

Though we are unable to discover the cause of the mutual attraction, experience has proved to us that this agency follows certain conditions or laws; for similar phenomena always present themselves, whenever the circumstances of experiment are the same.

Observation has taught us that attraction takes place between bodies of the same kind, and bodies of a different kind. The first is called attraction of aggregation, also corpuscular attraction; molecular attraction; and attraction of cohesion, or the cohesive power.

The latter is termed chymical attraction, chymical affinity, or affinity of composition.

ATTRACTION OF AGGREGATION.
Corpuscular attraction, or attraction of cohesion or aggregation, is that power by means of which the similar particles of bodies attract each other, and become united into one mass, without changing in the least the chymical properties they possessed before their union. The bodies may be in a solid, fluid, or aeriform state.

This attraction is different in different bodies. It is always in an inverse ratio to the power of repulsion, or the quantity of caloric interposed between the particles of

the acting bodies.

It becomes obvious from this, that the agency of attraction of aggregation consists in a mere successive and constant accumulation of similar particles into one mass; and that it produces adherence of surface, or apparent contact in the ratio of the surface.

This force is inherent in all the particles of all bodies (caloric and light perhaps excepted;) we never find the particles of bodies in a detached state, but constantly in masses of greater or smaller magnitude, made up of an indefinite number of particles united together by virtue of the force of cohesion.

The simplest case of the exertion of the attraction of aggregation is that, where two bodies placed in mutual contact with each other form a direct union without changing their chymical properties: thus if different particles of sulphur be melted together, they form a uniform mass or whole, the particles of which are held together by virtue of the power of attraction of aggregation, but the properties of the body are not altered.

The same effect takes place when pieces of the same metal, or particles of resin, wax, &c. are united in a similar manner.

The force of this attraction in solid bodies may be measured by the weight necessary to demolish it. Thus if a rod of metal, glass, wood, &c. be suspended in a perpendicular direction, and weights be attached to its lower extremity till the rod is broken by them, the weight attached to the rod just before it broke is the measure of the cohesive force of the rod.

Laws of attraction of aggregation.

1. The agency of attraction of aggregation acts only at insensible distances; its force increases as the distance of the bodies presented to each other decreases, and as the surfaces of apparent contact are more numerous: thus, if we take two sections of a leaden ball, having each a flat and smooth surface, and press them forcibly together, they will cohere, and a considerable effort is necessary to force them asunder: so also two plates of glass wetted with a little water to fill up their inequalities, when laid together, will cohere; and two pieces of marble having each a flat, smooth, and well polished surface, when moistened and slipt upon each other with a gentle pressure, will unite, and a considerable force is required to separate them. But if the two substances placed together, be not sufficiently smooth or polished, it will be in vain to try to cause them to adhere together, for this reason that the particles touch each other only in a few points; whereas on the contrary the particles of the former flat and smooth surfaces touch each other in many points. It has been noticed that a silk-worm's thread can be interposed, but not two.

The pressure of the atmosphere has no influence on these experiments, for they succeed equally well in vacuo as in the

open air.

It is on this account that carpenters when they intend to glue pieces of wood together, plane the surfaces perfectly smooth before they apply the glue: and that the surfaces of metals are scraped clean before they are soldered, &c.

Hence the attraction of aggregation always vanishes whenever the distance is measureable, and becomes exceedingly great whenever the distances is exceedingly diminished; but the particular rate which this power follows, is still unknown,

as we have no method of measuring either the distance at which it acts, or its relative intensity.

2. Attraction of aggregation acts differently in different bodies; according to the degree of force with which it acts between the particles of matter, the bodies appear

under different forms.

It is on this account that rock-crystal, flint, diamond, and various other precious stones are extremely hard, for the attraction of aggregation unites the particles of these bodies with a great degree of force. Hence a considerable mechanical effort is

necessary to disunite them.

In blocks of marble, chalk, lime-stone, &c. the particles are held together with a force considerably less. In these bodies it prevents all relative motion among the particles themselves, and hence the motion of one particle is followed by the motion of the whole mass; or if that is impossible, the cohesion is destroyed altogether, and the piece breaks.

The integrant parts of wax, tallow, suet, or lard, may be made to change their situations, with a less degree of force than the

former.

In these substances the motion of one particle of the body is not necessarily followed by that of all the rest, neither does that motion destroy the cohesion, nor break them.

The particles of water, spirit, and ether, move or slide over each other very readily; hence their resistance is considerably less.

And lastly, vapours, the air of the atmosphere, and all the gasses, yield to the slightest possible impulse.

3. Attraction of aggregation may be annihilated by every effort which tends to

separate the particles of bodies.

It need hardly be mentioned that all mechanical forces, such as grinding, cutting, filing, rasping, pounding, breaking, &c. are of this nature.

In all these cases the force applied must be more than equal to the force of the attraction; and as it was stated before, that the attraction of aggregation acts with different degrees of force between the particles of different bodies, so different degrees of force are necessary to destroy that attraction in different bodies; and hence it is that chalk is more easily reduced to powder than flint; wood is easier broken than lead; lead easier than iron, &c.

CHYMICAL AFFINITY.

Chymical affinity, or affinity of composition, is that power, by means of which the particles of bodies, whether simple or compound, attract each other so intimately as to produce a uniform whole, totally inseparable by mechanical efforts, and whose characteristic properties are often different, and sometimes contrary to those of its constituent parts.

It is obvious from this, that the particles of those bodies which are united by virtue of chymical affinity, form not a mere aggregate, but an entire new body, which can only be altered by the action of another

chymical power.

In considering this kind of affinity, it will be necessary to state;—In what manner it takes place between the particles of different bodies;—In what proportion they are capable of combining;—Under what conditions;—With what degree of force they unite;—And what takes place when a variety of different substances are made to act upon each other at the same time, under certain circumstances and in different proportions.

Hence chymical affinity is of greater importance than affinity of aggregation, for it takes place in all the complex operations

of chymistry.

Instances of chymical affinity.

To prove that chymical affinity acts differently from attraction of aggregation; that it takes place between the ultimate constituent parts of bodies; and that it produces substances possessing properties, frequently very different and sometimes contrary to those of the constituent parts, the following experiments may serve.

1. Put into a crucible placed in a coal fire, equal parts by weight of sulphur and mercury; stir the two substances together for a few minutes, and when the sulphur is melted, pour the contents out on a marble slab, or a piece of glass previously warmed

and greased.

The substance obtained by this means is a sulphuret of mercury, in which the mercury and sulphur are united by virtue of chymical affinity; for the compound has neither the colour, the splendour, the inflammability, the volatility, nor the specific gravity of either of its constituent parts; nor can the sulphur and mercury be separated by mechanical means; they are therefore chymically united.

2. If we melt together two very malleable and ductile metals, for instance, tin and iron, in equal quantities, the compound produced will have totally lost the properties which its constituent parts possessed before their union, for the alloy formed will be a brittle metal which may easily be

broken by the blow of a hammer.

3. Put two or three teaspoonfuls of an aqueous infusion of red cabbage or syrup of violets, into a wine glass of water, mix it well, and put half the mixture into another glass. By adding a few drops of sulphuric acid to one of the glasses and stirring it, the blue will be changed to a crimson; and by adding an alkali; for instance, potash, to the other glass, the blue fluid will be changed into a green.

If we drop carefully down the sides of the glass into the green obtained in this experiment, a few drops of sulphuric acid, crimson will be perceived at the bottom, purple in the middle, and green at the top. On adding a little alkali to the other glass, containing the crimson, these colours will appear in an inverted order.

4. When equal parts of muriate of ammonia and slaked lime, both substances destitute of odour, are intimately blended in a stone mortar, a very pungent gas (am-

monia) becomes evolved

Water impregnated with ammonia and concentrated muriatic acid, both fluids of a strong odour, when mixed together in proper proportions, instantly lose their odour, and form a fluid void of smell, (mu-

riate of ammonia.)

6. Into a saturated solution of muriate of lime, let fall gradually concentrated sulphuric acid, a quantity of pungent vapour will become disengaged, (muriatic acid gas,) and from the two fluids will thus be produced an almost solid compound, called sulphate of lime.

7. Let equal parts of fresh crystallized acetat of lead and acidulous sulphate of alumine and potash, be rubbed together intimately in a stone mortar, the saline mixture will soon become soft, and lastly

A like effect is produced by treating in a similar manner equal parts of crystallized nitrate of ammonia and sulphate of soda.

A solid alloy of mercury and bismuth, and another composed of lead and mercury, on being triturated together, instantly become fluid.

It is obvious from this, that when chymical combination takes place, the com-pound which is formed does not possess properties merely intermediate between those of its component parts, but has acquired others more or less new. This however does not hold good in all cases. There are various combinations in which the properties of bodies are only slightly altered.

Laws of chymical affinity.

Observation has shown that affinity of composition offers certain invariable phenomena, which being founded on a great number of facts are regarded by chymists as laws, and may be reduced under the following heads:

Law I - Chymical affinity can exert its action between a number of bodies, simple or compound, and unite them chymically

into one whole.

Law II .- The efficacy of chymical affinity is in an inverse ratio to that of attrac-

tion of aggregation.

Law III .- The agency of chymical affinity i influenced by temperature; its action is either accelerated, retarded, prevented, or rendered efficacious.

Law IV .- Chymical affinity is accompanied by a change of temperature at the in-

stant of its action.

Law V.—The agency of chymical affinity existing between two or more bodies may be dormant, until it is called into action by the interposition of another body which frequently exerts no energy upon any of them in a separate state.

Law VI.-The ratio of the energy of chymical affinity acting between various bodies, is different in different substances.

Law VII.—The agency of chymical affinity is either limited, or unlimited in cer-tain bodies; in other words, chymical af-finity is capable of uniting bodies in definite, or in indefinite proportions.

Law VIII .- The energy of the chymical affinity of different bodies is modified in proportion to the ponderable quantities of the bodies placed within the sphere of ac-

Such are the leading laws which regulate chymical affinity; they may be demonstrated by experiments.

I. Chymical affinity can exert its action between a number of bodies simple or compound, and unite them chymically into one whole;

There are an infinite variety of compounds, consisting of three, four, five or more simple substances in nature; and art can also effect combinations in which there are many simple bodies chymically united into one whole.

It frequently happens that various separate bodies presented to each other in a fluid, unite and form a single mass, which possesses all the characters of a homogeneous compound, and which retains these characters till its composition has been al-

tered by chymical means.

A considerable number of triple salts are known, which consists of three different substances; for instance, the common alum of commerce consists of sulphuric acid united to alumine and potash or soda. The salt formerly called microcosmic salt, or phosphate of soda and ammonia, consists of phosphoric acid united to soda and am-When the oxygenated murimonia, &c. ate of mercury is precipitated by the precisc quantity of carbonate of soda which is requisite to effect its decomposition, the precipitate obtained contains muriatic acid, carbonic acid, and oxyd of mercury in

It is a well known fact, that two, three, or more metals may be fused together so as to produce compounds whose properties are widely different from those of the con-

stituent parts.

Melt together in an iron ladle or crucible. eight parts of bismuth, five of lead, and three of tin, the fusibility of the metals will thus be altered, for the alloy melts at 212° Fahr. A spoon or any other utensil formed of this compound will therefore melt in water kept boiling.

If in a similar manner an alloy be made of lead, tin, bismuth, and mercury, their proportions being two, three, five, and one, the compound produced melts at a heat even less than that of boiling water.

A composition of lead, zinc, and bismuth, in equal parts may be kept in fusion upon

paper over a lamp.

II. The efficacy of chymical affinity is in an inverse ratio to that of corpuscular at-

The cohesion of the particles of a body is owing to the mutual affinity existing between them. It is this force which must be overcome by the action of the substance which has a tendency to combine with those particles chymically. Chymical affinity therefore does not become stronger as the affinity of aggregation becomes weaker, it becomes only more efficacious; the absolute powers remain the same; the effect produced by that agency increases, because the resistance opposed to it decreases.

Remark.—It is from this law that it was formerly inferred that some or at least one of the bodies should be in a state of fluidity. This however is by no means necessary. It is in general true, that the weaker the attraction of aggregation is, the more easily chymical affinity takes place, as may be evinced by means of the following experiments:

Let any quantity of dry carbonate of soda and tartareous acid be mingled together, and put the mixture into a wineglass, no chymical change will be produced; but if water be added, or either of the salts be previously dissolved, a violent effervescence ensues, and a chymical union is obtained.

The water added is of use merely to overcome the resistance which arises from the cohesion of the particles of the salts intended to be brought into the sphere of action, or to increase their mutual contact.

If we let fall a crystal, or lump of fluor spar (fluate of lime) into concentrated sulphuric acid, no sensible action will take place, both the sulphuric acid and the fluate of lime remain unaltered; but if the former be reduced to powder, and then brought into contact with the acid, a considerable action instantly takes place, the sulphuric acid unites to one of the constituent parts of the fluor spar, namely, to the lime, and its other constituent part, the fluoric acid, becomes disengaged in the state of white vapour, or fluoric acid gas.

If crystallized sulphate of alumine, or sulphate of soda, and acetate of lead are brought into contact with each other, the individuality of these bodies will not be destroyed, that is to say, no chymical change will take place; but if they be intimately rubbed together in a mortar, the

two solids will act upon each other and form a fluid.

It is obvious therefore that in order to facilitate chymical affinity, the attraction of aggregation must be broken; the bodies intended to be chymically united must not be presented to each other in their mass of contact, but mechanically divided, or reduced to the smallest moleculæ possible; hence liquids combine with more facility than solids, or even than a solid and a liquid, and in like manner vapours combine with rapidity and ease.

III. The agency of chymical affinity is influenced by temperature. Its action is either accelerated, retarded, prevented,

or rendered efficacious :-

If we expose phosphorus in an open vessel to the action of the atmosphere, a chymical union will take place between the phosphorus and one of the constituent parts of the atmosphere, namely, the oxygen gas; the phosphorus will gradually (but very slowly) disappear and become converted into a fluid called phosphorus acid.

But if we heat the vessel containing the phosphorus, the latter will take fire, and become converted into a yellowish white substance, which in a short time is changed into an acid analogous to the former.

If equal quantities of muriate of ammonia and carbonate of magnesia are mixed with six or eight parts of water, and siffered to stand for some time exposed to the ordinary temperature of the atmosphere, a mutual decomposition of the two salts will take place. For if the mixture, and the fluid which passes, are left to evaporate spontaneously, muriate of magnesia, and carbonate of ammonia will be obtained. On the contrary,

If equal quantities of muriate of magnesia and carbonate of ammonia be exposed to a temperature of 200° in about four parts of water, the products obtained are, muriate of ammonia and carbonate of

magnesia.

If muriate of soda and sulphate of magnesia be mixed together in any proportion, and exposed to a temperature below zero, they decompose each other, and muriate of magnesia and sulphate of soda are formed, but no decomposition takes place at a temperature above 30°.

Muriate of soda and acidulous sulphate of alumine and potash, exhibit precisely

the same phenomena.

If ardent spirit and a solution of salt and water be mixed together, the compound formed is a real chymical union; but if we carefully heat the fluid, the caloric applied will be divided between the three ingredients according to their respective affinities; the union will be broken, for the ardent spirit will first be-

come volatilized, and the union of the salt and water remain unaltered. On increasing the temperature, the water will escape in the form of vapour, and the salt will be left behind.

There are numerous cases in which an increase of temperature is essentially necessary to determine bodies to unite. If mercury be exposed to oxygen gas at the common temperature of the atmosphere, the corpuscular attraction subsisting between its particles is sufficient to prevent combination. But if the mercury be heated to a certain degree, the force which kept its particles united will become annihilated, and it then combines with the oxygen which is present.

Again, if the oxyd of mercury thus formed be exposed to a higher degree of temperature, the union is demolished, and the quick-silver re-appears in its metallic state.

Hence it is obvious that the action of caloric favours the union of the oxygen and mercury, in consequence of the diminution of the mutual affinity of the parts; but at length, by augmenting this difference, it again breaks the union, or renders the combination impossible.

That increased temperature augments the power of chymical union, the solutions of salt and water afford instances of.

A larger quantity of salt is soluble in a given quantity of water at a high, than at a low temperature, and this larger quantity of salt is again separated by cooling.

IV. Chymical affinity is accompanied by a change of temperature at the instant of

its action :-

When equal parts of concentrated sulphuric acid and ardent spirit are mingled together, the mixture in a few minutes becomes so hot as to render the vessel insupportable to the hands.

If four parts of sulphuric acid of commerce, and one part, by weight, of water, be mixed together, each at the temperature of 50°, the mixture immediately acquires a temperature of about 300°.

All the dense acids, ammonia, and ardent spirit, when mixed with water, have the property of raising its temperature remarkably: and the same is the case when alkalis are introduced into concentrated On the contrary, in many instances

cold is produced :-

Take one ounce and a half of muriate of ammonia and a like quantity of nitrate of potash; reduce each of these salts separately to a powder, and blend them inti-mately together: having done this, mix them gradually in a glass basin, or other thin glass vessel, with four ounces of wa-The result will be, that the cold produced will sink a thermometer immersed in it, to 36° Fahr. A new edition of the same quantity of salts will cool it to 14°,

which therefore will freeze water in a glass tube that is immersed in it, without the use of snow or ice. If the water used in a first process be used to reduce other water and salts to the temperature of about 32°, and these be applied to the performance of a second experiment, the temperature may be lowered to 4° below 0°.

A number of experiments have lately been made to produce artificial cold by means of such freezing mixtures. The most complete set of this kind are those of

Pepys, Lowitz and Walker.

V. The agency of chymical affinity between two or more bodies may lie dormant, until it is called into action by the interposition of another body, which frequently exerts no energy upon any of them in a separate state.

From this law originates what was formerly called disposing affinity, or that case in which two or more bodies are incapable of uniting, until the agency is called into action by the addition of a third body, which exerts no sensible affinity upon either of them. This may be proved in the following manner.

Water is a compound of hydrogen and oxygen; phosphorus is a simple body according to our present state of knowledge. If these be presented to each other, no chymical union will take place; but if we add to them an alkali, and then apply heat, the water will become decomposed; that is to say, part of the phosphorus will unite to the oxygen of the water, and form phosphoric acid, and the other part will be dissolved in the hydrogen gas and appear as phosphorated hydrogen.

Here the alkali acts as the substance requisite to favour the mutual action, or to

give the disposing affinity.

If iron and water be brought into contact with each other no perceptible change will be produced; but if a little sulphuric acid be added to the water and iron, a violent effervescence will take place, the water will become decomposed, hydrogen gas will be evolved, and the iron become dissolved in the acid.

In this case the sulphuric acid is the condition necessary to accelerate the chymical

action.

VI. The ratio of the energy of chymical affinity acting between various bodies, is

different in different substances.

This is the most important law of chymical attraction. As beginners will find it rather difficult to understand what passes in this more complicated agency, they must remember, that the combination which is effected between two or more bodies by virtue of chymical affinity becomes broken whenever we present to the compound another body, which has an attraction to one of the constituent parts of the compound, superior to that attraction

by which they were held together: the bodies, therefore, between which the strong. est a trac ion prevails, combine, and the

rest are disengaged, thus :-

If muratic acid be poured either on pure barytes, or on its carbonate, the barytes will be dissolved and the compound will be muriate of barytes, which compound is held together by the force of affinity existing between the muriatic acid and the barytes. On letting fall into this solution a few drops of sulphuric acid, an immediate change of principles takes place; the whole quantity of the muriatic acid which was combined with the barytes bccomes disengaged, and the sulphuric acid unites to the barytes with a force equal to their affinity, minus that of the muriatic

Again, if pure silver be dissolved in pure nitric acid, the silver will rem in united to the acid, till another body is presented to it which has a greater torce of attriction to one of the constituent ports of the compount; for instance, if mercury be added to this solution of silver, the mercury will be dissolved, and the silver becomes precipitated or disengaged The supernatant fluid will then be a solution of mercury in nitric acid.

If to the before obtained solution of mercury in nitre acid, a piece of heet lead be presented, the lead will be dissolved, and the mercury become precipitated. The fluid will then be a solution of lead in

If in this solution of lead, a thin slice of copper be suspended, the copper will be dissolved, and the lead will become disen-The fluid now is a solution of cop-

per in nitric acid

If in this solution of copper, a thin sheet of iron be kept immersed, the iron will be dissolved, and the copper become precipitated. The fluid now is a solution of iron in nitric acid

If to this solution of iron, a piece of zinc be presented, the zinc will be dissolved, and the iron become precipitated. The solution then consists of zinc and nitric

acid.

If to this solution of zinc in nitric acid some ammonia be gradually added, the ammonia will join to the acid, and the zinc will be precipitated. The solution will then be nitrate of ammonia.

I to this solution of nitrate of ammonia, some time-water be added, the ammonia will become disengaged (and manifest it-

self by a pungent odour) and the solution will be nitrate of lime.

If to this solution of nitrate of lime some oxalic acid be added, the lime will be precipit ted, and what now remains will be merel nitric acid.

We see from these experiments, that

different bodies have different degrees of affinity for one and the same substance, which can only be learnt from observation and experiments.

VII. The agency of chymical affinity is either limited or unlimited; in other words, chymical affinity is capable of uniting bodies in definite, or in indefinite pro-

portions :--

Experience has convinced us that in all bodies there are certain precise limits of combinations beyond which their action cannot pass, namely a minimum, and a maximum; it remains still to be ascertained how bodies can combine within these limits.

If we attend to what is known at present, we are forced to acknowledge that this law comprehends several modifications, which may be arranged under the following

classes.

1. Chymical affinity unites several bodies in any proportion whatsoever; their combination is therefore unlimited; for instance,

If water and ardent spirit be mingled together in any quantity, a chymical combination ensues; for the compound obtained has always a specific gravity different from the mean specific gravity of the fluids combined. Its bulk is likewise not the arithmetical mean of the fluids in a separate state.

The same is the case when liquid acids and water, or acids and ardent spirit, are combined together.

2 Chymical affinity combines several bodies to a certain extent or maximum

To this class belong all those bodies

which are capable of saturation.

If we take a quantity of any of the dense acids diluted with water, for instance, sulphuric acid, and let fall into it a solution of an alk di, for example soda, by a little at a time, and examine the mixture after every addition of the alkali, we find for a considerable time it will exhibit the properties of an acid, it will have a sour taste, and convert vegetable blue colours into red; but if we continue to add greater quanti-ties of soda, these acid properties will gradually diminish, and at last disappear At that point the combination altogether is at an end, it has reached its maximum in this case; for if we continue to add more alkali, the mixture will gradually acquire alkaline properties; it will convert blue vegetables into green; it will have a urisous or alkaline taste, &c. properties will become stronger, the greater the quantity of the soda is which is

Again, take muriatic acid, and let fall into it gradually carbonate of lime, or magnesia; an effervescence will take place, for a chymical union ensues between the acid and the lime, or magnesia, and the tarbonic acid, the other constituent of these bodies, becomes disengaged. But if we continue the addition of the line, or magnesia, until it produces no turther effervescence, no chymical union will be obtained; the lime will fall to the bottom innaltered, for the combination is at its maximum.

It is on this account that water can only dissolve a certain quantity of salt; ardent spirit a certain quantity of resin, &c.

The union of oxygen and hydrogen be-

longs likewise to this class,

3. Chymical affinity is capable of uniting different bodies in two, three, or more proportions; each of these combinations produces compounds, possessing peculiar properties.

This peculiarity of combination is highly

important.

It is owing to this circumstance that both nature and art produce substances of the same principles only combined in different proportions, which possess peculiar properties, widely different from each other.

An instance of this law may be seen in

the following experiment:

Introduce one ounce of copper filings into four ounces of muriatic acid, contained in a medicine-phial of eight ounces capacity, cork it well, and let it stand undisturbed; the acid will soon acquire a greenish colour, which becomes deeper in proportion as the copper becomes dissolved; but in a few days if the bottle be now and then agitated, the colour vanishes, and the solution at last becomes colourless.

If we now invert the bottle in mercury, or water, and remove the cork under that fluid, a quantity of the mercury will rush in: an evident proof that part of the air contained in the phial has disappeared.

If we examine the remaining air, we shall find that it is incapable of supporting flame, and that it is in arly deprived of all its oxygen. If we now open the phial, the solution becomes again green and colourless as before.

The rationale of these phenomena is this: The quantity of oxygen which is present in the confined quantity of air in the empty part of the phial, combines with the copper to a certain degree, which then becomes soluble in the acid, and exhibits the green solution.

This oxyd is gradually decomposed, more copper is dissolved, and the solution becomes colourless. If more oxygen be admitted, the solution becomes green again

as before.

VIII. The energy of the chymical affinity of different bodies is modified in proportion to the ponderable quantities of the substances placed within the sphere of action.

It is obvious, from this, that the denomination of elective affinity is erroneous; since it supposes the union of one en ire substance with another, in preference to a tund. But this is not the case; a mere division of action takes place in instances of this kind; that is to say, the substances ac according to the quantity existing within the sphere of activity. The excess of quantity is capable of compensating for the deficiency of the force of affinity.-When, therefore, a compound body of two substances is acted on by a third, that part of the compound which is the subject of combination, is divided between the two remaining, not only in proportion to their respective degrees of affinity, but also according to their ponderable quantities, so that by varying this in cither, the effect produced will be varied.

Thus Berthollet has proved, that in all cases a large quantity of a body is capable of abstracting a portion of another, from a small portion of a third, how weak soever the affinity between the first and second of these bodies may be, and how strong soever the affinity between the second and third. Thus potash is capable of abstracting part of the acid from oxalate of lime, phosphate of lime, and carbonare of lime. Soda and lime decompose partially sulphate of potash. Nitric acid subtracts part of the base from oxalate of lime, &c.

The following experiment, advanced by Berthollet, will prove this more clearly.

If equal parts, by weight, of sulphate of barytes and potash be boiled, in a small quantity of water, to dryness, it will be found that the sulphuric acid has been divided between the two bases in the compound ratio of their mass, and their force of affinity. The greater part of the sulphate of barytes will be found undecomposed; a small quantity or barytes will be found at liberty; most of the potash will also be uncombined, but a certain portion will be united with the sulphuric acid which the barytes has lost, in the form of sulphate of potash.

It is not merely in the instance stated here that this division of one body between two others, according to their respective masses and affinities, takes place, there being scarcely any example to the contrary.

And as the affinities of bodies vary with their masses, it is obvious that, when we speak of the affinities of bodies, we ought to consider them as always acting in certain determinate proportions.

AUANTE. (From 2020'22, to dry.) A dry disease, proceeding from a fermentation in the stomach, described by Hippocrates de Morbis.

ATAPSE. The same.

Archen. (From 20,262, to be proud.) The neck, which, in the posture of pride is made stiff and erect.

Auditory nerve. See Nervus auditorius and Portio mollis.

Auditory passage. See Meatus auditorius externus and internus.

Augustum. An epithet given to several compound medicines.

Auliscos. (From aulos, a pipe.) A catheter, or clyster-pipe.

Aulos. The same.

AURA. (From αω, to breathe.) Any

subtile vapour, or exhalation.

AURA EPILEPTICA. A sensation which is felt by epileptic patients, as if a blast of cold air ascended from the lower parts towards the heart and head.

AURA SEMINIS. The extremely subtile and vivifying portion of the semen virile, that ascends through the Fallopian tubes, to impregnate the ovum in the ova-

rium.

AURA VITALIS. So Helmont calls the vital heat.

AURANTII BACCÆ. Seville oranges. See

AURANTII CORTEX. See Aurantium.

AURANTIUM. (So called ab aureo colore, from its golden colour, or from Arantium, a town of Achaia.) Aurantium hispalense. Malus aurantia major. Malus aurantia. Aurantium vulgare. Malus aurantia vulgaris. Mala aurea. Chrysomelea. Nerantia. Martianum pomum. Poma aurantia. Seville orange. This plant is the citrus aurantium of Linnæus:-petiolis alutis foliis acuminatis. Class, Polyadelphia. Order, Icosandria. The China and Seville orange are both only varieties of the same species; the latter is met with in our pharmacopæias; and the flowers, leaves, wellow rind, and juice, are made use of for different medical purposes.

The flowers, flores naphæ, arc highly odoriferous, and are used as a perfume; they are bitter to the taste; they give their taste and smell both to water and to spirit, but most perfectly to rectified spirit of wine. The water which is distilled from these flowers, is called aqua florum naphæ. In distillation, they yield a small quantity of essential oil, which is called oleum vel essentia neroli: they are brought from Italy and France. Orange flowers were, at one time, said to be a useful remedy in convulsive and epileptic cases; but experience has not confirmed the virtues attribu-

ted to them.

The leaves have a bitterish taste, and vield, by distillation, an essential oil; indeed, by rubbing them between the fingers and the thumb, they manifest considerable fragrance. They have been applied for the same purposes as the flowers, but without success.

The yellow rind of the fruit, freed from the white fungous part, has a grateful aromatic flavour, and a warm, bitterish taste. Infused in boiling water, it gives out nearly all its smell and taste; cold water extracts the bitter, but very little of the flavour. In distillation, a light, fragrant, essential oil rises, without the bitter. Its qualities are those of an aromatic and bitter. It has been employed to restore the tone of the stomach, and is a very common addition to combinations of bitters, used in dyspepsia. It has likewise been given in intermittents, in a dose of a drachm, twice or thrice a day. It is also much celebrated as a powerful remedy, in menorrhagia, and immoderate uterine evacuations. Its expressed oil is essence of Bergamot.

The juice of Seville oranges is a grateful acid, which, by allaying heat, quenching thirst, promoting various excretions, and diminishing the action of the vascular sanguiferous system, proves extremely useful in both ardent and putrid fevers; though the China orange juice, as impregnated with a larger proportion of sugar, becomes more agreeable, and may be taken in larger quantities. The Seville orange juice is particularly serviceable as an antiscorbutic, and alone will prevent or cure scurvy in the most apparently desperate circumstances. In dyspepsia, putrid bile in the stomach, both lemon and orange juice are highly useful.

AURANTIA CURASSAVENTIA. Aurantium Curassavense. Curassoa, or Curassa apples, or oranges. The fruit so called seem to be the immature oranges, that by some accident have been checked in their growth. They are a grateful aromatic bitter, of a flavour very different from that of the peel of the ripe fruit, and without any acid; what little tartness they have when fresh, is lost in drying. Infused in wine, or brandy, they afford a good bitter for the stomach. They are used to promote the discharge, in issues, whence their name of issue peas, and to give the flavour of hops to hear.

AURICULA. (Dim. of auris, the ear.) The external ear, upon which are several eminences and depressions, as the helix, antihetix, tragus, antitragus, conche auricule, schapha, and lobulus.

AURICULA JUDÆ. Fungus sambucinus Agaricus. Auricula forma. Jew's ears. A membranaceous tungus, Peziza auricula; concava rugosa auriformis, of Linnæus, which resembles the human ear. Its virtues are adstringent, and when employed, (by some its internal use is not thought safe,) it is made into a decoction, as a gargle for relaxed sore throats.

AURICULA MURIS. See Pilosella.

AURICULE CORDIS. The auricles of the

heart. Sec Heart.

AURICULARIS. (Auricularis, sc. digitus: from auris, the ear.) The little finger; so called because people generally put it into the ear, when the hearing is obstructed.

Auriga. (A wagoner. Lat.) A bandage for the sides; so called because it is made like the traces of a wagon horse. Galen.

(Ab aureo colore: from its yellow colour.) The jaundice. See Icterus.

AURIPIGMENTUM. (From aurum, gold, and pigmentum, paint; so called from its colour and its use to painters. Yellow orpunent. Sec Arsenic.

AURIS. (From aura, air, as being the The ear, or organ of medium of hearing.)

hearing.) See Ear.

Auris Levator See Levator auris.
Auriscalpium. (From auris, the ear, and scalpo, to scrape.) An instrument for

cleansing the ear.

The wax of the ears. AURIUM SORDES. AURIUM TINNITUS. A ringing noise in the ears.

Aurugo. The jaundice.

AURUM. Gold.

AURUM HORIZONTALE. Oil of cinnamon and sugar.

AURUM LEPROSUM. Antimony.

AURUM MUSIYUM. A preparation of tin, sulphur, sal-ammoniac, and quick-silver.

AURUM POTABILA. Gold dissolved and mixed with oil of rosemary, to be drank.

AURUS BRAZILIANSIS. Calamus aromaticus.

AUTHEMEIION. (From autos, himself, and nusga, a day.) A medicine which gives relief, or is to be administered the same

AUTOLITHOTOMUS. One who cuts him-

self for the stone.

The healing power of AUTOCRATEIA. nature. Hippocrates.

AUTOPSIA. (From autoc, himself, and

οπίομαι to see.) Ocular evidence.

Autoprinos. (From αυτος, itself, and συζος, wheat.) Bread made with the meal

of wheat, from which the bran has not been removed. Galen Avenacy. A Molucca tree, of a caustic

Avante. Indigestion. AVANSIS.

AVELLANA. (From Abella, or avella, a town in Campania, where they grew.) The hazel nut.

AVELLANA CATHARTICA. Barbadoes nuts.

A purgative.

quality.

AVELLANA MEXICANA. Cocoa and cho-

AVELLANA PURGATRIX. Garden spurge. The pyramidal AUXILIARII MUSCULI. muscles of the abdomen.

AVENA. (From aveo, to covet; because cattle are so fond of it.) The oat.

1. The name of a genus of plants in the Linnæan system. Class, Triandria. Order, Dygynia.

The pharmacopæial name of the oat. Avena sativa of Linnaus. It is the seed which is commonly used, and called the

There are two kinds of oats: the black and the white. They have similar virtues, but the black are chiefly sown for horses. They are less farmaceous, and less nourishing, than rice, or wheat; yet afford a sufficient nourishment, of easy digestion, to such as feed constantly on them. In Scotland, and some of the Northern counties of England, cats form the chief bread of the inhabitants. They much used in Germany; but, in Norway, oat bread is a luxury, among the common people. Gruels, made with the flour, or meal, called oatmeal, digest easily. have a soft mucilaginous quanty, by which they obtund acrimony, and are used for common drink and food in fevers, inflammatory disorders, coughs, hoarseless, roughness, and exulceration of the fauces; and water-gruels answer all the purposes of Hippocrates' ptisan. Externally, poul-tices, with oatmeal, vinegar, and a very little oil, are good for sprains and bruises. Stimulant positices, with the grounds of strong beer, mixed up with oatmeal, are made for tumours, &c. of a gangrenous tendency.

AXI

The systematic name AVENA SATIVA. for the avena of the pharmacoperas. Avena.

Avens, common. See Avena.

Avens, common.

AVICENNIA TOMENTOSA. The systematic name for the plant which affords the Anacardium orientale of the pharmacopanas.

See Anacardium orientale. AVIGATO PEAR. This delicious fruit, the produce of the Laurus persea of Linnæus, when ripe, melts in the mouth like marrow, which it greatly resembles in flavour. It is supposed to be the most nutricious of all the trop cal fruits, and grows in vast abundance in the West Indies and New Spain. The unripe fruit have but little taste; yet, being very salubrious, are often eaten with salt and pepper. The sailors, when they arrive at the Hayannah, and those parts, purchase them in great quantities; and, chopping them into small pieces, with green capsicums and a little salt, regale themselves heartily with them. They are esteemed also for their antidysenteric qualities, and are prepared in a variety of ways for the tables of the rich.

AXILLA, (Axilla, atzil, Heb. Scaliger deduces it from ago, to act; in this manner, ago, axo, axa, axula, axilla.) The cavity under the upper part of the arm, called

the arm-pit.

AXILLARY ARTERIES. Arteria axillares. The axillary arteries are continuations of the subclavians, and give off, each of them, in the axilla, four mammary arteries, the subscapular, and the posterior and anterior circumflex arteries, which ramify about the joint

AXILLARY NERVE. Articular nerve. branch of the brachal plaxus, and sometimes of the radial nerve. It runs outwards and backwards, around the neck of the humerus, and is lost in the mucies of the scapuia.

AXILLARY VEINS. Venæ axillares. The axillary veins receive the blood from the veins of the arm, and evacuate it into

the subclavian vein.

Axis. (From ago, to act.) See Denta-

AXUNGIA. (From axis, an axle-tree, and unguo, to anoint.) Hig's lard.
Axungia curata. Purified hog's lard.

AXUNGIA DE MUMMIA. Marrow.

Azac (Arab.) Gum ammoniac. AZAMAH. Native cinnabar. Vermil-

liou. Azen. A fine kind of camphire.

AZOT. (From α, priv. and ζεω, to live; because it is unfit for respiration.) Nitrogen.

AZOT, GASEOUS OXYD OF. See Nitrogen,

gaseous exyd of.

AZOTH. An imaginary universal remedv.

Azun. Alum.

AZURIUM. Quicksilver, sulphur, and sal-ammoniac.

Azygess (From a, priv. and Zujos, a yoke ) The os phenoides was so called, because it has no tellow.

Azygos. (From a, priv. and Zoyos, a yoke; because it has no fellow.) single muscles, veins, bones, &c. are so called.

Azygos Mongagni. A muscle of the mouth.

A process of h e AZYGOS PROCESSUS. os sphænoides.

Palato-staphilinus of AZYGOS UVULE. Douglas. Staphilinus, or Epistaphilinus of Winslow. A muscle of the uvula, which arises at one extremity of the suture which joins the palate bones, runs down the whole length of the velum and uvula, resembling an earth-worm, and adhering to the tendons of the circumflext. It is inserted into the tip of the uvula. Its use is to raise the uvula upwards and forwards, and to short-

AZYGOS YEIN. Vena azygos. Vena sine pari. This vein is situated in the right cavity of the thorax, upon the dorsal vertebræ. It receives the blood from the vertebral, intercostal, bronchial, pericardiac, and diaphragmatic veins, and evacuates it into the vena cava superior.

B

B ABUZICARIUS. (From βαδαζω, to speak inarticulately) The incubus, or nightmare; so called because, in this disorder, the person is apt to make an inarticulate and confused noise.

BACCA MONSPELIENSIS. See Baccharis. BACCALIA, (à baccharum copia, because it abounds in berries.) The bay, or

laurel-tree. See Saponaria BACCE BERMUDENSES.

cucula. BACCE JUNIPERI. Juniper berries. See Juniperus

BACCE LAURI. Laurel berries, See Laurus.

BACCE NORLANDICE. The fruit of the Rubus arcticus of Linnxus : foliis alternatis, caule incrmi unifloro. They are recommended by Linnærs as possessing antiseptic, refrigerant, and antiscorbutic qualities.

BACCE PISC YFORIE. See Cocculus in-

dicus

BACCHARIS, (From bacchus, wine; from its fragrance resembling that liquor.) Bacchar. Bacca monspeliensis. Corryza tertia Dioscoridis, Eupatorium. The plant so called is the Inula dysenterica of Linnæus. Ploughman's spikenard, Great fleabane. It is sweet-scented, and the roots smell like cinnamon, and are said to powerfully enumenagogue, and the leaves moderately astringent.

BACHER'S PILLS. Pilule tonica Bacheri. A celebrated medicine in France, employed for the cure of dropsies. Their principal ingredient is the extract of melampodium,

or black hellebore.

(From bacchus, wine; be-BACCHIA cause it generally proceeds from hard drinking and intemperance.) Gutta rosucea. A name given by Linnaus to a pinipled face.

BACCULI. Is used, by some writers, for a particular k nd of lozenges, shaped into little short rolls. Hildanus likewise uses it for an instrument in surgery.

BACOBA. The Banana.

BADIAGA. A kind of sponge usually sold in Russia, the powder of which is said to t ke away the livid marks of blows and bruises within a few hours. It is only described by Bauxbaum, and its nature is not properly understood.

Badian semen. The seed of a tree which grows in China, and smells like aniseed. The Chinese (and Dutch, in imitation of them) sometimes use the badiane to give their tea an aromatic taste. See Anisum stellatum.

BADIZA AQUA. See Bath water,

BADRANUM SEMEN. Indian aniseed. BABUCCA. (Indian.) A species of cap-

BADZCHER. An antidote.

REOS. (Brioc.) In Hippocrates it means few; hut in P. Ægineta, it is an epithet for

a poultice.

BAGNIGGE WELLS. A saline mine-ral spring in London, resembling the Epsom mineral. In most constitutions, three half-pints is considered a full dose for purging.

BAGNIO. (From bagno, Ital.) A bathing

or sweating house.

BAHEI COYOLLI. Ray takes it to be the

Areca, or Funfel.

BAREL SCHULLY. An Indian-tree; the Genista spinosa Indica; a decoction of the roots of which is dirretic. The leaves, boiled and sprinkled in vinegar, have the same effect, according to Ray.

BALAC. White lead.

BALA. The plentain tree.

BALIENA MACROCEPHALA. (Bahawa from βαλλω, to cast. from its power in a sting up water; and μακουκφαλος; from μακρος, long, and modals " head; from the length of its head.) The systematic name of a species of whale.

BALALINUM OLEUM. Oil of the ben-nut. BALANOCISTANUM. (From Baharos, 2 nut, and nagaror, a chestnut; so called from its therous root.) The bunium bulbocastanum, or earth-nut.

Balanus. (From Banda, to BALANOS. east; because it sheds its fruit upon the

ground ) 1. An acorn.

2. Hippocrates, in his Treatise de Affectionibus, expresses by it the oak.

3 Theophrastus uses it sometimes, to express any glandiferous tree.

4. From the similitude of form, this word is used to express suppositories and pessaries.

5. A name of the glans penis.

BALAUSTIUM. (Fron Baxios, various, and ava, to dry; so called from the variety of its colours, and its becoming soon dry; or from Brasara, to germinate.) Ra-A large rose-like flower, of a red colour, the produce of the plant from which we obtain the granatum. See Granatum.

BALBUTIES. (From Balaza, to stammer; or from balbel, Heb. to stammer.) A defect of speech; properly, that sort of stammering where the patient sometimes hesitates, and immediately after, speaks precipitately. It is the Psellismus Balbunens of Cullen.

BALISTA. (From βαλλω, to cast.) The astragulus, a b oe of the toot, was formerly called os balis x, because the ancients used to cast it from their shings.

Balmoney. See Meum athamanticum. Balm. See Melissa.

Balm of Gilead. See Moldavica, Balm of Mecca. See Balsamum Gilea-

Balm, Turkey. See Moldavica.

BILLOTE. (From Exhlor, to send forth, and ss. wros, the ear; because it sends forth flowers like ears) Ballota Stinking horehound. A nettle-like plant. bullote nigra of Linnaus

BALNEUM. A bath, or bathing-house.

See Bath.

BALVEUM ANIMALE. The wrapping any part of an animal, just killed, round the body, or a limb.

BALNEUM ARENÆ. A sand-bath for chymical purposes. See Bath.

BALNEUM CALIDUM. A hot-bath. See Bath.

BALNEUM FRIGIDUM. A cold bath. See Bath.

BALNEUM MARIÆ. Balneum maris.

A warm-water both. See Bath BALNEUM MEDICATUM. A bath

impregnated with drugs.

BALNEUM SICCUM. Balneum cinereum. A dry bath, either with ashes, sand, or iron filings.

BALNEUM SULPHUREUM. A sulphur bath

BALNEUM TEPIDUM. A bath heated from 93 to 96 or 98 deg. of Fahrenheit's thermometer

BALNEUM VAPORIS. A vapout bath.

Biloon. (Ballon or balon, French) A large glass receiver in the form of a hollow globe. For certain chymical operations ballons are made with two necks, placed opposite to each other; one to receive the neck of a retort, and the other to e ter the neck of a second balloon: this apparatus is called enfiladed balloons. Their use is to increase the whole space of the receiver, because any number of these may be adjusted to each other. The only one of these vessels which is generally used, is a small ohlong balloon with two necks, which is to he luted to the retort, and to the receiver, or great balloon; it serves to remove this receiver from the body of the furnace, and to hinder it from being too much heated.

BALSAM. (Balsamum. From baal samum, Hebrew.) The term balsam was anciently applied to any strong-scented, natural vegetable resin of about the fluidity of treacle; inflammable, not miscible with water, without addition, and supposed to be possessed of many medical virtues. All the turpentines, the Peruvian

balsam, copaiba balsam, &c. are examples of natural balsams. Besides, many medicines compounded of various resins, or oils, and brought to this consistence, obtained the name of balsam. Latterly, however, the term has been restricted to those resins which contain the Benzoic acid. Of these only three are commonly known, the gum benzoin, balsam of Tolu, or Peru, and storax.

Balsam Apple, Male. The fruit of the momordica elaterium of Lionæus. It is the fæcula of the fruit of this plant, which af-

fords the elaterium of the shops.

Balsam, artificial. Compound medicines are thus termed which are made of a balsamic consistence and fragrance. They are generally composed of expressed or ethereal oils, resins, and other solid bodies, which give them the consistence of butter. The basis, or body of them, is expressed oil of nutmeg, and frequently wax, butter, &c. They are usually tinged with cinnabar and saffron.

Balsam Canary. See Moldavica.

Balsam of Canada. See Balsamum Canadense.

Balsam of Copaivæ. See Balsamum Copaivæ.

Balsam, Natural. A resin, which has not yet assumed the concrete form, but still continues in a fluid state, is so called, as common turpentine, balsamum copaiva, peruvianum, tolutanum, &c.

Balsam, Peruvian. See Balsamum Peru-

vianum,

Balsam of sulphur. See Balsamum sulphuris.

Balsam of Tolu. See Balsamum tolutanum. Balsam, Turkey. See Moldavica.

BALSAMATIO. (From balsamum, a balsam.)

The embalming of dead bodies.

BALSAMEA. (From balsamum, balsam.) The balm of Gilead fir; so called from its odour. See Balsamum canadense.

BALSAMELEON. (From balsamum, balsam, and shower, oil.) Balm of Gilead, or

BALSAMICA. (Balsamica, sc. medica-

true balsamum Judaicum.

Balsam oleum. Balm of Gilead.

menta; from βαγσαμον, balsam.) Balsamics. A term generally applied to substances of a smooth and oily consistence, which possess emollient, sweet, and generally aromatic qualities. Hoffman calls those medicines by this name, which are hot and acrid, and also the natural balsams, stimulations.

dicines by this name, which are hot and acrid, and also the natural balsams, stimulating gums, &c. by which the vital heat is increased. Dr. Cullen speaks of them under the joint title of balsamica et resinosa, considering that turpentine is the basis of all balsams.

BALSAMIFERA BRAZILIENSIS. The balsam copaiba tree.

BALSAMIFERA INDICANA. The Peruvian balsam tree.

BALSAMITA MAS. (From balsamum.) Balsamita major. Tanacetum hortense. Costus hortorum. Costomary, or alecost. The plant which bears this name in the pharmacopæias, is the Tanacetum balsamiti of Linnæus:—foliis ovatis, integris serratis.

A fragrant-smelling herb, somewhat like that of mint; formerly esteemed as a corroborant, carminative, and emmenagogue.

BALSAMITA FEMINEA. See Ageratum. BALSAMITA LUTEA. The polygonum per-

sicaria of Linnæus. See Persicaria.

BALSAMITA MINOR. Sweet maudlin.

BALSAMITA MAJOR. See Balsamita

mas.

BASAMUM. (From baal samen, Heb.
the prince of oils.) A balsam. See Bul-

sam.

Balsamum Ægyptiacum. See Balsamum Gileadense.

BALSAMUM AMERICANUM. See Balsamum Peruvianum.

BALSAMUM ANODYNUM. A preparation made from tacamalacca, distilled with turpentine and soap liniment, and tincture of opium.

BALSAMUM ALPINUM. See Balsamum

Gileadense.

BALSAMUM ANTIAONII. A remedy formerly applied to cancer.

Balsamum arc.el. A preparation composed of gum-elemi and suet.

BALSAMUM ASIATICUM. See Balsamum Gileadense.

Balsamum Braziliense. See Balsamum copaibæ.

BALSAMUM CANADENSE. Canada balsam. Balsam of Canadan fir. One of the purest turpentines, procured from the *Pinus balsamea* of Linnæus, and imported from Canada. For its properties, see *Turpentines*.

BALSAMUM CEPHALICUM. A distillation

of oils, nutmeg, cloves, amber, &c.

Balsamum commendatoris. A composition of storax, benzoe, myrrli, aloes, &c.

BALSAMUM COPAIBÆ. (Many of the Americans call all odoriferous resins and sweet-scented gums, copal; and the word iba, or iva, is the name for a tree; hence copaiva) Balsamum Braziliense. Balsamum de copaibu. Balsamum capivi. Copaiba.

Copaiba balsam is a yellow resinous juice, of a moderately agreeable smell, and a bitterish biting taste, very permanent on the tongue. The tree which affords it, is the Copaifera officinalis of Linnaus. Class, Decandria. Order, Mongynia. It is obtained by making deep incisions near its trunk, when the balsam immediately issues, and, at the proper season, flows in such abundance, that sometimes, in three hours, twelve pounds have been procured. The older tree

afford the best balsam, and yield it two or three times in the same year. balsam supplied by the young and vigorous trees, which abound with the most juice, is crude and watery, and is, therefore, accounted less valuable. While flowing from the tree, this balsam is a co our- Gileadense. less fluid; in time, however, it acquires a yellowish tinge, and the consistence of oil; but, though by age it has been found thick, like honey, yet it never becomes solid, like other resinous fluids. By distillation in water, the oil is separated from the resin; and, in the former, the taste and smell of the balsam are concentrated. If the operation is carefully performed, about one-half of the balsam rises into the receiver, in the form of oil. The balsam unites with fixed and volatile oils, and with spirit of wine. It is given in all diseases of the urinary organs, when no inflammation is present. In gleets, and in gonorrhoa, it was once a favourite remedy, but is now disused. In diseases of the kidneys it is still employed, though less frequently than usual; and in hamorrhoids it is occasionally trusted. The dose is from 20 to 30 drops, twice or three times a day, mixed with water, by means of an egg, or other mucilage. The balsam of copaivæ is occasionally adulterated with turpen ine, but its virtues are not greatly injured by the fraud.

BALSAMUM EMBRYONUM. A preparation of aniseed.

BALSAMUM GENUINUM ANTIQUORUM. See Balsamum Gileadense.

BALSAMUM GILEADENSE. Balsamum genninum antiquorum Balsamelæon. Aguptiacum balsamum. Balsamam Asiati-Balsamum Judiacum. Balsamum Baisantum è Mecca Bals.:mum Syriacium. Oleum balsami. Opobulsamum. Xyrobalsamum Balsam, or balin of Galead. A resinous juice, obtained by m. king incisions into the bark of the Amyris Gilea. densis of Linnaus: - folis ternaus integerrimis, pedunculis unifloris lateralibus. Class, Octandria. Order, Monogynia. The tree grows spontaneously, particularly near to Mecca, on the Asiatic side of the Red Sea. The juice of the fruit is termed carpobalsafium in the pharmacopæits, and that of the wood and branches xylobalsamum. The best sort is a spontaneous exadation from the tree, and is held in so high estimation by the Turks, that it is rarely, if ever, to be met with genuine among us. The medicinal virtues of the genuine balsam of Gilead, have been highly rated, undoubtedly with much exaggeration. The common balsam of Mecca is scarcely used; but its qualities seem to be very similar to those of the balsam of Tolu, with perhaps more acrimony. The dose is from 15 to 50 drops.

BALSAMUM GUALACINUM. Balsam of

Peru and spirits of wine.

BALSAMUM GUIDONIS. The same as balsamum anodynum.

A balsam BALSAMUM HUNGARICUM. prepared from a coniferous tree on the Carpathian mountains.

BALSAMUM JUDAICUM. See Balsamum

BALSAMEM LOCATELLI. (Locatelli; so called from its inventor Lucatellus.) Balsamum Lucatelli. A preparation made of oil, turpentine, wax, and red saunders; now disused; formerly exhibited in coughs of long standing.

BALSAMUM MAS. The herb costmary.

See Balsamitamas.

BALSAMUM E MECCA. See Balsamum

BALSAMUM MEXICANUM. See Balsamum Peruvianum.

BALSAMUM NOVUM. A new balsam from

a red fruit in the West Indics.

Balsamum oboriferum. A preparation

of oil, wax, and any essential oil.

BALSAMUM PERUVIANUM. (From its country, Peru.) Putzochill. Indian, Mexican, and American balsam. Carbareiba is the name of the tree from which, according to Piso and Ray, it is taken. It is the Myroxylon peruiferum of Linnæus, which grows in the warmest provinces of South America, and is remarkable for its clegant appearance. Every part of the tree abounds with a resinous juice; even the leaves being full of transparent resinous points, like those of the orange-

Balsam of Peru is of three kinds; or rather, it is one and the same balsam, having three several names: 1. The balsam of incision; 3. The dry balsam; 3. The balsam of lotion. The virtues of this balsam, as a cordial, pectoral, and restorative stimulant, and tonic, are by some thought to be very great. It is given with advantage from 5 to 10 or 15 drops for a dose, in dyspepsia, atonic gout, in consumptions, asthmas nephritic complaints, obstructions of the viscera, and suppressions of the menses. It is best taken dropped upon sugar. The yelk of an egg, or mucilage of gum-arabic, will, indeed, dissolve it; it may, by that way, be made into an emulsion; and it is less acrid in that form than when taken singly. It is often made an ingredient in boluses and electuaries, and enters into two of the officinal compositions: the tinetura balsami Peruvian compositi, and the trochisci glycyrrhyzx. Externally, it is recommended as a useful application to relaxed ulcers, not disposed to heal.

PALSAMUM PERSICUM. A balsamum composed of storax, benzoe, myrrh, and alics.

This balsam, BALSAMUM BACKASIRA. which is inodorous when cold, but of a smell approaching to that of Tolu balsam when heated, is brought from India in gourd-shells. It is slightly bitter to the taste, and adheres to the teeth, on chewing. It is supposed to be one of the factitious balsams, and is scarcely ever prescribed in this country.

BALSAMUM SAMECH. A factitious balsam, composed of tartar, dulcified by spirits of

BALSANUM SAPONACEUM. A name given to the preparation called opodeldoc.

BALSAMUM SATURNI. The remedy so named is prepared by dissolving the acetate of lead in oil of turpentine, and digesting the mixture till it acquires a red colour. This is found to be a good remedy for cleansing foul ulcers; but it is not acknowledged in our dispensatories.

BALSANUM STYRACIS BENZOINI. Gumbenjoin is so called See Benzoinum.

BALSAMUM SUCCINI. Oil of amber.

BALSAMUM SULPHURIS. A solution of sulphur in oil.

BALSAMUM SULPHURIS ANISATUM. Balsam

of sulphur, and oil of aniseed.

BALSAMUM SULPHURIS BARBADENSE, Sulphur boiled with Barbadoes tar.

BALSAMUM SULPHURIS CRASSUM. Thick balsam of sulphur.

Balsamum sulphuris Terebinthinatum. This is made by digesting the sulphur with oil of turpentine, and, in the latter, adding the oil of aniseed. They are now confined to veterinary medicine.

BALSAMUM SULPHURIS SIMPLEX. Sulphur

boiled with oil.

BALSAMUM SYRIACUM. The balm of Gilead. See Balsamum Gileadense.

BALSAMUM TOLUTANUM. Balsam of Tolu. The tree Toluifera balsamum of Linnæus, from which this balsam is procured, grows in South America, in the province of Tolu, behind Carthagena, whence we are supplied with the balsam, which is brought to us in little gourd-shells. The balsam is obtained by making incisions into the bark of the tree, and is collected into spoons, which are made of black wax, from which it is poured into proper vessels. It thickens, and in time becomes concrete: it has a fragrant odour, and a warm sweetish taste. It dissolves entirely in alcohol, and communicates its odour and taste to water, by boiling. It contains acid of benzoin. This is the mildest of all the balsams. It has been used as an expectorant; but its powers are very inconsiderable, and it is at present employed principally on account of its flavour somewhat resembling that of lemons. It is directed, by the pharmacopæias, in the syrupus Tolutanus, tinctura Tolutana, and syrupus balsamicus.

BALSAMUM TRAUMATICUM. Vulnerary balsam. A form of medicine prescribed in the London Dispensatory, intended to supply the place of the tincture commonly called Friar's balsam, so famous for curing

old ulcers. The London College have named it Tiectura Benzoini composita.

Balsamum universale. A name given to the unguentum saturninum of old pharmacopæias.

Balsamum Verum. See Balsamum Gilea-dense.

BALSAMUM VIRIDE. Linseed-oil, turpentine and verdigrise, mixed together.

BALSAMUM VITE HOFFMANNI. Beaume de vie. An artificial balsam, so named from its inventor, and composed of a great variety of the warmest and most grateful essential oils, such as nutmegs, cloves, lavender, &c. with balsam of Peru, dissolved in highly rectified spirit of wine; but it is now greatly abridged in the number of ingredients, and but little used.

BALZOINUM. The gum benjamin.

BAMBALIO. (From βαμβαίνω, to speak inarticulately.) A person who stammers, or lisps.

Banboo. (Indian.) The young shoots of the arundo bambos of Linnæus, which are prepared by the natives of both Indies with vinegar, garlic, pepper, &c. into a very excellent pickle, which promotes the appetite, and assists digestion.

Bamia Moschata. See Abelmoschus.

Bamier. The name of a plant common in Egypt, the husk of which they dress with meat, and, from its agreeable flavour, make great use of it in their ragouts.

BAN ARBOR. The coffee-tree.

BANANA. (Indian.) Banuneira. Ficoides. Ficas Indica. Musa fructu cucumerino breviori. Senoria. Pacaira. The Banana, or Plantain-tree. The most remarkable species of this genus of plants are,

The paradisaica, or plantain.
 The musa sapientum, or banana-tree.

Both are among the most important productions of the earth. The first sort is cultivated in all the islands of the West-Indies, where the fruit serves the Indians for bread; and some of the white people also prefer it to most other things, especially to the yams and cassada bread. This tree is cultivated, on a very extensive scale in Jamaica; without the fruit of which, Dr. Wright says, the island would scarcely be habitable, as no species of provision would supply their place. Even flour, or bread itself, would be less agreeable, and less able to support the laborious negro, so as to enable him to do his business, or to keep health. Plantains also fatten horses, cattle, swine, dogs, fowls, and other do-mestic animals. The leaves, being smooth and soft, are employed as dressings after blisters. The water from the soft trunk is astringent, and employed by some to check diarrhœas. Every other part of the tree is useful in different parts of rural economy. The leaves are used as napkins and tablecloths, and are food for hogs. The second sort, musa sapientum, or banana-tree, differs from the paradisiaca, in having its stalks marked with dark purple stripes and spots. The fruit is shorter, straighter, and rounder; the pulp is softer, and of a more luscious taste. It is never eaten green; but, when ripe, it is very agreeable, either eaten raw or fried in slices, as fritters, and is relished by all ranks of people in the West Indies. Both the above plants were carried to the West Indies from the Canary Islands; whither, it is believed, they had been brought from Guinea, where they grow naturally.

See Banana.

Bancia. The Elaphoboscum, or wild

BANDAGE. Deligatio. Fascia. apparatus consisting of one or several pieces of linen, or flannel, and intended for covering or surrounding parts of the body for surgical purposes. Bandages are either simple or compound. The chief of the simple are the circular, the spiral, the uniting, the retaining, the expellent, and the creeping. The compound bandages used in surgery, are the T bandage, the suspensory one, the capistrum, the eighteen-tail bandage, and others to be met with in surgical treatises.

BANDURA. A plant which grows in Ceylon, whose root is said to be astringent.

BANGUE. Bange. A species of opiate in great use throughout the East, for its intoxicating qualities. It is the leaf of a kind of wild hemp, growing in the countries of the Levant, and made into powder, pills, or conserves.

Banica The wild parsnip. Banilia. See Vanilla.

See Vanilla. BANILAS

BAOBAB. Bahobab. A species of the genus of plants called by Linnaus Adansonia. It grows mostly on the west coast of Africa, from the Niger to the kingdom of Benin. The bark is called lalo; the negroes dry it in the shade, then powder and keep it in little cotton bags, and put two or three pinches into their food. It is muciliaginous, and powerfully promotes perspiration. The mucilage obtained from this bark is a powerful remedy against the epidemic fevers of the country that produces these trees; so is a decoction of the dried leaves. The fresh fruit is as useful as the leaves, for the same purposes.

BAPTICA coccus. Kermes berries.

BAPTISTERIUM. (From Bxx70, to immerge.) A bath, or repository of water, to wash the body.

BAPTISTRUM. (From Barla, to dye.) A species of wild mustard; so called from

its reddish colour.

Banac. (From borak, Arabian, splendid.) Barach panis. Nitre. According to Rulandus, nitrum salis.

BARAS. (Arabian.) In M. A. Severimus, it is synonymous with Alphus, or Louce.

BARATHRUM. (Arabian.) Any cavity or hollow place.

BARBA. (From barbarus, because wild nations are usually unshaven.) 1. The beard of man.

2. Some vegetables have the specific name of barba, whose ramifications are

bushy, like a beard, as barba jovis, &c.

BARBA ARONIS. The arum.

BARBA CUPRIE. The ulmaria.

BARBA HIRCI. The tragopogou.

BARBA JOVIS. Jupiter's beard, or the

silver bush. Also a name of the semper-vivum majus, and of a species of anthyllis. 4-

The fruit of the BARBADOES CHERRY Malphigia glabra of Linnæus, resembling

the inferior of our cherries.

Barbadoes nut. See Ricinus major.

BARBADOES TAR. (So named from the island from which it is chiefly procured.) The use of this article in medicine is limited to its external application, at times, in paralytic cases.

BARBAREA. (From St. Barbary, who is said to have found its virtues.) The leaves of this plant, Erisymum barbaræa: foliis lyratis, extimo subrotundo of Linnæus, may be ranked among the the antiscorbutics .-They are seldom used in practice.

An obsolete BARBARIA. Barbaricum.

term formerly applied to rhubarb.

BARBAROSSÆ PILULA. Barbarossa's pill. An ancient composition of quicksilver, rhubarb, diagridium, musk, amber, &c. It was the first internal mercurial medicine which obtained any real credit.

BARBARUM. The name of a plaister in

Scribonius Largus.

BARBATINA. A Persian vermifuge seed. BARBEL. Barbo, And obling fish resembling the pike, the eating of whose roe often brings on the cholera morbus.

Barberry. See Berberis.

BARBOTA. The barbut. A small riverfish. It is remarkable for the size of its liver, which is esteemed the most delicate

part of it.

BARDANA. (From bardus, foolish; because silly people are apt to throw them on the garments of passengers, having the property of sticking to whatever they touch) Arctium. Betonica. Britannica. Ilaphis. Burdock. The plant so called in the pharmacopæias, is Arctium lappa: -foliis cordatis, inermibus, petiolatis, of It grows wild in uncultivated Linnæus. grounds. The seeds have a bitterish subacrid taste: they are recommended as very efficacious diuretics, given ei her in the form of emulsion, or in powder, to the quantity of a drachm. The roots taste sweetish, with a slight austority and bitterness: they are esteemed aperient, diuretic, and sudorific; and are said to act without irritation, so as to be safely ventured upon in acute disorders. Decections of them have of late been used, in rheumatic, gouty, venereal, and other disorders; and are preferred by some to those of sarsaparilla. Two ounces of the roots are to be boiled in three pints of water, to a quart; to this, two drachms of vitriolated kali have been usually added. Of this decoction, a pint should be taken every day, in scorbutic and rheumatic cases, and when intended as a diuretic, in a shorter period.

BAREGE WATER. The small village of Barege, celebrated for its thermal waters, is situated on the French side of the Pyrenees, about half way between the Mediterranean and the Bay of Biscay. The hot springs are four in number. They have all the same component parts, but differ somewhat in their temperature, and in the quantity of sulphur, the hottest being most strongly penetrated wi h this active ingredient. The coolest of these waters raises Fahrenheit's thermometer to 73 deg.; the hottest to 120 deg. Barege waters are remarkable for a very smooth soapy feel; they render the skin very supple and pliable, and dissolve perfectly well soap and animal lymph; and are resorted to as a bath in resolving tumours of various kinds, rigidities, and contractions of the tendons, stiffness of the joints, left by rheumatic and gouty complaints, and are highly serviceable in cutaneous eruptions. Internally taken, this water gives considerable relief in disorders of the stomach, especially attended with acidity and heart-burn, in obstinate cholics, jaundice, and in gravel, and other affections of the urinary organs. BARILLA. (Bariglia, the place where

it was formerly produced ) Bariglia. Ba-Anatvon. Natron Anaton. Nitrum antiquorum. Aphronitrum. Baurach. Sal alkalinus fixus fossilis Carbonas sode impurus. Sub-carbonas sodæ impurus. Soda Barilla is the term given, in commerce, to the impure mineral alkali, or imperfect carbonate of soda, imported from Spain and the Levant. It is made by burning to ashes different plants that grow on the seashore, chiefly of the genus salsola of Linneus, and is brought to us in hard porous masses, of a speckled brown colour. Kelp, a still more impure alkali, made in this country by burning various sea-weeds, is sometimes called British barilla. The marine plants, collected for the purpose of procuring baralla in this country, are the salsola kali, salicornia Europæa, zostera maritima, triglochen maritimum, chenopo-

phium, dipsacus fullonum, &c. &c.

BARK. A term very frequently employed to signify, by way of eminence,

Peruvian bark. See Cinchona.

gallica, cryngium maritimum, sedum tele-

dium maritimum, atriplex portulacoides and littoralis, plantago maritima, tamarix

Bark, Carribæan. See Cinchona Jamai.

Bark, Jamaica. See Cinchona Jamaicensis.

Bark, Peruvian. See Cinchona.
Bark, red. See Cinchona rubra.

Bark yellow. See Cinchona flava. Barley. See Hordeum. Bayley caustic. See Cavidilla.

Bayley, caustic. See Cavidilla.
Barley, pearl. See Hordeum perlatum.
Barm A name given to yeast.

BARNET WATER. It is of a purging kind, of a similar quantity to that of Epsom, and about half its strength.

BAROMETER. (From £agar, weight, and µrrgor, measure.) An instrument to determine the weight of the air; it is commonly called a weather-glass.

BARONES. Small worms; called also

Nepones.

Baroptis. A black stone, said to be an antidote to venomous bites.

BAROS. (Bagos.) Gravity.
1. Hippocrates uses this word to express by it, an uneasy weight in any part.

2. It is also the Indian name for a species of camphire, which is distilled from the roots of the true cinnamon-tree.

BARRENNESS. The same as sterility. BARTHOLINIANE GLANDULE. See Sub-

ingual glands.

BARYCOIA. (From Bzgυς, heavy, and axaww, to hear.) Deafness, or difficulty of hearing.

BARYOCOCCALON. (From βαζυς, heavy, and κρακαλος, a nut; because it gives a deep sound.) A name for the stramonium.

BARYPHONIA. (From βαξυς, dull, and φωνη, the voice.) A difficulty of speaking. BARYTES. (From βαξυς, beavy; so called because it is very ponderous.) Cauk. Calk. Terra ponderosa. Baryt. Ponde-

rous earth. Heavy earth.

Barytes does not exist pure in nature. It is always found in combination with sulphuric or carbonic acid. United with the sulphuric acid, it forms the mineral called sulphate of barytes, or baroselenite. It is found in Staffordshire, Derbyshire, &c. When united to carbonic acid, it is called erated barytes, or carbonate of barytes, found at Anglezark, near Chorley, in Lancashire. Both combinations are met with regularly crystallized and amorphous.

Pure barytes has a much stronger affinity than any other body for sulphuric acid; it turns blue tincture of cabbage green. It is entirely infusible, by heat alone, but melts when mixed with various carths. Its specific gravity is 4.000. It changes quickly in the air, swells, becomes soft, and falls into a white powder, with the aquisition of about one-fifth of its weight. This slaking is much more active and speedy than that of lime. It combines with phosphorus, which compound decomposes water rapidly. It unites to sulphur by the

dry and humid way. It has a powerful attraction for water, which it absorbs with a hissing noise and consolidates it strongly. It is soluble in twenty times its weight of cold, and twice its weight of boiling water. Its crystals are long four-sided prisms of a satin-like appearance. It is a deadly poi-

son to animals.

Method of obtaining pure Barytes.—1. Take native carbonate of barytes; reduce it to a fine powder and dissolve it in a sufficient quantity of diluted nitric acid; evaporate this solution till a pellicle appears, and then suffer it to crystallize in a shallow basin. The salt obtained is nitrate of barytes; expose this nitrate of barytes to the action of heat in a china cup, or silver crucible, and keep it in a dull red heat for at least one hour, then suffer the vessel to cool, and transfer the greenish solid contents, which are pure barytes, into a well stopped bottle. When dissolved in a small quantity of distilled water, and evaporated, it may be obtained in a beautiful crystaline form.

In this process the nitric acid, added to the native carbonate of barytes, unites to the barytes, and expels the carbonic acid, and forms nitrate of barytes; on exposing this nitrate to heat, it parts with its nitric acid, which becomes decomposed into its constituents, leaving the barytes behind.

2. Pure harytes may likewise be obtained from its sulphate. For this purpose, boil powdered sulphate of barytes in a solution of twice or three times its weight of carbonate of potash, in a Florence flask, for about two hours; filter the solution and expose what remains on the filter to the

action of a violent heat.

In this case the sulphuric acid of the barytes unites to the potash, and the carbonic acid of the latter, joins to the barytes; hence sulphate of potash and carbonate of barytes are obtained. The former is in solution and passes through the filter; the latter is insoluble, and remains behind. From this artificial carbonate of barytes, the carbonic acid is driven off by heat.

BASAAL. (Indian.) The name of an Indian tree. A decoction of its leaves, with ginger, in water, is used as a gargle in disorders of the fauces. The kernels of the

fruit kill worms. Ray's Hist.

BASALTES. (In the Æthiopic tongue, this word means iron, which is the colour of the stone.) A heavy and hard kind of stone, chiefly black, or green. It frequently contains iron, has a flinty hardness, is insoluble by acids, and is fusible by fire. The most remarkable property of this substance is its figure, being never found in strata, like other marbles, but always standing up in the form of regular angular columns, composed of a number of joints, one placed upon and nicely fitted to another, as if formed by the hands of a skilful architect. Some regard this fusible substance as a volcanic production, others

have supposed that it was formed of water. The Giant's Causeway, in the county of Antrim, in Ireland, and the rock of Percniere, near St. Santdoux, in Auvergne, are formed of these stones. The distinctive characters of basaltes are, a regular form, hardness sufficient to give fire with steel; and a cinereous, gray colour, inclining to black.

(From Baravila to find BASANITES. out.) A stone said by Pliny, to contain a bloody juice, and useful in diseases of the liver; also a stone upon which, by some, the purity of gold was formerly said to be tried, and of which medical mortars were made.

Base, acidifiable. See Acid.

Base, acidifying. See Acid.
Basiatio. (From basio, to kiss.) nerial connection between the sexes.

BASIATOR. See Constrictor labiorum. See Basilicum.

BASILARE OS. (Basilaris; from Basileus, a king.) Several bones were so termed by the ancients; as the sphænoid and occi-

pital bones.

Basilary artery. BASILARIS ARTERIA.
An artery of the brain. So called because it lies upon the basilary process of the occipital bone. It is formed by the junction of the two vertebral arteries within the skull, and runs forwards to the sclla turcica along the pons varolii, which it supplies, as well as the adjacent parts, with blood.

Basilaris processus. Basilary process. See Occipital bone.

The great apo-BASILIARIS APOPHYSIS. physis of the os occipitis.

BASILICA MEDIANA. See Basilica vena.

Basilica Nux. The walnut.

BASILICA VENA. The large vein that runs in the internal part of the arm, and evacuates its blood into the axillary vein. The branch which crosses, at the head of the arm, to join this vein, is called the basilic median. They may either of them be opened in the operation of bloodletting.

Basilicon contment. Sec Basilicum un-

BASILICUM. (From Exouning, royal; so called from its great virtues.) The plant which bears this name in the pharmacopæias, is the Ocinum basilicum of Linnæus:—foliis ovatis glabris; calycibus ciliatis. It is supposed to possess nervine qualities, but is soldom employed but as a condiment to season high dishes, to which it imparts a grateful odour and

BASILICUM UNGUENTUM. Unguentum basilicum flavum. An ointment popularly so called from its having the ocymum basilicum in its composition. It came afterwards to be composed of wax, resin, &c. and is now called ceratum resing flave.

Bisilious Pelvis. The royal powder.

A preparation formerly composed of calomel, rhubarb, and jalap. Many compositions, were, by the ancients, so called, from their supposed pre-eminence.

Basilibion. An itchy ointment was

formerly so called by Galen.

Basilis. A name formerly given to collyriums of supposed virtues, by Galen.

Basiliscus. (From βασιλως, a king.) The basilisk, or cockatrice, a poisonous serpent; so called from a white spot upon its head, which resembles a crown. Also the philosopher's stone, and corrosive sublimate.

BASIO-CERATO-CHONDRO-GLOSSUS. See Hyoglossus.

BASIO-GLOSSUM. See Hyoglossus.

BASIO-PHARENGEUS. See Constrictor pharyngis medius.

BASIS. (From Bawa, to go: the support of any thing, upon which it stands or goes.)

1. This word is very frequently applied anatomically to the body of any part, or to that part from which the other parts appear, as it were, to proceed, or by which they are supported.

2. In pharmacy it signifies the princi-

pal ingredient.

Basis cerebri. A term applied for-

merly to the palatum.

Basis condis. The broad part of the heart is so called, to distinguish it from the apex, or point.

Bassi colica. The name of a medicine in Scribonius Largus, compounded of aromatics and honey.

Bastard pleurisy. See Peripneumonia notha.

BATATAS. (So the natives of Peru call the potato, which is a native of that country, from our word potato.) A species of night-shade, solanum tuberosum, Linn. Potatoes were first brought into Europe by Sir Francis Drake, 1486. and planted in London. They are said to be natives of Peru.

BATH. Balneum. Baths are of several

kinds.

I. A convenient receptacle of water, for persons to wash or plunge in, either for health or pleasure, is called a bath. These are distinguished into hot and cold; and are either natural or artificial. The natural hot baths are formed of the water of hot springs, of which there are many in different parts of the world; especially in those countries where there are, or have evidently been, volcanoes. The artificial hot baths consist either of water, or of some other fluid, made hot by art. The cold bath consists of water, either fresh or salt, in its natural degree of heat; or it may be made colder by art, as by a mixture of nitre, şal-ammoniac, &c. The chief hot baths in our country are those of Bath and Bristol, and those of Buxton and Matlock; which latter, however, are rather warm, or tepid, than hot. The use of these baths is found to be beneficial in diseases of the

head, as palsies, &c.; in cuticular diseases, as leprosies, &c.; obstructions and constipations of the bowels, the scurvy, and stone; and in many diseases of women and children. The cold bath, though popularly esteemed one of the most innocent reme. dies yet discovered, is not, however, to be adopted indiscriminately. On the contrary, it is liable to do considerable mischief in all cases of diseased viscera, and is not, in any case, proper to be used during the existence of costiveness. preventive remedy for the young, and as a general bracer for persons of a relaxed fibre, especially of the female sex, it often proves highly advantageous; and in general, the popular idea is a correct one, that the glow which succeeds the use of cold or temperate baths, is a test of their utility; while, on the other hand, their producing chilliness, head-ache, &c. is a proof of their being pernicious.

The Cold Bath.

The diseases and morbid symptoms, for which the cold bath, under one form or another, may be applied with advantage, are very numerous; and some of them deserve particular attention. One of the most import ant of its uses is in ardent fever: and, under proper management, it forms a highly valuable remedy in this dangerous disorder. It is highly important, however, to attend to the precautions which the use of this vigorous remedial process requires. "Affusion with cold water," Dr. Currie observes, " may be used whenever the heat of the body is steadily above the natural standard, when there is no sense of chilliness, and especially when there is no general nor profuse perspiration. If used during the cold stage of a fever, even though the heat be higher than natural, it brings on interruption of respiration, a fluttering, weak, and extremely quick pulse, and certainly might be carried so far as to extinguish animation entirely." The most salutary consequence which follows the proper use of this powerful remedy, is the production of profuse and general perspira-It is this circumstance that appears to give so much advantage to a general effusion of cold water in fevers, in preference to any partial application. The cold bath is better known, especially in this country, as a general tonic remedy in various chronic diseases. The general circumstances of disorder for which cold bathing appears to be of service, according to Dr. Saunders, are a languor and weakness of circulation, accompanied with profuse sweating and fatigue, on very moderate exertion; tremors in the limbs, and many of those symptoms usually called nervous; where the moving powers are weak, and the mind listless and indolent; but, at the same time, where no permanent morbid obstruction, or visceral disease, is present. Such a state of body is often the conseBATH. 103

quence of a long and debilitating sickness, or of a sedentary life, without using the exercise requisite to keep up the activity of the bodily powers. In all these cases, the great object to be fulfilled, is to produce a considerable reaction, from the shock of cold water, at the ex; ense of as little heat as possible; and when cold-bathing does harm, it is precisely where the powers of the body are too languid to bring on reaction, and the chilling effects remain unopposed. When the patient feels the shock of immersion very severely, and, from experience of its pain, has acquired an insuperable dread of this application; when he has felt little or no friendly glow to succeed the first shock, but on coming out of the bath remains cold, shivering, sick at the stomach, oppressed with head-ache, languid, drowsy and listless, and verse to food and exercise during the whole of the day, we may be sure that the bath has been too cold, the shock too severe, and no reaction produced at all adequate to the impression on the surface of the body.

There is a kind of slow irregular fever, or rather febricula, in which Dr. Saunders has often found the cold hath of singular service. This disorder principally affects persons naturally of a sound constitution, but who lead a sedentary life, and at the same time are employed in some occupation which strongly engages their attention, requires much exertion of thought, and excites a degree of anxiety. Such persons have constantly a pulse rather quicker than natural, hot hands, restless nights, and an impaired appetite; but without any considerable derangement in the digestive organs. This disorder will continue for a long time, in an irregular way, never entirely preventing their ordinary occupation, but rendering it more than usually anxious and fatiguing, and often preparing the way for confirmed hypochondriasis. Persons in this situation, are remarkably relieved by the cold-bath, and for the most part, bear it well; and its use should also, if possible, be aided by that relaxation from business, and that diversion of the mind from its ordinary train of thinking, which are obtained by attending a watering-place. The Doctor also found cold bathing hurtful in chlorosis, and observes, that it is seldom admissible in those cases of disease in the stomach which are brought on by high living, and constitute what may be termed the true dyspepsia.

The topical application of cold water, or of a cold saturnine lotion, in cases of local inflammation, has become an established practice; the efficacy of which is daily experienced. Burns of every description will bear a most liberal use of cold water, or even of ice; and this may be applied to a very extensive inflamed surface, without even producing the ordinary effects of general chilling, which would be

brought on from the same application to a sound and healthy skin. Another very distressing symptom, remarkably relieved by cold water, topically applied, is that intolerable itching of the vagina, which women sometimes experience, entirely unconnected with any general cause, and which appears to be a kind of herpes confined to that part. Cold water has also been used topically in the various cases of strains, bruises, and similar injuries, in tendinous and ligamentous parts, with success; also in rigidity of muscles, that have been long kept at rest, in order to favour the union of bone, where there appears to have been no organic injury, but only a deficiency of nervous energy, and in mobility of parts, or at most, only slight adhesions, which would give way to a regular exercise of the weakened limb. Another very striking instance of the powerful effects of topical cold, in stimulating a part to action, is shown in the use of cold, or even iced water, to the vagina of parturient women, during the dangerous hæmorrhages that take place from the uterus, on the partial separation of the placenta.

The Shower Bath.

A species of cold bath. A modern invention, in which the water falls, through numerous apertures, on the body. A proper apparatus for this purpose is to be obtained at the shops. The use of the shower bath applies, in every case, to the cold bath, and is of en attended with particular advantages. 1. From the sudden contact of the water, which, in the common cold bath, is only momentary, but which, in the shower bath may be prolonged, re-peated, and modified, at pleasure; and, secondly, from the head and breast, which are exposed to some inconvenience and danger in the common bath, being here effectually secured, by receiving the first shock of the water.

The Tepid Bath.

The range of temperature, from the lowest degree of the warm bath to the highest of the cold bath, forms what may be termed the tepid. In general, the heat of water which we should term tepid, is about 90 deg. In a medicinal point of view, it produces the greatest effect in ardent fever, where the temperature is little above that of health, but the powers of the body weak, not able to bear the vigorous application of cold immersion. cutaneous diseases, a tepid bath is often quite sufficient to produce a salutary relaxation, and perspirability of the skin.

The Warm Bath.

From 93 to 96 deg. of Fahrenheit, the warm bath has a peculiar tendency to bring on a state of repose, to alleviate any local irritation, and thereby induce sleep. It is, upon the whole, a safer remedy than the cold bath, and more peculiarly appli104 BATH.

cable to very weak and irritable constitutions, whom the shock produced by cold immersion would overpower, and who have sufficient vigour of circulation for an adequate reaction. In cases of topical inflammation, connected with a phlogistic state of body, preceded by rigor and general fever, and where the local formation of matter is the solution of the general inflammatory symptoms, experience directs us to the use of the warm relaxing applications, rather than those which, by exciting a general reaction, would increase the local complaint. This object is particularly to be consulted when the part affected is one that is essential to life. Hence it is that in fever, where there is a great determination to the lungs, and the respiration appears to be locally affected, independently of the appression produced by mere febrile increase of circulation, practitioners have avoided the external use of cold, in order to promote the solution of the fever; and have trusted to the general antiphlogistic treatment, along with the topically relaxing application of warm vapour, inhaled by the lungs. Warm bathing appears to be peculiarly well calculated to relieve those complaints that seem to depend on an irregular or diminished action of any part of the alimentary canal; and the state of the skin, produced by immersion in warm water, seems highly favourable to the healthy action of the stomach and bowels. Another very important use of the warm bath, is in herpetic eruptions, by relaxing the skin, and rendering it more pervious, and preparing it admirably for receiving the stimulant applications of tar ointment, mercurials, and the like, that are intended to restore it to a healthy state. The constitutions of children seem more extensively relieved by the warm bath than those of adults; and this remedy seems more generally applicable to acute fevers in them than in persons of a more advanced age. Where the warm bath produces its salutary opera-tion, it is almost always followed by an easy and profound sleep. Dr. Saunders strongly recommends the use of the tepid warm bath, or even higher, in the true menorrhagia of females. In paralytic affections of particular parts, the powerful stimulus of heated water is generally allowed; and in these cases, the effect may be assisted by any thing which will increase the stimulating properties of the water, as, for instance, by the addition of salt. In these cases, much benefit may be expected from the use of warm sea-baths. The application of the warm bath topically, as in pediluvia, or fomentations to the feet, often produce the most powerful effects in quieting irritation in fever, and bringing on a sound and refreshing repose. The cases in which the warm bath is likely to be attended with danger, are particularly those

where there exists a strong tendency to a determination of blood to the head; and apoplexy has sometimes been thus brought on. The lowest temperature will be required for cutaneous complaints, and to bring on relaxation in the skin, during febrile irritation; the warmer will be necessary in paralysis; more heat should be employed on a deep-seated part than one that is superficial.

The Vapour Bath. The vapour bath, called also Balneum laconicum, though not much employed in England, forms a valuable remedy in a variety of cases. In most of the hot natural waters on the Continent, the vapour bath forms a regular part of the bathing apparatus, and is there highly valued. In no country, however, is this application carried to so great an extent as in Russia, where it forms the principal and almost daily luxury of all the people, in every rank; and it is employed as a sovereign remedy for a great variety of disorders. The Hon. Mr. Basil Cochrane has lately published a Treatise on the Vapour Bath, from which, it appears, he has brought the apparatus to such perfection, that he can apply it of all degrees of temperature, partially or generally, by shower, or by stream, with a great force or a small one; according to the particular circumstances under which patients are so variously placed, who require such assistance. See Cochrane on Vapour Bath. Connected with this article, is the air-pump vapour-bath; a species of vapour bath, or machine, to which the inventor has given this name. This apparatus has been found efficacious in removing paroxysms of the gout, and preventing their recurrence; in acute and chronic rheumatism, palsy, cutaneous diseases, ulcers, &c. It has also been proposed in chilblains, leprosy, yaws, tetanus, amenorrhea, and dropsy.

II. When the vessels in which bodies are exposed to the action of heat, are not placed in immediate contact with the fire, but receive the required degree of heat by another intermediate body, such apparatus is termed a bath. These have been variously named, as dry, vapour, &c. Modern chymists distinguish three kinds:

1. Balneum arenæ, or the sand bath. This consists merely of an open iron, or baked clay, sand-pot, whose bottom is mostly convex, and exposed to the furnace. Finely sifted sea-sand is put into this, and the vessel containing the substance to be heated, &c. in the sand bath, immersed in the middle.

2. Balneum mariæ, or the water bath. This is very simple, and requires no particular apparatus. The object is, to place the vessel containing the substance to be heated, in another, containing water; which last must be of such a nature as to

be fitted for the application of fire, as a comment still, or kettic.

3. The vapour bath. When any substance is heated by the steam, or vapour, of boiling water, chymists say it is done

by means of a vanour bath.

III. Those applications are called dry baths, which are made of ashes, sait, sand, &c The ancients had miny ways of exciting a sweat, by means of a dry heat; as by the use of hot's ad, stove rooms, or artificial bagnios; and even from certain natural bot steams of the earth, received under a proper arch, or het-house, as we learn from Celsus. They had also another kind of both by insolation, where the body was expesed to the sun for some time, in order to draw forth the superfluous moisture from the inward parts; and to this day it is a practice, in some nations, to cover the body over with horse-dung, especially in prinful chronic diseases, Nev England, they make a kind of stove of turi, wherein the sick are shut up to bathe, or sweat. It was probably from a knowledge of this practice, and of the exploded doctrines of Celsus, that the noted empiric Dr. Graham drew his notions of the salutery effects of what he called earth bathing; a practice which, in the way he used it, eonsign d some of his patients to a perpetual mansion under the ground. The like name of dry bath, is sometimes also given to another kind of bath, made of kindled coals, or burning spirit of winc. The patient being placed in a convenient close chair, for the reception of the fume, which rises and provokes sweat in a plentiful manner; care being taken to keep the head out, and to secure respiration bath has been said to be very effectual in removing old obstinate pains in the limbs.

IV. Medicated baths are such as are saturated with various mineral, vegetable, or Thus we sometimes animal substances. have sulphur and iron baths, aromatic and milk baths. There can be no doubt that such ingredients, if duly mixed, and a proper temperature be given to the water, may, in certain complaints, be productive of effects highly beneficial. Water, impregnated with sulphate of iron, will abound with the bracing and sulphureous particles of that metal, and may be useful for strengthening the part to which it is applied, reinvigorating debilitated limbs, stopping various kinds of bleeding, restoring the menstrual and hæmorrhoidal discharges when obstructed, and, in short, as a substitute for the natural iron bath. There are various other medicated baths, such as those prepared with alum and quick-lime, sal-ammeniae, &c. by boiling them together, or separately, in pure rain water. These have long been reputed as eminently serviceable in paralytic, and all

disea es arising from nervous and muscular debitity.

BATH WATERS. Rathoniæ aquæ Solis aque. Radigue aque. The city of Bath has been cetebrated, for a long series of years, for its numerous hot springs, which are of a higher temperature than any in this kingdom, (from 112° to 116°,) and, indeed are the only natural waters winch we po sess that are at all hot to the touch; all the other thermal waters being of a heat below the animal temperature, and only deserving that appellation from being inveriably warmer than the general average of the next of common springs. By the erection of elegant baths, these waters are patieularly adapted to the benefit of invalids, who find here a variety of establishments, contributing equally to health, convenience, and annusement. There are three principal springs in the city of Bath, namely, those called the King's Bath, the Cross Bath, and the Hot Bath; all within a short distance of each other, and emptying themselves into the river Avon, after having passed through the several baths. Their supply is so copious, that all the large reservoirs used for bathing are filled every evening with fresh water, from their respective fountains. In their sensible and medicinal properties, there is but a slight difference. According to Dr Falconer, the former are-1. That the water, when newly drawn, appears clear and colourless, remains perfectly inactive, without bubbles, or any sign of briskness, or effervescence. 2. After being exposed to the open air, for some hours, it becomes rather turbid, by the separation of a pale yellow, ochery precipitate, which gradually subsides. 3 No odour is perceptible from a glass of the fresh water, but a slight pungency to the taste from a large mass of it, when fresh drawn; which, however, is neither fetid nor sulphureous. 4. When hot from the pump, it affects the mouth with a strong chalybeate impression, without being of a saline or pungent taste. And, fifthly, on growing cold, the chalybeate taste is entirely lost, leaving only a very slight sensation on the tongue, by which it ean scarcely be distinguished from common hard spring-water. The temperature of the King's Bath water, which is usually preferred for drinking, is, when fresh drawn in the glass, above 116 deg.; that of the Cross Bath, 112 deg. But, after flowing into the spacious bathing vessels, it is generally from 100 to 106 deg, in the hotter baths, and from 92 to 94 deg. in the Cross Bath; a temperature which remains nearly stationary, and is greater than that of any other natural spring in Britain. A small quantity of gas is also disengaged from these water, which Dr. Priestley first discovered to contain no more than

one-twentieth part of its bulk of fixed air. or carbonic acid. The chymical proper-ties of the Bath waters, according to the most accurate analysers, Doctors Lucas, Falconer, and Cibbs, contain so small a propertion of iron, as to amount only to one-twentieth or one-thirty-eighth of a grain in the pint; and, according to Dr. Gibbs, fifteer grains and a quarter of siliceous earth in the gallon. Dr Saunders estimates a gallon of the King's Bath water to contain about eight cub c inches of carbonic acid, and a similar quantity of air, nearly azotic, about righty grains of solid ingredients, one-balf of which probably consists of sulphat and muriat of soda, fifteen grains and a half of siliceous earth, and the remainder is selenite, carbonate of lime, and so small a portion of oxyd of iron as to be scarcely calculable. Hence he concludes, that the King's Bath water, is the strongest chalybeate; next in order, the Hot Bath water; and lastly, that of the Cross Bath, which contains the smallest proportions of chalybeate, gaseous and saline, but considerably more of the earthy particles; while its water, in the pump, is also two degrees lower than that of the It is likewise now ascertained, that these springs do not exhibit the slightest traces of sulphur, though it was formerly believed, and erroneously supported on the authority of Dr. Charleton, that the subtile aromatic vapour in the Bath waters, was a sulphureous principle, entirely similar to common brimstone.

With regard to the effect of the Bath waters on the human system, independent of their specific properties, as a medicinal remedy not to be imitated completely by any chymical process, Dr. Saunders attributes much of their salubrious influence to the natural degree of warmth peculiar to these springs, which, for ages, have preserved an admirable degree of uniformity of temperature. He thinks too, that one of their most important uses is that of an external application, yet supposes that, in this respect, they appear to differ little from common water, when heated to the same temperature, and applied under similar circumstances.

According to Dr. Falconer, the Bath water, when drunk fresh from the spring, generally raises, or rather accelerates the pulse, increases the heat, and promotes the different secretions. These symptoms, in most cases, become perceptible soon after drinking it, and will sometimes continue for a considerable time. It is, however, remarkable, that they are only produced in invalids. Hence we may conclude, that these waters not only possess heating properties, but their internal use is likewise attended with a peculiar stimulus, acting more immediately on the nerves.

One of the most salutary effects of the Bath water, consists in its action on the urmary organs, even when taken in moderate doses. Its operation on the bowels varies in different individuals, like that of all other waters, which do not contain any cathartic salt; but, in general, it is productive of costiveness: an effect resulting from the want of an active stimulus to the intestines, and probably also from the detern ination this water occasions to the skin, more than from any astringency which it may possess, for, if perspiration be suddenly checked during the use of it, a diarrhea is sometimes the consequence. Hence it appears that its stimulant powers are primarily, and more particularly exerted in the stomach, where it produces a variety of symptoms, sometimes slight and transient, but, occasionally, so considerable and permanent, as to require it to be discontinued. In those individuals with whom it is likely to agree, and prove beneficial, the Bath waters excite, at first, an agreeable glowing sensation in the stomach, which is speedily followed by an increase both of appetite and spirits, as well as a quick secretion of urine. In others, when the use of them is attended with head-ache, thirst and constant dryness of the tongue, heaviness, loathing of the stomach, and sickness; or if they are not evacuated, either by urine or an increased perspiration, it may be justly inferred that their further continuance is improper.

The diseases for which these celebrated waters are resorted to, are very numerous, and are some of the most important and difficult of cure of all that come under medical treatment. In most of them, the bath is used along with the waters, as an internal medicine. The general indications, of the propriety of using this medicinal water, are in those cases where a gentle, gradual, and permanent stimulus is required. Bath water may certainly be considered as a chalybeate, in which the iron is very small in quantity, but in a highly active form; and the degree of temperature is in itself a stimulus, often of considerable powers. These circumstances again point out the necessity of certain cautions, which, from a view of the mere quantity of foreign contents, might be thought superfluous Although, in estimating the powers of this medicine, allowance must be made for local prejudice in its favour, there can be no doubt but that its employment is hazardous, and might often do considerable mischief, in various cases of active inflammation; especially in irritable habits, where there exists a strong tendency to hectic fever; and even in the less inflammatory state of diseased and suppurating viscera; and, in general, wherever a quick pulse and dry tongue, indicate a de-

gree of general fever. The cases, therefore, to which this water are peculiarly suited, are mostly of the curonic kind; and by a steady perseverance in this remedy, very obstinate disorders have given way. The following, Dr. Saunders, in his Treatise on Mineral Waters, considers as the principal, viz. 1. Chlorosis, a disease which, at all times, is much relieved by steel, and will bear it, even where there is a considerable degree of feverish irritation, receives particular benefit from the Bath water; and its use, as a warm bath excellently contributes to remove that languor of circulation, and obstruction of the natural evacuations, which constitute the leading features of this common and troublesome disorder. 2. The complicated diseases, which are often brought on by a long residence in hot climates, affecting the secretion of bile, the functions of the stomach, and alimentary canal, and which generally produce organic derangement in some part of the hepatic system, of en receive much benefit from the Bath water, if used at a time when suppurative inflammation is not actually present. 3. Another and less active disease of the biliary organs, the jaundice, which arises from a simple obstruction of the gall-ducts, is still oftener removed by both the internal and external use of these waters. 4. In rheumatic complaints, the power of this water, as Dr. Charleton well observes, is chiefly confined to that species of rheumatism which is unattended with inflammation, or in which the patient's pains arc not increased by the warmth of his bed. A great number of the patients that resort to Bath, especially those that are admitted into the hospital, are affected with rheumatism in all its stages, and it appears, from the most respectable testimony, that a large proportion of them receive a permanent cure. (See Falconer on Bath Water in Rheumatic Cases.) 5. In gout, the greatest benefit is derived from this water, in those cases where it produces anomalous affections of the head, stomach, and bowels; and it is here a principal advantage to be able to bring, by warnth, that active local inflammation in any limb, which relieves all the other troublesome and dangerous symptoms. Hence it is that Bath water is commonly said to produce the gout; by which is only meant that, where persons have a gouty affection, shifting from place to place, and thereby much disordering the system, the internal and external use of the Bath water will soon bring on a general increase of action, indicated by a flushing in the face, fulness in the circulating vessels, and relief of the dyspeptic symptoms; and the whole disorder will terminate in a regular fit of the gout in the extremities, which is the crisis always to be wished for. 6. The colice pictonum, and

the paralysis, or loss of nervous power in particular limbs, which is one of its most serious consequences, is found to be peculiarly releved by the use of the Bath waters, more especially when applied externally, either generally, or upon the part affected.

The quantity of water taken daily, during a full cours, and by adults, is recommended by Dr. Falconer, not to exceed a pint and a half, or two pints : and in chlorosis, with irritable habits, not more than one pint is employed; and when the bath is made use of, it is generally two or three times a week, in the morning. The Bath waters require a considerable time to be persevered in, before a full and fair trial can be made. Coronic rhelmatism, habitual gout, dyspepsia, from a long course of high and intemperate living, and the like, are disorders not to be removed by a short course of any mineral water, and many of those who have once received benefit at the fountains, find it recessary to make an annual visit to them, to repair the waste in health during the preceding

BATH, CAUTERES. A sulphureous bath near Barege, which raises the mercury in Fahrenheit's t' ormaneter to 131 deg.

BATH ST. SAUVEUR'S. A sulpharcous and alkalme bath, in the valley adjoining Barege, the latter of which, raise Fahrenheit's thermometer as high as 131 deg. It is much resorted to from the South of France, and used chiefly externally, as a simple thermal water.

BATHMIS. (From \$\mu \text{exam} \text{, to enter.) } Bathmus. The seat, or base; the cavity of a bone, with the protuberance of another, particularly those at the articulation of the humerus and ulna, according to Hippocrates and Galen.

BATHONIE AQUE. Bath waters.

BATHRON. (From Laira, to enter.) Bathrum The same as bathmis; also an instrument used in the extension of fractured laubs, called scannum. Hippocrates. And described by Oribasius and Scultetus.

BATIA. A name formerly given to a

BATINON-MORON. (From βατος, a bramble, and μοζοι, raspberry. A raspberry.

BATRACHIUM. (From 2x7gxxxx, a frog; so called from its likeness to a frog.) The herb crow's foot, or ranunculus.

BATHACHUS. (From βατραχω, a frog; so called because they who are infected with it, croak like a frog.) An inflammatory tumour under the tongue.

BATTARISMUS. (From Batto, a Cyrenaman prince, who stammered.) Stammering; a defect in pronunciation. See Pselliemus.

BATTATA VIBGINIANA, See Potato.

BATTATA PEREGRINA. The cathartic potato; perhaps a species of ipomea. about two ounces of them are eaten at bed-time, they greatly move the belly the next morning

BATTARISMUS. Stammering with hesitation. The psellismus lixsitans of Cullen. A vessel for dis illation was

BAUDA. formerly so c.Hed.

Baulmoney See Meum athamanticum. BAURACH. (Arab. Bourach ) A name formerly applied to nitre, or any salt; hence it is that borax took its name, which is also thus called, as well as the mineral fixed alkaline salt.

BAXANA. (Indian.) A poisonous tree growing near Ormuz; called by Ray, ra-

Bau-cherry. See Lauro-cerasus.

Bay leaves. See Laurus.

BAY-LEAVED PASSION-FLOWER. plant so called is the Passiflora laurifolia of Linnxus. A native of Surmam, where the fruit grows to the size of a small lemon, which it greatly resembles. Its flavour is dencately acid, and much esteemed to quench thirst. It strengthens the stomach, and is a salutary fruit in gastric affections, fevers, &c.

BAY-SALT. A very pure salt, prepared from sea-water by spontaneous evaporation. BAZCHER. A Persian word for antidote. suck.)

(From BSanna, to BDELLA. Bdellerum. A horse-leech.

BDELLIUM. (From bedallah. Acab.) Madeleon. Bolchon. Balchus. Called by the Arabians, mokel. A gum-like, very impure myrrh. It is one of the weakest of the deobstruent gums. It was sometimes used as a pectoral and an emmenagogue. Applied externally, it is stimulant, and promotes suppuration. It is never met with in the shops of this country.

BDELLUS. (From & Sew, to break wind.) A di charge of the wind by the anus.

(From &S see, to break BDELYGMIA. wind ) Any filthy and nauseous odour.

BEAN. The common bean is the seed of the Vicia faba of Linnaus, a native of Egypt. There are many varieties. Beans are very wholesome and nutritious to those whose stomachs are strong, and accustomed to the coarser modes of living. delicate stomachs they produce flatulency, dyspepsia, cardialgia, &c. especially when old. See Legumina.

Bean, French. See Bean, kidney.

BEAN, KIDNEY. This seed is often called the French bean; it is the pericarpium of the phaseolus vulgaris of Linnæus, which, when young and well boiled, is casy of digestion, and delicately flavoured. These are less liable to produce flatulency than peas. Sec Legumina,

Bean. Malucca. See Anacardium orien-

tale.

Bean of Carthagena. See Bejuio.

Bean, St. Ignatius. See Nux comica s.

BEARD. The hair growing on the clin and adjacent parts of the face, in adults of the male sex. Bear's-breech. See Acanthus.

Bear's foot See Helleboruster. Bear's whortleberry. Uva ursi.

Becca. A fine kind of resin from the turpentine and mastich trees of Greece and Syria, formerly held in great r pute.

BECCABUNGA. (From buch bungen, water-herb, German, because it grows in rivulets.) Anagallis aquatica. Luver Germanicum. Ver onica aquatica. Cepau. Water-pumperne! nd brooklime. The plant which bears these names, is the Veronica beccabunga of Linnaus:-racemis lateralibus, folis ovatis planis, caule repente. It was formerly considered of much use in several diseases, and was applied externally to wounds and ulcers: but if it have any peculiar efficacy, it is to be derived from its antiscarbutie virtue. As a mild refrigerant juice, it is preferred where an acrimomous state of the fluids prevails, indicated by prurient eruptions upon the skin, or in what has been called the hot scurvy. To derive much advantage from it, the juice ought to be taken in large quantities, or the fresh plant eaten as food.

BECHA. See Bechica.

BECHICA. (From Eng., a cough.) Medicines to relieve a cough. The trochesci bechici albi, obsolete term. consist of starch and liquorice, with a small proportion of florentine orris made into lozenges, with mucilage of gum-traga-canth. They are a soft pleasant demul-cent. The trochisci bechici nigri, consist chiefly of the juice of liquorice, with sugar and gum-tragacanth.

BECHION. (From But, a cough: so called from its supposed virtues in relieving coughs Bechium. The herb colt's foot,

or tussilago.

BECUIBA NUX. (Indian.) A large nut growing in Brazil, from which a balsam is drawn that is held in estimation in rheuma-

(Arab.) BEDEGUAR. Bedeguar. The Cardius lacetus Syriacus is so called, and also the cynosbatos, or rosa canina.

BEDENGIAN. The name of the loveapples in Avicenna:

Bedstraw, lady's. See Aparine.

BEE. Apis mellifica. of Lunaus. This insect was formerly exhibited, after being dried and powdered, internally, as a diuretic. It is to the industry of bees we are indebted for those valuable articles, honey and wax. See Honey and Wax.

BEES' WAX. Cera. The production of the honey-comb: it is a hard compact substance, and of a clear yellow colour, much used for medical purposes externally, in the composition of ointments, cerates, and plaist rs.

Beet, red. See Beta rubra.

BEEF, WHITE. A viriety of red beet. The juice and powder of the root are good to exerte successing, and will bring away a considerable quantity of mucus.

BEGMA. (From Enough, to cough) A cough. Expectora ed mucus, according

to Hippocrate:

BEHEN ALBEM. (From behen, a finger, Ar., ) Jacea orientals patula tricoides lutea. The true white behen of the alcents Centaurea behen of Languis. The root possesses astrogent virtues.

Benev office in Autum. The spatling poppy:—Cucubalus behen of Linnaus, tormerly used as a cordial and al xipharmic.

BEHEN RUBBIUM. Limonium Lemonium majus. Behen Sea-lavender, or red behen. The Statice limonium of Lumauu. The roots possess astringent and strengthening qualities, but not in a very remarkable degree.

Bettelsan, Beidellopar, A species of Asclepias, used in Africa as a remedy for fever and the bites of serpents. The caustic luice which issues from the roots when wounded, is used by the negroes to destroy

venereal and simitar swellings.

Beauto, Habilla de Carthagena. Bean of Carthagena. A kind of bean in South America, famed for being an effectual antidote againt the poison of all serpents, if a small quantity is eaten immediately. This bean is the peculiar product of the jurisdiction of Carthagena.

Bela-Ave courex. (Indian) Belae. A bark of Madagascar, said to be of considerable efficacy in the care of diar-

rheas.

BELEMNOIDES. (From Esparon, a dart, and sofos, form; so named from their dart-like shape.) Belemoides. Beloides. The styloid process of the temporal bone, and the lower end of the ulna, were formerly so called.

Beleson. (Indian.) Belilia. The Mussends frondosa of Lineaus, a decoction of

which is, according to Ray, cooling.

BELLADONNA (From bella donna, Italian, a handsome iady; so called because the ladies of Italy use it, to take away the too florid colour of their faces.) Solamm melonocerasus Solamm lethale, Atropa belladonna of Linnxus:—caule herbace, foliis ovatis integris. This plant has been long known as a strong poison of the narcotic kind, and the berries have furnished many instances of their fatal effects, particularly upon children that have been tempted to eat hem. The leaves were first used internally, to discuss scirrhous and cancerous tumo irs; and from the good efficts attending their use, physicians were induced to employ them internally, for the same disorders; and there are a consi-

detable number of well authenticated facts, which prove them a very serviceable and important remedy. The dose, at first, should be small; and gradually and cautiously increased. If we grains are considered a powerful dose, and apt to produce dimness of sight, verugo, &c.

Bellere. See Myrobalani bellerici. Belleregi. See Myrobalani bellerici. Belnileg. See Myrobalani bellerici.

Bellenica. See Myrobalani bellerici. Bellenicaes. (From bellis, a daisy, and

edoc, form ) See Bellis major.

BELLIS. (à bello colore, from its fair colour,) The name of a genus of plants in the Lunneon system. Class, Syngenesia. Order, Polygamia superflua. The daisy.

Bellis major. Buphthalmum majus Leucanthemum unigare. Bellidusi les. Consolida media Oculus bovis. Ox-eye daisy Mandin-wort. The pharmacopæal name for the Chrysantnemum leucanthemum of Lamwus:—fo.iis amptexicaulibus, oblongis supernè sevratis, infernè demans. The flowers and herb were formetly estremed in asthmatic and phthisical discusses, but have now deservedly faller into disuse.

Bellis Mivor. Bellis. The common daisy. The Bellis percents of Lunaus:—scape nude, or braise-wort, was formerly directed in pharmacopeias by this name. Although the leaves and flowers are rather actid, and are said to core several species of wounds, they are never employed by

modern surgeons.

Bellis Perennis. The systematic name of the common daisy. See Bellis menor.

Belloculus. (From bellus, fair, and oculus, the eye.) A precious stone, resembling the eye, and formerly supposed to be useful in its disorders.

Bellon. The Devonshire colic, or colica pictomin.

BELLONARIA. (From Bellona, the goddess of war.) An herb which, if eaten, makes people mad, and act outrageously, like the votaries of Bellona.

Bellutta Tslampacam (ladian.) A tree of Malabar, to which many virtues are

BELMUSCHUS, A name given to the Abel-

Beloere. (Indian.) An evergreen plant of America, whose seeds purge moderately, but the leaves roughly.

BELONOIDES. Beloides. The same as

belemnoides.

Belulcum. (Fram Belos, a dart, and elike, to draw out.) A surgeon's instrument for extracting thorns, or darts.

BELLUZZAR, Beluzaar. The Chaldee word for antidote.

nu manuante.

Belzoe. See Benzoinum. Belzoinum. See Benzoinum,

Beneurini. An Indian shrub used in gout.

BEM-TAMARA. (Arab.) The faba Ægyp-

BEN. (Arab.) Glans unguentaria. Been Balanus mirepsica. Coattis. oily acorn, or ben-nut. A whitish nut, about the size of a small filberd, of a roundish triangular shape, including a kernel of the same figure, covered with a white skin. It is the fruit of the Guilandina moringa of Linnæus:—intermis, foliis, sub-pinnatis, foliolis inferioribus ternatis. They were formerly employed to remove ob-structions of the prima via. The oil af-forded by simple pressure, is remarkable for its not growing rancid in keeping, or, at least, not until it has stood for a number of years; and, on this account, it is used in extricating the aromatic principle of such odoriferous flowers as yield little or no essential oil in distillation. The unalterability of this oil would render it the most valuable substance for cerates, or liniments, were it sufficiently common. It is actually employed for this purpose in many parts of Italy.

BEN MAGNUM. Monardus calls by this name, the avellana purgatrix, which purges

and vomits violently.

BEN TAMARA. The Egyptian bean.

BENATH. (Arab.) Small pustules pro-

duced by sweating in the night.

BENEDICT. (From benedico, to bless.) A specific name prefixed to many compositions and herbs on account of their supposed good qualities; as benedicta herba, benedicta aqua, &c.

BENEDICTA AQUA. Lime water was formerly so cailed: also, a water distilled from serpyllum, and, in Schroeder, it is the

name for an emetic.

BENEDICTA AQUA COMPOSITA.

pound lime water.

BENEDICTA HERBA. Scc Caryophyllata. BENEDICTA LAXATIVA. A compound of turbeth, scammony, and spurges, with some warm aromatics.

BENEDICTUM LAXATIVUM. Rhubarb, and sometimes the lenitive electuary.

BENEDICTUM LICTUM. A term applied to Guaiacum.

Antimonial wine. BENEDICTUM VINUM. BENEDICTUS CARDUCS. Sec Carduus benedictus:

BENEDICTUS LAPIS. A name for the phi-

losopher's stone.

BENEOLENTIA. (From bene, well and oleo, to smell.) Sweet-scented medicines, as gums, &c.

BENG. A name given by the Mahomedans to the leaves of hemp, formed into pills, or conserve. They possess exhilarating and intoxicating powers.

BENGALE RADIX. (From Bengal, its

native place.) See Cassumuniar.

BENGAL QUINCE. This fruit, which is the produce of the Erateva marmelos of Linnaus, of spontaneous growth in several

parts of India, is about the size of an orange, and covered with a hard bony shell, containing a yellow viscous pulp, of a most agreeable flavour; this is scooped out, and being mixed with sugar and orange, is brought to the tables of the grandees in India, who eat it as a great delicacy. It is also esteemed as a sovereign remedy against dysentery.

BENGALLE INDORUM. (From Bengal,

its native place.) Sec Cassuminiar.

Bengi Eiri. A species of evergreen, Indian ricinus, which grows in Malabar.

Beuit herb. See Caryophyllata.

Benjul Arbor. See Benzoinum, Benjamin. See Benzoinum.

Benjamin flowers. See Benzoic acid. BENZOAS. A benzoate. A salt formed by the union of benzoic acid, with an alkaline, earthy, or metallic base; as benzoate of alumine, &c.

Benzoe. See Benzoinum.

BENZOE AMYGDALOIDES. See

BENZOIC ACID. Acidum benzoicum. Flores benzoes. Flores benzoini Benjamin

flowers. This acid exists in several balsams, but principally in the concrete balsam, called benzoin. (See Benzoinum.) Chymists have obtained it from this balsam in various ways, either by sublimation, which gives beautiful foliated crystals, but requires to be repeated thrice, and pressed between bibulous paper after each sublimation, to obtain them white and free from any adherent essential oil: or, by forming some of its soluble compounds, and afterwards decomposing them, so as to precipitate the acid; or, by simply boiling the benzoin in water, which dissolves the acid, and, as it, cools, allows it to separate again. The London Pharmacopæia directs it to be obtained thus:-Take of benzoin, a pound and a half: fresh lime, four ounces: water, a gallon and a half: muratic acid, four fluid-ounces. Rub together the benzoin and lime; then boil them in a gallon of the water, for half an hour, constantly stirring; and, when it is cold, pour off the liquor. Boil what remains, a second time, in four pints of water, and pour off the liquor as before. Mix the liquors, and boil down to half, then strain through paper, and add the muriatic acid gradually, until it ccases to produce a precipitate. Lastly, having poured off the liquor, dry the powder in a gentle heat; put it into a proper vessel, placed in a sand bath; and by a very gentle fire sublime the benzoic acid.

The Edinburgh Pharmacopæia forms a benzoate of soda, precipitates the acid by sulphuric acid, and afterwards crystallizes it by solution in hot water, which dissolves a larger quantity than cold.

Benzoic acid has a strong, pungent, arc-

BES 11:

untic, and peculiar odour. Its crystals are ductile, not pulverizable; it sublimes in a moderate heat, forming a white irritating smoke. It is soluble in about twenty-four times its weight of boiling water, which, as it cools, precipitates 19-20ths of what it had previously dissolved. It is soluble in alcohol.

Benzoic acid is very seldom used in the cure of diseases; but now and then it is ordered as a stimulant against convulsive coughs and difficulty of breathing. The dose is from one grain to five.

It combines with alkaline, metallic, and earthy bodies; and forms BENZOATES.

BENZOIFERA. Benzoinum.

BENZOINUM. (From the Arabic term benzoah.) Benjoinum. Assa dulcis. Assa odorata. Liquor cyreniacus. Balzoinum. Benzoin. Benjui. Benjuin. Gumbenjamin. This substance is classed, by modern chymists, among the balsams. There are two kinds of benzoin: benzoe amygdaloides, which is formed of white tears, resembling almonds, united together by a brown matter; and common benzoin, which is brown and without tears. The tree which affords this balsam, formerly called Laurus henzoin. Benzoifera. Arbor benici, is the Styrax benzoin, foliis oblongis acuminatis, subtus tomentosis, racenus compositis longitudine foliorum of Dryander, from which it is obtained by incisions. The benzoin of the shops is usually in very large brittle masses When chewed, it imparts very little taste, except that it impresses on the palate a slight sweetness; its smell, especially when rubbed or heated, is extremely fragrant and agreeable. It has rarely been used medicinally in a simple state, but its preparations are much esteemed against inveterate coughs and phthisical complaints, unattended with much fever; it has also been used as a cosmetic, and in the way of fumigation, for the resolution of indolent tumours. The acid of benzoin is employed in the tinctura camphoræ composita, and a tincture is directed to be made of the balsam.

Benzoes flores. See Benzoic acid.
Benzoini magisterium. Magistery or precipitate of giim-benjamin.

BERBERIS. (Berberi, wild. Arab. used

by Averrhoes and the officinal writers.)
1. The name of a genus of plants in the Linnman system. Class, Hexandria. Order, Monogynia. The barberry, or pepperidge bush.

2. The pharmacopæial name for the common barberry, or pepperidge bush. Oxycantha Galeni. Spina acida Crespi-

21118

This tree, Berberis vulgaris of Linnæus:

—pedunculis racemosis, spinis triplicibus,
is a native of England. The fruit or berices, which are gratefully acid, and moderately adstringent, are said to be of great

use in biliary fluxes, and in all cases where heat, acrimony, and putridity of the humours prevail. The filaments of this shrub possess a remarkable degree of irritability; for on being touched near the base with the point of a pin, a sudden contraction is produced, which may be repeated several times.

BERBERIS GELATINA. Barberries boiled in sugar.

Betheris Vulgaris. The systematic name for the berberis of the pharmacopoias. See Berberis.

BEREDIRAS. An ointment.

Benevice. (The city from whence it

was formerly brought.) Amber.

BEHENICUM. (From \$\rho\_{\text{tgw}}\$, to bring, and \$\rho\_{\text{tgw}}\$, victory.) A term applied by the old Greek writers to nitre, from its supposed power in healing wounds.

BERENI SECUM. Mugwort. See Arte-

misia vulgaris.

BERGAMOTE. A species of citron. Citrus mella rosa of Lamarck; and a variety of the citrus medica of Linnæus. It was produced, at first, casually, by an Italian grafting a citron on a stock of a bergamot pear-tree; whence the fruit produced by this union, participated both of the citron tree and the pear-tree. The essence prepared from this fruit is called essence of bergamote and essentia de cedra.

BERIBERI. (An Hindostane word signifying a sheep.) Beriberia. A species of palsy, common in some parts of the East Indies, according to Bontius. In this disease, the patients lift up their legs very much in the same manner as is usual with sheep. Bontius adds that this palsy is a kind of trembling in, which there is deprivation of the motion and sensation of the hands and feet, and sometimes of the body.

Bermudas berry. See Saponaria nucula.

Bennarvi. An electuary.

BERRIONIS. A name for colophory, or black rosin.

Bens. Formerly the name of an exhilarating electuary.

BERULA GALLICA. Upright water pars-

nip.

BERTTION. (From Berytius, its inventor A collyrium described by Galen.

BES. An eight-ounce measure.

Besacuan. An obsolete term for a sponge.

Besasa. Formerly applied to wild rue. Besbase. An old name for mace.

BESENNA. (Arab.) Muscarum Fungus. Probably a sponge, which is the nidus of some sorts of flies.

Bessanfn. (Arab.) A redness of the external parts, resembling that which precedes the leprosy; it occupies the face and extremities. Avicenna.

BESTO. A name in Oribasius for Saxi-

frage.

BETA. (So called from the river Betis, in Sprin, where it grows naturally; or, according to Blanchard, from the Greek letter fora, which it is said to resemble when turgid with seed.)

1. The name of a genus of plants in the Linnann eystem. Class, Pentandria. Or-

der, Digynia. The beet

2. The pharmacepoial name of the com-

mon beet.

Beta rulgaris of Linnxus :- floribus congestis The root of this plant is frequently eaten by the French; it may be considered as nutritious and antiscorbutic, and forms a very elegant pickle with vinegar. The root and leaves, although formerly employed as laxatives and emoflients, are new forgotten. A considerable quantity of sugar may be obtained from the root of the beet. It is likewise said, that if beet roots be dried in the same manner as malt, after the greater part of their juice is pressed out, very good beer may be made from them. It is occasionally used to improve the colour of claret.

Beta vulgaris. The systematic name

for the beet of the pharmacopæias.

BETELE. Bethle. Betle. Betelle. An oriental plant, like the tail of a lizard. It is chewed by the Ladians, and makes the teeth black; is cordial and exhilarating, and in very general use throughout the East. It is supposed to be the long pepper

BETONICA (Corrupted from Vettonica, which is derived from the Veetones, an

ancient people of Spain.)

1. The name of a genus of plants in the Linnæan system. Class. Didynamia. der, Gymnospermia. Betony.

2. The pharmacopæial name for

wood betony.

Betonica purpurea. Vetonica cordi. Betonica officinalis of Linnæus:-spica interrupta, corollarum labii lacinia intermedia emarginata, common in our woods and heaths. The leaves and tops of this plant have an agreeable, but weak smell; and to the taste they discover a slight warmth, accompanied with some degree of adstringency and bitterness. The powder of the leaves of betony, snuffed up the nose, provoke sneezing; and hence it is sometimes made an ingredient in sternutatory powders. Its leaves are sometimes smoked like tobacco. The roots differ greatly, in their quality, from the other parts; their taste is very bitter and nauseous; taken in a small dose, they vomit and purge violently, and are supposed to have somewhat in common with the roots of hellebore. Like many other plants, formerly in high medical estimation, betony is now almost entire neglected. Antonius Musa, physician to the Emperor Augustus, filled a whole volume with enumerating its virtues, stating it as a remedy for no less than forty-seven disorders: and hence in Italy the proverbial compliment, You have

more virtues than betony.

B TONICA AQUATICA. Scroplin oria aquatica Grea er wat r-fig vort. W. er-betony The leaves of this pt rt, Screphularia aquatica ( Larrat :- folis cortatis obtus's, petiolatis, decurrentibus; caule membranis angulato; racemis terminalibus, are celebrated s correctors of the ill flavour They were, also, ferrietly in o, senno high estimation against piles, tumours of the scrop) ulous pature, inflammations, &c.

BITONICA PAULI A Species of vero-

The systematic BETONICA VULGARIS. name of the betonica of the pharmacopaias. See Betonica

Betony, water. See Betonica aquatica. BETULA. 1. The name of a genus of plants in the Linguan system. Cl'ss, Monoecia. Order, Terrendria. Alder and birch.

2 The thermacer will name of the white Betula alba et Lunaus :- foliis birch.

ovatis, acuminatis serrans.

The juice, leaves, and bark of this tree, have been employed medicinally If the tree be bored early in the spring, there issues, by degrees, a large quantity of limpid, watery, sweetish j ice: it is said that one tree will afferd from one to two gallons a day. This jnice is esteemed as an antiscorbutic, oechstruent, and diuretic. The leaves and back are used externally as resolvents, detergents, and antiseptics.

BETULA ALBA. The systematic name for the betula of the pharmacopæias.

BETCLA ALNOS. The systematic name for the alnus of the pharmacopæias. See

Brx. (From βησσω, to cough.) A cough. BEXUGO. The root of the . Ematitis Peruviana of Casper Bauhin; one drachm of which is sufficient for a purge.

BEXAGUILLO. A name given to the white ipecacuanha, which the Spaniards bring from Peru, as the Portuguese do the brown from Brazil.

BUZAHAN. The fossile bezoar.

BEZETTA CORVIER Succus heliotropii. Lacmus sen tornæ. Lacca carulea. Litmus. The juice of the Croton tinctorium; folis rhombeis repandis, capsulis pendulis, caule herbaceo of Lirnwus It is much used by chymists as a test. Sec Tests.

BEZOAR (From pazahar, Persian, a destroyer of poison.) Lapis bezoardicus. Bezoard. A preternatural or morbid concretion formed in the bedies of land-animals. Several of these kinds of substances were formerly celebrated for their medicinal virtues, and distinguished by the names of the countries from whence they came, or the animal in which they were found. They were considered as high alexirharmics, in so much so, that other medicines, possessed, or supposed to be possessed of alexinharmic powers, were called bezoar-

dies; and so efficacions were they once thought, that they were bought for ten times their weight in gold. These virtues, however, are in the present day justly denied them, as they produce no other effects than those common to the saline particles which they contain, and which may be given to greater advantage from other sources. A composition of bezoar with absorbent powders, has been much in repute, as a popular remedy for disorders in children, by the name of Gascoigne's powder and Gascoigne's ball; but the real be-zoar was rarely, if ever, used for these, its price offering such a temptation to counterfeit it. Some have employed, for this purpose, a resinous composition, capable of melting in the fire and soluble in alco-hol; but Newmann supposed that those nearest resembling it, were made of gypsum, chalk, or some other earth, to which the proper colour was imparted by some vegetable juice. We understand, however, that tobacco pipe clay, tinged with ox-gall, is commonly employed, at least for the Gascoigne's powder; this giving a vellow tint to paper, rubbed with chalk, and a green to paper rubbed over with quicklime; which are considered as proofs of genuine bezoar, and which a vegetable juice would net effect.

BEZOAR BOVINUM. the bezoar from the ox.

BEZOAR GERMANICUM. The bezoar from the alpine goat.

BEZOAR HYSTRISIS. Lapis porcinus. Lapis malacensis. Pedro del porce. The bezoar of the Indian porcupine. Said to be found in the gall-bladder of an Indian porcupine, particularly in the province of Malacca. This concrete differs from others; it has an intensely bitter taste; and on being steeped in water for a very little time, impregnates the fluid with its bitterness, and with aperient, stomachic, and, as it is supposed, with alexipharmic virtues. How far it differs in virtue from the similar concretions found in the gall-bladder of the ox, and other animals, does not appear.

BEZOAR OCCIDENTALE. Occidental bezoar. This concretion is said to be found in the stomach of an animal of the stag or goat kind, a native of Peru, &c. It is or a larger size than the oriental bezoar, and sometimes as large as a hen's egg; its surface is rough, and the colour green, grey-

ish, or brown.

BEZOAR OUIENTALE. Lapis bezoar orientalis. Oriental bezoar stone. This concretion is said to be found in the pylorus, or fourth stomach of an animal of the goat kind, which inhabits the mountains of Persia. It is generally about the size of a kidney bean, of a roundish or oblong figure, smooth, and of a shining olive or dark greenish colour.

BEZOAR MICHOCOSMICUM. The calculus found in the human bladder.

Bezoar porcinum. See Bezoar hystricis.

BEZOAR SIMLE. The bezoar of the monkey.

BEZOARDICA RADIX. See Contrayerva.

BEZOARDICUM JOVIALE. Bezoar with tin-It differed very little from the Antihecticum Poterii.

BEZOARDICUM LUNALE. A preparation of antimony and silver.

BEZOARDICUM MARTIALE. A prepara-

BEZOARDICUM MINERALE, A preparation of antimony, made by adding nitrous acid to butter of antimony.

BEZOARDICUM SATURNI. A preparation of autimony and lead.

Perocentry and lead.

BEZOARDICUS PULVIS. The powder of the oriental bezoar.

BEZOARTICUM MINERALE. An inert calx

of antimony.

BEZOARTICUS SPIRITUS NITRI. The dis-

tillled acid of the bezoarticum minerale.

Bezoas. A common chymical epithet.

Blæon. Wine of sun-raisins and sea-

water.
BIBINELLA. See Pimpinella.

BIBITCARYS. (Bibitorius, sc. musculus; from bibo, to drink; because by drawing the eye inwards towards the nose, it causes those who drink to look into the cup.) See Rectus internus oculi.

BICEPS. (From bis, twice, and coput, a head.) Many muscles have this denomination, from their having two distinct heads, or origins.

BICEPS BRACHII. See Biceps flexor cubiti.

Bicers cruris. See Biceps flexor cru-

BICEPS CUBITI. See Biceps flexor cubiti.

BICEPS EXTURNUS. See Triceps extensor cubiti.

BICEPS FLEXOR CRURIS. cruris of Albinus. Biceps of Winslow. Douglas, and Cowper, and Ischio-femoroperonien of Dumas. A muscle of the leg, situated on the hind part of the thigh. It arises by two distinct heads; the first, called longus, arises, in common with the semitendinosus, from the upper and posterior part of the tuberosity of the os ischi-The second, called brevis, arises from the linea aspera, a little below the termination of the glutæns maximus, by a fleshy acute beginning, which soon grows broader as it descends to join with the first head, a little above the external condyle of the os femoris. It is inserted, by a strong tendon, into the upper part of the head of the fibu-Its use is to bend the leg. This muscle forms what is called the outer hamstring; and, between it and the inner, the

Q \*

nervus popliteus, arteria and vena poplitea, are situated.

BICEPS FLEXOR CUBITI. Biceps brachii of Albinus. Coraco-radialis, seu biceps of Winslow. Biceps internus of Douglas. Biceps internus humeri of Cow-Scapulo coracoradial of Dumas. A muscle of the fore-arm, situated on the fore part of the os humeri. It arises by two heads. The first and outermost, called longus, begins tendinous from the upper edge of the glenoid cavity of the scapula, passes over the head of the os huneri within the joint, and, in its descent without the joint, is enclosed in a groove near the head of the os humeri, by a membranous ligament that proceeds from the capsular ligament and adjacent tendons. The second, or innermost head, called brevis, arises, tendinous and fleshy, from the coracoid process of the scapula, in common with the coracobrachialis muscle. A little below the middle of the fore-part of the os humeri, these heads unite. It is inserted by a strong roundish tendon into the tubercle on the upper end of the radius internally. Its use is to turn the hand supine, and to bend the fore-arm. At the bending of the elbow, where it begins to grow tendinous, it sends off an aponeurosis, which covers all the muscles on the inside of the fore-arm, and joins with another tendinous membrane, which is sent off from the triceps extensor cubiti, and covers all the muscles on the outside of the fore-arm, and a number of the fibres, from opposite sides, decussate each other. It serves to strengthen the muscles, by keeping them from swelling too much outwardly, when in action, and a number of their fleshy fibres take their origin from it.

BICEPS INTERNUS. See Biceps flexor

BICHICHIE. An epithet of certain pectorals, or rather troches, described by Rhazes, which were made of liquorice, &c.

Bichos. A Portuguese name for the worms that get under the toe of the people in the Indies, which are destroyed by the oil of cashew nut

BICORN (Bicornis: from bis, twice, and cornu a norn.) An epithet sometimes applied to the os hyoides, which has two processes, or horns; and likewise, in former times, to muscles that had two terminations.

BICUSPIS. (Bicuspis: from bis, twice, and cuspis, a spear.) The name of those teeth which have double points, or fangs.

See Teeth.

BIDENS. (From bis, twice, and dens, a tooth; so called from its being deeply

serrated, or indented.)

1. The name of a genus of plants in the Linnæan system. Class, Syngenesia. Order, Polygamia aqualis.

BIFURCATED. (Bifurcus: from bis, twice, and furca, a fork.) A vessel, or nerve is said to bifurcate when it divides into two branches; thus the bifurcation of the aorta, &c.

BIGASTER. (Bigaster: from bis, twice, and vasne, a belly.) A name given to

muscles which have two bellies.

BINERNIUS. (From bis, double, and hernia, a disease so called.) Having a hernia, or rupture on each side of the scro-

BILADEN. A name of iron.

BILE. (Bilis. Nævius derives it from bis, twice, and lis, contention; as being supposed to be the cause of anger and dispute.) The gall. A bitter fluid, secreted in the glandular substance of the liver; in part flowing into the intestines, and in part regurgitating into the gall-bladder. The secretory organ of this fluid is the penicilli of the liver, which terminate in very minute canals, called biliary ducts. The biliary ducts exonerate their bile into the ductus hepaticus, which conveys it into the ductus communis choledochus, from whence it is in part carried into the duodenum. The other part of the bile regurgitates through the cystic duct (see Gall bladder,) into the gall-bladder: for hepatic bile, except during digestion, cannot flow into the duodenum, which contracts when empty; hence it necessarily regurgitates into the gall-bladder. The branches of the vena portæ contribute most to the secretion of bile; its peculiar blood, returning from the abdominal viscera, is supposed to be, in some réspects, different from other venal blood, and to answer exactly to the nature of bile. It is not yet ascertained clearly whether the florid blood, in the hepatic artery, merely nourishes the liver, or whether, at the same time, it contributes a ther, at the same time, it contains the forma-tion of bile. It has been supposed, by physiologists, that cystic bile was secreted by the arterial vessels of the gall-bladder; but the fallacy of this opinion is proved by making a ligature on the cystic duct of a living animal. From what has been said, it appears that there are, as it were, two kinds of bile in the human body : 1. Hepatic bile, which flows from the liver into the duodenum: this is thin, of a faint vellow colour, inodorous, and very slightly bitter, otherwise the liver of animals would not be eatable, 2. Cystic bile, which regurgitates from the hepatic duct into the gallbladder, and there, from stagnating, becomes thicker, the aqueous part being absorbed by lymphatic vessels, and more acrid from concentration. Healthy bile is of a yellow, green colour; of a plastic consistence, like thin oil, and when very much agitated, it froths like soap and water: its smell is fatuous, somewhat like

musk, especially the putrefying or eva-porared bile of animals: its task is bitter. The constituent principles of bite are: 1. Water, which constitut the greatest part of line. 2. In albaminous principle, precipitated by alcohol and inmeral acids. 3. A resinous principle, obtained by evaporating a fincture made of alcohol and bile. 4. A colouring principle, which adheres to the resinous part, and gives the colour to 5. Soda, in its caustic state: hence healthy bue does not effervesce with acids, and affords a neutral salt. 6. A phosphated calx. The primary uses of this fluid, so important in the animal economy, are: 1. To extricate the chyle from the chyme: thus chyle is never observed in the duodenum bef re the cuyme has been mixed with the bile: and thus it is that oil is extricated from linea by the bile of animals. 2 By its acridity it excites the peristaltic motion of the intestines; hence the bowels are so inactive in people with jaundice. imparts a yellow colour to the excrements; thus the white colour of fæces in jaundice, in which disease the flow of bile into the duodenum is entirely prevented. prevents the abundance of mucus and acidity in the primæ viæ; hence acid, pituitous, and verminous saburra are common from deficient or inert bile.

BILIAHY DUCT. Ductus biliosus. The very vascular glandules, which compose almost the whole substance of the liver, terminate in very small canals, called biliary ducts, which at length form one trunk, the ductus hepaticus. Their use is to convey the bile, secreted by the liver, into the hepatic duct: this uniting with a duct from the gall-bladder, forms one common canal, called the ductus communis choledochus, which conveys the bile into the intestmal

BILIMBI, (Indian.) Biting-bing of Bontius. The malus indica :- fructu pentagono of Europeans. It is carefully cultivated in the gardens of the East-Indies, where it flowers throughout the year. The juice of the root is cooling and drank as a cure for fevers. The leaves hoiled and made into a cataplasm with rice, are famed in all sorts of tumours, and the juice of the fruit is used in almost all external heats, dipping linnen rags in it, and applying them to the parts. It is drank, mixed with arrack, to cure duarrhwas; and the dried leaves, mixed with hetel leaves and given in arrack, are said to promote delivery. The ripe fruit is eaten as a delicacy, and the unripe made into a pickle for the use of the table

Billious. A term very generally made use of, to express diseases which arise from too copius a secretion of bile: thus bilious colic, bilious diarrhoa, bilious fever, &c.

See Bile.

BILIS ATRA. Black bile. The supposed cause among the ancients of melancholy.

BILIS CYSTICA. Bilis fellea. Cystic bile. The bile when in the gail-bladder is so called to distinguish it from that which is found in the liver.

BILIS HEPATICA. Hepatic bile. The bile when it has not entered the gall-bladder.

BILDBUS. (From bis, double, and lobus, the end of the ear.) Having two lobes, resembling the tips of ears.

BIMESTRIS. (From bis, twice, and mensis, month.) Two months old.

Bindweed, See Convolvulus major.

BINGALLE See Casumunar.

BINOCULUS. (From binus, double, and oculus, the eye.) A bandage for securing the dressings on both eyes.

BINSICA. A disordered mind. Helmont. BINSICA. MORS. The binsical, or that death which follows a disordered mind.

BIOLYCHNIUM, (From Bios, life, and λυχνων, a lamp.) Vital heat: an officinal nostrum.

BIOTE. (From Bus, life.) Life. Light food. BI THANATI (From Bus, life, and Javalos, death.) Those who die a violent death, or suddenly, as if there were no space between life and death.

BIPEMULLA. See Pimpinella. BIPENELLA. See Pimpinella. BIRA. Malt liquor or beer. BIRAO Stone parsley. Birch tree. See Betula.

BIRDSTONGUE. A name given to the seeds of the Fraxinus excelsior of Linnaus.

BIRSEN. (Heb. an aperture) A deep ulcer, or imposimme in the breast.

Birthwort, climbing. See Aristolochia

Biscocrus. (From bis, twice, and coquo, to boil.) Twice dressed. It is chiefly applied to bread much baked, as biscuit.

BISCUTELLA. Mustard.
BISCHMAS. A name formerly given to clary, or garden clary.

Bishop's weed. Sec Animi.

Bislingua. (From bis, twice, and lingua, a tongue; so called from its appearance of being double-tongued; that is, of having upon each leaf a less leaf.) The Alexandrian laurel.

BISMALVA. (From vismalva quasi viscum malva, from its superior viscidity.) The water or marsh-mallow.

BISMUTH. (Bismut, Germ.)

A metal which is found in the earth in very few different states, more generally native or in the metallie state. Native bismuth is met with in solid masses, and also in small particles dispersed in and frequently deposited on different stones, at Schreeberg in Saxony, Sweden, &c. Sometimes it is crystallized in four-sided tables, or indistinct cubes. It exists combined with oxygen in the oxyd of bismuth (bismuth othre), found in small particles, dispersed, of a blucish or vellowish-gray colour, needle-shaped and

capillary; sometimes laminated, forming small cells. It is also though more seldom united to sulphur and iron in the form of a sulphuret in the martial sulphurated bismuth ore. This ore has a yellowish-gray appearance, resembling somewhat the martial pyrites. And, it is sometimes combined with arsenic.

Properties.—Bismuth is of a silver-white colour inclining to red. It soon tarnishes and becomes iridescent. It is brittle and can easily be reduced to small particles. It is soft enough to be cut with a knife. It has a lamellated texture. Its specific gravity is 9.800. It requires less lieat for fusion than any other metal, tin excepted, melting by a heat = 460 deg. Fahr. It can be volatilized by heat and escapes in the state of grayish-white vapour. It readily unites with mercury and with sulphur. When fused, it exhibits on cooling, cubical figures on the surface. It is soluble in sulphuric, nitric, and muriatic acids. The solution in nitric acid is decomposable by mere dilution with pure water. It inflames in oxygenated muriatic acid gas. It is capable of combining with the greatest number of the metals; and when in certain proportions, promotes their fusibility remarkably. It speedily becomes black by sulpinurated hydrogen gas.

BISMUTHUM. (From bismut. German.)

See Bismuth.

Bistort See Bistorta.

BISTORTA. (From bis, twice, and torqueo, to bend; so called from the contor-

tions of its roots.) Bistort.

Polygonum bistorta of Linnxus :- caule simplicissimo monastachio, foliis ovatis in petiolum decurrentibus. This plant is a native of Britain. Every part manifests a degree of stipticity to the taste, and the root is esteemed to be one of the most powerful of the vegetable adstringents, and frequently made use of as such, in disorders proceeding from a laxity and debility of the solids, for restraining alvine fluxes, after due evacuations, and other preternatural discharges both serous and sanguineous. It has been sometimes given in intermitting fevers; and sometimes also, in small doses, as a corroborant and antiseptic, in acute malignant and colliquative fevers; in which intentions Peruvian bark has now deservedly superseded both these and all other adstringents. The comman dose of bistort root in substance, is 15 or 20 grains: in urgent cases it is extended to a dram. Its astringent matter is totally dissolved both by water and rectified spiries.

Bistoury. (Bistoire, French.) Any sin all knote for surgical purposes.

Burninos. A Galenical plaister.

BITRIVICI EMPLASTRUM. A plaister for the spaces.

Bitter apple. See Colocynthis.

BIT NOBEN. Salt of bitumen.

white saline substance has lately been imported from India by this name, which is not a natural production, but a Hindoo preparation of great antiquity. It is called in the country bit noben, padnoon, and soucherloon and popularly khala mimue, or black salt. Mr Henderson, of Bengal, conjectures it to be the sal asphaltites, and sal sodomenus of Pliny and Galen. This salt is far more extensively used in Hindostan than any other medicine whatever. The Hindoos use it to improve their appetite and digestion. They consider it as a spesific for obstructions of the liver and spleen; and it is in high estimation with them in paralytic disorders, particularly those that affect the organs of speech, cutaneous affections, worms, old rheumatisms, and indeed all chronic disorders of man and beast.

BITUMEN. (wilvua, wilvs, pine; because it flows from the pine-tree; or, quod vi tumeat è terra, from its bursting forth from the earth.) Bitumens are com-bustible, solid, soft, or fluid substances, whose smell is strong, acrid, or aromatic, composed of hydrogen and carbon with a contamination of earth and other sub-stances in small proportions. They are found either in the internal part of the earth, or exuding through the clefts of the rocks, or floating on the surface of waters. Like oils they burn with a rapid flame. Natural historians have divided them into several genera; but modern chymists arrange them according to their chymical properties, and are only acquainted with six species, which are very distinct from each other: these are, naphtha, amber, asphaltos, jet, pit-coal, and petroleum.

BITUMEN BARBADENSE. Sec Petroleum

barbudense.

BITUMEN JUDAICUM. Asphaltus. Jews' pitch. A solid light bituminous substance, of a dusky colour on the outside, and a deep shining black within; of very little taste, and scarcely any smell, unless heated, when it emits a strong pitchy one. It is said to be found plentifully in the earth in several parts of Egypt, and floating on the surface of the Dead Sea. It is now wholly expunged from the catalogue of officinals of this country; but was formerly esteemed as a discutient, sudorific, and emmenagogue.

BITUMEN LIQUIDUM. See Petroleum. BIVENTER (Biventer; from bis, twice, and venter, a belly.) A muscle is so termed,

which has two bellies.

BIVENTER CERVICIS. A muscle of the lower jaw.

BIVENTER MAXILLÆ INFERIORIS. See Digastricus.

BIXA ORELLANA. The systematic name for the terra orleana of the pharmacopæias. See Orleana.

BLACCIE. The measles. Rhazes.

BLACKBEHRY. The fruit of the common bramble, Rubus fruticosus of Linnæus. The berries are eaten in abundance by children, and are wholesome and gently aperient. Too large quantities, however, when the stomach is weak, produce vorming and great distention of the belly, from flatus. See Fruits, summer.

Bladder. See Urinary bladder, and Gall-

Rladder, inflamed. See Cystitis.

Blade-bone. See Scapula.
BLEISTEAS. (From blesus.) A defect in speech, called stammering.

BLESUS. (From Brando, to injure.) A

BLANCI. (Blanc, French.) A purging mixture; so called, because it was supposed to evacuate the white phlegmatic humours. Also white lead.

BLANCA MULIERUM. White lead. BLASA. (Indian.) A tree, the fruit of which the Indians powder, and use to de-

stroy worms.

(From βλασανώ, to germi-BLASTEMA. nate.) A bud or shoot. Hippocrates uses it to signify a cutaneous pimple 'like a

BLASTUM MOSYLITUM. Cassia bark kept

with the wood.

BLATTA. (From Bratta, to hurt.) sort of beetle, or bookworm; so called from its injuring books and clothes: the kermes insect.

BLATTARIA LUTEA. (From blatta; so called, because, according to Pliny, it engenders the blatta.) The herb yellow

moth-mullein.

BLECHON. (From βληχαομαι, to bleat; so called according to Pliny, because if sheep taste it they bleat.) The herb wild penny-royal,

Bleeding. Sec Blood-letting and Hamor-

Bleeding at the nose. See Epistaxis. BLEMA. (From βαλλω, to inflict.) A wound.

BLENDE. A species of zinc ore, formed of zinc in combination with sulphur,

Mucus, a BLENNA. (BASVVa.) Blen $\alpha$ . thick excrementitious humour.

BLENNORRHOEA. (From Brevez, mucus, and gea, to flow.) Gonorrhaa mucosa. A gleet. An increased discharge of mucus from the urethra, arising from weakness.

BLENNORRHAGIA. (From BASVVa, inucus, and gee, to flow.) The discharge

of mucus from the methra.

BLEPHARA. (Quasi BASTES Ф1905, 25 being the cover and defence of the sight.) The cyclids.

BLETHANIDES. (From Exempor.) The hair upon the cyclids; also the part of the

eyelids where the hair grows.

BLEPHAROPHTHALMIA. (From Shepapor, the eyelid, and οφθαλμιλία, a disease of the eye.) An inflammation of the eyelid.

BLEPHAROPTOSIS. (From βλεφαρον, the eyelid, and molaris, from mirla, to A prolapse, or falling down of the upper eyelid, so as to cover the cornea-

BLEPHAROTIS. (From βλεφαρον, the eyelid.) An inflammation of the eyelids.

BLEPHAROXYSTON. (From βλεφαρου, the eyelid, and ξεω, to scrape off.) A brush for the eyes. An instrument for cleansing or scraping off foul substances from the eye-lids.

BLEPHAROXYSIS. (From βλεφαρον, the eyelid, and ξεω, to scrape of ) The cleansing of the eyelids. Inflamination of the eyelids.

Blessed thistle. See Carduns benedictus. BLESTRISMUS. (From Bando, to throw

about.) Phrenctic restlesness.

BLETA. A word used by Paracelsus to signify white, and applied to urine when it is milky, and proceeds from a disease of the kidneys.

BLETI. (Bletus, from Banna, to strike.) Those seized with dyspnæa or suffocation.

BLISTER. A topical application which when put on the skin raises the cuticle in the form of a vesicle, filled with a serous fluid. Various substances produce this effect on the skin; but the powder of the lytta vesicatoria, or blistering fly, is what operates with most certainty and expedition, and is now invariably made use of for

the purpose.

When it is not wished to maintain a discharge from the blistered part, it is sufficient to make a puncture in the cuticle to let out the fluid; but when the case requires keeping up a secretion of pus, the surgeon must remove the whole of the detached cuticle with a pair of scissors, and dress the excoriated surface in a particular manner. Practitioners used formerly to mix powder of cantharides with ointment, and dress the part with this composition. But such a dressing not unfrequently oc-casioned very painful affections of the bladder, a scalding sensation in making of water, and very afflicting stranguries. The treatment of such complaints consists in removing every particle of the fly from the blistered part, making the patient drink abundantly of mucilaginous drinks, giving emulsions and some doscs of camphor.

These objections to the employment of salves containing the lytta, for dressing blistered surfaces, led to the use of mezereon, euphorbium, and other irritating substances, which when incorporated with ointment, form very proper compositions for keeping busters open, which they do without the inconvenience of irritating the bladder, like the blistering fly.—The favourite application however for keeping open blisters, is the powder of savine, which was brought into notice by Mr. Crowther in his book on white swellings. The following is the form adopted by the London College: "Take of fresh

leaves of savine bruised, a pound; vellow wax, half a pound; prepared lard, two pounds. Having melted together the wax and lard, boil therein the savinc leaves, and strain through a linen cloth." On the use of the savine cerate, immediately after the cuticle raised by the blister is removed, says Mr. Crowther, it should be observed that experience has proved the advantage of using the application lowered by a half or two-thirds of the unguentum eeræ. An attention to this direction will produce less irritation and more discharge, than if the savine cerate were used in its full strength. Mr. Crowther says also, that he has found fomenting the part with, flannel, wrung out of warm water, a more easy and preferable way of keeping the blistered surface clean, and fit for the impression of the ointment, than scraping the part, as has been directed by oth rs. An occasional dressing of unguentum resina flava, he has found a very useful application for rendering the sore free from an appearance of slough, or rather dense lymph, which has sometimes been so firm in its texture as to be separated by the probe, with as much readiness as the euticle is detached after blistering. As the discharge diminishes, the strength of the savine dressing should be proportionably increased. The ceraum sabinæ must be used in a stronger or weaker degree, in proportion to the excitement produced on the patient's skin.

BLITUM FORTIDUM. See Atriplex fatida. BLOOD. Sanguis, A red homogeneous fluid, of a saltish taste, and somewhat urinous smell, and glutinous consistence, which erculates in the eavities of the heart, arteries, and veins. The quantity is estimated to be about twenty-eight pounds in an adult: of this, four parts are contained in the veins, and a fifth in the arteries. The colour of the blood is red; in the arteries it is of a florid hue, in the veins darker; except only the pulmonary veins, in which it is of a lighter east. Physiology demonstrates, that it acquires this florid colour in passing through the lungs, and from the oxygen it absorbs. The blood is the most important fluid of our body. Some physicians and anatomists have considered it as alive, and have formed many ingenious hypotheses in support of its vitality. The temperature of this fluid is of considerable importance, and appears to depend upon the circulation and respiration. The blood of man, quadrupeds, and birds, is hotter than the medium they inhabit; hence they are termed animals of warm blood; whilst in fishes and reptiles, animals with cold blood, it is nearly of the temperature of the medium they inh bit. The microscope discovers that the blood contains a great number of round globules, which are seen floating about in a yellowish fluid, the serum. The blood also possesses remarkable physical properties; its taste is saltish, and the smell of its halitus or vapour, when recently drawn, is somewhat urinous; it is of a plastic consistence, somewhat glutinous and adhesive. Chymical analysis of blood, by means of distillation, dise vers, 1. A considerable quantity of insipid water, which very soon becomes putrid. 2. Empyreumatic oil, 3. Ammoniacal sprit 4. Carbon, which remains behind, is very spongy, and with great difficulty incinerated. The ashes, however, consist of a small quantity of culinary salt, soda, pliosphorated lime, and a very small portion of iron. White hot, and in motion, the blood remains constantly fluid, and red; when it cools, and is at rest, it takes the form of a fluid mass, which gradually and spontaneously separates into two parts; the one, which is red, and floating becomes of a darker colour, remains concrete, and is called the cruor, crassamentum, or cake; the other, which occupies the lower part of the vessel, is of a yellow greenish colour, and adhesive, and is called the serum or lymph.

The eruor forms more than one half of the blood; it is very plastic, thick, and, in consistence, like glutinous jelly. It soon putrefies in the temperature of the air; but, dried by a gentle heat, becomes a brittle, dark, red mass. It is insoluble in water; and, when boiled in it, is converted into a hard grumous mass, internally red. The surface of the cruor of the blood, after being exposed in a vessel to atmospheric air, becomes of a florid red colour; but the inferior surface, contiguous to the vessel, is of a deep black : the change of colour on the surface is owing to the oxygen of the atmosphere uniting with the blood. The bruor of the blood is composed of, 1. Red globules, which chymistry demonstrates consist of a fibrous gluten and oxydated iron. The experiments of the eelebrated Rhades shew, that in twenty-five pounds of blood from the human body, near two drachms of the oxyd of iron were obtained. 2. The fibrous gluten of the cruor, which remains after washing the cruor of blood for a considerable time in cold water, and enclosed in a fine linen cloth; in which case the red globules are washed away. If the red water obtained in this experiment be evaporated, and then distilled to dryness, it leaves behind a carbon, exhibiting, when incinerated, a great quantity of iron, attractable by the magnet. From these experiments it would appear, that the redness of the globules is imparted from the oxydated iron, for which purpose a small quantity is sufficient.

The serum of the blood is a lymphatic fluid, almost inodorous; rather saltish to the taste; pellueid, and of a yellowish green colour; and rather of a plastic consistence. It forms scarcely one half of the blood; and it contains, 1. A large portion of water; from forty-seven ounces of serum, forty three of insipid water were yielded by distill tion. 2. Alkuminous gluten, like the white of an egg, obtained by boiling, or by stirring it with a stick, or by an admixture of alcohol or concentrated mineral acid. 3. Jelly. If equal parts of water and serum of the blood be coagulated by fire, that part of the serum which is not coagulated, upon being cooled, puts on the appearance of a tremulous jelly. 4. Carbonated soda, obtained by pouring a mineral acid upon recent diluted serum. 5. Culinary salt, found in the incinerated carbon of blood. The albuminous principle of the serum, more commonly called the coagulable lymph, appears to be of very considerable importance in the animal according, both in diseased and healthy states of it: it affords, by analysis, carbon, azot, and hydr gen. The importance of the blood is very considerable; it distends the cavities of the heart and blood-vessels, and prevents them from collapsing; it stimulates to contraction the cavities of the heart and vessels, by which means the circulation of the blood is performed; it generates within itself animal heat, which it propagates throughout the body: it nourishes the whole body; and, lastly, it is that source from which every secretion of the body is separated

Blood dragon's. See Sungnis draconis. BLOOD LETTING. Under this term is comprehended every artificial discharge of blood made with a view to cure or prevent a disease. Blood-letting is divided into general and topical. As examples of the former, venesection and arteriotomy may be mentioned; and of the latter, the application of leeches, cupping-glasses, and

scurification.

Blood, spitting of. See Hemothysis. Blood, vomiting of. See Hematemesis. Blood stone. See Hematites.

Bloody flux. See Dysenteria.

Boa (From &sc, an ox.) A pustulous eruption like the small-pox, so called because it was cured, according to Pliny, by anoming it with hot ox-dung: also the name of a serpent of Calabria; and of the hydroa.

BOCHETUM. A decoction of the woods prepared by a second boiling with fresh

water.

Boenia, A subliming vessel.

Bochium. A swelling of the bronchial glands.

Bodies, commustrate. This term is given by chymists to all substances which, on account of their affinity with oxygen, are capable of burning.

Bodies, GASEOUS. See Gas.

Bodies, INFLAMMABLE. Chymists give this name to such bodies as burn with facility, and flame in an incrersed temperature; although, strictly speaking, all combustible

bodies are inflammable bodies: such are the diamond, sulphur, bitumens, &c.

Bodies, Phosphorescent. Bodies which produce light, though their temperature be not increased.

BODY. Corpus. The human body is dived by anatomists into the trunk and extremities. i. e. the head, and inferior and superior extremities, each of which have certain regions before any part is removed, by which the physician is enabled to direct the application of blisters and the like, and the situation of diseases is better described.

The head is distinguished into the hairy part and the face. The former has five regions, viz. the crown of the head or vertex, the fore part of the head or sinciput, the hind-part or occiput, and the sides, partes laterales capitis. In the latter are distinguished the region of the forehead, frons; temples, or tempora; the nose, or nasses; the eyes, or oculi; the mouth, or os; the cheeks, bucce; the chin, or mentum; and the ears, or aures.

and the ears, or aures.

The trunk is distinguished into three principal parts, the neck, thorax, and abdomen. The neck is divided into the anterior region or pars antica, in which, in men, is an eminence called pontum Adami; the posterior region is called nuche colli; and the laterial regions, partes laterales

colli

The thorax is distinguished into the anterior region, in which are the sternum and mamma, and at whose inferior part is a pit or hollow called scrobiculus cordis; a posterior region, called dorsum; and the sides, or latera thoracis.

The abdomen is distinguished into an anterior region, properly the abdomen; a posterior region, called the loins, or lumbi; and lateral regions or flanks, called latera abdominis. The anterior region of the abdomen being very extensive, is subdivided into the chigastric, hypochondriac, umbilical, and hypogastric regions, which are described under their respective names. Immediately below the abdomen is the mons Veneris, and at its sides the groins or inguina. The space between the organs of generation and the anus, or fundament, is called the perinaum.

The superior extremity is distinguished into the shoulder, summitas humeri, under which is the arm-pit, called axilla or fovea axillaris; the brachium, or arm; the anti-brachium, or fore-arm, in which anteriorly is the bend of the arm, where the veins are generally opened, called fexura antibrachi; and posteriorly the elbow, called angulus cubit; and the hand, in which are the carpus or wrist, the back or dorsum nianis, and the palm or vola.

The inferior extremity is divided into, 1. the region of the femur, in which are distinguished the coxa or regio ischiadica, and outer and superior part; 2. the leg, in

which are the knee or genn, the bend or cavum poplitis, and the calf or sura; 3. the foot, in which are the outer and inner ankle, or maleolus externus and internus, the back or dorsum, and the sole or

BOE. (From Boaw, to exclaim.) Clamour, or moaning made by a sick person.

BOETHEMA. (From βουθεω, to assist.) A

BOETHEMATICA. (From Confew, to assist.)

Favourable symptoms. Bog-bean. See Trifolium paludosum.

Bogia Gummi. Gamboge. Bohea tea. See Tea

Bois de coissi. See Quassi. Bolar oarths. See Bole.

BOLE. (Boxos, a mass.) A friable earthy substance, uniting with water into a smooth paste, adhering to the tongue, and dissolving, as it were, in the mouth; of the argillaceous or clay kind, but more readily imbibing water than the clays strictly so Those used in medicine, are the Armenian and French boles. See Bole Armenian, and Bolus Gallicu. Many other bolar earths have been recommended for medicinal uses, and were formerly ranked amongst the officinals; as red boles from Armenia, Lemnos, Strigonium, Portugal, Tuscany, and Livonia; yellow boles from Armenia, Tockay, Silesia, Bohemia, and Blois; white boles from Armenia, Lemnos, Nocera, Eretria, Lamos, Chio, Malta, Tuscany, and Goltberg. Several of these earths have been commonly made into little cakes or flat masses, and stamped with certain impressions; from which circumstance they received the name of terræ sigillatæ, or sealed earths.

BOLE, ARMENIAN. Bolus Armenia. Bole-armenic. A pale, but bright red coloured earth, which is occasionally mixed with honey, and applied to children's mouths when afflicted with aphthra. It forms, like all argillaceous earths, a good tooth-powder, when mixed with some aromatic.

BOLETUS. (From Banker, a mass, or

Sωλιτης, from its globular form.)

The name of a genus of plants in the Linnæan system. Class, Cryptogamia. Order, Fungi. Boletus. Spunk.

BOLETUS CERVI. The mushroom.

BOLETUS IGNIARIUS, The systematic name for the agaricus of the pharmacopæias. See Agaricus.

BOLETUS LARICIS. The systematic name for the officinal agaricus albus. See Agaricus albus.

BOLETUS PINI LARICIS. A species of

BOLETUS SUAVEOLENS. The systematic name for the fungus salicis of the pharmaco. pæias. See Fungus salicis.

Bolismus. A voracious appetite, according to Avicenna; but most probably meant for bulimus.

BOLUS. (Baxos, a bole or bolus.) Any

medicine, rolled round, that is larger than an ordinary sized pea, and yet not too large to be swallowed.

Bolus ALEXIPHARMICA. A preparation

of contraverva.

BOLUS EX ALUMINE. Alum, bark, and nutmeg.

BOLUS ARMENA. See Bole Armenian.

BOLUS ARMENA ALBA. The white arme-

BOLUS ARMONIAC. See Bole Armenian.

Bolus Blessensis. Bole of Blois. See Bole Armenian.

Bolus Gallica, French bole. A pale red coloured bolar earth, variegated with irregular specks and veins of white and yellow. It is occasionally administered as an absorbent and antacid.

BOMBAX. Gossypium. The cottontree. The seeds of the cotton-tree, Gossypium herbaceum of Linnaus :- foliis quinquelobis subtus eglandulosis, caule herbaceo, are directed for medicinal use in some foreign pharmacopæias; and are administered in coughs, on account of the mucilage they contain. The cotton, the produce of this tree is well known for domestic purposes.

BOMBIAS. A bombiate. A salt formed by the union of the bombic acid with different bases; thus bombiat of alumine,

BOMBIC ACID. Acidum bombicum. Acid of the silk-worm. Silk worms contain, especially when in the state of chrysalis, an acid liquor in a reservoir placed near the anus. It is obtained by expressing their juice in a cloth, and precipitating the mucilage by spirit of wine, and likewise by infusing the chrysalides in that liquor. This acid is very penetrating, of a yellow amber colour, but its nature and combinations are not yet well known.

BOMBUS. (Bombos.) A resounding noise, or ringing of the ears. Also, a sonorous expulsion of flatus from the intestines.

BON ARBOR. A name given to the coffee-tree.

BONA. Boona. The phaseolus, or kidney-

Molucca or bezoar BONDUCH INDORUM. The produce of the Guillandina bondue of Linnæus. It possesses warm, bitter, and carminaive virtues.

BONE. Os. Bones are hard, dry, and insensible parts of the body, of a whitish colour, and composed of a spongy, compact, or reticular substance. They vary much in their appearances, some being long and hollow, others flat and compact, &c. The greater number of bones have several processes and cavities, which are distinguished from their figure, situation, use, &c. Thus processes extended from the end of a bone, if smooth and round, are called heads; and condyles, when flattened either above or laterally. That part which is beneath the BONE. 12

head, and which exceeds the rest of the bone in smallness and levity, is called the neck. Rough, unequal processes are called tuberosities or tubercles: but the longer and more acute, spinous or styloid processes, from their resemblance to a thorn. Thin broad processes with sharp extremities, are known by the name of crista, or sharp edges. Other processes are distinguished by their form, and called alar or pterygoid, manillary or mastoid, dentiform or odontoid, &c. Others, from their situation, are called superior, inferior, exterior, and interior. Some have their name from their direction, as oblique, straight, transverse. &c.; and some from their use, as trochanters, rotators, &c. Furrows, depressions, and cavities, are destined either for the reception of contiguous bones, to form an articulation with them, when they are called articular cavities, which are sometimes deeper, sometimes shallower; or they receive hard parts, but do not constitute a joint with them. Cavities serve also for the transmission and attachment of soft parts. Various names are given to them, according to the magnitude and figure of bones. If they be broad and large at the beginning, and not deep, but contracted at their ends, they are called fovee or pits. Furrows are open canals, extending longitu-dinally in the surface of bones. A hollow, circular tube, for the most part of the same diameter from beginning to end, and more or less crooked, straight, long or short, is named a canal. Foramina are the apertures of canals, or they are formed of the excavated margins of two bones, placed against each other. If such be the form of the margin of a bone, as if a portion were taken out of it, it is called a notch.

With respect to the formation of bone, there have been various opinions. Physiologists of the present day assert that it is from a specific action of small arteries, by which ossific matter is separated from the blood, and deposited where it is required. first thing observable in the embryo, where bone is to be formed, is a transparent jelly, which becomes gradually firmer, and is formed into cartilage. The cartilage gradually increases to a certain size, and when the process of ossification commences, vanishes as it advances. Cartilages, previous to the ossific action, are solid, and without any cavity; but when the ossific action of the arterics is about to commence, the absorbents become very active, and form a small cavity in which the bony matter is deposited; bone continues to be separated, and the absorbents model the mass into its required shape. The process of ossification is extremely rapid in utero: it advances slowly after birth, and is not completed in the human body till about the twentieth year. Ossification in the flat bones, as those of the skull, always begins from cen-

tral points, and the radiated fibres meet the radii of other ossifying points, or the edges of the adjoining bone. In long bones, as those of the arm and leg, the clavicle, metacarpal, and metatarsal bones, a central ring is formed in the body of the bone, the head and extremities being cartilage, in the centre of which ossification afterwards begins. The central ring of the body shoots its bony fibres towards the head and extremities, which extend towards the body of the bone. The head and extremities at length come so close to the body as to be merely separated by a cartilage, which becomes gradually thinner until the twentieth year. Thick and round bones, as those of the tarsus, carpus, sternum, and patella, are, at first, all cartilage: ossification begins in the centre of each. the bones are deprived of their soft parts, and are hung together in their natural situation, by means of wire, the whole is termed an artificial skeleton; but when they are kept together by means of their ligaments, it is called a natural skeleton.-The uses of the bones are various, and are to be found in the account of each bone; it is, therefore, only necessary to observe, in this place, that they give shape to the body, contain and defend the vital viscera, and afford an attachment to all the mus-

Bonebinder. See Osteocolla.
Bononiensis Lapis. The Bononian

step.

Metatarsus

Phalanges

stone. Call I also phosphorus bononiensis, phosphorus kircheri, the light-carrier, or Bononian phosphorus. As a medicane the

stone is caustic and emetic. Bonus Hennicus. (Henricus; so called because its virtues were detected by some one whose name was Henry. ) Tota bona. Lapathum unctuosum. Chenopodium. glish mercury. The plant to which this name is given in the pharmacopæias, is the Chenopodium bonus Henricus; foliis triangulari-sagittatis integerrimis, spicis compositis aphyllis axillaribus, of Linnæus. It is a native of this country, and common in waste grounds from June to August. The young plant differs little from spinnge when cultivated; and in many places the young shoots are eaten in spring like asparagus. The leaves of this plant are accounted emollient, and in this intention have been made an ingredient in decoctions for glysters. They are applied by the common people to flesh wounds and sores under the notion of drawing and healing.

BORACIC ACID. Acidum ber acicum. Sedative salt of Homberg. Acid of borax. Boracine acid. A concrete sait crystall zed in small white scales, which may be ob tained from borax, by adding concentrated sulphuric, the nitric, the muratic, and even regetable acids, to a hot solution of borax,

till the lixivium becomes somewhat acid: the solution is then to be cooled, when the acid will appear in the shape of bright scales. This acid in combination with alkalies, earths, and metallic oxyds, forms borates.

BORAS. A borate. A salt formed of borncic acid with an earthy, alkaline or metallic base: as borate of soda, &cc.

Borage. See Borago.

Bonago. (Formerly written Corago; from cor, the heart, and ugo, to affect; because it was supposed to comfort the heart and spirits.) Barage.

1. The name of a genus of plants in the Linnæ in system. Class, Pentandria.

der, Monogynia.

2. The pharm copeial name of the officual borage. Buglossum verum. Borago hortensis. glossum latifolium

The leaves and flowers of this plant, Borago officinales of Linnans :- foliis omnibus alternis, calycibus patentibus, are este-med in some countries as refrigerant and cordul. A syrup is prepared from the leaves in France, and used in pleurisies and inflammatory fevers. Their principal use in this island is in that grateful summer beverage, known by the name of cool

Borago officinalis. The systematic name for the borage of the shops. See Borago.

BORAS SOUE. Borate of soda. Sub boras sode and Borax.

B.RATE. Se Boras

BORAX (Borak, Arab) Boras sode, sub boras sode. The obsolete synonyms are Chryscolla, capistrum auri, ancinar, loraxtrion, annear, antinear tineal, amphitane, baurach, nitrum factitinm, santerna, and mirum nativam. This salt consisting of boracic acid uniting with soda, the soda being slightly in excess, is brought from Thibet and Persia, where it is found in a native state. This native or crude borax is c.1 ed tincal, tincor, borech, pounxa, in the East Lidics, and was formerly purified in Europe by the Venetians, when it was called refined or Venetian borax; but it is now prepared by the Datch by solution in hot water, filtration, and careful crystalliza-The particular process is not known. Its tasteis cool: it is soluble in eighteen parts of cold and six of ho' wa'er. It is decomposed by several of the reads. Borax is rarely used internally in modern practice; and according to Murray it does not appear to possess any activity, a'though it is supposed by some to be, in do es of half a drachin or two seruples, dirretic and emenagorue. It is occasionally given in cardialgia as an antacid. Its solution is in common use as a cooling gargle, and to detach mucus, &c. from the mouth in putrid fever; and mixed with an equal part of sugar, it is used in the form of pawder to remove the aphthous

crust from the tongue in children. The sal's formed by the union of the acid of borax with different bases are called bo-

BORBORYGMUS. (From BopGopuZw, to make a noise ) The rumbling noise occasioned by flatus in the intestines. It frequently precedes hysterical affections.

BOROZATL. (Adhiop.) An epidemic disease of the Æthiopians, in appearance similar to the lues venerea.

Bourago. See Borago.

Bount (Indian.) Borri-borri. Boberri. The Indian name for turmeric; also an om ment used there, in which the roots of turmeric are a chief ingredient.

Bosa. An Egyptian word for a mass which is made of the meal of darnel, hempseed, and water. It is nebriating.

Bosnonos. (From Rooko, to eat, and popos, a part: because 1 is divided for food by the mill) Bosporas A species

of meal.

BOTALE FORAMEN, A name formerly

applied to he for amen ovale.

BOTANY. (Botanica. Bolavian: from Bolavia, an herb or griss.) That part of natural history which considers every thing respecting the natural history of vegetables.

BOTANICON. (From Botavn, an herb.) A plaster made of herbs, and described by

Panhis Ægineta.

Bornon. (Arab.) Tumours: pimples in the face: also the small-pox or measles.

BOTHRION (From Robertor, a little pit.) Botrium The alveolus or socket for the tooth; also an ulcer ted cornea.

Boria. A name given to scrophula.

Borin. A name for turpentine.

Bornen. Bocium. Indurated bronchial

Bororainum. The most evident symp-

tom of disease.

Bornuttis. (From Googus, a bunch of grapes.) Botrgites A sort of bornt cadmia, collected in the top of the furnace, and resembling a bunch of grapes.

Bornes. (Bolpus, a cluster of grapes; so called because it- seeds hang down like a bunch of grapes.) The oak of Jerusalem.

BOTHYS MEXICANA Botrys ambrosioides Mexicana. Chenopodium Mexicanum, Botrys Americana. Mexico tea. Spanish rea and Artemisian botrys A d coction of this plant, Chenopodium ambrosiondes of Linnæns:-folis lanceolatis dentatis, racemis foliatis simplicibus, is recommended in paral, tic cases. Formerly the infusion was drank instead of Chinese tea.

Bothys Vulganis. Bothys. Ambrosia. Artimesia chenopodium. Atriplex odorata. Artiplex suaveolens Jerusalem oak This plant, Chenopodi in botrys of Linnaus;foliis oblongis sinuatis, racemis nudis multifidis was form rly ad a nistered i . rm of decoction in some diseases of the chest; as

humoral asthma, coughs, and catarrhs. is now fallen into disusc.

Botus. Botia. Botus barbutus. A cucurbit of the chymists.

Boubalios. See Cucumis ugrestis, and Pudeudum muliebre

BOUBON. See Bubo.

(French for wax candle.) BOUGIE. Candela cerea. Candela medicata. Catheters of Swedianr. Cerei medicati of Le Dran. Cereolus chirurgorum. A term applied by surg ons to a long, slender instrument, that is oduced through the urethra into the bladder. Boughes made of the clastic gum are preferable to those made of wax. The caustic bougie differs from the ordinary one in having a thin roll of caustic in its middle, which destroys the stricture, or any part it comes in contact with. Those made of catgut are very seldom used, but are deserving of the attention of the surgeon. Bougies are chiefly used to overcome strictures in the urethra, and the introduction of them requires a good deal of address and caution. They should not be kept in the urethra so long at one time as to excite much pain or irritation. Before their use is discontinued, they should, if practicable, be carried the length of the bladder, in order to ascertain the extent of the strictures, taking care that this be performed not at once, but in a gradual manner, and after repeated trials; for much injury might arise from any hasty or violent efforts to remove the resistance that may present itself. There are bougies also for the esoplagus and rectum.

BOULINUS. (From \$2, greatly, and \u00e4mus, hunger; or from Eshouar, to desire.) A

canine or voracious appetite.

BOVILLE. (From bos, an ox, because cattle were supposed subject to it.) The

BOYINA FIMES. The same as bulimia. Boyista. Crepitus lupi. Puff ball. This is the Incoperdon bovista; -subrotundum, lacerato dehiscens, of Lunnaus, which when dry contains a powder used by the common people to stop the blood in recent cuts, &c.

Box-tree See Buxus.

BRACHERIUM. (From brachiale, a bracelet.) A truss or bandage for hernia; a term used by the barbarous Latin writers.

BRACHIEUS MUSCULUS. See Brachialis. BRICHLEUS EXTERNUS. See Brachialis externus

See Brachialis BRACHLEUS INTERNUS. internus.

BRACHIAL ARTERY. Arteria brachialis The brachial artery is the continuation of the axillary artery, which, as it passes behind the tendon of the pecte. ralis major, receives the name of brackial. It runs down on the inside of the arm, over the musculus coraco brachial's, and anconæus internus, and, along the inner

edge of the biceps, behind the vena basilica, giving out small branches as it goes along. Priow the bend of the arm it divides into he subitalis and radialis. Sometimes, the savely, the brachial artery is divided from its origin into two large branches, which run down on the arm, and afterwards on the fore-arm, where they are called cubitalis and radialis.

Brachiale. The word means a bracelet: but the anciest anatomical writers apply this term to the carpus, the part on

which the bracelet was worn.

BRACHIALIS. See Brachidlis internus. BRACHIALIS EXTERNUS. See Triceps extensor cubiti

BRACHIALIS INTERNUS. Brachieus of Winslow. Brachiaus internus of Cowper, and Humero-cubital of Dumas. A muscle of the fore-arm, situated on the fore-part of the os humeri. It arises fleshy from the middle of the os humeri, at each side of the insertion of the deltoid muscle, covering all the inferior and fore-part of this bone, runs over the joint, and adheres firmly to the ligament; is inserted, by a strong short tendon, into the coronoid process of the Its use is to bend the fore-arm, and to prevent the capsular ligament of the joint from being pinched.

BRACHIO-CUBITAL LIGAMENT. Ligamentum brachio cubitale, The expansion of the lateral ligament, which is fixed in the inner condyle of the os humeri, runs over the capsular, to which it closely adheres, and is inserted like radii on the side of the great sigmoid cavity of the ulna; it is covered on the inside by several tendons, which adhere closely to it, and seem to

strengthen it very considerably.

BRACHIO-RADIAL LIGAMENT. Lizamentum brachio-radiale. The expansion of the lateral ligament, which runs over the external condyle of the os humeri, is inserted round the coronary ligament, from thence all the way down to the neck of the radius, and also in the neighbouring parts of the ulna. Through all this passage it covers the capsular ligament, and is covered by several tendons adhering closely to both.

Brachi os, See Humeri os.

BRACHIUM. (Beaxing, the arm.) The arm, from the shoulder to the wrist.

BRACHIUM MOVENS QUARTUS. See Latissimus dorsi.

BRACHUNA. According to Avicenna, a species of furor uterinus,

BRACHY-CHRONIUS. (From Beaxus, Short, and xgoros, time.) A disease which continues but a short time.

BRACHPYNEA. (From Leaxus, short, and www, to breathe.) Shortness and difficulty

of breathing.

BRACHYS. (From Beaxus, short.) A muscle of the scapula.

Bracium. Copper. Verdigris.

BRADYPEPSIA. (From Beadus, slow, and werlω, to concoct.) Weak digestion. See Dyspepsia.

BRAGGAT. A name formerly applied to

a ptisan of honey and water.

Brain. See Cerebrum See Cerebellum. Brain, little

BRAN. Furfur. The husks or shells of wheat, which remain in the bolting machine. It contains a portion of the farinaceous matter and is said to have a laxative quality. Decoctions of bran, sweetened with sugar, are used by the common people, and sometimes with success, against coughs, hoarsenesses, &c.

(Branca, Span. a foot, or BRANCA. branch.) A term applied to some herbs, which are supposed to resemble a particular foot; as branca leonis, lion's foot; branca

ursina, bear's foot.

BRANCA LEONINA. See Alchemilla. BRANCA URSINA. The plant which is directed by this name in for ign pharmacopæias, is the Heracleum spondylium of Linnæus: -foliolis pinnatificlis, levibus; floribus uniformibus In Siberia it grows extremely high, and appears to have virtues in the cure of dysentery, which the plants of this country do not possess. See also Acanthus.

BRANCA LEONIS. See Alchemilla.

BRANCHÆ. (From Beexa, to moist.) Branchi. Swelled tonsils, or glandulous tumours, of the fauces, which se-

Branchus. (From βgeχω, to moisten.) A defluxion of humours from the fauces.

BRANDY. Spiritus Gallicus. lourless, slightly opake, and milky fluid, of a hot and penetrating taste, and a strong and agreeable smell, obtained by distilling from wine. It consists of water, ardent spirit, and a small portion of oil, which renders it milky at first, and, after a certain time, colours it yellow. It is the fluid from which rectified or ardent spirit is obtained. Its peculiar flavour depends on the nature of the volatile principles, or essential oil, which come over along with it in the distillation, and likewise, in some measure upon the management of the fire, the wood of the cask in which it is kept, &c. It is said, that our rectifiers imitate the flavour of brandy, by adding a small proportion of nitrous ether to the spirit of malt, or molasses. The utility of brandy is very considerable, but, from its pleasant taste and exhilarating property, it is too often taken to excess. It gives energy to the animal functions; is a powerful tonic, cordial, and antispasmodic; and its utility with camphire, in gangrenous affections, is very great.

Brunks. The name, in Scotland, for the

mumps. See Cynanche parotidea.

Brankursine. See Acanthus.

Buasilia. Brazil wood.

BHASILIENSE LIGNUM. Hæmatoxyllum.

BRASILIENSIS RADIX. The ipecacuanha root is sometimes so called. See Ipe-

BRASIUM. (From Leaven, to boil.) Malt, or germinated barley

BHASMA. (From Bearow, to boil.) unripe black pepper. Fermentation.
Bussios The same.

BRASS. Es. A combination of copper

BRASSADELLA, Brassatella. Ophioglos-

sum, or the herb adder's tongue.

BRASSICA. (Varro says, quasi præsica: from præseco, to cut off; because it is cut from the stalk for use; or from ægaou, a bed in a garden where they are cultivated.) Crambe. Cabbage.

The name of a genus of plants in the Linnaan system. See Brassica

tata.

BRASSICA ALBA. The white cabbage. Brassica APIANA. Jagged or crimpled

colewort.

The mercurialis BRASSICA CANINA.

earltata, Cabbage. There BRASSICA are several varieties of cabbage, all of which are generally hard of digestion, producing flatulencies, and afford very little nourishment, These inconveniencies are not experienced by those whose stomachs are strong and accustomed to them. Few vegetables run into a state of putrefaction so quickly as cabbages; they ought, therefore, always to be used immediately after cutting In Holland and Germany there is a method of preserving them, by cutting them into pieces, and sprinkling salt and some aromatic herbs among them: this mass is put into a tub, where it is pressed close, and left to ferment, when it is called sour croat, or sauer kraut. These, and all pickles of cabbage, are considered as wholesome and antiscorbutic, from the vinegar and spices they contain.

Turnip cab-BHASSICA CONGYLODES.

hage.

Brassica eumana. Red colewort. Brassica eruca The systematic name for the plant which affords the semen erucæ. See Eruca.

BRASSICA ERUCASTRUM, See Eruca sylvestris,

BHASSICA FLORIDA. Cauliflower. A variety of the oleracea.

BHASSICA. GONYLICODES. Turnip cabbage.

BHASSICA LACUTURRIA. Brassica lacuturris. The savoy plant.

Вплемся МАШИЛА, Крамби Эпласоия. Convolvulus maritimus. Soldanella. Soldanella. This plant, Convolvulus soldanella of Linnæus: foliis reniformibus, pedun-culis unifloris, is a native of our coasts. The leaves are said to be a drastic purge. It is only used by the common people, the pharmacopoias having now substituted more safe and valuable remedies in its

BRASISCA NAPUS. The systematic name for the plant from which the semen napi is

obtained. See Napi.

BRASSICA OLERACEA, The systematic name for the brassica capitata of the shops. See Brassica capitata.

Brassica napa. The systematic name for the plant whose root is called turnip,

See Rapa.

Brassica Rubra. Red cabbage. Mr. Watt finds that the red cabbage affords a very excellent test both for acids and alkalis, in which it is superior to litmus, being naturally blue, turning green with alkalis, and red with acids.

Brassica sativa. The common gar-

de.. cabbage.

Brassica sabauda. The savoy plant.

BRASSIDELLICA Aus. A way of curing wounds, mentioned by Paracelsus, by applying the herb Brassidella to them.

BRATHU. (Βεαθυ.) An old name for savine.

BREAD FRUIT. The tree which affords this, grows in all the Ladrone Islands in the South Sea, in Otaherte, and now in the West Indies. The bread-fruit grows upon a tree the size of a middling oak. The fruit is about the size of a child's head, and the surface is reticulated, not much unlike the surface of a truffle. It is covered with a thin skin, and has a core about the size of a small knife. The eatable part is between the skin and the core: it is as white as snow, and somewhat of the consistence of new bread. It must be toasted before it is eaten, being first divided into three or four parts. Its taste is insipid, with a slight sweetness, nearly like that of whealen This fruit bread and artichoke together. is the constant food of the inhabitants all the year, it being in season eight months.

BREAST. Mamma. The two globular projections, composed of common integuments, adipose substance, and lacteal glands and vessels, and adhering to the anterior and lateral regions of the thorax of females. On the middle of each breast is a projecting portion, termed the papilla or nipple, in which the excretory ducts of the glands terminate, and around which is a coloured orb, or disc, called the areola. The use of the breasts is to snckle new-born infants.

Breast-bone. Sec Sternum.

Bregna. (From βgeχω, to moisten; formerly so called because, in infants, and sometimes even in adults, they are tender and moist.) An old name for the parietal bones.

BREVIA. (From brevis, short.) specific name of some parts whose termination is not far from their insertion, as brevia vasa, the branches of the splenic

BREVIS MUSCULUS. A muscle of the scapula.

BREVIS CUBITI. A muscle of the fore-

Brevis extensor pollicis pedis, tensor brevis pollicis peclis.

Brevis flexor pollicis pedis. See Flexor brevis pollicis pedis.

BREVIS PERONEUS. See Peroneus brevis.

Brevis pronator radii. · See Pronator radii brevis.

BREYNIA. (An American plant named in honour of Dr. Brennius ) A species of capparis

Briar, wild. See Rosa canina.

BRICUMUM. A name which the Gauls gave to the herb artemisia,

Brimstone See Sulphur.

HOT-WELL. BRISTOL Bristoliensis aqua. A pure, thermal or warm, slightly acidulated, mineral spring, situated about a mile below Bristol. The fresh water is inodorous, perfectly limpid, and sparkling, and sends forth numerous air bubbles when poured into a glass. It is very agreeable to the palate, but without having any very decided taste, at least none that can be aistinguished by a common observer. specific gravity is only 1.00077, which approaches so near to that of distilled water. that this circumstance alone would shew that it contained but a very small admixture of foreign ingredients. The temperature of these waters, taking the average of the most accurate observations, may be reckoned at 74 deg.; and this does not very sensibly vary during winter or summer. Bristol water contains both solid and gaseous matter, and the distinction between the two requires to be attended to, as it is owing to the very small quantity of solid matter that it deserves the character of a very fine natural spring; and to an excess in gaseous contents, that it seems to be principally indebted for its medical properties, whatever they may be, inde-pendent of those of mere water, with an increase of temperature. From the different investigations of chymists, it appears that the principal component parts of the Hotwell water, are a large proportion of carbonic acid gas, or fixed air, and a certain portion or magnesia and lime, in various combinations, with the muriatic, vitriolic, and carbonic acids. The general inference is, that it is considerably pure for a natural fountain, as it contains no other solid matter than is found in almost all common spring water, and in less quantity.

On account of these ingredients, especially the carbonic acid gas, the Hotwell water is efficacious in promoting salutary hæmorrhages, in green sickness, as well as in the blind hæmorrhoides. It may be taken with advantage in obstructions, and weakness of the bowels, arising from habitual costiveness; and, from the purity of its aqueous pare, it has justly been considered as a specific in diabetes, rendering the urinary organs more fitted to receive benefit from those medicines which are generally prescribed, and sometimes success-

But the high reputation which this spring has acquired, is chiefly in the cure of pulmonary consumption. From the number of unsuccessful cases among those who frequent this place, many have demed any peculiar efficacy in this spring, superior to that of common water. It is not easy to determine how much may be owing to the favourable situation and mild temperate climate which Bristol enjoys; but it cannot be doubted that the Ho well water, though by no means a cure for consumption, alleviates some of the most harassing symptoms of this formidable disease. It is particularly efficacious in moderating the thirst, the dry burning heat of the hands and feet, the partial night sweats, and the symptoms that are peculiarly hectical; and thus in the earlier stages of plithisis, it may marerially contribute to a complete re-establishment of health; and even in the latter periods, mitigate the disease when the cure is doubtful, if not hopeless.

The sensible effects of this water, when drank warm and fresh from the spring, are a gentle glow of the stomach, succeeded sometimes by a slight and transient degree of headach and giddiness. By a continued use, in most cases it is diurctic, keeps the skin moist and perspirable, and improves the appetite and health. Its effects on the bowels are variable. On the whole, a tendency to costiveness seems to be the more general consequence of a long course of this medicinal spring, and therefore the use of a mild aperient is requisite. These effects, however, are applicable only to invalids, for healthy persons, who taste the water at the fountain, seldom discover any thing in it but a degree of warmth, which distinguishes it from the common element.

The season for the Hotwell is generally from the middle of May to October; but as the medicinal properties of the water continue the same throughout the year, the summer months are preferred merely on account of the concomitant benefits of air and exercise.

It should be mentioned, that another spring, nearly resembling the Hotwell, has heen discovered at Clifton, which is situated on the suminit of the same hill, from the bottom of which the Hotwell issues. The water of Sion spring, as it is called, is one or two degrees colder than the Hotwell; but in other respects it sufficiently resembles it to be employed for all similar purposes.

BHITANNICA HERHA. See Hydrolapa-

thum

Burrish off. A variety of the black species of petroleum, to which this name has been given as an empirical remedy.

Buoccoll. Brussica Italica. As an article of diet, this may be considered as more delicious than cauliflower and cabbage. Sound stomachs digest broccoli without any inconvenience; but in dyspeptic stomachs, even when combined with pepper, &c it always produces flatulency, and pauscous cructations.

Brochos. (Βεοχος, a snare.) A bandage. BROCHTHUS. (From βgeχω, to pour.) The throat; also a small kind of drinking-

Brochus. (Beoros.) One with a prominent upper-lip, or one with a full mouth

and prominent teeth.

BROITUM. A term in pharmacy, signifying the same with jusculum, broth, or the liquor in which any thing is boiled. Thus we sometimes read of Brodium Salis, or a decoction of salt.

BROMA. (From Bework, to cat.) Food of any kind that is masticated, and not

drank. BROMA-THEON. (From Beautie, to cat.)

Mushreom

BROMATOLOGY. (Bromatologia: from βεσμα, food, and λογος, a discourse.) A discourse or treatise on food

BROMELIA ANANAS. The systematic name of the plant which affords the anguas. See Ananas

The systematic BROMELIA KARATAS, name of the plant from which we obtain the first called penguin, which is given in the Spanish West! udies to cool and quench thirst in fevers, dysenteries, &c. It grows in a cluster, there being several of the size of one's finger together. Each portion is clothed with a husk, containing a white pulpy substance, which is the eatable part; and it it be not perfectly ripe, its flavour resembles that of the pine-apple. The juice of the ripe fruit is very austere, and s made use of to acidulate punch. The inhabitants of the West I dies make a wine f the penguin, which is very intoxicating, and has a good flavour.

BROMION. (From Bzapes, the oat.) The nume of a plaister, made with oaten flour,

menti ned by Paulus Ægineta.

BROWLS STERILIS. (From Egarka, to cat.) The wild oat

From Respos, the BRONCHIA. 'hroat.) See Trachca.

BRONCHIALES ARTERLE, Bronchial arteries. Branches of the aorta given off in th chest

BRONCHIALES GLANDULE glands. Large blackish glands, situated about the bronchia and trachea, which se-

crete blackish mucus.

BRONCHOCELE. (From Beorges, the windpipe, and иман, a tumour. Botium. Hernia gutturis Guttur tumidum Trachelophyma. Gossum Exechebronchos. Gongrona. Bocium. Hernia bronchialis. Tracheocele. Darbyshire neck This disease is marked by a tumour on the fore-part of the neck, and scated between the trachea and skin. In general it has been suppos d principally to occupy the thyroid gland. We are given to understand that it is a very common disorder in Derbyshire; but its occurrence is by no means frequent in other parts of Great Britain, or in Ireland. Amongst the inhabitants of the Alps, and other mountainous countries bordering thereon, it is a disease very often met with, and is there known by the name of goitre. The cause which gives rise to it, is by no means certain, and the observations of different writers are of very little prictical utility. Dr. Saunders controverts the general idea of the branchocele being produced by the use of snow water. The swelling is at first without pain, or any evident fluctuation, when the disease is of long standing, and the swelling considerable, we find it in general a very difficult matter to effect a cure by medicine, or any external application; and it might be unsafe to attempt its removal with a kmfe, on account of the enlarged state of its arteries, and its vicinity to the carotids; but, in an early stage of the disease, by the aid of medicine a cure may be effected.

Although some relief has been obtained at times, and the disease probably somewhat retarded by external applications, such as blisters discritient embracations, and saponaccous and mercurial plaisters, still a complete cure has soldom been effected with-out an internal use of medicine; and that which has always proved the most efficawhich this is most usually exhibited, is that of a lozenge. R. spongiæ ustæ 3-s. mucilag. Arab. gum. q. s. hat trochiscus. When the tunior appears about the age of puberty, and before its structure has been too morbidly deranged, a pill, consisting of a grain or two of calomel, must be given for three successive mghts; and, on the fourth morning, a saline purge. Every night afterwards, for three weeks, one of the troches should, when the patient is in bed, be put under the tongue, suffered to dissolve gradually, and the solution swallowed. The disgust at first arising from this remedy soon wears off. The pilis and the purge are to be repeated at the end of three

weeks, and the troches had recourse to as before; and this plan is to be pursued till the tumour is entirely dispersed. Some recommend the burnt sponge to be administered in larger doses. Sulphurated potash dissolved in water, in the proportion of 30 grains to a quart daily, is a remedy which has been employed by Dr. Ritchter with success, in some cases, where catcined sponge failed. The natron preparatum being the basis of burnt sponge, is now frequently employed instead of it, and, indeed, it is a more active medicine.

BRONCHOTOMY. (Bronchotomia :from Beorxos, the wind-pipe, and TEMVW, to cut.) Trichectomy. Laryngotomy. This is an operation in which an opening is made into he larynx, or trachea, either for the purpose of making a passage for the air into and out of the lungs, when any disease prevents the patient from breathing through the mouth and nostrils, or of extracting foreign bodies, which have accidentally fallen into the traches; or, lastly, in order to be able to inflate the lungs, in cases of sudden suffocation, drowning, &c. Its practicableness, and little danger, are founded on the facility with which certain wounds of the wind-pipe, even of the most complicated kind, have been healed, without leaving any ill effects whatever, and on the nature of the parts cut, which are not furnished with any vessel of consequence.

Broxenos. (Bgoyxos, the wind-pipe.)
A catarrh; a suppression of the voice from

a catarrh.

Browenus. (From Bgsze, to pour.) The wind-pipe. The ancients believed that the solids were conveyed into the stomach by the coopbagus, and the fluids by the bronchia; whence its name.

Brooklime Speedwell. See Beccubunga.

Broom, Common. See Genista

BRUCEA. (So named by Sir Joseph Banks in honour of Mr. Bruce, the traveller in Abyssinia, who first brought the seeds thence into England.) The name of a genus of plants in the Linnaan system.

Brucea antinesentence. The systematic name of the plant from which it was supposed we obtained the angustura bark.

See Angusturæ cortex.

BRUCEA FERRUGINEA. This plant is also supposed to afford the angustura bark. See Angustura cortex.

Bruisewort. See Saponaria.
BRUNELLA. See Prunella.

Brunner's glands. Brunneri glandule. Peyer's glands. The muciparious glands, situated between the villous and cellular coat of the intestinal canal; so named after Brunner, who discovered them.

Brunus. An erysipelatous eruption. Bruscus. See Ruscus. Bruta. (Arab.) Instinct. Savine.

BRUTIA. An epithet for the most resinous kind of pitch, therefore used to make the Oleum Picinum. The Pix Brutia was so called from Brutia, a country in the extreme parts of Italy, where it was produced.

BRUTINO. Turpentine.

BRUTOBON. The name of an ointment used by the Greeks.

BRUTUA. See Pareira brava.

BRUXANELI. (Indian.) A tall tree in Malabar, whose bark is diuretic, according to Ray.

BRYAMUS. (From Bevza, to make a noise.) A peculiar kind of noise, such as is made by gnashing or grating the teeth; or, according to some, a certain kind of convulsion affecting the lower jaw, and striking the teeth together, most frequently observed in such children as have worms,

BRYONIA. (From Beva to abound, from

its abundance.) Bryony.

1. The name of a genus of plants in the Linnman system. Class, Dioecia. Order,

Syngenesia.

2. The pharmacopæial name of the white bryony Vitis alba sylvestris. Agrostis, Ampelos. Archeostris. Echetrosis of Hippocrates. Bryonia aspera. Cedrostis. Chelidonium Labrusca. Melothrum. Ophrostaphylon. Psilothrum. Bryonia alba of Linnæus:—foliis palmatis utrinque calloso scabris.

White bryony, or wild vine, is a very common plant in woods and hedges. The root has a very nauseous biting taste, and disagreeable smell. Bergius states the virtues of this root to be purgative, hydragogue, emmenagogue, and diuretic; the fresh root emetic. This powerful and irritating cathartic, though now seldom prescribed by physicians, is said to be of great efficacy in evacuating serous humours, and has been chiefly employed in hydropical cases. Instances of its good effects in other chronic diseases are also mentioned, as astlima, mania, and epilepsy. In small doses, it is reported to operate as a diuretio, and to be resolvent and deobstruent. In powder, from Aj. to a drachm, it proves strongly purgative; and the juice, which issues spontaneously, in doses of a spoonful or more, has similar effects, but is more gentle in its operation. An extract prepared by water acts more mildly, and with greater safety than the root in substance, given from half a drachm to a drachm. It is said to prove a gentle purgative, and likewise to operate powerfully by urinc. Of the expressed juice, a spoonful acts violently both upwards and downwards; but cream of tartar is said to take off its virulence. Externally, the fre h root has been employed in cataplasms, as a resolvent and discutient; also in ischiadic and other rheumatic affections.

BRYONIA ALBA. The systematic name of the white bryony plant. See Bryonia.

BUC

BRYONIA MECHOACHANA NIGRICANS. A name given to the jalap root.

BRYONIA NIGRA Black bryony, or vine. The Tamus communis of Linnaus.

BRYONIA PERUVIANA. Jalap.

Bryony, black. See Bryonia nigra. Bryony, white See Bryona.

Burrinon. (Bgottov.) A malagma so called, and described by Paulus Ægineta. Burron. (From Egua, to pour out.)

A kind of alc, or wine, made of barley.

BUBASTECONDIUM. (From bubastus and cor, the heart.) A name formerly given

to artemisia, or innewort.

BUBO. (From 2850), the groin; because they most frequently happen in that part.) Modern surgeons mean, by this term, a swelling of the lymphatic glands, particularly of those of the groin and axilla. The disease may arise from the mere irritation of some local disorder, when it is called sympathetic bubo; from the absorption of some irritating matter, such as the venereal poison; or from constitutional causes, as in the pestilential bubo, and scrophulous swellings, of the inguinal and axillary glands.

BUBON. (From Boulaw, the groin, or a tumour to which that part is liable, and which it was supposed to cure.) The name of a genus of plants in the Linnaan system. Class, Pentandria. Order, Digynia.

BUBON GALBANUM. The systematic name of the plant which affords the officinal galbanum. See Galbanum.

BUBON MACEDONICUM. The systematic name of the plant which affords the

semen petroselini Macedonici of the shops. See Petroselinum Macedonicum.

BUBONITY. (From Excar, the groin.) A name of the golden starwort; so called because it was supposed to be efficacious

in diseases of the groin.

BUBONOCELE. (From Escar, the groin, and knan, a tumour.) Hernia inguinalis. Inguinal hernia, or rupture of the groin. A species of hernia, in which the bowels protrude, at the abdominal ring. See Hernia.

Bucca (Heb.) The cheek. The hollow inner part of the check, that is inflated

by the act of blowing.

Buccachaton. (From bucca, or bucella, that is, a morsel of bread sopped in wine, which served in old times for a breakfast.) Paracelsus calls by the name of Bucella, the carneons excrescence of the polypus in the nose, because he supposes it to be a portion of flesh parting from the bucca, and insinuating itself into the nose.

BUCCAL GLANDS. (Glandule buccina. les: from bucca, the check.) The small glands of the mouth, under the cheek, which assist in secreting saliva into that

cavity.

Buccea. (From bucca, the cheek; as much as can be obtained at one time with-

in the checks.) A mouthful; a morsel; a polypus of the nose.

Buccellaton. (From buccella, a morsel.) A purging medicine, made up in the form of a loaf; consisting of scammony, &c. put into fermented flour, and then baked in an oven.

BUUELLA. See Buccea.

(From buccellatus, cut BUCELLATIO. into small pieces.) Bucelatio. A method of stopping an hæmorrhage, by applying small pieces of lint to the vein, or artery.

BUCCINATOR (Musculus buccinator. So named from its use in forcing the breath to sound the trumpet; from Bounavov, a trumpet.) Retractor anguli oris of Albinus, and alveolo maxillaire of Dumas. The trumpeter's muscle. The buccinator was long thought to be a muscle of the lower jaw, arising from the upper alveoli, and inserted into the lower alveoli, to pull the jaw upwards; but its origin and insertion, and the direction of its fibres, are quite the reverse of this. For this large flat muscle, which forms in a manner the walls of the cheek, arises chiefly from the coronoid process of the lower jaw-bone, and partly also from the end of the alveoli, or socket process of the upper jaw, close by the pterygoid process of the sphænoid bone: it goes forward with direct fibres, to be implanted into the corner of the month; it is thin and flat, covers in the mouth, and forms the walls of the cheek, and is perforated in the middle of the cheek by the duct of the parotid gland. These are its principal uses :-it flattens the cheek, and so assists in swallowing liquids; -it turns, or helps to turn, the morsel in the mouth, while chewing, and prevents it from getting without the line of the teeth:in blowing wind-instruments, it both reecives and expels the wind; -it dilates like a bag, so as to receive the wind in the cheeks; and it contracts upon the wind, so as to expel the wind, and to swell the note. In blowing the strong wind-instru-ments, we cannot blow from the lungs, for it distresses the breathing, we reserve the air in the mouth, which we keep continually full; and from this circumstance, as mentioned above, it is named buccinator, from blowing the trumpet.

Breevla. (Dim. of bucca, the cheek.)

The fleshy part under the chin.

The plant BUCEPHALON, RED-FRUITED. so called, is the Trophis Americana of Linnaus. Its fruit is a kind of rough red berry, which is eaten by the inhabitants of Jamaica, although its flavour is by no means pleasant.

BUCERAS. (From Exc, an ox, and xiggs, a horn; so called from the horn-like appearance of its seed.) Buceros. Fenngreek seed. See Fanumgracum.

Buck bean. Sec Trifoaum paludosum. Buck-elorn. See Spina cervina.

The Polygonum fagofy-BUCKWHEAT. rum of Linnæus. The grain of this plant constitutes the principal food of the inhabitants of Russia, Germany, and Switzerland.

BUCK-WHEAT, EASTERN. The Polygo-mm divaricatum of Linnæus. The roots, The Polugoreduced into a coarse meal, are the ordi-

nary food of the Siberians.

BUCRANION. (From £85, an ox, and ngarror, the head; so called from its supposed resemblance to a calt's snout.) The antirrhinum, or snap dragon plant.

The hymen, according to BUCTON.

Piræus.

BUGANTIA. Chilblams.

Bugle. See Prunella.

Bugloss. Sce Buglossum.

BUGLOSSUM. (From Bes, an ox, and ρλασσα, a tongue; so called from the shape and roughness of its leaf.) Buglossa. Buglossum angustifolium majus. Buglossum vulgare majus. Buglossum sativum cinal bugloss, or alkanet. This plant, Anchusa officinalis of Linnaus :- fohis lanceolatis strigosis, spicis secundis imbricatis, calycibus quinquepartitis, was formetly esteemed as a cordial in melancholic and hypochondriacal diseases. It is seldom used in modern practice, and then only as an aperient and refrigerant.

BUGLOSSUM SYLVESTRE. The stone

bugloss.

Bugula. (A dim. of buglossa.) See

Consolida media.

BULBO ASTANUM. (From Box600, a bulb, and xasayor, a chesnut; so called from its bulbous appearance.) Agriccasta-Nucula terrestris. Bulbocastaneum. Bulbocastanum majus et minus. Earth-nut. Hawk-nut. Kipper-nut, and pig-nut. This plant, the Bunium bulbocastanum of Linnæus, has a root as large as a nutmeg; hard, tuberous and whitish; is eaten raw, or roasted. It is sweetish to the taste, nonrishing, and supposed to be of use against strangury and bloody urine.

Bulbocavernosus, (Bulbocavernosus, sc. musculus: so called from its origin and insertion) See Accelerator urine.

BULBONACH. (Germ.) The rediviva of Linnaus. Satin and honesty. It is said, by Ray, to be a warm diuretic.

Such bulbous BULBUS ISCULENTUS. roots as arc commonly eaten are so called.

Bulbus vomitorius. . Iluscari. acynthus muscari, of Linnæus. Grape-flower. Emetic and durctic, according to Ray.

Bulge-water tree. The Geoffroya Jamai-

BULIMIA (From &s, a particle of excess, and rigger, hunger.) Bulimiasis, Boulimos, Bulinnus Bolismos of Avicen-Fines canina . Appetitus caninus. Phagedæna. Adephagia. Bupeina lyno. rexia. Insatiable hunger, or canine appetite.

Dr. Cullen places this genus of disease in the class locales, and order dysorexie; and distinguishes three species. 1. Bulimia hellnonum; in which there is no other disorder of the stomach, than an excessive craving of food. 2. Bulimia syncopalis; in which there is a frequent desire of food, and the sense of hunger is preceded by swooning. 3. Bulima emetica, also cynorexia; in which an extraordinary appetite for food is followed by vomiting. The real causes of this disease are, perhaps, not properly understood In some cases, it has been supposed to proceed from an acid in the stomach, and in others, from a superabundance of acid in the gastric juice, and from indigested sordes, or worms. In most instances, some consider it as depending more frequently on monstrosity than disease. An extraordinary and well-attested case of this disease, is related, in the third volume of the Medical and Physical Journal, of a French prisoner, who, in one day, consumed of raw cow's udder, 4 lbs. raw beef, 10 lbs. candies, 2 lbs.; total, 16 lbs.; besides 5 bottles of porter.

BULIMIA ADDEPHAGI. A voracious appe-

tite.

BULINIA CANINA. A voracious appetite, with subsequent vomiting.

BULIMIA CARDIALGICA. voracious appetite, with heartburn.

BULIMIA CONVULSORUM. A voracious

appetite, with convulsions. Bulimia emetica. A voracious appe-

tite, with vomiting. BULIMIA HELLUOYUM. Gluttony.

BULIMIA ESURIGIO. Gluttony.

BULIMIA SYNCOPALIS. A voracious appetite, with fainting, from hunger.

BULIMIA VERMINOSA. voracious appetite, from worms.

BULIMIASIS. See Bulimia.

BULIMUS. See Bulimia.
BULITHUM. (From &\*s., an ox, and 21905, a stone.) A bezoar, or stone, found in the kidneys, or gall, or urinary bladder, of an ox, or cow.

(A bubble.) A clear vesicle. BULLA. which arises from burns, or scalds; or

other causes.

The fruit so called, is the BULLACE. produce of the Prunus insitia of Linnaus, which grows wild in our hedges. There are two varieties of bullace, the red and the white, which are used with the same intentions as the common damsons.

Bullosa ferris. An epithet applied to the vesicular fever, because the skin is covered with little vesicles, or blisters See

Pemphigus.

BUNIUM. (From Esvos, a little hill; so called from the tuberosity of its root.)

1. The name of a genus of plants in the Linnan system. Class, Pentaudria. Order, Digynia.

2. The name of the wild parsley.

BUNITES VINUM. (From bunium, wild parsley) A wine made of bunium and

BUNIUM. BI LHOCASTANUM. The systerratic name of a plant whose root is called the pig-nut. See Bulbocastanum.

Bunius. A species of turnip.

BUPEINA. (From &s, a particle of magnitude, and warz, hunger.) A voracious

appetite.

Burnagos. (From  $\beta \varepsilon$ , a particle of excess, and  $\phi \circ \varphi_{\mathcal{O}}$ , to eat.) The name of an antidote which created a voracious appetite in Marcellus Empiricus.

BUPHTHALMUM. (From \$80, an ox, and οφθαλμος, an eye; so called from its flow "s, which are supposed to resemble an eye ) The herb ox-eye daisy. See Bellis major

BUPHTHALMUM CURTICUM. Pellitory of

Spain. See Pyrethrum

BUUN PHALMUM GERMANICUM. The com-

mon ox-eye daisy

MAJUS. Great, or ox-BUPHTHALMUM

eye dansy. See Bellis major.

BUPHTHALMUS. (From Bre, an ox, and οφθαλμος, an eve; so named from its large appearance, like an ox's eye.) Ox eye.

1. Diseased enlargement of the eye.

2. Houseleek.

BUPLEURUM. (From \(\beta\_8\), large, and wasugov, a rib; so named from its having large rib-like filaments upon its leaves.)

1. The name of a genus of plants in the

Linnæan system.

2 The pharmacopoial name of the Buplewon Buplewordes. The herb hare'sear. See Perfoliuta

BUPLEURUM ROTUNDIFOLIUM. systematic name of the plant called perfoliata, in the pharmacopæias. See Perfolicita.

Burdock See Burdana.

Burgundy pitch. So Pix Burgundica. Burac. (Arab.) Borax. It also means any kind of salt.

According to Avicenna, a Bums. scirrhous hernia, or hard abscess.

BURNEA Pitch.

Burnet saxifrage See Pimpinella.

Brenning. An ancient me-BURNING dical term, denoting an infectious disease, got in the stews by conversing with lewd women, and supposed to be the same with what we now call the venereal disease.

BURRIU SPIRITUS MATRICALIS. rhu's spirit, for disorders of the womb. A compound of myrrh, olibanum, amber,

and spirit of wine.

Burnt hartshorn. See Cornu ustum. Burnt sponge. See Spongia usta.

Bunsa. A bag

1. The scrotum.

2 A herb called Thlaspi bursa pastoris, from the resemblance of its seminal tollicles to a triangular purse.

BURSALOGY. (From Bugaz, a bag,

and Apper, a discourse ) The doctrine of the bur a muc sa

B RSE MUCOSE. Mucous bags, composed of proper membranes, conta ning a kind of mucous fat, formed by the exhaling arteries of the internal coat. They are of different sizes and firmness, and are connected by the cellular membrane with articular cavities, tendons, ligaments, or the periosteum. The use of the bursæ mucosæ is to secrete, and contain a substance to lubricate tendons, muscles, and bones, in order to render their motion easy.

A Table of all the Bursa Mucosa.

In the Head.

1. A bursa of the superior oblique muscle of the eye, situated behind its trochlea in the orbit.

2. The bursa of the digostricus, situated in the internal surface of its tendons

3. A bursa of the circumflexus, or tensor palati, situated between the hook-like process of the sphenoid bone and the tendon of that muscle

4. A bursa of the sterno hyoideus muscle, situated between the os hyoides and larvnx.

About the Shoulder joint

1. The external acromial, situated under the acromion, between the coracoid process, deltoid muscle, and capsular liga-

2. The internal acromial, situated above the tendon of the infra-spinatus and teres major: it often communicates with the

former.

3. The coracoid bursa, situated near the root of the coracoid process: it is sometimes double and sometimes triple.

4. The clavicua r bursa, found where the clavicle touches the coracoid process.

5. The subclavian bursa, between the tendon of the subclavicularis muscle and the first rib.

6. The coraco-brachial, placed between the common origin of this muscle and the

biceps, and the capsular ligament.

7 The bursa of the pectoralis major, situated under the head of the humerus, between the internal surface of the tendon of that muscle and another bursa placed on the long head of the biceps.

8 An external bursa of the teres major, under the head of the os humeri, between it and the tendon of the teres major.

9. In internal bursa of the teres major, found within the muscle where the fibres of its tendon diverge.

10. A bursa of the latissimus dorsi, between the tendon of this muscle and the os humeri.

11. The humero-bicipital bursa, in the vagina of the tendon of the biceps.

There are other bursæ mucosæ about the humerus, but their situation is uncertain.

Near the Elbox-joint.

1. The radio-bicipita, situated between

the tendon of the biceps, brachialis, and anterior tubercle of the radius.

2. The cubito-radial, between the tendon of the biceps, supinator brevis, and the ligament common to the radius and ulna.

3. The anconeal bursa, between the olccranon and tendon of the anconeus muscle,

4. The capitule radial bursu, between the tendon common to the extensor carpi radialis brevis, and extensor communis digitorum and round head of the radius. There are occasionally other bursæ, but as their situation varies, they are omitted.

About the inferior part of the Fore-arm and

On the inside of the Wrist and Hand.

1. A very large bursa, for the tendon of the flexor pollicis longus.

2. Four short burse on the fore-part of

the tendons of the flexor sublimis

3. A large bursa behind the tendon of the flexor pollicis longus, between it and the fore-part of the radius, capsular ligament of the wrist and os trapezium

- 4. Alarge bursa behind the tendons of the flexor digitorum profundus, and on the fore-part of the end of the radius, and forepart of the capsular ligament of the wrist. In some subjects it communicates with the former.
- 5. An oblong bursa between the tendon of the flexor carpi radialis and os trapc-
- 6. A very small bursa between the tendon of the flexor carpi ulnaris and os pisiforme.

On the back part of the Wrist and Hand.

7. A bursa between the tendon of the abductor pollicis longus and the radius.

8. A large bursa between the two extensores carpi radiales.

9. Another below it, common to the ex-

tensores carpi radiales. 10. A bursa, at the insertion of the ten-

don of the extensor carpi radialis.

11. An oblong bursa, for the tendon of the extensor policies longus, and which communicates with 9.

12. A bursa, for the tendon of the extensor pollicis longus, between it and the metacarpal bone of the thumb

13. A bursa between the tendons of the extensor of the forc, middle, and ring fingers.

14. A bursa for the extensors of the lit-, tle finger

15. .1 bursa between the tendon of the extensor carpi ulnaris and ligament of the wrist.

There are also bursæ mucosæ between the musculi lumbricales and interessei.

Near the Hip joint. On the forc-part of the joint.

1. The ileo-puberal, situated between the iliacus internus, psoas magnus, and the capsular ligament of the head and the femur.

2. The pectincal, between the tendon of the pectineus and the thigh bone.

3. . A small bursa of the gluteus medius muscle, situated between it and the great trochanter, before the inscrtion of the py-

4. Abursa of the gluteus minimus muscle between its tendon and the great tro-

5. The gluteo fascial, between the gluteus maximus and vastus externus.

On the posterior part of the Hip joint. 6. The tubero ischiatic bursa, situated between the obturator internus muscle, the posterior spine of the ichium, and its tu-

7. The obturatory bursa, which is oblong, and found between the obturator intermus and gemini muscles, and the capsular ligament.

8. A bursa of the semi membranosus, under its origin and the long head of the bi-

ceps femoris.

9 The gluteo-trochanteral bursa, situated between the tendon of the psoas muscle and the root of the great trochanter.

10. Two gluteo-femoral bursa, situated between the tendon of the gluteus maxi-

mus and os femoris.

11. A bursa of the quadratus femoris, situated between it and the little trochanter.

12. The iliac bursa, situated between the tendon of the iliacus internus and the little trochanter.

Near the Knec-joint.

1. The supra genual, which adheres to the tendons of the vastus and cruralis and the fore part of the thigh-bone.

The infra genual bursa, situated under the ligament of the patella, and often com-

municating with the above.

3 The anterior genual, placed between the tendon of the sartorius, gracilis and semitendinosus and the internal and lateral ligament of the knee.

4. The posterior genual, which is some-times double, and is situated between the tendons of the semi-membranosus, the internal head of the gastrocnemius, the capsular ligament, and internal condyle.

5. The popliteal, conspicuous between the tendon of that muscle, the external condyle of the femur, the semilunar cartilage,

and external condyle of the tibia.

6. The bursa of the biceps cruris, between the external part of the tendon, the biceps cruris, and the external lateral ligament of the knec.

In the Foot.

On the back, side, and hind part of the Foot. 1. A bursa of the tibialis anticus, between its tendon, the lower part of the tibia, and capsular ligament of the ankle.

2. A bursa between the tendon of the extensor pollicis pedis longus, the tibia and

capsular ligament of the ankle

3. A bursa of the extensor digitorum communis, between its tendons, the tibia, and ligament of the ankle.

133

4. A large bursa, common to the tendons of the peronei muscles.

5. I bursa of the peroneus brevis, proper

to its rendon

6. The calcaneal bursa, between the tendo Achillis and os calcis.

In the Sole of the Foot.

1. A bursa for the tendon of the peroneus

longus.

2. A bursa common to the tendon of the flexor pollicis pedis-longus, and the tendon of the flexor digitorum pedis communis longus profundus.

3. A bursa of the tibialis posticus, between its tendon, the tibia, and astragalus

4. Five bursæ for the flexor tendons, which begin a little above the first-joint of each toe, and extend to the root of the third phalanx, or insertion of the tendons.

BURSALIS MUSCULUS. (From its resemblance to a bursa, or purse.) See Obtu-

rator externus et internus.

BUSELINUM. (From &s, great, and os-

Bussii spinitus, Bezoandicus. The bezoardic spirit of Bussius, an eminent physician at Dresden. A distillation of ivory, sal-ammoniac, amber, &c.

Butchersbroom. See Ruscus.

BUTIGA. A synonym for gutta rosacea. BUTINO. Turpentine.

BUTTER. (Butyrum: from \$25, cow, and rugos, congulum, or cream.) concrete and soft substance, of a yellow colour, approaching more or less to that of gold, and of a mild, agreeable taste. It melts by a gentle heat, and becomes solid by cooling. Fresh butter is nourishing, and relaxing, but it readily becomes sour, and, in general, agrees with few stomachs. Rancid butter is one of the most unwholesome and indigestible of all food.

Butter-bur. See Petasites. See Ranunculus. Butter-flower.

The thin and sour milk BUTTER-MILK. which is separated from the cream by churning it into butter.

See Pinguicula. Butterwort. BUTTA. Sec Pariera brava. BUTYRUM. See Butter.

BUTTRUM ANTIMONIL. See Murias an-

BUXTON WATERS. Buxtonienses aque. Warm mineral springs, which rise in the village of Buxton, in Derbyshire. They have been long celebrated for their medicinal properties With respect to sensible properties, the Buxton water can-not be distinguished from common spring water, when heated to the same temperature. Its temperature in the gentleman's bath, is invariably 82°. The principal peculiarity in the appearance of this spring, is a large quantity of elastic vapour, that rises and forms bubbles, which pass through the water, and break as soon as they reach the surface. The air of these bubbles was ascertained, by Dr. Pearson, to consist of azotic gas, mixed with a small proportion of atmospheric air. Buxton water is frequently employed, both internally and externally; one of which methods often prove beneficial, when the other would be injurious; but, as a bath alone, it, virtues may not be superior to those of tepid common water. As the temperature of 82° is several degrees below that of the human body, a slight shock of cold is felt on the first immersion into the bath; but this is almost immediately succeeded by a pleasant glow over the whole system. therefore proper for very delicate and irritable habits. The cases which derive most benefit from the external use of Buxton waters, are those in which a loss of action, and sometimes of sensation, affects particular limbs, in consequence of long continued or violent inflammation, or external injury. Hence the chronic rheumatism, succeeding the acute, and where the inflammation has been seated in particular limbs, is often wonderfully relieved by this bath The internal use of the water has been found to be of considerable service in symptoms of defective digestion, and de-rangement of the alimentary organs. A judicious use of this simple remedy, will often relieve the heartburn, flatule cy, and sickness; it will increase the appetite, animate the spirits, and improve the health. At first, however, it sometimes occasions a diarrhæa, which is rather salutary than detrimental; but costiveness is a more usual effect, especially in sluggish habits. It also affords great relief when taken internally, in painful disorders of the bladders and kidneys; and has likewise been recommended in cases of gout; but when taken for these complaints, the addition of some aromatic tincture is recommended. In all cases of active inflammation, the use of these waters should be carefully avoided, on account of their supposed heating properties. A full course consists of two glasses, each containing one-third of a pint, before breakfast; which quantity should be repeated between breakfast and dinner. In chronic cases a long residence on the spot is requisite to ensure the desired ef-

BUXUS. (From wuxazw, to become

hard.) The box tree.

1. The name of a genus of plants in the Linnaan system. Class, Monoecia. Order, Triandria.

2 The pharmacopæial name of the Buxus sempervirens of Linnaus, possess a very strong nauseous, bitter taste, and aperient virtues. They are occasionally exhibited, in form of decoction, amongst the lower orders of people, in cases of dropsy and astlima, and worms. As much as will lay

upon a shilling, of the common dwarf box, dried and powdered, may be given at bedtime, every night, to an infant.

BUXUS SEMPERVIRENS. The systematic name of the buxus of the pharmacopæias.

See Buxus.

BYARUS. A plexus of blood vessels in the brain.

Byng A Chinese name for green tea. BYRETHRUM. (Beretta, Ital. or barette, Fr. a cap ) Byrethrus An odoriferous cap, filled with cephalic drugs, for the head.

BYRSA. (Bugoa, leather.) A leather

skin, to spread plaisters upon.

BYSAUCHEN. (From Bow, to hide, and αυχην, the neck.) Morbid stiffness of the neck.

Brssus. (Heb.) A woolly kind of moss. Pudendum muliebre. A kind of

fine linen.

BYTHOS. (Βυθος, deep.) An epithet used by Hypocrates for the bottom of the stomach.

(From Bow, to rush together.) BYZEN. In a heap; throngingly. Hippocrates uses this word to express the hurry in which the mensus flow in an excessive discharge.

), In the Chemical alphabet, means nitre.

CAA-APIA. (Indian.) A Brazil root, which, chewed, has nearly the effects of ipecacuanha. It is the Dorstenia Brasiliensis of Wildenow. The Brasilians cure the wounds from poisoned darts with the juice of this root, which they pour into the

CAA-ATAYA. (Indian.) A bitter plant of Brazil, very powerfully cathartic and emetic. It resembles the cuphrasia. Ray.

CAACICA. (Indian.) A Brazilian herb applied in cataplasms against venemous bites; called also colubrina Lusitanica.

CAACO. The name of a species of sensitive plant, whose root is used by the natives of America as an antidote to several

poisons.

Senecio Brasiliensis. CAAETIMAY. decoction of the plant thus called, is used as a wash to cure the itch. Its systematic. name is unknown. Ray.

(Indian.) CAAGHIYUYO Frutex baccifer Brasiliensis. A shrub of Brazil, whose leaves are applied to ulcers, as de

siccative.

CAA-OPIA. (Indian.) Arbuscula gummifera Brasiliensis. Hypericum bacciferum of modern naturalists. The name of a tree in the Brazils, whose bark emits a juice, when wounded, which, in a dried state, resembles gamboge, except that it is rather of a darker colour.

CAAPEBA. See Pareira brava.

CAAPONGA. (Indian.) The Brasilian name for crithmum; also called Trifolia spica. Crithmum marinum non spinosum. Inula crithmoides of Linnaus The leaves and young stalks are pickled for the use of the table, they are gently diuretic.

CAAROBA. (Indian) The name of a tree which grows in the Brazils. coction of its leaves promotes perspiration, and is given in the cure of the venereal disease. Ray.

CABALISTICA ARS. Cabala. Cabula. Kabala. The cabalistic art. It is derived from the Hebrew word, signifying to receive by tradition. It is a term that hath been anciently used, in a very mysterious sense, amongst divines; and since, some enthusiastic philosophers and chemists have transplanted it into medicine, importing by it somewhat magical: but such unmeaning terms are now justly rejected.

Caballine aloes. See Aloes. Cabbage. See Brassica.

Cabbage-bark tree. See Cortex Geoffrea Jamaicensis.

Cabbalistic art. See Cabalistica ars. CABUREIBA. Caburiiba. A name of the Balsamum Peruvianum. Ray thinks it

is the tree which affords that balsam, CACAGOGA. (From nann, excrement, and aya, to expel.) Cathartics. Ointments which, being rubbed on the funda. ment, procure stools, according to Paulus Ægineta.

CACALIA. (From RERSY, bad, and RIZY, exceedingly; because it is mischievous to the soil on which it grows. (Cacamum. The herb wild chervil, or wild carraways,

formerly said to be pectoral.

CACAMOTICTLANO QUILONI. (Indian.) Batatas peregrina. The purging potatoc. CACAMUM. See Cocalia.

CACAO, Cacoa, Cocoa. Cacavifera. Quahoil. Cacata. The cocoa or chocolate nut of Virginia and Jamaica.

CACAPHONIA (From RARGE, bad, and φωνη, the voice.) Defective articula-

CACARI. See Cacao.

CACATORIA FEBRIS. (From caco, to go to stool.) An epithet given by Sylvius to a kind of intermittent fever, attended with copious stools.

A sort of pill recom-CACCIONDE. mended by Baglivi against dyscnteries;

its basis is catechu.

CACHEXIA. (From acros, bad, and (s, a habit.) A bad habit of body, known by a depraved or vitiated state of the solids and fluids.

CACHEALE. A class of diseases in Cullen's nosology, embracing three orders, viz. marcores, intumescentia, and impetigines.

The fluor albus CACHENIA CTERINA.

is sometimes so called.

The jaundice, CACHEXIA ICTERICA. or a disposition thereto.

CACHLAN. The bathalmum verim.

CACHLEX. A little stone, or pebble. Galen says, that he cachileces, heated in the fire and quenened in whey, become astringents and useful in dysenteries.

CACHINNATIO. (From cadinno, to laugh atoud.) A tendency to namoderate laughter, as in some hysteric and maniacal affections.

CACHORE A name for catechi.

Cacnos. (Indian.) A shrub which the Indians use as a diurctic, and to expel con-

cretions from the kidneys.

CACHUNDE. A medicing highly celebrated among the Chinese and Indians, made of several aromatic ingridients, perfumes, medicinal earths, and precious stones. They make the whole into a stiff paste, and form out of it several figures, according to their fancy, which are dried for use. These are principally used in the East Indies, but are sometimes brought over to Portugal. In China the principal persons usually carry a small piece in their mouths, which is a continued cordial, and gives their breath a very sweet smell. is highly esteemed as a medicine in nervous complaints; and it is reckoned a prolonger of life, and a provocative to venery; the two great intentions of most of the medicines used in the East.

Galen says it sometimes CACHRYS. means parched barley. In Linnaus's botany, it is the name of a genus of which he

enumerates three species.

A plant, the CACHRYS ODONTALGICA. root of which may be substituted for that of the pyrethrum.

CACHYMIA. (Kanumia.) An imperfect metal, or an immature metalline ore, ac-

cording to Paracelsus.

CACOALEXITERIUM. (From nance, bad, and antidote and antidote to poison or infectious diseases. Alexiphar-

CACOCOLIA. (From waxos, and woxos, bile.) An indisposition, or disease of the

CACOCHYLIA. (From xxxoc, bad, and xuxn, the chyle. Indigestion or depraved chy-

CACOCHYMIA. (From nance, bad, and xumor, junce, or humour ) A diseased or depraved state of the humours.

CACOUNEMUS. (From MEROS, bad, and uvnun, the leg.) Having a natural defect in the tibia.

CACOCOREMA. (From RERES, bad, and xogea, to purge, or cleanse.) A medicine which purges off the viciated humours.

(From nance, bad, and CACOD EMON. Samon, a spirit.) An evil spirit, or genius, which was supposed to preside over the bodies of men, and afflict them with certain d.sorders The night-mare.

CACODIA. (From MANOS, bad, and aga, to smell.) A defect in the sense of smelling.

CACOETHES. (From REROS, Ill, and EBOC, a word which when applied to diseases, signifies a quality, or a disposition.) Hippocrates applied this word to malignant and difficult distempers. Galen and some others, express by it an incurable ulcer, that is rendered so through the acrimony of the humours flowing to it. Linhaus and Vegel use this term much in the same sense with Galen, and describe the ulcer as superficial spreading, weeping, and with callous edges.

(From Manos, bad, and CACOPATHIA. maθos, affection.) An ill affection of the

body, or part.

(From nanos, bad, and CACOPHONIA. payn, the voice.) A defect in the organs of speech; a bad pronunciation.

CACOPRAGIA. (From nanos, bad, wearlω, to perform.) Diseased chylopoietic

viscera.

(From nance, bad, and CACOURYTHMUS. gυθμος, order ) A disordered pulse.
CAUOSIS. (From κακος, bad.) A bad

disposition of body.

CACOSTIA. (From MANOS, and food.) An aversion to food, or nausea. CACOSPHYXIA. (From MUROS, bad, and σφυξις, pulse.) A disorder of the pulse.

CACOSTOMACHES. (From REXES, bad, and somaxor, the stomach.) A bad or disordered stomach; also food which the stomach rejects.

CACOSTOMUS. (From nanos, bad, and soura, a mouth.) Having a bad formed, or

disordered mouth.

CACOTHYMIA. (From RARCE, ill, and Sothe mind; or a diseased mind.

CACOTROPAIA. (From MANOS, ill, and 1964, nutriment.) A vitiated nourishτροφη, nutriment.) ment; a wasting of the body, through a defect of nutrition.

CACTUS. The name of a genus of plants in the Linnæau system. Icosandria. Order, Monogynia. The melonthistle.

CACTUS OPENTIA. The systematic name of the plant bearing the epithet · opuntia in the pharmacopæias. See Opuntia.

CACUBALUS. (From REROC, evil, and 3xx. Aa, to cast out; so named because it was thought to be efficacious in expeling poisons.) The berry bearing chickweed. See Cucubalus.

Cacker. The Arabian term for cardamoms.

CACUMEN. The top or point.

CADAVER. (From cado, to fall; because the body, when deprived of life, falls to the ground.) A carcase. A body deprived of life.

CADMIA, (Heb.) Chlimia. Catimia. A name given to the lapis calaminaris. See

Zinc.

CADMIA METALLICA. A name given, by the Germans, to cobalt.

Capuca, (From cado, to fall down.) See Decidua.

Capocus Morbus. (From cado, to fall down.) The epilepsy, or falling sickness.

Charters. (From cacus, blind.) Blind-

ness. See Caligo, and Amaurosis.

C.ECUM From excus, blind. (The excum, or blind gut: so called from its being periorated at one end only. The first portion of the large intestines, placed in the right like region, about four fingers' breadth in length. It is in this intestine that the ileum terminates by a valve, called the valve of the excum. The appendicula caci verniformis is also attached to it. See Intestines.

Caenos. (Kaigos.) Hippocrates, by this word, means the opportunity or moment in which whatever is to be effected should

be done

C.ESARIAN OPERATION. (So called because Julius Casar is said to have been extracted in this manner.) Hysterotomia Hysterotomatocia. The operation for extracting the factus from the uterus, by dividing the integuments of the abdomen

and the uterus.

There are three cases in which this operation may be necessary.-1. When the fœtus is perceived to be alive, and the mother dies, either in labour or in the last two months. 2. When the fœtus is dead, but cannot be delivered in the usual way, from the deformity of the mother, or the disproportionate size of the child. 3. When both the mother and the child are living, but delivery cannot take place, from the same causes as in the second instance. Both the mother and the child, if accounts can be credited, have often lived after the Cresarian operation, and the mother even borne children afterwards. Heister gives a relation of such success, in his Institutes of Surgery, and others. In England, the Cæsarian operation has almost always failed. Mr. James Barlow, of Charley, Lancashire, succeeded, however, in taking a fætus out of the uterus by this bold proceeding, and the mother was perfectly restored to health.

CESARES. Casones. Children who are brought into the world by the Casarian operation.

CETCHU. See Catechu.

CAF. (Arab.) Cafa. Caffa. A name given by the Arabs to camphire.

CAGASTRUM. A babarous term used by

Paracelus, to express the morbific matter

which generates diseases.

CAJAN Cayan. The Phaseolus creticus of Linnaus A decoction of the leaves restrains the henorrhoids when excessive. Ray.

CAJEPUT OIL. Oleum cajeputie. Oleum Vittnebianum. Oleum volatile melaleucæ. Oleum, cajeput. The tree which affords this oil, by distillation of its leaves, was supposed to be the Melaleuca leucadendron of Unnæus, but it appears from the specimen of the tree producing the true oil, sent home from India, by Mr. Christopher Snith, that it is another species which is therefore named Melaleuca cujupiti. Thunberg says cajeput oil has the appearance of inflammable spirit, is of a green colour, and so completely volatile, that it evaporates entirely, leaving no residum; its odour of the camphoraceous kind, with a terebinthinate admixture Goetz says it is limpid, or rather yellowish. It is a very powerful medicine, and in high esteem in India and Germany, in the character of a general remedy in chronic and painful diseases; it is used for the same purposes for which we employ the officinal æthers, to which it seems to have a considerable affinity; the cajeput, however, is more potent and pungent; taken into the stomach, in the dose of five or six drops, it heats and stimulates the whole system, proving, at the same time, a very certain diaphoretic, by which probably the good effects, it is said to have in dropsies and intermittent fevers, are to be explained. For its efficacy in various convulsive and spasmodic complaints, it is highly esteemed It has also been used both internally and externally, with much advantage, in several other obstinate disorders; as palsies, hypochondriacal and hysterical affections, deafness, defective vision, tooth ache, gout, rheumatism, &c. The dose is from two to six, or even twelve

CALABA. The Indian mastich-tree. Cataphyllum inophyllum of Linnzus, a native of America, accounted vulnerary, resolvent and anodyne.

CALAGUALE RADIX. Calaguele radix. The root so called is knotty, and somewhat like that of the polypody tribe. It has been exhibited internally at Rome, with success, in dropsy; and it is said to be efficacious in pleurisy, contusions, absecses, &c. It was first used in America, where it is obtained; and Italian physicians have since written concerning it, in terms of approbation.

CALAMAGROSTIS. (From καλαμος, a reed, and αγζωσις, a sort of grass.) Sheer grass. Reed grass.

CALAMBAC. (Indian.) The agallochum, or aromatic aloe.

CALAMACORUS, Indian reed.

CALAMEDON. (From zahaus, a reed.)

A sort of fracture which runs along the bone, in a straight line, like a reed, but is

lunated in the extremity

CALAMINA PRÆPARATA. Prepared calamine. Burn the calamine, and reduce it to powder; then let it be brought into the state of a very fine powder, in the same manner that chalk is directed to be prepared. Sec Calamine.

CALAMINE. (From calamus, a reed; so called from its reed-like appearance.) Cadmia. Cathmia. Cadmia lapidosa erosa. Cadmia fossilis. Calamina. Lapis calaminaris An ore of zinc. A sort of stone, or mineral, containing zinc and carbonic acid, united with a portion of iron, and sometimes other substances. It is very heavy, moderately hard and brittle, of a gray, vellowish, red, or blackish brown; found in quarries of considerable extent, in several parts of Europe, and particularly in this country, in Derbyshire, Gloucestershire. Nottinghamshire, and Somersetshire; as also in Wales. The calamine of England is, by the best judges, allowed to be superior in quality to that of most other countries. It seldom lies very deep, being chiefly found in clayey grounds, near the surface. In some places it is mixed with lead ores. This mineral, or semimetal, is an article in the materia medica: but, before it comes to the shops, it is usually roasted, or calcined, to separate some arsenical or sulphurcous particles which, in its crude state, it is supposed to contain, and in order to render it more easily reducible into a fine powder. In this state, it is employed in collyria, for weak eyes, for promoting the cicatrization of ulcers, and healing excoriations of the skin. It is the basis of an officinal cerate, called Ceratum calaminæ, by the London College, formerly called ceratum lapidis calammaris. ceratum epuloticum; and ceratum car-bon's zinci impuri by the Edinburgh College. These compositions form the cerate which Turner strongly recommends for healing ulcerations and excoriations, and which have been popularly distinguished by his name. The collyria in which the prepared calamine has been employed, have consisted simply of that substance added to rose-water, or elder-flower water.

Calamint, common. See Calamintha. Calamint, mountain. See Calamintha

magno flore

CALAMINTHA. (From καλος, beautiful, or καλαμος, a reed, and μινθη, mint.) Common calamint. Calamintha montana. Calamintha vulgaris. Calamintha officinarum Melissa calamintha of Linnaus :peduncules axillaribus, dichotomis, longitudine foliorum. This plant smells strongly, like wild mint, though more agreeable; and is often used by the common people, in form of tea, against weakness of the

stomach, flatulent colic, uterine obstructions, hysteria, &c.

CALAMINTHA ANGLICA. Field calamint. Spotted calamint. Calamintha odore. Nepeta agrestis. It is the Melissa nepeta of Linnaus. It was formerly used as an aromatic.

CALAMINTHA HUMILIOR. The ground-ivy. CALAMINTHA MAGNO FLORE. Calamintha montana. Mountain calamint. This plant, Melissa grandiflora of Linnæus, has a moderately pungent taste, and a more agreeable aromatic smell than the common calamint, and appears to be more eligible as a stomachic.

CALAMINTHA MONTANA. See Calamin-

CALAMUS. A word of Arabian derivation.

1. A general name denoting the stalk of any plant. .

2. The name of a genus of plants in the Linnæan system. Class, Hexandria.

der, Monogynia.

AROMATICUS. CALAMUS (From kalam, Arab.) Acorus verus. Calamus Calamus vulgaris. odoratus. Jacerantatinga. Typha aromatica. Clava rugosa. Sweet-flag or acorus. Acorus calanus scapi mucrone longissimo foliaceo of Linnæus. The root of this plant has been long employed medicinally. It has a moderately strong aromatic smell, and a warm, pungent, bitterish taste; and is deemed useful as a warm stomachic. Powdered, and mixed with some absorbent, it forms a useful and pleasant dentifice.

CALAMUS AHOMATICUS ASIATICUS.

Acorus calamus of Linnæus.

CALAMUS ODORATUS. See Calamus aromaticus.

CALAMUS HOTANG. The systematic name of the plant from which we obtain the Dragon's blood. See Sanguis draconis.

CALAMUS SCRIPTORIUS. A kind of canal at the bottom of the fourth ventricle of the brain, so called from its resemblance to a writing pen.

CALAMUS VULGARIS. See Calamus aro. maticus.

CALATHIANA. (From xxxx8000, a twig basket; so called from the shape of its flowers.) The herb marsh-gentian, or Gentiana pneumonanthe of Linnxus.

Calbianum. The name of a plaister in

Myrepsus.

Vitriol. CALCADINUM.

CALCADIS. An Arabian name for white vitrol and alkali.

CALCANEUM. (From calx, the heel.) Calcar pterna. Os calcis. The largest bone of the tarsus, which forms the heel. It is situated posteriorly under the astragalus, is very regular, and divided into a body and processes. It has a large tuberosity or knob, projecting behind to form the heel. A sinuous cavity, at its fore part

which in the fresh subject is filled with fat, and gives origin to several ligaments. Two prominences, at the inner and fore part of the bone, with a pit between them, for the articulation of the under and fore part of the astragulus. A depression, in the external surface of the bone near its forepart, where the tendon of the peronaus longus runs. A large cavity, at the inner sid of the bone, for lodging the long flexors of the toes, together with the vessels and nerves of the sole. There are two prominences, at the under and back part of this bone, that give origin to the aponeurosis and several muscles of the sole. The anterior surface of the os calcis is concave, fot its articulation with the os cuboides, and it is articulated to the astragulus by ligaments.

CALCANTHUM. (From xannos, brass, and aisos, a flower; i. e. flowers of brass.) Cal-

canthos. Copperas. Vitriol.

CALCAR. (From calx, the heel; also from cales, to heat.) The heel-bone; also the furnace of a laboratory.

Calcareous earth See Calx. CALCARIS FLOS. The Larkspur. CALCARIUS LAPIS. Limestone. CALCATAR. A name for vitriol.

CALCATON. White arsenic. Troches of arsenic.

See Consolida media. CALCATRIPPA.

Calcenonius. CALCENA. Calcetus. racelsus uses these words to express the tartarous matter in the blood; or that the blood is impregnated with tartarous principles.

CALCES, METALLIC. Metals which have undergone the process of calcination, or combustion; or any other equivalent ope-

ration.

CALCEUM EQUINUM. (From calceus, a shoe, and equus, a horse; so called from the figure of its leaf.) The herb tussilago, or colt's foot.

CALCUTTUEOS. (From RANXIOV, purple.)

Verdigrise.

CALCHOIDES. (From ZZAIZ, a chalk-stone, and edge, form.) Calchoidea ossicula. A name of the cuneiform bones.

CALCIBICIUM. The name of a medicine

in which arsenic is an ingredient.

CALCIFRAGA. (From calx, a stone, and frango, to break; so named from its supposed property of breaking the human calculus.) Breakstone. The herb spleenwort, or scolopendrium, in Scribonius

Largus.

CALCINATION. Oxydation. The fixed residues of such matters as have undergone combustion are called cinders, in common language, and calces, but now more commonly oxyds, by chymists; and the operation, when considered with regard to these residues, is termed calcination. In this general way, it has likewise been applied to bodies not really combustible, but only

deprived of some of their principles by heat. Thus we hear of the calcination of chalk, to convert it into lime by driving off its carbonic acid and water; of gypsum, or plaster stone, of alum, of borax, and other saline bodies, by which they are deprived of their water of crystallization; of bones which lose their volatile parts by this treatment, and of various other bodies.

CALCINATUM. Cinificatum. Terms appli-

cable to calcined substances.

CALCINATUM MAJUS. It is whatsoever is dulcified by the chymical art, which was not so by nature; such as dulcified mercury, lead, and the like substances, which are very speedily consolidated.

CALCINATUM MAJUS POTERII. Mercury dissolved in aqua-fortis, and precipitated with salt water. Poterius used it in the

cure of ulcers.

CALCINATUM MINUS. Any thing which is sweet by nature, and speedily cures, as sugar, manna, tamarinds &c.

CALCINONIA. See Calcena.

CALCIS AQUA. See Liquor calcis. CALCIS VIVI FLORES. The pellicle on lime

CALCIS OS. See Calcaneum.

CALCITARI. Alkaline salt.

Vitriol. CALCITEA.

CALCITEOSA. Litharge.

CALCITHOS. Verdigrise.

CALCITRAPA. Carduus stellatus. Jacea ramocissima, stellata, rupina Common star-thistle. Star-knapweed. The plant thus called in the pharmacopæias, is the Centaurea calcitrapa of Linnaus :- calycibus sub. duplicato-spinosis, sessilibus : foliis pinnatifidis, linearibus dentatis; canle piloso; every part of which is bitter. The juice, or extract, or infusion, are said to cure intermittents, and the bark of the root, and the seeds, have been recommended in nephritic disorders, and in suppression of urine. It scarcely differs, in its effects, from other bitters, and is now little used.

CALCITRAPA OFFICINALIS. Carduus stel-Carduus solstitialis. latus lutea. stellata Jacea lutea capite spinosa minori. Leucanthe veterum. St. Barnaby's thistle. The Centaurea solstitialis of Linnaus. commended as an anticteric, anti-cachectic, and lithontriptic, but is, in reality only a

weak tonic.

CALCITREA. Vitriol.

CALCOIDEA OSSICULA. The cuneiform bones.

CALCOTAR. Vitriol.

CALCULIFRAGUS. (From calculus, a stone, and frango, to break.) Having the power to break calculi, or stones in the human body.

A synonym of lithontriptic. See Li-

thoutriptics.

2. A name sometimes applied to scolopendrium, or the pimpernel, from its supposed virtue.

CALCULUS. (Dim. of calx, a limestone.) Calculus humanus. Bezoar microcosmicum. Gravel. Stone. In English we understand by gravel, small sandlike concretions, or stones, which pass from the kidneys through the ureters in a few days; and by stone, a calculous concretion in the kidneys or bladder, of too large a size to pass, without great difficulty. Similar concretions are found occasionally in other cavities, or passages. When a disposition to form minute calculi or gravel exists, we often find nephritic paroxysms, as they are called, (see Nephritis,) which consist of pain in the back, shooting down through the pelvis to the thighs; sometimes a numbness in one leg, and a retraction of either testicle in men, symptoms arising from the irritation of a stone passing through the urcters, as these cross the spermatic cord, on the nerves passing to the lower extremities. These pains, often violent, are terminated by the painful discharge of small stones through the urethra, and the patient is for a time easy. What, however, is meant by the stone is a more serious and violent disease. It is singular that these discharges of small gravel do not usually terminate in stone. M ny have experienced them during a long life, without any more serious inconvenience: while the latter is a disease chiefly of the young, and depending on circumstances not easily explained. If the stone attacks persons more advanced in age, it is often the consequence of paroxysms of gout, long protracted, and terminating imperfectly.

When once a stone has acquired a moderate size, it usually oceasions the following symptoms .- frequent inclination to make water, excessive pain in voiding it drop by drop, and sometimes a sudden stoppage of it, if discharged in a stream; after making water, great torture in the glans penis, which lasts one, two, or three minutes; and in most constitutions, the violent straining makes the rectum cortract and expel its excrements; or, if it be empty, occasions a tenesmus, which is sometimes accompanied with a prolapsus blood, from a rupture of the vessels, and sometimes pure blond itself is discharged. Sometimes the urine is very clear, but fiesediment deposited at the bottom of it, which is only a preternatural separation of the mucilage of the bladder, but has often been mistaken for pus. The stone is a disease to which both sexes and all ages are liable; and calculi have even been found in the bladders of very young children, pay of infants only six months old.

Women seem less subject to this complaint than men, either owing to constitutional causes, or to the capaciousness, shortness, and straightness of their urethra, allowing the calculi to be discharged while small, together with the urine.

Chymical analysis of urinary calculi.

It is only since the time of Scheele that we have become acquainted with the nature of urmary calculi, this subject having been quite in the dark before that great chymist discovered, in the year 1776, a peculiar acid (the lithic acid) in them, and at the same time found them to contain no lime, a circumstance which was soon after confirmed by the experiments of Bergman. From this period the chymists bestowed a particular attention upon the examination of urinary concrements, as appears from the writings of Dobson, Percival, Falconer, Achard, Hartenkeit, Tychsen, Link, Titius, Wal-ther, Gariner, Brugnatelli, Pearson, and several others, some of whom confirmed the discovery of Scheele, while others contradicted, and others enlarged it.

But we are particularly indebted to Fourcroy and Vauquelin, who, since 1786, had turned their attention on this subject, for having made many experiments, by which great light is thrown on the nature of urinary concrements. The following are the interesting results of their chymical in-

quiries.

The Seat and Physical Properties of Urinary Calculi.

Calculi are found in different parts of the urinary system, in the pelvis of the kidney, in the ureters, in the bladder and irrethra: but as they, for the most part, originate in the kidney, the calculi renales make the nucleus of the greatest number of urinary stones. The calculi renales differ greatly with respect to their external qualities; for the most part, however, they consist of small, concrete, roundish, smooth, glossy, and crystalline bodies, of a red-vellow colour, like that of wood, and so hard as to admit of polishing. On account of their minuteness, they easily pass through the urinary passages in form of gravel, which being sometimes of a rough surface, cause several complemts on their passage. But in some instances they are of too great a size to be able to pass along the ureters; in which case they increase in the kilners, sometimes to a great size. Calculi renales of this kind are generally of a brown, dark red, or black colour, and surrounded with several stra'a of coagulated blood and pus; they have also been observed of a vellow, reddish, and lighter colour; and some con isting of a homogen, ous stony mass; but white or grey calculi renales are very rarely to be met with Am ngst the great number that were exan ried one or two only were found of a gration blockish colour, and a composition similar to those which generally bear the name of mulherry-like stones.

The stones in the ureters, which on passingle to the freters, we prevented by their size from descending into the bladder, frequently increase very much; they, however, rarely occur; their colour is white, and they consist of phosphat of lime.

The stones in the bladder are the most frequent urinary concrements that have been principally examined; they draw their first origin from the kidneys, whence they descend into the bladder, where they increase; or they immediately originate and increase in the bladder; or they arise from a foreign body that by chance has got into the bladder, which not unfrequently happens, particularly in the female sex. Concretions of this kind differ greatly in their respective physical qualities and external form, which, however, is generally spherical, oval, or compressed on both sides; and sometimes, when there are several stones in the bladder, they have a polyedrous or cubical form; their extremities are frequently pointed or roundish, but they are very seldom found cylindrical, and more rarely with cylinders at their ends.

There is a great variety in the size of the calculi, and likewise in their colour, which is materially different, according to their respective nature and composition. They occur, 1. of a yellowish colour, approaching nearly to red, or brown; such stones consist of lithic acid. 2. Gray, or more or less white; these stones always contain phosphats of earths. 3. Dark gray, or blackish; stones of this colour oxalats of earths. Many stones shew brown or gray spots, on a yellow or white ground, generally raised on the surface, and consisting of oxalat of lime, which is enclosed in lithic acid, when the ground-colour of the stone is of a wood colour, or in phosphat of lime, when it is white. These spots are, in general, only to be observed in the middle of the stone, or at one of its extremities.

All that is here stated, is the result of observations on more than 600 calculi; and different other colours, that are said to have been observed, either arise from heterogeneous substances, or are merely variations of the above colours. Their surface is smooth and polished in some, in others only smooth, and in others uneven, and covered with rough or smooth corpuscles, which are always of a yellow colour; in some, the surface is partly smooth and partly rough. The white ones are frequently even and smooth, half transparent, and covered with shining crystals, that generally indicate phosphat of ammonia with tale; or they are faint, and consist of minute grains; or rough, in which case they consist of phosphat of lime. The brown and dark gray stones are, from their similarity to mulberries, called mulberrystones, and being frequently very rugged, they cause the moat pain of all.

On examining the specific weight of urinary calculi in more than 500 specimens, it was found to be, in the lightest, 1213:1000,

in the heaviest, as 1976:1000. Their smell is partly strong, like urine or ammonia, partly insipid, and terreous; especially, the white ones, which are like sawed avory or rasped bone.

The internal texture of calculi is but seldom guessed from their external appearance, particularly when they exceed the size of a pigeon's egg. On breaking them, they generally separate into two or three strata, more or less thick and even, which prove that they are formed by different precipitations, at different times. In the middle, a nucleus is generally seen, of the same mass as the rest. When the place they are broken at is finely streaked, and of a yellow or reddish colour, the lithic acid predominates; but when they are half transparent, luminous like spar, they have ammoniacal magnesia in them, and phosphat of lime and then they are brittle and friable; but when they are so hard as to resist the instrument, of a smooth surface, and a smell like ivory, they contain saccharic lime. It frequently happens, that the exterior stratum consists of white phosphat of earth, while the nucleus is yellow lithic acid, or oxalat of lime, covered sometimes with a yellow stratum of lithic acid, in which case the nucleus appears radiant; but when it consists of lithic acid, and is covered with white phosphate of earth, it is roundish, oval, and somewhat crooked. These concretions have very seldom three strata; namely, on the outside a phosphat of salt, towards the inside lithic acid, and quite withinside an oxalat of lime; but still rarer these substances occur in more strata, or in another order, as before-mentioned.

Stones of the urethra are seldom generated in the urethra itself; however, there are instances of their having been formed in the fossa navicularis, by means of foreign bodies that have got into the urethra. We also very frequently observe stony concrements deposited between the glans and prepuce. All the concretions produced in the inside and outside the urethra consist of phosphats of earths, which are easily precipitated from the urine. There are likewise stones in the urethra, which have come out of the bladder, having been produced there, or in the kidneys; and they generally possess the properties of stones of the kidneys.

The different constituent Particles of Urinary Calculi.

It has been mentioned before, that Scheele found a peculiar acid in the urinary concretions, and likewise that phosphat of lime was discovered in them. The identity of the lithic acid, however, was much doubted by modern chymists, particularly by Dr. Pearson, who asserted that it was merely an oxyd, whereby he gave rise to the discoveries which Fourcroy and Vauquelin have since made on this subject, because they were induced to repeat the ex-

periments, in order to examine whether the lithic acid were really an acid. Their endcavours were fully rewarded, as they not only found the lithic acid and phosphat of lime in the different calculi, but also five other substances, viz. the lithat of ammonia, oxalat of lime, siliceous earth, phosphat of ammoniacal magnesia, and an animal matter.

1. Of the Lithic or Uric Acid. The acid discovered by Mr. Scheele, in the urinary concretions, was styled lithic acid; or, according to Dr. Pearson's Researches, uric acid, which, after Scheele, has the following properties. It is insipid, without smell, hard, crystallizable, not soluble in cold water, and in boiling water only in several thousand times greater The solution, after having bequantity. come cool, deposits the acid in form of minute yellow needles, easily soluble in the lie of fixed alkalis, out of which, however, it is precipitated by all acids, even the carbonic acid, except the sulphuric and muriatic acid, which have no effect on it. Concentrated nitric acid, on dissolving it, obtains a red colour. On distilling the lithic acid, it yields a small quantity of sublimed, undecomposed acid, very little oil and water crystallized carbonat of ammonia, carbonic acid, and a very black coal, which, however, contains neither alkalı nor lime. Besides these properties, it possesses still others. On rubbing it with concentrated lie of kali or natron, it immediately forms a saponaceous, thick, and pulpy mass, which is very soluble in water, when supersaturated with alkali, but little soluble when only saturated with it. The saturated combinations have little taste, are not crystallizable, and when diluted with water, the muriatic acid precipitates the uric acid in form of small needle-like, shining, somewhat yellowish crystals. Ammonia receives very little of it, which combination is almost quite indissoluble. Lime-water has likewise very little effect on it, and the carbonats of alkalis none at all. On being dissolved in nitrio acid, a part of the lithic acid is changed into oxalic acid. The red colour which appears after this combination, is said to prove, according to Pearson. that substance to be merely an oxyd, but it arises from a peculiar animal matter. When oxygenated muriatic acid is brought in contact with lithic acid, the colour of it grows pale, it puffs up, becomes soft and gelatinous, and at last obtains the consistency of a milky liquor; from which process only ouc-sixtieth of a white, light animal substance remains, and a quantity of carbonic acid evolves itself under continual slow effervescence. The liquor yields muriat of ammonia, oxalat of ammonia, both in crystals, free muriatic and malic acid; consequently the oxygenated muriatic acid separates the uric acid into ammonia, carbonic acid, oxalic acid, and malic acid, whereby we observe that the oxygenated muria-

tic acid changes the uric acid, first into ammonia and malic acid, but on the addition of more acid, into oxalic acid; and when still more acid is added, into water and carbonic acid. The remaining white substance is the same, from which the red colour originates that appears on the combination of the uric acid with nitric acid, and which imparts the cubical form to the muriat of ammonia, obtained by the evaporation of the liquor. It remains now to be stated what is observed in the distillation of that acid, by which it yields, not only carbonat of ammonia, but also car-bonic gas, very little oil, Prussic acid, partly in form of gas, partly in fluid form, a considerable quantity of coal that contains no salt, and a little water. The productions thus obtained have the smell of bitter almonds. The results of these inquiries manifestly shew, that the lithic acid is really a distinct acid from all others, consisting of azote, carbon, hydrogen, and oxy-This peculiar acid is an excrementitions substance, which is carried off by the urine, and, at the forming of calculi, combines itself with a coloured animal matter, from which also it probably originates by a process still unknown.

2. Of the Lithat of Ammonia.

This substance seems to have been unknown before, or at least not properly discerned from the uric acid; and, though Scheele has observed it, he was ignorant of its particular nature. It is easily to be distinguished, by the small even strata in which it is formed, by its colour, that looks like milk colonred with coffec, and by its forming but small calculi. It dissolves in the lees of kali and natron like the lithic acid, but with the characteristic difference that it discharges ammonia, a phenomenon already observed by Scheele. It is more soluble in cold as well as warm water, than the lithic acid. It is in the same way affected by acids, except that a greater quantity is required for changing it. It is generally mixed with phosphat of ammoniacal magnesia, because it seems only to take place after a sufficient quantity of ammoniacal magnesia has been formed, to saturate the phosphat of kali and the free uric acid.

3. Of the Phosphat of Lime.

The existence of this substance had hitherto been but inaccurately determined, every substance which was not lithic acid being formerly comprised by the name of phosphat of lime. It occurs in small friable strata, which break in scales, or splints, of a grey white colour, and are faint, opaque, without any smell or taste, and crystallized in aluminous or spar-like form; instead of strata, it is frequently composed of friable grains, that slightly cohere, and has many holes and pores, like a spongy texture. It never forms a calculus by itself, being in a calculus always united with

exposing it to a strong heat, and burns to coal, exhaling the odour of burned bones : and yields water, oil, carbonat of ammonia, and a carbonaceous residuum. Being calcined white, it only leaves lime, and phosphat of lime, without any water of crystallization. It is not soluble in cold water, but in boiling water a part of its gelatine dissolves, spreading an animal odour. All acids, except the boracic and carbonic acid, dissolve it, leaving on the bottom of the vessels transparent spots of animal matter. These solutions are all precipitated by alkalis, but without any decomposition, the precipitation remaining phosphat of lime. On treating the phosphat of lime with concentrated nitric acid, a thick pulpy mass of acid sulphat and phosphat of lime will be obtained, on which pure alkalis, as well as carbonat of alkalis, have no effect. We never could find acid phosphat of lime, as Brugnatelli pretends to have observed.

4. Of the Phosphat of Ammoniacal Magnesia.

It consists of scaly, half-transparent, hard, and coherent strata; can be sawed without crumbling, and reduced to a fine, soft and white powder. It is of a sweetish insipid taste, somewhat soluble, and crystallized in rhomboids, or thick liminas, dispersed in the cavities of other calculous substances; and it is frequently found on the surface of other calculi. It contains, betwixt its strata, a gelatinous substance; but less than the phosphat of lime on which account it also blackens by being heated. Though it be but little soluble in water, yet it dissolves in such a quantity as to be capable of crystallizing by slow evaporation. Acids dissolve it more quickly than they do the phosphat of lime. Weak suiphuric acid entirely dissolves it, forming sulphat of ammoniacal magnesia. In diluted muriatic or nitric acid, it disappears more quickly than phosphat of lime. Ammonia, by which that salt is made turbid, only precipitates small particles of magnesia. The lees of fixed alkalis discngage from it ammonia, without forming with it a solution; and, depriving it of the phosphoric acid, Icave the magnesia behind.

5. Of the Oxalat of Lime.

It is, according to our observations, only found in the mulberry-like calculi, in combination with a coloured animal matter, and consist of strata covered with pointed, roundish, rough or smooth protuberances; outside it appears of a dark or brown colour, but internally it is grey, frequently with white streaks, of a solid texture, and may be polished like ivory; it breaks in scales, or in the shape of shells; and, on being pounded, or sawed, it exhales an animal odour, like semen. It is the heaviest

an animal gelatmous matter; on account of of all calculous substances, and the only which circumstance it becomes black by one which yields one-third of lime by calcination. It dissolves with difficulty in acids and is precipitated unaltered by alkalis from nitric acid. The fixed alkalis decompose it when they are impregnated with carbonic acid, and when it is pulverized, and the solution heated, whereby carbonat of lime and oxalat of alkalis are obtained.

The great quantity of animal matter which constantly adheres to this oxalat of lime is very characteristic, it imparts the brown, reddish, blackish colour to the above kind of stones, and likewise the fine and solid texture. This substance may be obtained by putting small pieces of these stones into diluted nitric acid, whereby it appears of the same colour, and becomes soft and spongy. The great hardness of this kind of calculous substance, most probably arises from the intimate connexion of its particles, produced by the combination of the oxalat of lime with animall matter, in the same way as lime obtains a great degree of solidity by its combination with albuminous matter, of which, and of a peculiar matter of urine, that animal substance seems to consist.

6. Of the Siliceous Earth.

Amongst 600 calculi that were examined, there were only two which contained this earth; both had the texture of mulberry-like stones, though of a lighter colour, and by being calcined, lost one-third of their weight, without giving free-lime; heated with acids they lost nothing, but when melted with four times as much of alkali, they yielded siliceous earth by being treated with muriatic acid. They contained phosphat of lime, and an animal matter similar to that which is united with the oxalat of lime. They were hard, difficult to be sawed and pulverized, and the powder made scratches in metal. On being burnt, they emit an animal odour; they imparted nothing to the boiling water, and to the acids a little phosphat of lime. which difficultly scparates from the siliceous earth. Alkalis, either pure, or combined with carbonic acid, did not affect them, merely depriving them of a part of their animal matter. Their essential character consists in their being fusible and vitrifiable with fixed alkalis.

7. Of the Animal Matter.

All the six substances just examined, which constitute the urinary calculi of the human species, are always combined with an animal matter, as appears from its being burnt to coal from the productions yields by distillation, from its stench on being burnt, and from the cellulous membranous floccula which remain when pieces of calculi are dissolved in diluted acids. This animal matter has been frequently, and with good reason, considered as the basis of all urinary concretions, like as in boncs

the gelatinous matter, the first basis of the ber and thickness, and are frequently of a bones, forms an organic texture, in the insmooth surface. The specific weight of terstices of which the phosphat of lime is deposited. It is very remarkable, that the different constituary particles of urmary calculi arc combined with a dissimilar animal matter, which are sometimes albuminous, sometimes gelatinous, sometimes composed of both, and frequently united with the matter of urine. Thus the litnic acid, or the lithat of ammonia, contains a third of albuminous matter, combined with the matter of urine, the phosphats of earths, albuminous matter, gelatine in form of membranes, and laminas, or tela cellulosa; the oxalat of lime, a spongy, yet more solid texture, of the colour of albumen, and the siliceous earth, a similar substance. On the whole, the animal matter seems to unite and join together all the acid and salme particles of urinary concretions.

The Classification of Urinary Stones.

The old classification of urinary calculi, made according to their figure and their size, cannot at present, where we have acquired so accurate a knowledge of their internal nature, be retained, as they ought rather to be classed according to their constituent particles; however, no regard is to be had to the animal matter, as being found in all urinary concretions, and having no influence on their respective difference. On comparing the results of the analyses of more than 600 stones, Fourcroy was induced to bring them under three genera; the first of which comprehends such stones as are merely composed of one substance, besides the animal matter; the second contains urinary concretions, consisting of two substances, besides the animal matter; and the third comprises all those which are formed by more than three cal-culous substances. These three genera comprehend about twelve species, namely, the first genns three, the second seven, and the third two; but it must be remembered that the number of the genera, as well as of the species, is determined after the observations hitherto made, and may consequently be increased in future.

1. The first species of urinary concrethis kind most frequently occur, as there were, amongst 600, about 150. They are easily distinguished by their reddish or high yellow colour, much resembling that of wood, by their brittle, radiant-like, homogeneous, and fine texture, and by their perfect solubility in the lies of fixed alkalis, without disengaging the smell of ammonia. Their size varies from the bigness of a pea to that of a duck's egg, &c. and their figure is roundish, spheroid, compressed, oval, oblong, &c. the surface polished like marble, but frequently rough and watry; of a crimson light red, yellowish, light brown colour, but never white, gray, or black; their strata differ in num- crystals of phosphat of ammoniacal mag-

these stones is from 1,276, to 1,786, but generally more than 1,500. The urinary concretions in the kidneys are mostly of

this species.

2. The second species is composed of lithate of ammonia, and differs from the former by disengaging aminonia on their being dissolved in the lies of fixed alkalis. Concretions of this kind are generally small, of a pale or gray colour, and consist of fine strata, easily separable from each other; they mostly contain a nucleus, which is easily separated from the strata that cover it. Their figure is generally oblong, compressed like almonds, and of a smooth surface, which is frequently crystalline. Their specific weight varies from 1,225 to 1,720. They are entirely soluble in water, particularly when previously pulverized. All acids, principally the muriatic acid, deprive them of the ammonia, leaving the pure lithic acid behind. They are frequently found covered with a thin stratum of lithic acid. Amongst 600 calculi there were but few of this kind.

3. The third species, consisting of oxalat of lime, are easily to be distinguished by the protuberances and inequality of their surface, whence they have got the appella-tion of mulberry-like stones; by their hardness, gray colour, solid texture, their polish like ivory, in the inside, and their particular smell on being sawed, which resembles that of semen. A peculiar characteristic, which distinguishes them from all others, consists in their leaving lime after the calciantion, in their being with difficulty soluble in acids and not soluble in alkalis, and, at last, in their being only decomposed by the lees of carbonats of alkali. They weigh from 1,428 to 1,976, and their size varies from that of a calculus renalis to the bigness of an egg, or more; their figure is generally spherical or spheroid They often make the nucleus of other stones, in which case they belong to another species. In 300 stones they bore the proportion of one-fourth or one-fifth.

4. Stones of this species contain lithic acid and phosphat of earth, but in a separate state. Their surface is white, cretaceous, brittle, and half transparent, as it either consists of phosphat of lime, or of phosphat of ammoniacal magnesia, the kernel being formed by lithic acid; thus both constituents are exactly separate from each other. They were found in the proportion of one-twelfth amongst the stones that were examined, and they grow bigger than any of the rest, as they appear from she size of an egg to that of the whole bladder, even when extended. They generally have an oval form, often pointed at one end, of a smooth surface, which, however, is frequently covered with nesia. Sometimes the lithic acid in the middle is alternately covered with phosphat of lime, and phosphat of ammoniacal magnesia. The specific weight of these stones

is extremely variable.

5. The fifth species of calculi contains, likewise, lithic acid and phosphats of earth, but intimately mixed with each other. Of these stones a great many varieties are observed, depending on the proportionable quantity of their constituent particles, as well as on the strata in which they lie above one another. The chief constituents, the phosphats of earths, are separated in different strata, but sometimes so intimately mixed with each other, that it is impossible to distinguish them with the eye; and the analysis could only shew their difference. From this circumstance arise the variety in the colour, figure, and number of the strata. The colour, however, is generally gray, but frequently variegated like marble, sometimes like soap. Their figure is irregular, oval, or globular, and the surface mostly brittle, cretaceous, or whitish, as to make us believe that they only consist of phosphat of lime. The polyedrous stones generally belong to this species, when they have the appearance of being worn away by rubbing. They make about one fifth of the stones that were examined. Their specific weight varies extremely, the least being 1,213, the greatest 1,739.

6. This species is constituted by lithat of ammonia and phosphat of earth, i. e. of lime and ammoniacal magnesia; and resembles in its external appearances the fourth species. One of the constituents, generally the lithat of ammonia, makes the nucleus, while a mixture of the two others, but rarely one by itself, forms the crust. Sometimes, however, the nucleus contains also the phosphats, and the crust a little lithat of ammonia, which, even in some varieties, is mixed with pure lithic The strata in stones of this kind are more easily separable, and always smaller than those of the fourth species. Their specific weight is 1,312 to 1,761; and they are more rarely met with than most of the rest. Amongst 600 there were only twenty

of this kind,

7. Stones of the seventh species consist likewise of lithat of animonia and phosphat of earths, but intimately mixed with each other. They are of a paler colour, much lighter than the first species, and disengage a great deal of aminonia on their being treated with kali. We found them only in the proportion of one-fortieth amongst the stones which we have analysed. They never grow so large as the two former.

8. The constituent particles of the eighth species are phosphat of lime and phosphat of ammoniacal magnesia. The pure white colour, the friability, their being insoluble in alkalis, and their easy solubility even in

weak acids, constitute the chief characteristics of this sort of stones, of which about 60 were found amongst 600: sometimes they are of an enormous size, of irregular form, rarely round, but frequently of an uneven surface, and resembling an incrustation. Their texture is formed of white brittle strata, sometimes interwoven with solid half-transparent crystals of ammoniacal magnesia. The crusts formed on foreign bodies that happened to penetrate into the bladder, belong to this species; the specific weight of which is 1,138 to 1,473.

9. This species of calculi contains oxalat of lime, but externally uric acid, in more or less quantity, and are only to be distinguished by the nucleus from the first species. The proportion of both constituents, and the specific weight, vary extremely, the latter being 1,341 to 1,754. Sometimes the nucleus, consisting of oxalat of lime, is only covered on one side with uric acid, and discernible on the other by protuberances with which the surface is variegated; which variety, however, seldom occurs.

10. Stones of this species have, in their centre, oxalat of lime, surrounded by phosphat of earths; the kernel is gray, or brown, and radiant-like, the crust white and cretaceous; their size and figure differ extremely, and their specific weight is from 1,168 to 1,752. They amount to one-fifth of the 600 stones that were examined.

11. This species contains stones composed of three or four calculous substances, namely, of oxalat of kali, phosphat of earths, and of uric acid, either pure or combined with ammonia. They rarely occur; and amongst 600 stones only ten or twelve were observed. They often consist of three distinct strata, viz. in the interior, of oxalat of lime; in the middle of lithat of ammonia; and the exterior, of phosphats of earths, which are frequently mixed with uric acid or lithat of ammonia, all which are distinguished on their being sawed through. This, species comprehends three varieties; the first of which consists of oxalat of lime, uric acid, and phosphats of earths; the second contains lithat of ammonia, combined with pure uric acid, and the two other constituents; the third has, besides these two substances, free uric acid and lithat of ammonia, mixed with the phosphats of earths. We forbear to mention other varieties of this species, as being less remarkable and instructive.

12. The last species of calculi is of a very complicated composition. The siliccous earth acems to have taken the place of the oxalat of lime; it is mixed with uric acid and lithat of ammonia, and covered by phosphats of earths. Stones of this kind are the rarest of all, and there were only

two amongst 600.

The Causes of the Generation of Urinary Calculi.

To inquire into the causes by which

which urinary concretions are produced, is both interesting and useful, however attended with the greatest difficulties. The writings of medical authors are full of conjectures and hypotheses with regard to this subject, on which nothing could be ascertained before we had acquired an aecurate knowledge of the nature of urinary conerctions. It is owing to this circumstance that the most enlightened physicians aequiesced in ascribing the immediate cause of them to a superabundance of terreous matter in the urine; and Boerhaave, as well as, particularly, Van Swieten, imagined that the urine of all men contained calculous matter in the natural state, and that, for the generation of stones, a nucleus was only required, to attract it. That this may be the case, in some instances, is proved by frequent experience; but stones produced by foreign bodies, that have accidentally got into the urethra or bladder, are always white and eomposed of phosphat of earths, and seldom or never covered with lithie acid, a substance which is observed to form the stones that most frequently occur; but even in these the nucleus consists of a substance formed in the body itself, as a partiele descended from the kidneys, &c. which must, therefore, have necessarily originated in a peculiar internal cause. A superabundance of uric acid in stony patients, and its more eopious generation than in a sound state, though it seems to be one of the principal and most certain causes, is by no means satisfactory, as it only explains the precipitation of stony matter from the urine, but not why it unites in strata. A coagulating substance is required for separating, attracting, and, as it were, agglutinating the condensible partieles that are precipitated. This substance is undoubtedly the animal matter which we have constantly found in all calculous masses, and which seems to constitute the basis of stones, like the membranous gelatina that of bones. It is known that the urine of calculous patients is generally muddy, duetile, in threads, slimy, and as if mixed with albumen, which quality it obtains at the moment when the ammonia is disengaged, or on the addition of kali that separates it from the acid in which it was dissolved; and in all eases of superabundance of lithic acid the urine contains a great quantity of that animal matter, which promotes the precipitation of it, and attracts and unites the partieles thus separated. Hence it appears, that every thing capable of increasing the quantity of that pituitous gluten in the urine, may be eonsidered as the remote cause of the formation of ealeuli. And the old ideas on pituitous temperaments, or superahundant pituita,&e.whieli were thought to dispose people to a calculus, seems to be connected with the late discoveries on the nature of urinary stones. Though the animal matter appears

to be different in different calculi, yet it is eertain, that every calculous substance contains an animal gluten, from which its concrete and solid state arises; whence we may fairly state the superabundance of that substance as the chief and principal cause of the formation of calculi.

There are, however, other eauses which seem to have a particular influence on the nature of urmary stones, and the strata in which they are formed; but it is extremely difficult to penetrate and to explain them. We are, for instance, entirely ignorant of the manner in which urmary stones are formed from the oxalat of lime; though, from their occurring more frequently in children than in adults, we might be en-titled to ascribe them to a disposition to acor, a cause considered by Boerhaave as the general source of a great number of diseases incident to the infantile age. This opinion seems to be proved by the ideas of Bonhomine, physician at Avignon, on the oxalic or saceharie acid, as the cause of mollities ossium in the rickets; by this acid being discovered in a species of saliva by Brugnatelli; and, lastly, by an observation of Turgais, who found this acid in the urine of a child diseased with worms. We but rarely observe saceharic acid in the human body, which appears to be mostly adventitious, and by which the animal matter is rendered coagulable, and deposited, or precipitated, with the oxalat of lime; or the oxalic acid decomposes the phosphat of lime, and forms an insoluble combination, incapable of being any longer kept dissolved in the urme. It is, however, extremely difficult to determine bow far the constitution of the body is connected with that particular disposition in the nrine, of precipitating sometimes phosphat of lime mixed with oxalat of lime, sometimes phosphat of ammoniacal magnesia, either by itself or mixed with lithie acid, &c. &c. Who can explain the reason why, of 600 stones, there were only two in which siliceous earth could be traced? Still more difficult is it to explain the eauses why the above substances precipitate either at once or in different strata; but it may suffice to have shewn how many observations and experiments are required, and what accurate attention and perseverance are necessary, in order to throw light on so difficult a subject.

CALCULUS BILIARIS. See Gall-stone.

CALDARIUM. (From caleo, to make hot.) A vessel in the baths of the ancients, to hold hot water.

CALEFACIENTS. (Calefacientia, sc. medicamenta: from calidus, warm, and facia, to make. (Medicines, or other substances, which exeite a degree of warmth in the parts to which they are applied; as piper, spiritus vini, &c. They belong to the class of stimulants.

CALENDULA. (Quod singulis calendie,

i. e. mensibus, floreseat; so called because it flowers every month.) Marigold.

1. The name of a genus of plants in the Linnæan system. Class, Syngenesia. Or-

der, Polygamia necessaria.

2. The pharmacopoial name of the Calendula sativa. Chrysanthemum. Sponsa solis. Caltha vulgaris. Single marigold. Garden marigold. The flowers and leaves of this plant, Calendula officinulis of Linnaus:—seminibus cymbiformibus, muricatis, incurvatis omnibus, have been exhibited medicinally: the former, as aperients in uterine obstructions and icteric disorders, and as diaphoretics in exanthematous fevers; the latter, as gentle aperients, and to promote the secretions in general.

CALENDULA ALPINA. The Arnica montana

of Linnaus. See Arnica.

CALENDULA ARVENSIS. The wild marigold. The Caltha arvensis of Linnæus. It is sometimes preferred to the former. Its juice is given, from one to four ounces, in jaundice and cachexia; and the leaves are commended as a salad for children afflicted with scrophulous tumours.

CALENDULA OFFICINALIS. The systematic name of the single marigold plant. See

Calendula.

CALENDULA PALUSTRIS. The Caltha palustris of Linnæus. Common single marsh marigold. It is said to be caustic and deleterious: but this may be questioned.

CALENTURE. A febrile delirium, said to be peculiar to sailors, wherein they imagine the sea to be green fields, and will throw themselves into it if not restrained. Bonetus gives an account of it; also Dr. Oliver and Dr. Stubbs. It is probably a species of phrenitis.

CALESIUM. (Indian.) A tree which grows in Malabar, whose bark, made into an ointment with butter, cures coavulsions from wounds, and heals ulcers. The juice of the bark cures the aphthæ, and, taken

inwardly, the dysentery. Ray.

CALL. (Arab.) The same as kali.
CALIGHAPA. The spina alba, or white-

CALIDUM. In medical language, it is commonly used with the adjective animale, or innatum, for animal heat, or the vis vita.

Caliera. (From καλιπς, a nest, which it somewhat resembles.) Calliette. A fungus

growing on the juniper-tree.

CALIGO. A disease of the cye, known by diminished or destroyed sight; and by the interposition of a dark body between the object and the retina. It is arranged by Cullen in the class locales, and order dysæsthesiæ. The species of caligo are distinguished according to the situation of the interposed body: thus caligo lentis, caligo corneæ, caligo pupillæ, caligo lumorum, and caligo palpebrarum.

CALIGO LENTIS. Glaucoma Woulhousi.

The true cataract. See Cuturact.

CALIGO CORNER. An opacity of the cornea.

Califo Pupillæ. Synchysis. Amyosis. Blindness from obstruction in the pupil, See Caligo.

Caligo humorum. Glaucoma Vogelii. Blindness from a fault in the humours of

the eye. See Caligo.

Caligo Palpebrarum. Blindness from a disorder in the eyelids. See Caligo.

CALIHACHA. The cassia-lignea, or cassiatree of Malabat.

CALIMIA. The lapis calaminaris.

CALIX. (Calix, icis, m.; from  $\varkappa \omega \lambda \upsilon \pi^{\gamma} \omega$ , to cover.) Calyx.

1. The term calix is given to the membrane which covers the papillæ in the

pelvis of the human kidney.

2. The name of the case, or sheath, in which the flower of plants is concealed before it expands.

CALLEUM. (From καλλυνω, to adorn.) Calleon. The gills of a cock, which, Galen says, is food not to be praised or condemned.

Callena. A kind of salt-petre. Call. Nodes in the gout. Galen.

CALLIA. (From READS, beautiful.) A name of the chamomile.

Calliblephara. (From καλος, good, and βλεφαξον, the eyelid.) Medicines, or compositions, appropriated to the eyelids.

CALLICREAS. (From \*\*2005, good, and \*\*xgett, meat; so named from its delicacy as food.) The pancreas, or sweetbread.

Calligonum. (From \*\*\*\rightarrows, beautiful, and \( \gamma \) or joint; so named from its being handsomely jointed, like a cane.) The polygonum, or knot-grass.

Calliomarchus. The Gaulish name, in

Marcellus Empiricus, for tussilago, or

colt's foot.

CALLION. A kind of night-shade.

Callistruthia. (From καλος, good, and 5guθος, a sparrow: because it was said to fatten sparrows.) A fig mentioned by

Pliny, of a good taste.

CALLITRIUM. (From \*\*maxhos\*, beauty, and 3gg, hair; so named because it has the appearance of long, beautiful hair, or, according to Littleton, because it nourishes the hair, and makes it beautiful.) The herb maidenhair.

CALLONE. (From \*\*Acce, fair.) Hippocrates uses this word, to signify that decency and gravity of character and deportment which it is necessary that all medical men should be possessed of.

CALLOSITAS. Callosity, or preterna-

tural hardness.

CALLOUS. A surgical term, signifying hardened or indurated; thus the callous edges of ulcers.

CALLUS. Callum.

1. The bony matter deposited between the divided ends of broken bones, about the fourteenth day after the fracture.

2. A preternatural hardness, or indura-

tion, of any fleshy parts

CALOCATANUS. (From READS, heautiful, and READSON, a cup; so called from the beauty of its flower and shape.) The papaver rheas, or wild poppy.

CALOMELANOS TURQUETI. So Riverius calls a purgative medicine, composed of

calomel and scammony.

CALOMELAS. (From καλος, good, and μελας, black; from its virtues and colour. The preparation called Æthiop's mineral, or hydrargyrus cum sulphure, was formerly and properly so named. But calomel now means a white preparation of sublimed mercury.) See Submurias hydrargyru.

CALORIC. (Caloricum; from calor,

heat.) Heat. Igneous fluid.

Heat and cold are perceptions of which we acquire the ideas from the senses; they indicate only a certain state in which we find ourselves independent of any exterior object. But as these sensations are for the most part produced by bodies around us, we consider them as causes, and judging by appearances, we apply the terms hot, or cold, to the substances themselves; calling those bodies hot, which produce in us the sensation of heat, and those cold, which communicate the contrary sensation.

This ambiguity, though of little consequence in the common affairs of human life, has led unavoidably to confusion and perplexity in philosophical discussions. It was to prevent this, that the framers of the new nomenclature adopted the word caloric, which denotes that which produces

the sensation of heat.

Theories of Heat.

Two opinions have long divided the philosophical world concerning the nature of heat.

1. The one is: that the cause which produces the sensation of heat, is a real, or distinct substance, universally pervading nature, penetrating the particles or pores of all bodies, with more or less facility, and in different quantities.

This substance, if applied to our system in a greater proportion than it already contains, warms it, as we call it, or produces the sensation of heat; and hence it

lias been called caloric or calorific.

2. The other theory concerning heat is; that the cause which produces that sensation, is not a separate or self-existing substance; but that it is merely like gravity, a property of matter; and that it consists in a specific or peculiar motion, or vibration of the particles of bodies.

The arguments in favour of the first theory have been principally deduced from the evolution, and absorption of heat

during chemical combinations; those of the latter, are chiefly founded on the production of heat by friction. For it has been observed, that whatever is capable of producing motion in the particles of any mass of matter, excites heat. Count Rumford and Professor Davy have paid uncommon attention to this fact, and proved, that heat continues to be evolved from a body subjected to friction, so long as it is applied, and the texture or form of the body be not altered.

All the effects of heat, according to this theory, depend therefore entirely on the vibratory motion of the particles of bodies. According as this is more or less intense, a higher or lower temperature is produced; and as it predominates over—is nearly equal—or inferior to the attraction of cohesion, bodies exist in the gaseous, fluid,

or solid state.

Different bodies are susceptible of it in different degrees, and receive and communicate it with different celerity. From the generation, communication and abstraction of this repulsive motion, under these laws, all the phenomena ascribed to heat are explicable.

Each of these theories has been supported by the most able philosophers, and given occasion to the most important disputes in which chemists have been engaged; and have contributed in a very particular manner to the advancement of the science. The obscurity of the subject, however, is such, that both parties have been able to advance the most plausible arguments.

Setting aside all enquiries concerning the merits of these different doctrines, we shall confine ourselves to the general effects, which heat produces on different bodies. For the phenomena which heat presents, and their relation to each other, may be investigated with sufficient precision, though the materiality, or immateriality or it, may remain unknown to us.

Nature of Heat.

Those who consider heat as matter, assert that caloric exists in two states, namely, in combination, and in a radiant state,

or at liberty.

In the first state it is not sensible to our organs, nor indicated by the thermometer: it forms a constituent part of the body; but it may be brought back to the state of radiant or sensible heat. In this state it affects animals with the sensation of heat. It therefore has been called sensible or free heat, or fire; and is synonymous with uncombined caloric, thermometrical caloric, caloric of temperature, interposed caloric, &c. expressions now pretty generally superseded.

From the diversity of opinions among chemists respecting the nature of caloric, several other expressions have been intro-

148 CALORIC.

duced, which it is proper to notice. For instance, by specific heat is understood, the relative quantities of caloric contained in equal weights of different bodies at the same temperature. Latent heat is the expression used to denote that quantity of caloric which a body absorbs when changing in its form. It is, however, more properly called caloric of fluidity. The disposition, or property, by which different bodies contain certain quantities of caloric, at any temperature, is termed their capacity for heat. By the expression of absolute heat, is understood the whole quantity of caloric which any body contains.

Methods of exciting and collecting Heat.
Of the different methods of exciting heat,
the following are the most usual:

1. Production of Heat by Percussion or Collision.

This method of producing heat is the simplest, and therefore it is generally made use of in the common purposes of life for

obtaining fire.

When a piece of hardened steel is struck with a flint, some particles of the metal are scraped away from the mass, and so violent is the heat which follows the stroke, that it melts and vitrifies them. If the fragments of steel are caught upon paper, and viewed with a microscope, most of them will be found perfect spherules, and very highly polished. Their sphericity demonstrates that they have been in a fluid state, and the polish upon their surface, shews them to be vitrified.

No heat, however, has been observed to follow the percussion of liquids, nor of the softer kind of bodies which yield to a

slight impulse.

2. Production of Heat by Friction.

Heat may likewise be excited by mere friction. This practice is still retained in some parts of the world. The natives of New Holland are said to produce fire in this manner, with great facility, and spread it in a wonderful manner. For that purpose, they take two pieces of dry wood; one is a stick, about eight or nine inches long, and the other piece is flat; the stick they point into an obtuse point at one end, and pressing it upon the other piece, they turn it very nimbly, by holding it between both hands, as we do a chocolate-mill, often shifting their hands up, and then moving down upon it, in order to increase the pressure as much as possible. By this method, they get fire in a few minutes, and from the smallest spark they increase it with great speed and dexterity.

If the irons at the axis of a coach-wheel are applied to each other, without the interposition of some unctuous matter to keep them from immediate contact, they will become so hot when the carriage runs swiftly along, as to set the wood on fire; and the fore-wheels, being smallest, and

making most revolutions in a given time, will be most in danger.

The same will happen to mill-work, or

to any other machinery.

It is no uncommon practice in this country, for blacksmiths to use a plate of iron as an extemporaneous substitute for a tinderbox; for it may be hammered on an anvil till it becomes red-hot, and will fire a brimstone match. A strong man, who strikes quick, and keeps turning the iron so that both sides may be equally exposed to the force of the hammer, will perform this in less time than would be expected.

If, in the coldest season, one dense iron plate be laid on another, and pressed to gether by a weight, and then rubbed upon each other by reciprocal motions, they will gradually grow so hot as, in a short time, to emit sparks, and at last become ig-

nited.

It is not necessary that the substances should be very hard; a cord rubbed backwards and forwards swiftly against a post

or a tree will take fire.

Count Rumford and Professor Pictet have made some very ingenious and valuable experiments concerning the heat evolved by friction.

3. Production of Heat by Chemical Action.

To this belongs the heat produced by combustion. There are, besides this, many chemical processes wherein rapid chemical action takes place, accompanied with a developement of heat, or fire and flame.

4. Solar Heat.

It is well known that the solar rays, when collected by a mirror, or lens, into a focus, produce the most astonishing effects.

Dr. Herschell has discovered that there are rays emitted from the sun, which have not the power of illuminating or producing vision; and that these are the rays which produce the heat of the solar light.

Consequently, heat is emitted from the sun in rays, but these rays are not the same

with the rays of light.

5. Production of Heat by the Electric Spark, and by Galvanism.

The effects of electricity are too well known in this point of view, to need any description

description.

Galvanism has of late become a powerful instrument for the purpose of exciting heat. Not only easily inflammable substances, such as phosphorus, sulphur, &c. have been fired, but likewise gold, silver, copper, tin, and the rest of the metals, have been burnt by means of galvanism.

General Effects of Heat.

Expansive property of Heat.—This is the first and most obvious effect which heat produces on bodies. Experience has taught us that, at all times, when bodies become loot, they increase in bulk. The bodies experience a dilatation which is greater in proportion to the accumulation of caloric,

or, in other words, to the intensity of the heat. This is a general law, which holds good as long as the bodies have suffered no change either in their combination or in the quantity of their chemical principles.

This power which heat possesses, consists, therefore, in a constant tendency to separate the particles of bodies. Hence philosophers consider heat as the repulsive power which acts upon all bodies whatever, and which is in constant opposition to the power of attraction.

The phenomena which result from these mutual actions, scem, as it were, the secret

mutual actions, seem, as it were, the secret springs of nature. Heat, however, does not expand all bodies equally, and we are still ignorant of the laws which it follows.

1. Expansion of Fluid Bodies by Heat.

Take a glass globe, with a long slender neck (called a bolt head); fill it up to the neck with water, ardent spirit, or any other fluid which may be coloured with red or black ink, in order to be more visible, and then immerse the globe of the instrument in a vessel of hot water; the included fluid will instantly begin to mount into the neck. If it be taken out of the water and brought near the fire, it will ascend more and more, in proportion as it becomes heated; but upon removing it from the source of heat, it will sink again: a clear proof that caloric dilates it, so as to make it occupy more space when hot than when cold. These experiments may, therefore, serve as a demonstration that heat expands fluid bodies.

It appears that liquids of the least density expand most, with the same temperature. Thus hydrogen gas dilates more with the same degree of heat than atmospheric air; atmospheric air more than sulphuric ether; ether more than ardent spirit; ardent spirit more than oil; oil more than water; water more than acids, and acids more than mercury. But if we compare the periods of time necessary for each fluid to acquire the maximum of rarefaction it is susceptible of, there is no law

to guide us yet known.

2. Expansion of Aëriform Bodies by Heat. Take a bladder partly filled with air, take a bladder partly filled with air, to prevent the inclosed air from escaping, and let it be held near a fire. The air will soon begin to occupy more space, and the bladder will become gradually distended; on continuing the expansion of the air, by increasing the heat, the bladder will burst with a lond report.

3. Expansion of Solid Bodies by Heat. If we take a bar of iron, six inches long, and put it into a fire till it becomes redulot; and then measure it in this state accurately, it will be found 1-20th of an inch longer than it was before; that is, about 120th part of the whole. That the metal is proportionally expanded in

breadth, will be seen by trying to pass it through an aperture which it fitted exactly when cold, but which will not admit it when red hot. The bar is, therefore, increased in length and diameter.

To discover the minutest changes of expansion by heat, and the relative proportions thereof, instruments have been contrived, called *Pyrometers*, the sensibility of which is so delicate as to shew the expansion from 1-50000 to 1-100000 of an inch.

It is owing to this expansion of metals, that the motion of time-pieces is rendered crroneous; but the ingenuity of artists has discovered methods of obviating this inaccuracy, by employing the greater expansion of one metal to counteract the expansion of another; this is effected in what is called the grid-iron pendulum. Upon the same principle a particular construction of watches has been contrived.

The expansion of metals is likewise one

The expansion of metals is likewise one of the principal reasons that clocks and watches vary in winter and summer, when worn in the pocket, or exposed to the open air, or when carried into a hotter or a colder climate. For the number of the vibrations of the pendulum are always in the sub-duplicate ratio of its length, and as the length is changed by heat and cold, the times of vibration will be also changed. The quantity of alteration, when considered in a single vibration, is exceedingly small, but when they are often repeated, it will be very sensible. An alteration of one-thousandth part in the time of a single vibration of a pendulum which beats seconds, will make a change of eighty-six whole vibrations in twenty-four hours.

As different metals expand differently with the same degree of heat; such musical instruments, therefore, whose parts are to maintain a constant true proportion, should never be strung with different metals. It is on this account that harpsichords, &c. are out of tune by a change of tempe-

Bodies which are brittle, or which want flexibility, crack or break, if suddenly heated or cooled. This likewise depends upon the expansive force of heat, stretching the surface to which it is applied, while the other parts, not being equally heated, do not expand in the same ratio, and are therefore torn asunder or break. Hence thin vessels stand heat better than thick

ones.

Measurement of Heat.

Upon the expansive property of heat, which we have considered before, is founded its artificial measurement. Various means have been therefore employed to assist the imperfection of our sensations in judging of the different degrees of heat, for our feelings unaided afford but very inaccurate information concerning this matter; they indicate the presence of leat, only when the

CALORIC.

bodies presented to them are hoiter than the actual temperature of our organs of feeling. When those bodies are precisely of the same temperature with our body, which we make the standard of comparison, we then are not sensible of the presence of heat in them. When their temperature is less hot than that of our bodies, their contact gives us what is called the sensation of cold.

The effects of heat upon material bodies in general, which are easily visible to us, afford more precise and determinate indications of the intensity, than can be derived from our feelings alone. The ingenuity of the philosopher and artist has therefore furnished us with instruments for measuring the relative heat or temperature of bodies. These instruments are called Thermometers and Pyrometers. By these, all degrees are measurable, from the slightest, to that of the most intense heat.

1. Nature of the Thermometer.

A thermometer is a hollow tube of glass, hermetically sealed, and blown at one end in the shape of a hollow globe. The bulb and part of the tube are filled with mercury, which is the only fluid which expands equally. When we immerse the bulb of the thermometer in a hot body, the mercury expands, and of course rises in the tube; but when we plunge it into a cold body, the mercury contracts, and of course falls in the tube.

The rising of the mercury indicates, therefore, an increase of heat; its falling, a diminution of it; and the quantity which it rises or falls, denotes the proportion of increase or diminution. To facilitate observation, the tube is divided into a number of equal parts, called degrees.

Further, if we plunge a thermometer ever so often into melting snow or ice, it will always stand at the same point. Hence we learn that snow or ice always begins to

melt at the same temperature.

If we plunge a thermometer repeatedly into water kept boiling, we find that the mercury rises up to a certain point. This is therefore the point at which water always boils, provided the pressure of the atmosphere be the same.

There are four different thermometers used at present in Europe, differing from each other in the number of degrees into which the space between the freezing and boiling points is divided. These are Fahrenheit's, Reaumur's, Celsius's, and Delisle's.

The thermometer uniformly used in Britain, is Fahrenheit's; in this the freezing point is fixed at 32°—the boiling point, at 212° above 0°—or the part at which both the ascending and descending series of numbers commence.

In the thermometer which was first con-

structed by Reaumur, the scale is divided into a smaller number of degrees upon the same length, and contains not more than 80° between the freezing and the boiling points. The freezing point is fixed in this thermometer precisely at 0°, the term between the ascending and the descending series of numbers 100 is the number of the degrees between the freezing and the boiling points in the scale of Celsius; which has been introduced into France, since the revolution, under the name of the Centigrade thermometer; and the freezing point is in this, as in the thermometer of Reaumur, fixed at 0°. One degree on the scale of Fahrenheit, appears, from this account. to be equal to 4.9ths of a degree on that of Reaumur, and to 59ths of a degree on that of Celsius.

The space in Delisle's thermometer between the freezing and boiling points is divided into 150°, but the graduation begins at the boiling point, and increases towards the freezing point. The boiling point is marked 0, the freezing point 150°. Hence  $180 \, \mathrm{F} := 150 \, \mathrm{D}$ , or  $6 \, \mathrm{F} := 5 \, \mathrm{D}$ . To reduce the degrees of Delisle's thermometer under the boiling point to those of Fahrenheit; we have  $F := 212 - 6.5 \, \mathrm{D}$ ; to reduce those above the boiling point  $F := 212 - 6.5 \, \mathrm{D}$ . Upon the knowledge of this proportion it is easy for the student to reduce the degrees of any of these thermometers into the degrees of any other of them.

2. Nature of the Pyrometer.

To measure those higher degrees of heat to which the thermometer cannot be applied, there have been other instruments invented by different philosophers: these are called *pyrometers*. The most celebrated instrument of this kind, and which has been adopted into general use, is that invented by the late ingenious Mr. Wedgwood.

This instrument is also sufficiently sim-It consists of two pieces of brass fixed on a plate, so as to be 6-10ths of an inch asunder at one end, and 3-10ths at the other; a scale is marked upon them, which is divided into 240 equal parts, each 1-10th of an inch; and with this his gauge, are furnished a sufficient number of pieces of baked clay, which must have been prepared in a red heat, and must be of given dimensions. These pieces of clay, thus prepared, are first to be applied cold, to the rule of the gauge, that there may no mistake take place in regard to their dimen-Then any one of them is to be exposed to the heat which is to be measured, till it shall have been completely penetrated by it. It is then removed and applied to the gauge. The difference between its former and its present dimensions, will shew how much it has shrunk; and will consequently indicate to what degree the

intensity of the heat to which it was exposed, amounted.

High temperatures can thus be ascertained with accuracy. Each degree of Wedgwood's pyrometer is equal to 130° of Fah-

Exceptions to the Expansion by Heat.

Philosophers have noticed a few exceptions to the law of heat expanding bodies. For instance; water, when cooled down to the freezing point, instead of contracting on the farther deprivation of heat, actually expands

Another seeming exception is manifested in alumine, or clay; others occur in the case of cast-iron, and various other metals. Alumine contracts on being heated, and cast-iron, bismuth, &c. when fully fused, are more dense than when solid; for, as soon as they become so, they decrease in density, they expand in the act of cooling, and hence the sharpness of figures upon iron which has been cast in moulds, com-

pared to that of other metals.

Some philosophers have persuaded themselves that these exceptions are only apparent, but not really true. They say when water freezes, it assumes a crystalline form, the crystals cross each other and cause numerous vacuities, and thus the ice occupies more space. The same is the case with fused iron, bismuth, and zinc. The contraction of clay is owing to the loss of water, of which it loses a part at every increased degree of temperature hitherto tried; there is therefore a loss of matter; and a reduction of volume must follow.

Mr. Tilloch has published a brief examination of the received doctrines respecting heat and caloric, in which these truths are more fully considered, together with many other interesting facts relative to the re-ceived notions of heat.

Equal Distribution of Heat.

If a number of bodies of different temperatures are placed in contact with each other, they will all at a certain time acquire a temperature, which is the mean temperature of the different substances; the caloric of the hottest body will diffuse itself among those which are heated in a less degree, till they have all acquired a certain temperature. Thus, if a bar of iron which has been made red-hot be kept in the open air, it does not retain the heat which it had received, but becomes gradually colder and colder, till it arrives at the temperature of the bodies in its neighbourhood. On the other hand; if we cool down the iron bar by keeping it for some time covered with snow, and then carry it into a warm room, it does not retain its low temperature, but becomes gradually notter, till it acquires the temperature of the room. It is therefore obvious, that in the one instance the temperature is lowered, and in the other it is raised.

These changes of temperature occupy a

longer or a shorter time, according to the nature of the body, but they always take place at last. This law itself is, indeed, familiar to every one: when we wish to heat a body, we carry it towards the fire; when we wish to cool it, we surround it by cold bodies.

Propagation of Heat.
We have seen, that when bodies of higher temperature than others are brought into contact with each other, the heat is propagated from the first to the second, or the colder body deprives the warmer of its excess of heat.-We shall now see that some bodies do so much more quickly than others. Through some bodies caloric passes with undiminished velocity, through

others its passage is prodigiously retarded.
This disposition of bodies of admitting, under equal circumstances, the refrigeration of a heated body within a shorter or a longer time, is called the power of conducting heat; and a body is said to be a better or worse conductor of heat, as it allows the refrigeration to go on quicker or slower. Those bodies, therefore, which possess the property of letting heat pass with facility, are called good conductors; those through which it passes with difficulty, are called bad conductors, and those through which it does not pass at all, are called non conductors: thus we say, in the common language, some bodies are warm, or capable of preserving warmth; and from this arises the great difference in the sensation excited by different bodics, when applied at the same temperature to our organs of feeling. Hence, if we immerse our hand in mercury, we feel a greater sensation of cold than when we immerse it in water, and a piece of metal appears to be much colder than a piece of wood, though their temperatures, when examined by means of

the thermometer, are precisely the same. It is probable that all solids conduct heat in some degree, though they differ very much in their conducting power. Metals are the best conductors of heat; but the conducting powers of these substances are by no means equal. Stones seem to be the next best conductors. Glass conducts heat very slowly; wood and charcoal still slower; and feathers, silk, wool, and hair, are still worse conductors than any of the substances yet mentioned.

The best conductors of electricity and galvanism are also the best conductors of

Experiment. - Take a number of straight wires, of equal diameters and lengths, but of different metals; for instance, gold, silver, copper, iron, &c.; cover each of them with a thin coat of wax, or tallow, and plunge their extremitics into water, kept boiling, or into melted lead. The melting of the coat of wax will shew that caloric is more quickly transmitted through some metals than others.

It is on this account also, that the end of a glass rod may be kept red-hot for a long time, or even melted, without any inconvenience to the hand which holds the other extremity; though a similar metallic rod, heated in the same manner, would very soon become too hot to be held.

Liquor and Aëriform Bodies convey Heat by an actual Change in the Situation of their

Particles.

Count Rumford was the first who proved that fluids in general, and aeriform bodies, convey heat on a different principle from that observed in solids. This opinion is pretty generally admitted, though various ingenious experiments have been made by different philosophiers to prove the contrary. In water, for instance, which is, in the strictest sense of the word, a perfect non-conductor of heat, the Count has proved that caloric is propagated only in consequence of the motion which is occasioned in the insulated and solitary particles of that fluid.

All fluids are considered, strictly speaking, in a similar respect as non-conductors of caloric. They can receive it, indeed, from other substances, and can give it to other substances, but no particle can either receive it from or give it to another particle. Before a fluid, therefore, can be heated or cooled, every particle must go individually to the substance from which it receives or to which it gives out caloric. Heat being, therefore, only propagated in fluids, in consequence of the internal mo-tion of their particles, which transport the heat; the more rapid these motions are, the more rapid is the communication of heat. The cause of these motions is the change in the specific gravity of the fluid, occasioned by the change of temperature, and the rapidity is in proportion to the change of the specific gravity of the liquid by any given change of temperature. The following experiment may serve to illustrate this theory.

Take a thin glass tube, eight or ten inches long, and about an inch in diameter. Pour into the bottom part, for about the depth of one inch, a little water coloured with Brazil-wood, or litmus, and then fill up the tube with common water, extremely gently, so as to keep the two stratu quite distinct from each other. Having done this, heat the bottom part of the tube over a lamp; the coloured infusion will then ascend, and gradually tinge the whole fluid; the water in the upper part of the tube may be made to boil, but the colouring matter will remain at the bottom undisturbed. The heat cannot act downwards to make it

ascend.

By thus being able to make the upper part of a fluid boil without heating the bottom part, water may be kept boiling for a considerable time in a glass tube over ice, without melting it.

Other experiments, illustrating the same principle, may be found in Count Rumford's excellent Essays, especially in Essay the 7th: 1797.

To this indefatigable philosopher we are wholly indebted for the above facts: he was the first who taught us that air and water were nearly non-conductors. The results of his experiments, which are contained in the above Essay, are highly interesting; they also shew that the conducting power of fluids is impaired by the admixture of fibrious and glutinous matter.

Count Rumford proved that ice melted more than 80 times slower, when boiling-hot water stood on its surface, than when the ice was placed to swim on the surface of the hot water. Other experiments shewed that water, only eight degrees of Fahrenheit above the freezing point, or at the temperature of forty degrees, melts as much ice, in any given time, as an equal volume of that fluid at any higher temperature, provided the water stands on the surface of the ice. Water, at the temperature of 41°, is found to melt more ice, when standing on its surface, than boiling water.

It becomes further evident, from the Count's ingenious experiments, that of the different substances used in clothing, hares' fur and eider-down are the warmest; next to these, beavers' fur, raw silk, sheep's wool, cotton wool, and lastly, lint, or the scrapings of fine linen. In fur, the air interposed among its particles is so engaged as not to be driven away by the heat communicated thereto by the animal body; not being easily displaced, it becomes a barrier to defend the animal body from the external cold. Hence it is obvious that those skins are warmest which have the finest, longest, and thickest fur; and that the furs of the beaver, otter, and other like quadrupeds, which live much in the water, and the feathers of water-fowl, are capable of confining the heat of those animals in winter, notwithstanding the coldness of the water which they frequent. Bears, and various other animals, inliabitants of cold climates, which do not often take the water, have their fur much thicker on their backs than on their bellies.

The snow which covers the surface of the earth in winter, in high latitudes, is doubtless designed as a garment to defend it against the piercing winds from the polar regions, which prevail during the cold season.

Without dwelling farther upon the philosophy of this truth, we must briefly remark that the happy application of this law, satisfactorily clucidates some of the most interesting facts of the economy of pature.

CALORIC. 153

Theory of Caloric of Fluidity, or Latent room, it will become gradually less cold,

Heat. as may be discovered by means of the

There are some bodies which, when submitted to the action of caloric, dilate to such a degree, and the power of aggregation subsisting among their particles is so much destroyed and removed to such a distance by the interposition of caloric, that they slide over each other in every direction, and therefore appear in a fluid state. This phenomenon is called fusion. Bodies thus rendered fluid by means of caloric are said to be fused, or melted; and those that are subject to it, are called fusible.

The greater number of solid bodies may, by the application of heat, be converted into fluids. Thus metals may be fused; sulphur, resin, phosphorus, may be melted; ice may be converted into water; &c.

Those bodies which cannot be rendered fluid by any degree of heat hitherto known,

are called fixed, or infusible.

If the effects of licat under certain circumstances, be carried still further than is necessary to render bodies fluid, vaporization begins; the bodies then become converted into the vaporous or guscous state. Vaporization, however does not always require a previous fusion. Some bodies are capable of being converted into the vaporous state, without previously becoming fluid, and others cannot be volatilized at any temperature hitherto known.

Fluidity is therefore by no means essential to any species of inatter, but always depends on the presence of a quantity of caloric. Solidity is the natural state of all bodies, and there can be no doubt that every fluid is capable of being rendered solid by a due reduction of temperature; and every solid may be fused by the agency of caloric, if the latter does not decompose them at a temperature inferior to that which would be necessary for their fusion.

Caloric of Fluidity.

Dr. Black was the first who proved that, whenever caloric combines with a solid body, the body becomes heated only, until it is rendered fluid: or that, whenever it has acquired the fluid state, its temperature remains stationary, though caloric is continued to be added to it. The same is the case when fluids are converted into the aëriform or vaporous state.

From these facts, the laws of latent heat have been inferred. The theory may be illustrated by means of the following ex-

periments.

If a lump of ice, at a low temperature, suppose at 22°, be brought into a warm

room, it will become gradually less cold, as may be discovered by means of the thermometer. After a very short time, it will reach the temperature of 32°, (the fireezing point); but there it stops. The ice then begins to melt; but the process goes on very slowly. During the whole of that time its temperature continues at 32°; and as it is constantly surrounded by warm air, we have reason to believe that caloric is constantly entering into it; yet it does not become hotter till it is changed into water. Ice, therefore, is converted into water by a quantity of caloric uniting with it.

It has been found by calculation, that one pound of ice in melting absorbs 140° of caloric, the temperature of the water produced still remaining at 32°.

This fact may be proved in a direct man-

Take one pound of ice, at 32 degrees reduced to a coarse powder; put it into a wooden bowl, and pour over it gradually, one pound of water, heated to 172 deg.; all the icc will become melted, and the temperature of the whole fluid, if examined by a thermometer, will be 32 deg.; 140 deg. of caloric are therefore lost, and it is this quantity which was requisite to convert the ice into water.

This caloric has been called *latent caloria*, or rather caloric of fluidity, because its presence is not measurable by the thermo-

meter.

Dr. Black has also ascertained, by experiment, that the fluidity of melted wax, tallow, spermaceti, metals, &c. is owing to the same cause; and Ladriani proved that this is the case with sulphur, alum, nitrate of potash, &c.

We consider it, therefore, as a general law, that whenever a solid is converted into a fluid, it combines with caloric, and

that is the cause of fluidity.

On the sudden transition of solids into fluids, is founded the well known

Production of Artificial Cold, by Means of Frigorific Mixtures.

A number of experiments have been lately made by different philosophers, in order to produce artificial cold. And as these methods are often employed in chymistry, with a view to expose bodies to the influence of very low temperatures, we shall enumerate the different substances which may be made use of for that purpose, and the degrees of cold which they are capable of producing. We are indebted for them to Pepys, Walker, and Lowwitz.

## A TABLE OF FREEZING MIXTURES.

Muriate of ammonia   5 parts	Mixtures.	* Thermometer Sinks
Nitrate of potash   Sulphate of soda   Sulphate of soda   2	Muriate of ammonia         -         5 pa           Nitrate of potash         -         -         5           Water         -         -         16	rts

Diluted sulphuric acid	Snow 3	From 32° to — 51°,
Diluted sulphuric acid	Diluted sulphuric acid - 1 Diluted nitric acid - 1	From — 10° to — 56°.
Snow	Diluted sulphuric acid - 1	From 20° to — 60°.
Snow	Snow 1	Profit of to = 60°.
Snow	Snow 1	From $-40^{\circ}$ to $-73^{\circ}$ .
Water 1  Nitrate of ammonia Carbonate of soda - 1 Water 1  Suphate of soda - 6 parts Muriate of potash - 2 Diluted nitric acid - 4  Phosphate of soda - 6 parts Nitrate of ammonia Diluted nitric acid - 4  Phosphate of soda - 9 parts  New 5004 100		From — 68° to — 91°.
Carbonate of soda - 1 Water 1  Suphate of soda - 6 parts Muriate of ammonia - 4 Nitrate of potash - 2 Diluted nitric acid - 4  Sulphate of soda - 6 parts Nitrate of ammonia - 5 Diluted nitric acid - 4  Phosphate of soda - 9 parts  From 50° to 3°.  From 50° to 10°.  From 50° to 10°.	Water 1	From 50° to 4 .
Muriate of ammonia - 4 Nitrate of potash - 2 Diluted nitric acid - 4  Sulphate of soda - 6 parts Nitrate of ammonia - 5 Diluted nitric acid - 4  Phosphate of soda - 9 parts  New 5004 100.	Carbonate of soda 1 Water 1	From 50° to 3°.
Nitrate of ammonia - 5 From 50° to 14°.  Diluted nitric acid - 4  Phosphate of soda 9 parts  Diluted nitric acid - 4	Muriate of ammonia - 4 Nitrate of potash - 2 Diluted nitric acid - 4	From 50° to 10°.
	Nitrate of ammonia - 5 Diluted nitric acid - 4	From 50° to 14°.
Different intric acid 4	Diluted nitric acid 4	From 50° to 12°.
Phosphate of soda - 9 parts Nitrate of ammonia - 6 Diluted nitric acid - 4  From 50° to 21°.	Nitrate of ammonia 6 Diluted nitric acid 4	From 50° to 21°.
Sulphate of soda 5 parts  Diluted sulphuric acid - 4  From 50° to 3°.	Sulphate of soda - 5 Diluted sulphuric acid - 4	parts From 50° to 3°.

CALORIC. 155

Management of the preceding Mixtures for producing Cold.

To produce the effects before stated, the salts must be reduced to powder, and contain their full quantity of water of crystallization. The vessel in which the freezing mixture is made should be very thin, and just large enough to hold it, and the materials should be mixed together as expeditiously as possible, taking care to stir the mixture at the same time with a rod of glass or wood.

In order to obtain the full effect, the materials ought to be first cooled to the temperature marked in the table, by introducing them into some of the other frigorific mixtures, and then mingting them together in a similar mixture. If, for instance, we wish to produce =- 46°, the snow and diluted nitric acid ought to be cooled down to 0°, by putting the vessel which contains each of them into the fifth freezing mixture in the above table, before they are mingled together. If a more intense cold be required, the materials to produce it are to be brought to the proper temperature by being previously placed in the second freezing mixture.

This process is to be continued till the required degree of cold has been pro-

cured.

Conversion of Solids and Fluids into the Aër form or Gaseous State.

We have seen before, that, in order to reader solids fluid, a certain quantity of caloric is necessary, which combines with the body, and therefore cannot be measured by the thermometer; we shall now endeavour to prove, that the same holds good in respect to the conversion of solids or fluids into the vaporous or gaseous state.

Take a small quantity of carbonate of ammonia, introduce it into a retort, the neck of which is directed under a cylinder filled with mercury and inverted in a basin of the same fluid. On applying heat to the body of the retort, the carbonate of ammonia will be volatilized, it will expel the mercury out of the cylinder, and become an invisible gas, and would remain so, if its temperature was not lowered.

The same is the case with benzoic acid, camphire, and various other substances.

All fluids may by the application of heat be converted into an aëriform elastic state.

When we consider water in a boiling state, we find that this fluid, when examined by the thermometer, is not hotter, after boiling several hours, than when it began to boil, though to maintain it boiling, a brisk fire must necessarily be kept up. What then, we may ask, becomes of the wasted caloric? It is not perceptible in the water, nor is it manifested by the steam; for the steam, if not compressed,

upon examination is found not to be hotter than boiling water. The caloric is therefore absorbed by the steam, and although what is so absorbed is absolutely necessary for the conversion of water into the form of steam, it does not increase its temperature, and is therfore not appreciable by the thernometer.

This conclusion is further strengthened by the heat given out by steam on its being condensed by cold. This is particularly manifested in the condensation of this fluid in the process of distilling, where, upon examining the refrigeratory, it will be found that a much greater quantity of caloric is communicated to it, than could possibly have been transmitted by the caloric which was sensibly acting before the condensation. This may be easily ascertained by observing the quantity of caloric communicated to the water in the refrigeratory of a still, by any given quantity of liquid that passes over.

1. The boiling points of different fluids are influenced by atmospheric pressure.

The boiling point, or the conversion of fluids into gases, always takes p.acc at certain temperatures, which is different in different fluids, provided the pressure of the atmosphere be the same.

Put any quantity of sulphuric ether into a Florence flask, suspend a thermometer in it, and hold the flask over an Argand's lamp, the ether will immediately begin to boil, and the thermometer will indicate 98°, if the ether has been highly rectified.

If highly rectified ardent spirit is heated in a similar manner, the thermometer will rise to 176°, and there remain stationary.

If water is substituted, it will rise to 212°.

If strong nitrous acid of commerce be made use of, it will be found to boil at 248°;—sulphuric acid at 546°;—and mercury and linsecd-oil at 600°, &c.

2. The boiling point of fluids is retarded

by pressure.

Mr. Watt heated water under a strong pressure to 400°. Yet still, when the pressure was removed, only part of the water was converted into vapour, and the temperature of this vapour, as well as that of the remaining fluid, was no more than 212°. There was therefore 188° of caloric suddenly lost. This caloric was carried off by the steam. Now as only about one-fifth of the water was converted into steam, that steam must contain not only its own 1880. but also the 188° lost by each of the other four parts; that is to say, it must contain 188 x 5, or about 940°. Steam, therefore, is water combined with at least 940° of caloric, the presence of which is not indicated by the thermometer.

156 CALORIC.

3. When pressure is removed from the surface of bodies, their conversion into the gaseous state is greatly facilitated, or their boiling point is lowered.

In proof of this the following experiments

may serve:

Let a small bottle be filled with highly rectified sulphuric ether, and a piece of wetted bladder be tied over its orifice around its neck. Transfer it under the receiver of an air-pump, and take away the super-incumbent pressure of the air in the receiver. When the exhaustion is complete, pierce the bladder by means of a pointed sinding wire, passing through a coliar of leather which covers the upper opening of the receiver. Having done this, the ether will instantly begin to boil, and become converted into an invisible gaseous fluid.

Take a small retort or Florence flask, fill it one half, or less, with water, and make it boil over a lamp; when kept briskly boiling, for about five minutes, cork the mouth of the retort as expeditiously as possible, and remove it from the

lamp

The water, on being removed from the source of heat, will keep boiling for a few minutes, and when the ebullition begins to slacken, it may be renewed by dipping the

retort into cold water.

The water during boiling becomes converted into vapour; this vapour expels the air of the vessel, and occupies its place; on diminishing the heat, it condenses; when the retort is stopped, a partial vacuum is formed; the pressure becomes diminished, and a less degree of heat is sufficient to cause an ebullition.

For the same reason water may be made to boil under the exhausted receiver at 94° Fahr. or even at a much lower degree; alkohol at 56°, and ether at—20°.

On the conversion of fluids into gases is founded the following experiment, by which water is frozen by means of sulphu-

ric ether.

Take a thin glass tube, four or five inches long, and about two or three-eighths of an inch in diameter, and a two-ounce bottle furnished with a capillary tube fitted to its neck. In order to make ice, pour a little water into the tube, taking care not to wet the outside, nor to leave it moist. Having done this, let a stream of sulphuric ether fall through the capillary tube upon that part of it containing the water, which by this means will be converted into ice in a few minutes, and this it will do even near a fire, or in the midst of summer.

If the glass tube containing the water be exposed to the brisk thorough air, or free draught of an open window, a large quantity of water may be frozen in a shorter time; and if a thin spiral wire be introduced precious to the congelation of the

water, the ice will adhere to it, and may thus be drawn out conveniently.

A person might be easily frozen to death during very warm weather, by merely pouring upon his body, for some time, sulphuric ether, and keeping him exposed to a thorough draught of air.

Artificial Refrigeration.

The cooling or refrigeration of rooms in the summer season by sprinkling them with water, becomes likewise obvious on this account.

The method of making ice artificially in the East-Indies depends on the same principle. The ice-makers at Benares dig pits in large open plains, the bottom of which they strew with sugar-canes or dried stems of maize or Indian corn. Upon this bed they place a number of unglazed pans, made of so porous an earth that the water penetrates through their whole substance. These pans are filled towards evening in the winter season with water that has boiled, and left in that situation till morning, when more or less ice is found in them, according to the temperature of the air; there being more formed in dry and warm weather, than in that which is cloudy, though it may be colder to the human body.

Every thing in this process is calculated to produce cold by evaporation; the beds on which the pans are placed suffer the air to have free passage to their bottoms; and the pans, constantly oozing out water to their external surface, are cooled by the

evaporation of it.

In Spain, they use a kind of earthen jars, called buxaros, which are only half-baked, the earth of which is so porous, that the outside is kept moist by the water which filters through it, and though placed in the sun, the water in the jar becomes as cold

as ice.

It is a common practice in China to cool wine or other liquors by wrapping the bottle in a wet cloth, and hanging it up in the sun. The water in the cloth becomes converted into vapour, and thus cold is produced.

The Blacks in Senegambia have a similar method of cooling water by filling tanned leather bags with it, which they hang up in the sun; the water oozes more or less through the leather, so as to keep the outward surface wet, which by its quick and continued evaporation cools the water re-

markably.

The winds on the borders of the Persian Gulph are often so scorching, that travelers are suddenly suffocated, unless they cover their heads with a wet cloth; if this be too wet, they immediately feel an intolerable cold, which would prove fatal if the mosture was not speedily dissipated by the heat.

If a cold vessel is brought into a warm room, particularly where many people are assembled, the outside of it will soon become covered with a sort of dew.

Before some changes of weather, the stone pavements, the walls of a house, the balustrades of starcases and other solid objects, feel clammy and damp.

In frosty nights, when the air abroad is colder than the air within, the dampness of this air, for the same reason, settles on the glass panes of the windows, and is there frozen into curious and beautiful figures.

Thus fogs and dews take place, and in the higher regions clouds are formed from the condensed vapour. The still greater condensation produces mists and rain.

Capacity of Bodies for containing Heat.

The property which different bodies possess, of containing at the same temperature, and in equal quantities, either of mass or bulk, unequal quantities of heat, is called their capacity for heat. The capacities of bodies for heat are therefore considered as great or small in the ratio as their temperatures are either raised or lowered by the addition, or diminished by the deprivation

of equal quantities of heat.

In homogeneous bodies, the quantities of caloric which they contain are in the ratio of their temperature and quantity of mass; for instance, when equal quantities of water, oil, or mercury, of unequal temperatures, are mingled together, the temperature of the whole will be the arithmetical mean between the temperatures of the two quantities that had been mixed together. It is a self-evident truth that this should be the case, for the particles of different portions of the same substance being alike, their effects must be equal. For instance:

Mix a pound of water at 172°, with a pound at 32°, half the excess of heat in the hot water will quit it to go over into the colder portion; thus the hot water will be cooled 70°, and the cold will receive 70° of temperature; therefore 172—70, or 32+70—102 will give the heat of the mixture. To attain the arithmetical mean very exactly, several precautions how-

ever are necessary.

When heterogenous bodies of different temperatures are mixed together, the temperature produced is never the arithmetical mean of the two original temperatures.

In order to ascertain the comparative quantities of heat of different bodies, equal weights of them are mingled together; the experiments for this purpose being in general more easily executed than those by which they are compared from equal bulks.

Thus, if one pound of mercury heated to 110° Fahr, be added to one pound of water of 44°, the temperature of the blended fluids will not be changed to 77°, as it it would be if the surplus of heat were divided among those fluids in the

proportion of their quantities. It will be found on examination to be only 47°.

On the contrary; if the pound of mercury be heated to 44° and the water to 110°, then on stirring them together the common temperature will be 107°.

Hence if the quicksilver loses by this distribution 63° of caloric, an equal weight of water gains only 3° from this lose of 63° of heat. And on the contrary, if the water

loses 3°, the mercury gains 63°.

When, instead of comparing the quantities of caloric which equal weights of different bodies contain, we compare the quantities contained in equal volumes, we still find that the same difference takes place. Thus it is found by experiment, that the quantity of caloric necessary to raise the temperature of a given volume of water any number of degrees, is, to that necessary to raise an equal volume of mercury, the same number of degrees as 2 to 1. This is therefore the proportion between the comparative quantities of caloric which these two bodies contain, estimated by their volumes; and similar differences exist with respect to every other kind of matter.

From the nature of the experiments by which the quantities of caloric which bodies contain are ascertained, it is evident that we discover merely the *comparative*, not the *absolute* quantities. Hence water has been chosen as a standard, to which other bodies may be referred; its capacity is stated as the arbitrary term of 1000, and with this the capacities of other bodies are

compared.

It need not be told that pains have been taken to estimate on these experiments that portion of heat which diffuses itself into the air or into the vessel where the mercury and water are blended together. As however such valuations cannot be made with complete accuracy, the numbers stated above are only an approximation to truth.

Radiation of Caloric.

Caloric is thrown off or radiates from heated bodies in right lines, and moves through space with inconceivable velocity. It is retarded in its passage by atmospheric air, by colourless fluids, glass, and other transparent bodies.

If a glass mirror be placed before a fire, the mirror transmits the rays of light, but

not the rays of heat.

If a plate of glass, tale, or a glass vessel filled with water be suddenly interposed between the fire and the eye, the rays of light pass through it, but the rays of caloric are considerably retarded in its passage; for no heat is perceived until the interposed substance is saturated with heat, or has reached its maximum. It then ceases to intercept the rays of caloric, and allows

158 CALORIC.

them to pass as freely as the rays of

light.

It has been lately shewn by Dr. Herschel that the rays of caloric are refrangible, but less so than the rays of light; and the same philosopher has also proved by experiment, that it is not only the rays of caloric emitted by the sun, which are refrangible, but likewise the rays emitted by common fires, by candles, by heated iron, and even by hot water.

Whether the rays of caloric are differently refracted, in different mediums, has not yet been ascertained. We are certain, however, that they are refracted by all transparent bodies which have been employed as burning glasses.

The rays of caloric are also reflected by polished surfaces, in the same manner as

the rays of light.

This was long ago noticed by Lambert, Saussure, Sheele, Pictet, and lately by Dr.

Herschell.

Professor Pictet placed two concave metallic mirrors opposite to each other at the distance of about twelve feet. When a hot body, an iron bullet for instance, was placed in the focus of the one, and a mercurial thermometer in that of the other, a substance radiated from the bullet; it passed with incalculable velocity through the air, it was reflected from the mirrors, it became concentrated, and influenced the thermometer placed in the focus, according to the degree of its concentration.

An iron bail, two inches in diameter, heated so that it was not luminous in the dark, raised the thermometer not less than ten and a half degrees of Reaumur's scale,

in six minutes.

A lighted candle occasioned a rise in the

thermometer nearly the same.

A Florence flask, containing two ounces and three drachins of boiling water, raised Fahrenneit's thermometer three degrees. He blackened the bulb of his thermometer, and found that it was more speedily influenced by the radiation than before, and that it rose to a greater height.

M. Pictet discovered another very singulor fact; namely, the apparent radiation of cold. When, instead of a heated body, a Florence flask full of ice or snow is placed in the focus of one of the mirrors, the thermometer placed in the focus of the other immediately descends, and ascends again whenever the cold body is removed.

This phenomenon may be explained on the supporition, that from every body at eyery temperature caloric radiates, but in less quantity as the temperature is low; so that in the above experiment, the thermometer gives out more caloric by radiation, than it receives from the body in the opposite focus, and therefore its temperature is lowered. Or, as Pictet has supposed,

when a number of bodies near to each other have the same temperature, there is no radiation of caloric, because in all of them it exists in a state of equal tension; but as soon as a body at an inferior temperature is introduced, the balance of tension is broken, and caloric begins to radiate from all of them, till the temperature of that body is raised to an equality with theirs. In the above experiment, therefore, the placing the snow or ice in the focus of the inirror causes the radiation of caloric from the thermometer, and hence the diminution of temperature which it suffers.

These experiments have been lately repeated by Dr. Young and Professor Davy, at the theatre of the Royal Institution. These gentlemen inflamed phosphorus by reflected caloric; and proved that the heat thus excited was very sensible to the organs

of feeling.

It is therefore evident that caloric is thrown off from bodies in rays which are invisible, or incapable of exciting vision, but which are capable of exciting heat.

These invisible rays of caloric are propagated in right lines, with extreme velocity, and are capable of the laws of reflection and refraction.

The heating agency however is different in the different coloured rays of the prismatic spectrum. According to Dr. Herschel's experiments, it follows inversely the order of the refrangibility of the rays of light. The least refrangible possessing it

in the greatest degree.

Sir Henry Englefield has lately made a series of experiments on the same subject, from which we learn that a thermometer, having its ball blackened, rose when placed in the blue ray of the prismatic spectrum in 3' from 55° to 56°; in the green, in 3' from 45° to 58°; in the yellow, in 3' from 56° to 62°; in the full red, in 2 1-2' from 56° to 72°; in the confines of the red, in 2' from 58° to 73 10-2tn; and quite out of the visible light, in 2' from 61° to 79°.

Between each of the observations, the thermometer was placed in the shade so long, as to sink it below the heat to which it had risen in the preceding observation, of course its rise above that point could only be the effect of the ray to which it was exposed. It was continued in the focus tong after it had ceased to rise; therefore the heats given are the greatest effects of the several rays on the thermometer in each observation. A thermometer placed constantly in the shade near the apparatus, was found scarcely to vary during the experiments.

Sir Henry made other experiments with thermometers with naked balls, and with others whose balls were painted white, for which we refer the reader to the interesting paper of the Baronet, from which the above experiments are transcribed.

The coloured rays emitted from the sun and combustible bodies, since they excite heat and vision, must consist of a mixture of heat-making rays, and rays of light.

And as the rays of heat and light accompany each other when emitted from luminous bodies, the velocity with which the rays of caloric move must be equal to that of light, and hence its particles must be equally minute. They differ however in this particular, that the rays of light produce the sensation of vision, and possess certain chemical properties, whilst in those of caloric the peculiar agency of heat resides.

CALORIMETER. An instrument by which the whole quantity of absolute heat existing in a body in chemical union can be ascertained.

CALTHA. (Kaλθa, corrupted from χαλχα, yellow, from whence, says Vossius, come calthula, caldula, caledula, calendula.) Marsh marigold.

1. The name of a genus of plants in the Linnæan system. Class, Polyandria. Order,

2. The pharmacopæial name of the herb marigold, so called from its colour. Colendula arvensis.

CALTHA PALUSTRIS. The marsh marigold. The young buds of this plant make, when properly pickled, very good substitutes for capers.

CALTHA VULGARIS. See

arvensis.

CALTHULA. The caltha is so called.

CALTROPS. A name of the Trapa natans of Linnæus, whose fruit is said to be nrtritious and demulcent, and to be useful in diarrhoas from abraded bowels, and against calculus.

CALUMBA. The name now adopted by the London college of physicians for the

columbo. See Cotumbo.

CALVA. (From calvus, bald.) The scalp or upper part of the cranium or top of the head; so called because it often grows

CALVARIA. (From calvus, bald.) The upper part of the cranium which becomes soon bald. It means all above the orbits, temples, ears and ocipital eminence.

CALVITIES. (From calvus, bald.) vitium Baldness; want or loss of hair, particularly upon the sinciput.

CALX. (Kalah, to burn. Arab.)

1. Chalk. Limestone.

2. Lime. Calx viva. The London College direct it to be prepared thus: Take of limestone one pound. Break it into small pieces and heat it in a crucible in a strong fire for an hour, or until the carbonic acid is entirely driven off, so that on the addition of acetic acid, no bubbles of gas shall be extricated. Lime may be made by the same process from shells previously washed in

boiling water, and cleared from extraneous matters. Sce Line.

CALX ANTIMONII. See Oxydum antimonii. CALX CUM KALI PURO. The preparation formerly called by this name is now termed, in the London pharmacopæia, potassa cum calce.

CALX HYDRARGYRI ALBA. See hydrargyrus præcipitatus albus.

CALX VIVA. See Calx.

CALYPTER. (From καλυπτω, to hide.) A carneous excrescence covering the hemorrhoidal vein.

CAMARA. (камара, a vault.) Camarium. The fornix of the brain: also the vaulted part of the auricle of the heart.

CAMARIUM. (From Kamasa, a vault.)

See Camara.

CAMAROMA. (From намара, a vault.) Camarosis. Camaratio. A fracture of the skull, in the shape of an arch or vault.

CAMBING. A tree of the Molucca islands, whose bark has been recommended in dysenteries.

CAMBIREA. So Paraselsus calls the venereal bubo.

CAMBIUM. (From cambio, to exchange.) That nutricious humour which is changed into the matter of which the body is composed.

Cambodia. See Gambogia.

CAMBOGIA GUTTA. See Gambogia.

CAMBOGIUM. (From the province of Cambogia, whence it was brought.) See Gam-

CAMBRO-BRITANNICA. See Chamamorus. CAMBUCA. Cambuta membrata. Paracelsus calls the venereal cancer. by some it is described as a bubo, an ulcer, an abscess on the pudenda: also a boil in the groin.

CAMBUI. The wild American myrtle of Piso and Margrave, which is said to be

astringent.

Camel's hay. See Juncus odoratus.

The chambers or cavities CAMERA. of the eye are termed cameræ.

CAMERATIO. See Camaroma. CAMES. Camet. Silver.

CAMINGA. See Canella alba.

CAMINUS. A furnace and its chimney. In Rulandus it signifies a bell.

CAMISIA FŒTUS. (From the Arabic term kamisah, an under garment.) The shirt of the fœtus. It is frequently put for the chorion.

Camomile. See Chamemelum.

Camomile, stinking. See Cotula fatida.

CAMOMILLA. Corrupted from chamæmelum.

CAMMORUM. (xauuceov, quia homines, κακω μερω, perimat; because, if eaten, it brings men to a miserable end.) A species of monkshood. See . Iconitum.

CAMPANA. A bell. In Chemistry, a receptacle like a bell, for making sulphuric acid; thus the oleum sulphuris per campanam.

CAMPANULA. (From Campana, a bell, named from its shape.) The bell-flower.

The name of a genus of plants in the Linnæan system. Class, Pentandria. Order, Monogynia.

CAMPE. (From καμπτω, to bend.) flexure or bending. It is also used for the ham, and a joint, or articulation.

Campeachy wood. See Lignum campe-

CAMPECHENSE LIGNUM. See Lignum Campechense.

Camphire. See Camphora. Camphor. See Camphora.

CAMPHORA. (Camphura, Arab. The ancients by camphor meant what now is called asphaltum, or Jews' pitch; καφερα.) Camphura. Caf. Cafar. Ligatura veneris. Caphora. Capur. Alkovor. Altesor. Camphire. Camphor. A peculiar concrete substance prepared by distillation from the Laurus camphora of Linnæus;—foliis triplinerviis lanceolato-ovatis, a tree indigenous to Japan, where it grows abundantly. The camphice is found to lodge every where in the inter-stices of the fibres of the wood, pith, and knots of the tree. The crude camphire, exported from Japan, appears in small greyish pieces, and is intermixed with various extraneous matters; in this state it is received by the Dutch, and purified by a second sublimation; it is then formed into loaves, in which state it is sent to England. When pure, it is white, pellucid, somewhat unctuous to the touch; of a bitterish, aromatic, acid taste, yet accompanied with a sense of coolness; of a fragrant smell, and approaching to that of rosemary, but much stronger. It is totally volatile and inflammable, soluble in vinous spirits, oils, and the mineral acids; not in water, fixed nor volatile alkaline liquors, nor in acids of the vegetable kingdom. The use of this important medicine, in different diseases, is very considerable. It has been much employed, with great advantage, in fevers of all kinds, particularly in nervous fevers attended with delirium and much watchfulness. The experienced Werlhoff has witnessed its utility in several inflammatory diseases, and speaks highly in favour of its refrigerant qualities. The benefit derived from it in putrid fevers, where bark and acids are contra-indicated, is remarkable. In spasmodic and convulsive affections it is also of much service, and even in epilepsy. In chronic diseases this medicine is likewise employed; and against rheumatism, arthritis, and mania, we have several accounts of its efficacy. Nor is it less efficacious when applied externally in certain diseases: it dissipates inflammatory tumours in a short time; and its antisceptic quality, in resisting and during gangrene, is very considerable. Another property peculiar to this medicine must not, however, be omitted; the power it possesses of obviating the strangury that is produced by cantharides, when sprinkled over a blister.

The preparations of camphor are, spiritus camphoratus, oleum camphoratum, linimentum camphora, tinctura opii camphorata, and the mistura camphorata. Camphor dissolved in acetic acid, with some essential oils, forms the aromatic vinegar.

The subtile sub-CAMPHORÆ FLORES. stance which first ascends in subliming camphor. It is nothing more than the camphor.

CAMPHORE FLORES COMPOSITI. Camphor

sublinied with gum benzoin.

CAMPHOROSMA. (From camphora. and orun, to smell; so called from its smelling of camphirc.) The camphor-smelling

1. The name of a genus of plants in the Linnaan system. Class, Tetrandria.

der, Monogynia.

2. The pharmacopæial name of the camphorala. Sce Camphorala.

CAMPHORASMA. (From camphora: so called from its camphor-like smell.) Balm of Gilead. See Moldavica.

CAMPHORATA. Chamepeuce. Camphorata hirsuta. Camphorasma Monspeliaca. Stinking ground-pine. This plant, Camphorosma Monspeliensis of Linnaus:-foliis hirsutis linearibus, took its name from its smell resembling so strongly that of camphor: it has been exhibited internally, in form of decoction, in dropsical and asthmatic complaints, and by some is esteemedin fomen. tations agains pain. It is rarely or ever used inmodern practice.

CAMPHORAS. A salt formed by the union of the camphoric acid with different bases: thus. camphorat of allumin, camphorat

of ammoniac, &c.

CAMPHORATUM OLEUM. A mixture of olive oil, two parts, with one of camphor: of use in inflammatory swellings of the throat, if mixed with a proper cataplasm, and applied to it. In ascites, when the ab-domen is much distended, if rubbed on freely every night and morning, it is sup-

posed to be useful.

CAMPHORIC ACID. Acidum camphoricum. If nitric acid be distilled several times (six or eight) from camphor, a crystallized salt is obtained, called the acid of camphor, which reddens syrup of violets and the tincture of turnsole. Its taste is bitter, and it differs from oxalic acid in not precipitating lime from the muriatic acid. The union of this acid with different bases forms what is called camplorates, none of which have vet been used medicinally.

CAMPHOROSMA MONSPELIENSIS. systematic name of the plant called camphorata in the pharmacopæias. See Cam-

CAMPTER. (From naundo, to bend.) An inflexion or incurvation.

CAMPULUM. (From καμπτω, to twist about.) A distortion of the eyelids or other parts.

CAMPYLOTIS. (From nammunos, bent. A preternatural incurvation, or recurvation of a part. A distortion of the eyelids

CAMPYLUM. See Campylotis.
CANABIL. A sort of medicinal earth.
CANABINA AQUATICA. See Bidens.

CANABIS INDICA. See Banque and Can-

Canada Bulsam, See Bulsamum Canadense

CANABIS PEREGRINA. See Cannabis

Canadansis. (Brought from Canada.) A name of the copina and other baisams.

CANALES SEMICIRCULARES. Three semicircular canals placed in the posterior part of the labyrinth of the ear. They open by five orifices into the vestibulum. See Ear

Canaliculus. (Dim. of canalis, a channel) That blood-vessel, which in a fætus is situated between the pulmonary artery and the aorta, but in the adult is extinct, is called the canaliculus arteriosus. The

same as canalis arteriosus.

canalis. (From \$\chize{x}\chick{e}\_0\$; an aperture, or rather from \$canna\$, a reed.) A Canal. A hollow round instrument like a reed, for embracing and holding a broken limb. The hollow of the spine. Also it is specifically applied to many parts of the body; as \$canalis venosus\$.

CANALIS ARTERIOSUS. Canalis Rotalii. A blood-vessel peculiar to the factus, d;sappearing after birth; through which the blood passes from the pulmonary artery

into the aorta.

CANALIS NASALIS. A canal going from the internal canthus of the eye downwards into the nose: it is situated in the superior maxillary bone, and is lined with the pituitary membrane continued from the nose

CANALIS PETITIANUS. A triangular cavity, naturally containing a moisture, between the two lamina of the hyaloid membrane of the eye, in the anterior part, formed by the separation of the anterior lamina from the posterior. It is named after its discoverer, M. Petit.

CANALIS SEMISPETROS. The half bony canal of the car

CANALIS VENOSUS. A canal peculiar to the fætus, disappearing after birth, that conveys the maternal blood from the porta of the liver to the ascending vena cana.

Canary balm. See Melissa Turcica.

CANCELLI. Lattice work; generally applied to the reticular substance in bones.

CANCELLUS. (From cancer, a crab.) The wrong heir. Bernard the hermit. A species of cray-fish supposed to cure rheumatism, if rubbed on the part.

CANCER. (From naphnoc, a crab; so called by the ancients, because it exhibited large blue veins like crab's claws.)

1. The name of a disease likewise called Carcinoma, carcinos by the Greeks, Lupus by the Romans, because it eats away the flesh like a wolf. Dr. Cullen places this genus of disease in the class locales, and order tumores. He defines it a painful scirrhus tumour, terminating in a fatal ulcer. Any part of the body may be the seat of cancer, though the glands are most subject to it. It is distinguished according to its stages into occut and open; by the former is meant its scirrhous state, which is a hard tumour that sometimes remains in a quiet state for many years. When the cancerous action commences in it, it is attended with frequent shooting pains : the skin that covers it becomes discoloured, and ulceration sooner or later takes place; when the disease is denominated open cancer. Mr. Pearson says, "When a malignant scirrhus or a warty excrescence, hath proceeded to a period of ulceration, attended with a constant sense of ardent and occasionally shooting pains, is arregular in its figure, and presents an unequal surface; if it discharges sordid, sanious or fetid matter; if the edges of the sore be thick, indurated, and often exquisitely painful, sometimes inverted, at other times retorted, and exhibit a serrated appearance; and should the ulcer in its progress be frequently attended hamorrhage, in consequence of the erosion of blood-vessels; there will be little hazard of mistake in calling it a cancerous ulcer." In men, a cancer most frequently seizes the tongue, mouth, or penis; in women, the breasts, or the uterus, particularly about the cessation of their periodical discharges; and in children, in the eyes. The following description of Scirrhus and Cancer, from the above writer, will serve to elucidate the subject. A hard unequal tumour that is indolent and without any discoloration in the skin is called a scirrhus; but when an itching is peceived in it, which is followed by a pricking, shooting or lancinating pain, and a change of colour in the skin, it is usually denominated a cancer. It generally is small in the beginning and increases gradually; but though the skin changes to a red or livid appearance, and the state of the tumour from an indolent to a painful one, it is sometimes very difficult to say when the scirrhus really becomes a cancer, the progress being quick or slow according to concurring causes. When the tumour is attended with a peculiar kind of burning, shooting pains, and the skin hath acquired the dusky purple or livid hue, it may then be deemed the malignant scirrhus or con-firmed cancer. When thus far advanced in women's breasts, the tumour sometimes increases speedily to a great size, having a knotty unequal surface, more glands becoming obstsucted, the nipple sinks in, turgid veins are conspicuous, ramifying around and resembling a crab's claw. These are the

characteristics of an occult cancer on the external parts; and we may suspect the existence of one internally when such pain and heat as has been described, succeed in parts where the patient hath before been sensible of a weight and pressure, attended with obcuse pain. A cancerous tumour never melts down in suppuration like an inflammatory one: but when it is ready to break open, especially in the breast, it generally becomes proniment in some minute point, attended with an increase of the peculiar kind of burning, shooting pain, felt before at intervals, in a less degree and deeper in the body of the gland. In the prominent parts of the tumour, in this state, a corroding ichor sometimes transudes through the skin, soon forming an ulcer; at other times a considerable quantity of a thin lymphatic fluid tinged with blood from eroded vessels is found on it. Ulcers of the cancerous nature discharge a thin, fetid, acrid sames, which corrodes the parts, having thick dark-coloured retorted lips; and fungous excressences frequently rise from these ulcers, notwithstanding the corrosiveness of the discharge. In this state they are often attended with excruciating, pungent, lancinating, burning pains, and sometimes with bleeding.

Though a scirrhus may truly be deemed a cancer, as soon as a pain is perceived in it, yet every painful tumour is not a cancer: nor is it always easy to say whether a cancer is the disorder or not: irregular hard lumps may be perceived in the breast; but on examining the other breast, where no uneasiness is perceived, the same kind of tumours are sometimes found, which renders the diagnostic uncertain. Yet in every case, after the cessation of the catamenia, hard unequal tumours in the breast are suspicious; nor, though without pain, are they to be supposed indolent or innoxious.

2. The name of a crab-fish, from which the chelæ cancrorum, oculi cancrorum, or lapides cancrorum are produced The shell-fish so called is the Cancer astacus of Linnaus: the officinal preparations are neverth-less obtained also from the cancer gammarus, macurus and pagarus of Linnæus. Crab's claws and crab's eyes, as they are called, which are cerebral concretions, are of a calcareous quality and possess antacid virtues. They are exhibited with their compounds in pyrosis, diarrhæa and in infantile convulsions from acidity.

CANCER MUNDITORUM. Chimney-sweeper's cancer.

CANCHRYS. Cachrys. Libanotis. Galen saye it sometimes means parched barley.

CANCRENA. Paracelsus uses this word instead of gangræna.

CANCRORUM CHELE. Crab's claws. Carbonas calcis durior,

CANCHRORUM OCULI. See Carbonas calvis durior.

CANCHRUM ORIS. (From cancer, a spreading ulcer.) Canker of the mouth; called also aphthæ serpentes, gangræna oris, &c. See Aphtha.

CANDELA. (From candeo, to shine.) A

candle.

CANDELA FUNALIS A candle made of odoriferous powders and resinous matters, to purify the air and excite the spirits.

CANDELA REGIA See Candelaria.

CANDELARIA. (From candela, a candle, so called from the resemblance of its stalks to a candle.) The herb mullein. See Verbascum.

Candy carrot. See Daucus Creticus.

CANELA Sometimes used by the ancients for cinnamon, or rather cassia.

CANELLA (Canella, dim. of canna, a reed; so named because the pieces of bark are rolled up in the form of a reed.) The name of a genus of plants in the Linnæan system. Class, Dodecandria. Order, Mo-

nogynia. The canella-tree.

CANELLA ALBA The pharmacopæial name of the laure-leaved canella Winteranus spurius. Canella cubana. nella alba of Linnæus. The tree which produces the bark so called, is a native of the West-Indies. It is brought into Europe in long quills, somewhat thicker than cinnamon; their taste is moderately warm, aromatic, and bitterish; and of an agreeable smell, somewhat resembling that of cloves. Canella alba has been supposed to possess considerable medicinal powers in the cure of the scurvy and some other complaints. It is now merely considered as a useful and cheap aromatic, and is chiefly employed for the purpose of correcting, and rendering less disagreeable the more powerful and nauseous drugs; with which view it is used in the tinctura amara, vinum amarum, vinum rhei, &c. of the Edinburgh Pharmacopæia.

CANELLA CUBANA. See Canella alba. CANELLA CUURDO. The true cinnamon-

tree.

CANELLE MALABARICA: CORTEX. Cassia lignea.

CANELIFERA MALABARICA. See Cassia

lignea.

CANEON. (From MATTIN, because it was made of split cane.) A sort of tube or instrument, mentioned by Hippocrates, for conveying the fumes of antihysteric drugs into the womb.

CANICA. A spice used in the Island of Cuba, probably the pimento; or from some

of the species of myrrhs.

CANICE. (From canis.) Coarse meal was so called by the ancients, from canis, a dog, because it was food for dogs. Hence panis caniceus, very coarse bread

CANICIDA. (From canis, a dog, and cado, to kill; so called because dogs are destroyed by eating it.) The herb dog's bane or

aconitum.

CANICIDIUM. (From canis, a dog, and eado, to kill.) The anatomical dissection of living dogs.

CANINA BRASSICA. The mercurialis syl-

Canina Lingua. The cynoglossum. Canina malus. The mandragora.

CANINA RABIES. The hydrophobia. CANINE. Whatever partakes of, or has

any relation to the nature of a dog. Canine appetite. See Bulimia.

Canine madness Se Hydrophobia. CANINE TRETH Dentes canini. Cynodontes. Cuspidati of Mr. John Huner; because they have the two sides of their edge sloped off to a point, and this point is very sharp or cuspidated Cohi-mellares of Varro and Pfiny. The four eye-teeth are so called from their resemblance to those of the dog. They are situated, two in each jaw, on the side of the four middle or incisor teeth. fangs are longer than those of the incisores, and therefore, from the fangs of those in the upper jaw heing supposed to extend the greatest part of the way to the eye, they have been called the eye-teeth.

Caninus, (Caninus, sc. musculus; because it arises near the canine or eye-tooth.)

See Levator anguli oris.

Caninus sentis. (From canis, a dog, and sentis, a horn; from its being prickly like a thorn.) See Cynosbatos.

CANIRAM. (Indian.) See Nux vomica. CANIRUBUS. (From canis, and rubus, a

bramble.) See Cynosbatos.

CANIS. A dog. The white dung of this animal called album gracum, was for merly in esteem, but now disused. This term was also applied to the frænum of the penis.

CANUS INTERFECTOR. Indian caustic bar-

ley or cevadilla.

CANIS PONTICUS. See Castor.
CANNA. (Heb.) A reed or hollow cane: also a name of the fibula, from its resemblance to a reed.

CANNA FISTULA. See Cassia fistula.

CANNA INDICA. The Sagittaria alexipharmica.

CANNA MAJOR. The tibia.

CANNA MINOR CRURIS. A name formerly applied to the fibula

CANNABINA. (From canua, a reed; named from its reed-like stalk.) So Tournefort named the Datisca.

(From xayya, a reed. CANNABIS. KavvaCos are foul springs, wherein hemp, &c. grow naturally. Or from kanaba, from grow naturally. Or from kan kanah, to mow. Arab.) Hemp.

1. The name of a genus of plants in the Linnæan system. Class, Dioecia. Order,

Pentandria.

2. The pharmacopæial name of the Cannabis sativa of Linnans. It has a rank smell of a narcotic kind. The effluvia from the fresh herb are said to affect the eyes and

head, and that the water in which it has been long steeped is a sudden poison. Hemp-seeds, when fresh, afford a considerable quantity of oil. Decoctions and emulsions of them have been recommended against coughs, ardor urinæ, &c. Their nse, in general, depends on their emollient and demulcent qualities. The leaves of an oriental hemp, called bang or bangue, and by he Egyptians assis, are said to be used in Eastern countries, as a narcotic and aphrodisiac. See Bangue.

CANNABIS SAVITA. The systematic name of the hemp plant. See Cannabis.

CANNACORUS RADICE CROCEA See Cur-

CANNULA. (Dim. of canna, 2 reed.)

The name of a surgical instrument. See CANON. (Kavav.) A rule or canon, by

which medicines are compounded.

CANONIAI. (Kayovai.) Hippocrates in his book De Aëre, &c. calls those persons thus, who have straight, and not prominent beilies He would intimate that they are disposed, as it were by a straight rule.

CANOPICON (From x2varce, the flower of the elder.) A sort of spurge named from its resemblance; also a collyrium, of which the chief ingredient was elder-flowers.

CANOPITE. The name of a collyrium mentioned by Celsus.

CANOPUM. (Kaywoov.) The flower or bark of the elder-tree, in Paulus Ægineta.

CANTABRICA. Convolvulus minimus spica Convolvulus linaria folio. Convolvalus Cantabrica of Linneus. Lavender-leaved bindweed. Pliny says it was dis-covered in the time of Augustus, in the country of the Cantabri in Spain; whence its name. It is anthelmintic and actively cathartic.

CANTABRUM. (From kanta. Heb.) In Cœlius Aurelianus it signifies bran or fur-

CANTACON. Garden saffron. CANTARA. The plant which bears the St. Ignatius's bean

CANTARI FIGULINI. Earthen cucurbits.

CANTHARIS (Cantharis, pl. cantha. rides; from xaybapos, a beetle, to whose tribe it belongs.) Musce Hispanice Lytta vesi-catoria of Linnaus. The blistering fly. Spanish fly. The importance of these flies, by their stimulant, corrosive, and epispastic qualities, in the practice of physic and surgery, is very considerable; indeed, so much so, as to induce many to consider them as the most powerful medicine in the materia medica. These flies have a green shining gold body, and are common in Spain, Italy, France, and Germany, The largest come from haly, but the Spanish cantharides are generally preferred. When applied on the skin, in the form of a plaster, it soon raises a blister full of serous matter, and thus

relieves inflammatory diseases, as phrenitis, pleuritis, hepatitis, phelgmon, bubo, myositis, arthritis, &c. The tincture of these flies is also of great utility in several cutaneous diseases, rheumatic affections, sciatic pains, &c. but ought to be used with much caution. See Blister.

CANTHUM. Sugar-candy.

CANTIIUS. (Κανθως, the iron binding of a cart-wheel. Dr. Turton, in his glossary, supposes, from its etymology, that it originally signified the circular extremety of the eye-lid.) The angle or corner of the eye, where the upper and under eye-lids meet. That next the nose is termed the internal or greater canthus, and the other, the external or lesser canthus.

CANTION. An epithet for sugar.

CANTUARIENSIS AQUA. Canterbury water is strongly impregnated with iron, sulphur, and carbonic acid gas; recom-mended in disorders of the stomach, in gouty complaints, jaundice, diseases of the skin and chlorosis

CANULA. (Dim. of canna, a reed.) tube adapted to a sharp instrument, with which it is thrust into a cavity or tumour, containing a fluid; the perforation being made, the sharp instrument is withdrawn, and the banula left, in order that the fluid may pass through it

CANUSA. Crystal.

CAOUTCHOUC. See Indian rubber.

Capaiva balsam. See Bulsamum Copaibx. CAPELINA. (From capeline, a woman's hat, or bandage, French.) A doubleheaded roller put round the head.

CAPELLA. A cupel or test. Caper-bush. See Copparis.

CAPETUS. (Καπέλος per aphæresin, pro σκαπείος: from σκαπίω, to dig.) Hippocrates means by this word a foramen, which is impervious and needs the use of a chirurgical instrument to make an opening; as the anus of some new-born infants.

CAPHORA. (Arab ) Camphire.

C. PHURA BAROS INDORUM. A name for camplifre.

CAPHURE OLEUM. An aromatic essential oil distilled from the root of the cinnamontree.

CAPILLARES VERMICULI. See Crinones and Dracunculi.

CAPILLARY VESSELS. (Vasa capillaria; from capillus, a little hair; so called from their resemblance to hairs or fine threads.) The very small ramifications of the arteries, which terminate upon the external surface of the body, or on the surface of internal cavities.

CAPILLATIO. (From capillus, a hair.) A

capillary fracture of the cranium

CAPILLUS. (Quasi capitis pilus, the hair of the head.) The hair. Small, cylindrical, transparent, insensible, and elastic filaments, which arise from the skin, and are fastened in it by means of small roots.

The human hair is composed of a spongy, cellular texture, containing a coloured liquid, and a proper covering. divided into two kinds : long, which arises on the scalp, cheek, chin, breasts, of men, the anterior parts of the arms and legs, the arm-pits, groins, and pelvis: and short, which is softer than the long, is present over the whole body, except only the palm of the hand and sole of the foot. The hair originates in the adipose membrane from an oblong membraneous bulb, which has vessels peculiar to it. The hair is distinguished by different names in certain parts: as, capillus, on the top of the head; crinis, on the back of he head; circrinnus, on the temples; cilium, on the eye-lids; supercilium, on the eyebrows; vibrussa, in the nostrils; barba, on the chin; pappus, on the middle of the chin; mystax, on the upper lip; pilus, on the body.

CAPILLUS VENERIS. See Adianthum. CAPILLUS VENERIS CANADENSIS.

Adiantum Canadense.

CAPIPLENIUM. (From caput, the head, and plenus, full.) A catarrh. It is a barbarous word; but Baglivi uses it to signify that continual heavmess or di-order in the head, which the Greeks call Carebaria. सबदृह्दिवदाव.

CAPISTRATIO. (From capistrum, a bridle; so called because the prapuce is restrained as it were with a bridle ) See

Phymosis.

CAPISTRUM. (From caput, the head.) A bandage for the head is so called. In Vogel's Nosology it is the same as Trismus. CAPITAL. The upper part of an alem-

bic; likewise called the head.

CAPITALIA. (From caput, the head.) Cephalics: medicines which relieve disorders of the head.

CAPITELLUM. The head or seed vessels, frequently applied to mosses, &c. Some say it signifies soapy water, others say it is a lixivium.

CAPITILUVIUM. (From caput, the head, and lave, to wash. A lotion or bath for the head.

Capitis obliquus inferior et major. Obliquus inferior.

Capitis par tertium Follopii plexus minor

Capitis posticus. See Rectus major ca-

Capitis rectus. See Rectus minor capitis. CAPITULUM. (Dim. of caput, the head.) An alemb.c. In anatomy, a small head or protuberance of a bone, received into the concavity of another bone.

CAPIVI. (Indian.) A tree of Brazil. which affords the drug called balsam of

capivi. See Balsamum copaibæ.

CAPNELEUM (From narros, smoke, and exacev, oil; so named from its smoky exhatations when exposed to heat.) In Galen's works, it is said to be a resin.

CAPNIAS. (From RETTYOS, a smoke.) A jasper of a smoaky colour. Also a kind of vine which bears white and part black

CAPNISTOM. (From KATTVOS, Smoke) preparation made of spices and oil, by

kindling the spices and funngating the oil. CAPNITIS. (From RATIVOS, SINOKE; called from its smoky colour.) Tutty.

CAPNOIDES. (From καπνος, fumitory, and suboc, likeness.) A species of fumitory.

CAPNOS. Karros Fumitory: so called, says Blanchard, because its juice if applied to the eyes, produces the same effect and sensations as smoke.

CAPO MOLAGO. The Piper Indicum.

CAPPA. (à-capite, from the head; so called from its supposed resemblanee.) The herb monkstrood.

CAPPARIS. (From cabar, Arab or wapa to nattavely apay, from its curing madness and inclandingly.) The caper plant.

1. The name of a genus of plants in the Linnwan system. Cfass, Polyandria. Or-

der, Monogynia.

2. The pharmacopæial name of the Capparis spinosa of Linuxus:-pedinculis solitariis unifloris, stipulis spinosis, foliis annus, capsulis ovalibus. The buss or unexpanded flowers of this plant, are in common use as a pickle, which is said to possess antiscorbutic virtues. The bark of the root was formerly in high esteem as a deobstruent,

The systematic CAPPARIS SPINOSA. name of the caper plant. See Capparis

CAPHEOLARIS. (From capreolus, a ten-Capreolatus. Resembling in its contortions, or other appearance, the tendrils of a vine; as the spermatic vessels.

CAPHEOLATUS. See Capreolaris.

CAPREOLUS (Dun. of caprea, a tendril.) It means the helix or circle of the ear, from its tendrild ke contortion. Dr. Turton suggests its derivation from caper, a goat, whose hom its contortions somewhat resemble.

Capricounus. Lead.

CAPRIFICUS. (From caper, a goat, and ficus, a fig; because they are a chief food of goats.) The wild fig-tree.

CAPRIZANS. Is by Galen and others used to express an inequality in the pulse, when it leaps, and, as it were, dances in uncertain strokes and periods.

CAPSELLA. (Dim. of capsa, a chest, from its resemblance.) A name in Marcellus Empiricus for viper's bugloss.

CAPSICUM. (From xx7/w, to bite, on account of its effect on the mouth.)

1. The name of a genus of plants in the Linear n system. Class, Pentandria. Order, Monogynia. Guinea pepper.

2. The phermacopoial name of the Capsicum annuum of Linnaus What is generally used under the name of Cayenne pepper, is an indiscruminate mixture of the powder

of the dried pods of many species of cap-sicums, but e pecially of the capsicum manimum, or bird pepper, which is the hottest of all. These peppers have been chiefly used as condiments. They prevent flaturence from vegetable food and give warmth to the stomach, possessing all the virtues of the oriental spices, without producing those complaints of the head which the latter are apt to occasion. An abuse of them, however, gives rise to visceral obstructions, especially of the liver. In the practice of medicine, there can be little doubt that they furnish us with one of the purest and strongest stimulants which can be introduced into the stomach. Dr. Adair who first introduced them into practice, found them useful in the cachexia Africana, which he considers as a most frequent and fatal predisposition to disease among the slaves. Dr. Wright says, that in dropsical and other complaints where chalybeates are indicated, a minute portion of powdered capsicium forms an excellent addition and recommends its use in lethargic affections. This pepper has also been successfully employed in a species of eynanche maligna, which proved very fatal in the West Indies, resisting the use of Peruvian bark, wine, and other remedies commonly employed. In tropical fevers, coma and delirium arc common attendants, and in such cases cataplasms of capsicum have a speedy and happy effect. They redden the parts, but seldom blister unless when kept on too long. In ophthalmia from retaxation, the diluted juice of capsicum is found to be a valuable remedy. Adair gave six or eight grains for a dose, made into pills; or else he prepared a tincture by digesting half an ounce of the pepper in a pound of alcohol, the dose of which was one or two drachins, diluted with a sufficient quantity of water. A tinctura capsaci is now for the first time introduced into the London pharmaco. pœia.

CAPSULA. (Dim. of capsa, a chest or case.) A term given by anatomists to any membranous production enclosing a part of the body like a bag; as the capsular ligaments, the capsule of the crystalline lens, &c.

CAPSULE ATRABILARIÆ. See Renal capsules.

CAPSULE RENALES. See Renal capsules. CAPSULAR LIGAMENT. (Capsularis; from capsa, a bag.) Ligamentum capsulare. The figament which surrounds every movable articulation, and contains the synovia like a bag.

CAPSULE OF GLYSSON. Capsula communis, Glissonii. Vagina portæ. Vagina Glyssonii. A strong tunic, formed of cellular texture, which accompanies the vena

p rix, and its most minute ramifications throughout the whole liver.

CAPULUM. (From καμπτω, to bend.) A contortion of the eye-lids, or other parts.

CAPUR. (Arab.) Camphor. CAPUT. (From capio, to take; because from it, according to Varro, the senses take their origin.) The head, cranium or skull. It is situated above or upon the trunk, and united to the cervical vertebræ

For its bones, see Skull. It is distinguished into skull and face. On the skull are observed vertex, or crown; sinciput, or fore-part; occiput, or hinder part; and the temples. The parts distinguished on the face are well known; as the forehead, nose, eyes, &c. The arteries of the head are branches of the carotids; and the veins empty themselves into the jugulars.

CAPUT GALLINAGINIS. Verumontanum A cutaneous eminence in the urethra of men, before the neck of the bladder, somewhat like the head of a cock in miniature, around which the seminal duets, and the ducts of the prostate gland,

CAPUT MORTUUM. A fanciful term, much used by the old chymists, but now entirely rejected. It denoted the fixed residue of operations. As the earlier chymists did not examine these, they did not find any inconvenience in one general term to denote them : but the most slender acquaintance with modern chymistry must show that it is utterly impracticable to denote, by one general term, all the various matters that remain fixed in certain degrees of heat.

CAPUT OBSTIPUM. The wry neck.

mostly a spasmodic complaint.

CAPUT PURGIA. (A barbarous word, from caput, the head, and purgo, to purge.) Medicines which purge the head. Errhines. Masticatories.

CAPARIDION. (From narrogos, burnt.) Capyrion A medicated cake, much baked.

CAPYRION. See Capyridion.

CARABE. (Persian.) Amber. CARABE FUNERUM. A name given to

bitumen. CARABUS. A genus of insects of the beetle kind. Two species, the chrysocephalus and ferruginous, have been recommended for the tooth-ach. They must be pressed between the fingers, and then rubbed on the gum and tooth affected.

CARACOSMOS. A name of the sour mare's milk, so much admired by the Tar-

CARAGUATA. The common aloe of

CARANNA, Caragna. Caranna gummi. (Spanish.) Bresilis. A concrete resinous juice, that exudes from a large tree, of which we have no particular account. It

in little masses, rolled up in leaves of flags; externally and internally it is of a brownish colour, variegated with irregular white streaks. When fresh, it is soft and tenacious, but becomes dry and friable by keeping. Pure caranna has an agreeable aromatic smell, especially when heated, and a bitterish slightly pungent taste. It was formerly employed as an ingredient in vulnerary balsams, strengthening, discutient, and suppurating plaisters; but its scarcity has caused it to be forgotten.

CARA SCHULLI. (Indian) Frutex Indica spinosa. An Indian shrub, like the caper-bush. A decoction of the root

proves diuretic. Ray

Carawayseed. See Carum.

CARBASUS. (Kaglasos) Scribonius Lar-

gus uses this word for lint

CARBO (Carbah, Heb. burnt, or dried.) Coal. In medicine and chymistry, it is commonly understood to mean charcoal, and receives its name from its mode of preparation, which is by burning pieces of light wood into a dry black coal.

CARBO LIGNI. Charcoal. As an external application, powdered charcoal has been recommended in the cure of gangrene, from external causes, and all descriptions of fætid ulcers. Meat which has acquired a mawkish or even putrid smell, is found to be rendered perfectly sweet by rubbing

it with powdered charcoal.

CARBON. (From carbo, coal.) The chymical name of charcoal. It is the black residue of vegetables, which have suffered a complete decomposition of their volatile principles by fire. Charcoal is black, brittle, sonorous and light. It is placed among simple bodies, because no experiment has hitherto shown the possibility of decomposing it. It exists in the animal, vegetable, and mineral kingdom. When it is required to procure carbon in a state of great purity, it must be dried by strong ignition in a closed vessel. The diamond when burnt in oxygen gas forms charcoal. Charcoal is therefore considered to be an oxyd of diamond, and the diamond pure carbon.

CARBON, GASEOUS OXID Gaseous oxyd of carbon was first described by Dr. Priestley, who mistook it for a hydro-carbonate. With the true nature of it we have been only lately acquainted. It was first proved to be a peculiar gas, by Mr. Cruikshank, of Woolwich, who made it known to us as such, in April 1801, through the medium of Nicholson's Journal for that month. Several additional properties of this gas were soon afterwards noticed by Desormes, Clement and others. Gaseous oxyd of carbon forms an intermediate substance between the pure hydro-carbonates and carbonic acid gas; but not being possessed of is brought from New Spain and America, acid properties. Mr Cruikshank has called

it conformable to the rules of the chymical nomenclature, gaseous oxyd of carbon, for it con ists of oxygen and carbon rendered

gascons by caloric

Though the gaseous oxyd of carbon has some of the properties peculiar to the common hidro-carbonates, the following characteristic properties sufficiently prove that none of those at present known are similar to it. We are, therefore, entitled to con-

sider it as a peculiar gas.

Properties.—Gaseous oxyd of carbon is considerably lighter than any of the hydrocarbonates. It is lighter than common air, in the proportion of 22 to 23 When mingled with common air, and ignited, it does not explode, but burns with a lambent blue flame, and the product is carbonic acid. It is very little absorbable by water; it is void of taste and odour. A mixture of 20 parts of gascous oxyd of carbon and 8 of oxygen gas, fired over mercury, by electricity, diminishes to a volume equal to about 18 or 19 parts, which is carbonic acid gas. It contains neither water nor the basis of that fluid. It is exceedingly noxious; animals die in it instantly; when breathed for a few minutes only, it produces giddiness Neither light, heat, nor and faintings. electricity have any effect upon it. When equal quantities of gaseous oxyd of carbon and hydrogen gas are passed through a red-hot glass tube, the tube is lined with charcoal, water is formed, and an excess of hydrogen makes its escape. If a piece of iron be put into the tube, it is oxydated, but not converted into steel. Neither nitrogen gas nor sulphur have any action on it even at high temperatures. It is capable of dissolving a minute quantity of charcoal, and increases in bulk. It dissolves phosphorus and acquires the property of The alkalies burning with a yellow flame. have no effect on this gas. It is not altered when passed with ammonia through an When the red oxyd of merignited tube. cury is heated in it, a commencement of reduction takes place. Neither sulphuric, nitric, nor nitro-muriatic acids, alter it, when passed with it through a red-hot tube. Four parts of oxygenated muriatic acid gas teft with one of carbonic acid gas, decompose it completely. Nitrous gas has no effect upon it. When mixed with sulphurated hydrogen gas, and passed through a red-hot tube, sulphur is deposited, and sulphurated hydrogen gas remains mixed with gaseous oxyd of carbon.

Methods of obtaining Gaseous Oxyd of Carbon.—Gaseous oxyd of carbon may be obtained by a decomposition of carbonic acid at high temperatures, by means of various fixed substances which have a considerable affinity to oxygen. This may be done by distilling a mixture of charcoal with any of the metallic oxyds, or by ex-

posing to a strong red heat, a mixture of carbonate of lime or barytes, and filings of iron, zinc, &c.

The method of obtaining the gaseous oxyd of carbon in a state of purity, recommended by Mr. Cruikshank, is the follow-

ng:

1. Take one part of chalk, previously exposed to a low red heat, for about ten minutes, mix it with an equal quantity of perfectly dry filings of z nc; let the mixture be introduced into a retort, and expose it to a heat gradually increased. As soon as the retort becomes of a dull red heat, gas will be disengaged in great abundance. The gas which comes over first is carbonic acid gas, but as soon as the retort becomes thoroughly ignited, pure gaseous oxyd of carbon is liberated in a prodigious quantity, which may be collected in the usual manner over water.

In this process, a decomposition of the carbonic acid of the chalk takes place in its nascent state. The zinc robs the carbonic acid of part of its oxygen at a high temperature, and becomes to a certain degree oxydated. The carbonic acid, by being thus deprived of part of its oxygen, becomes converted into a new inflammable gas, which is the gascous oxyd of carbon.

Carbonaceous acid. See Carbonic acid. CARBONAS A carbonate. A neutral salt, formed by the union of carbonic acid with an alkaline, earthy, or metallic base. The carbonates employed in medicine are some of them perfect and some imperfect.

The imperfect carbonates in use are-

1. The subcarbonas potassæ.

The subcarbonas sodæ.
 The subcarbonas sodæ exsiccata.

4. The subcarbonas plumbi. The perfect carbonates are—

The carbonas ammoniæ.
 The liquor carbonatis ammoniæ.

3. The carbonas potassæ.

4 The carbonas sodæ.5. The creta præparata.

6. The carbonas magnesiæ.

7. The carbonas ferri

CARBONAS AMMONIÆ. Carbonate of animonia. This preparation was formerly called animonia preparata, and sal volatilis salis animoniaci, and sal volatilis. It is made thus:—take of muriate of animonia, a pound; of prepared chalk, dried, two pounds. Reduce them seperately to powder; then mix them together, and sublime in a heat gradually raised, till the retort becomes red.

This salt possesses nervine and stimulating powers, and is highly beneficial in the dosc of from two to eight grains, in nervous affections, debilities, flatulency,

from acidity and dyspepsia.

CARBONAS CALCIS. Carbonate of lime. Several of these are used in medi-

cine; the purest and best are the creta preparati, chelæ cancrorum, testæ ostrearum, testæ ovorum, and occuli cancrorum.

CARBONAS PLUMBI. See Cerussa. CARBONAS POTASSÆ. Carbonate of potash. This preparation, which has been long known by the name of Kali ara tum, appeared in the last London pharmacopæia, for the first time. It is made thus:—Take of subcarbonate of potash, made from tartar, a pound; carbonate of ammonia three ounces; distilled water, a pint. Having previously dissolved the subcarbonate of potash in the water, add the carbonate of ammonia: then, by means of a sand-bath, apply a heat of 180° for three hours, or until the ammonia shall be driven off; lastly, set the solution by, to crystallize. The remaining solution may be evaporated in the same manner, that

crystals may again form when it is set by. This process was invented by Bertholet. The potash takes the carbonic acid from the ammonia, which is volatile, and passes off in the temperature employed. It is, however, very difficult to detach the ammonia entirely. Potash is thus saturated with carbonic acid, of which it contains double the quantity that the subcarbo-nate of potash does; it gives out this proportion on the addition of muriatic acid, and may be converted again into the subsalt, by heating it again a short time, to redness. It is less nauseous to the taste than the subcarbonate; it crystallizes, and does not deliquesce. Water, at the common temperature, dissolves one fourth its weight, and at 212°, five-sixths; but this latter heat detaches some of the carbonic

The carbonate of potash is generally used for the purpose of imparting carbonic acid to the stomach, by giving a scruple in solution with a table spoon-ful of lemon-

juice, in the act of effervescing.

CAREONAS SODE. Carbonate of soda, a pound; of the subcarbonate of soda, a pound; of the carbonate of ammonia, three ounces; of distilled water, a pint. Having previously dissolved the soda in the water, add the ammonia: then, by means of a sand-bath, apply a heat of 180° for three hours, or until the ammonia is driven off. Lastly, set the solution by, to crystallize. The remaining solution may, in the same manner, be evaporated, and set by, that crystals may again form.

This salt which is called also aërated soda and natron, bears to the subcarbonate of soda, the same relation that the carbonate of potash does to its subcarbonate. It is prepared in the same way, possesses the same comparative advantages, and contains double the quantity of carbonic acid.

CARBONAS MAGNESIÆ. Magnesia alba. The carbonate of magnesia. This

preparation is variously prepared. The college of physicians of London direct it thus:—Take of sulphate of magnesia, of subcarbonate of potash, of each a pound; water, three gallons. Dissolve the subcarbonate of potash in three pints of the water, and strain. Dissolve also the sulphate of magnesia separately, in five pints of the water, and strain; then add the rest of the water to the latter solution, apply heat, and, when it boils, pour in the former solution, stirring them well together; next, strain through a linen cloth; lastly, wash the powder repeatedly with boiling water, and dry it upon bibulous paper, in a heat of 200 deg.

Carbonate of magnesia is esteemed as an aperient and antacid, and is given against constipation, flatulency, acidity of the stomach, and its effects. The dose is from

ten grains to a drachm.

CARBONAS FERRI Ferrum practipitatum. Carbonate of iron. This preparation is made by decomposing the sulphate of iron by the subcarbonate of soda, thus—Take of the sulphate of iron, eight ounces; subcarbonate of soda, ten ounces; boiling water, a gallon. Dissolve the sulphate of iron and subcarbonate of soda separately, each in four pints of water; next mix the solutions together, and set it by, that the precipitated powder may subside; then, having poured off the supernatant liquor, wash the carbonate of iron with hot water, and dry it upon bibulous paper, in a gentle heat.

This salt is a subcarbonate of iron, and not a perfect carbonate. It is substituted for the rubigo ferri of the former pharmacopæias. It is much esteemed as a mild chalph-ate, and is given in the dose of

from five grains to a scruple.

CARBONATED HYDROGEN GAS, LIGHT Light carbonated hydrogen gas is hydrogen gas holding charcoal in solution. There are several combinations of this kind of gas obtained by different processes, which differ in their properties, and in the proportion of their constituent principles.

Properties.—Light carbonated hydrogen gas has a fætid odour. It is neither absorbed nor altered by water. It is inflammable, and burns with a denser and deeper coloured flame than hydrogen gas. It is unalterable by acids or alkalies, and by water. Its specific gravity is greater than that of hydrogen gas, or that of common air. Its combustion with a due proportion of oxygen gas, is product ve of water and carbonic acid. When passed through melted sulphur, it becomes converted into sulphurated hydrogen gas, and charcoal is deposited. Electrization dilates it permanently to a little more than twice its original bulk. The air thus expanded, re-

dures a greater quantity of oxygen to decompose it, than the same quantity of gas not dilated by electricity; 100 cubic inches of pure carbonated hydrogen gas weigh from

16 to 24 grains.

Light carbonated hydroden gas may be obtained from animal, vegetable, or mineral substances. Nature produces it ready formed in marshes and disches, on the surface of putrid water, in burying-places, common sewers, and in those situations where putrid animal and vegetable matters are accumulated. It is also generated in the intestinal canal of living animals.

1. Light carbonated hydrogen gas may be plentifully procured from most stagnant waters: to do this, fill a wide-mouthed bottle with the water, and keep it inverted therem, with a finnel in its neck; then, with a stick, stir the mid at the bottlom, just under the funnel in the bottle, so as to let the bubbles of air, which rise from the mid, enter into the bottle; when, by thus stirring the inud in various places, and catching the air in the bottle, it is filled, it must be corked nader water.

2. It may be also obtained during the distillation of animal and vegetable mat-

ters. For instance:

Let shavings of wood, or saw-dust, be put into a retort, and begin the distillation with a gentle heat, increasing it gradually, till the retort becomes red hot; a great quantity of gas will be liberated, which may be caught over water. On examining this gas, it will be found to consist of carbonic acid gas and carbonated hydrogen gas. In order to obtain the latter in a state of purity, the whole must be mixed with lime-water, or with a caustic alkalme solution. The carbonic acid gas will be absorbed, and the carbonated hydrogen gas left behind, in a pure state.

The production of this gas in this manner, is the result of a partial analysis of the wood. It proves that wood contains solid hydrogen, carbon, and oxygen. When the intensity of the heat has reached a certain degree, a part of the charcoal unites with part of the oxygen and produces carbonic acid, which, by means of caloric, is melted into the gaseous state, and forms carbonic acid gas; at the same time, a part of the hydrogen of the wood combines with another portion of carbon and caloric, and forms carbonated hydrogen gas.

Remark.—The flame of burning wood, &c. is the inflamed carbonated hydrogen gas, liberated on the application of caloric

to such bodies.

3. Charcoal is in general made use of for obtaining light carbonated hydrogen gas. For this purpose, put some moistened charcoal into an earthen retort, apply heat, and increase it till the retort becomes ig-

nited; gas will be evolved, consisting partly of carbonic acid gas, and partly of light carbonated hydrogen gas, which may be separated as before.

In this case a decomposition of the water takes place, by means of the charcoal. The oxygen forsakes its hydrogen, and unites to part of the charcoal, at this temperature, and forms carbonic acid gas, in conjunction with caloric; the liberated hydrogen assisted by caloric, dissolves another portion of the charcoal, and forms with it light carbonated hydrogen gas.

4. Light carbonated hydrogen gas may be formed in a dovet manner, by dissolving charcoal in hydrogen gas. This may be effected by directing the rays of the sun collected in the focus of a mirror, upon a small piece of charcoal placed on mercury, in a receiver filled with hydrogen

gas.

CARBONATED HYDROGEN GAS, HEAVY. This gas was first brought into notice by a society of Dutch chymists, consisting of Deiman, Troostwyk, Bond, and Laurenburgh. They observed in this gas the particular property, that when it was combined with oxygenated nutriatic acid gas, in a certain proportion, the elastic form of both fluids became destroyed, and an oil was produced; for which reason

they called it Olefiant gas.

Properties .- He vy carbonated hydrogen gas is not absorbed craftered by water. Its weight, compared with common air, is as 909 to 1000. It has a disagreeable fætid odour, different from that of light carbonated hydrogen gas. It burns with a strong compact flame, similar to that of a resinous oil. When mixed with oxygenated muriatic acid gas, its bulk is diminished, and an oil is formed. When the mixture of these two gases is fired, a quantity of charcoal is immediately deposited, in the form of fine soot. Sulphuric, sulphureous. nitrie, nitrous, and muriatic acids do not act upon it; neither does nitrous gas, nor any of the fixed alkalies. Ammonia adds to its volume without occasioning any other change. Phosphorus heated in it, even to fusion does not affect it. When made to pass through an Ignited glass tube, it does not diminish in volume, but loses the property of forming oil with exvengated muriatic acid gas. Electric shocks passed through it, dilate and likewise d prive it of this property. When passed through an ignited porcelain tube, it affords hydrogen gas mingled with carbonic acid, and carbon is deposited. When passed through a tube with sulphur in fusion, sulphurated hydro. gen gas is obtained, and charcoal-deposited. When burnt with oxygen gas, or when passed through a red-hot tube, filled with oxyd of manganese, carbonic acid gas is formed,

Z

Preparation.—Heavy carbonated hydrogen gas is obtained by decomposing alcohol by sulphuric acid, at high temperatures. It is also obtained in abundanc when alcohol or other is passed through a red-liberature, sulphuric ether mixed with sulphuric acid, and subjected to heat, also thards it, but in a less pure state.

The Dutch chymists observed, that if the vapour of ardent spirit or ether be made to pass through a glass tube, over the component parts of the earthern tube, namely, alumine and silex, this gas was also produced; or by passing it through a

red-not tube of pipe-clay.

In order to obtain this gas the following

method may serve:

Let four parts of concentrated sulphuric acid, and one of highly rectified ardent spirit, be mingled together gradually in a glass retort; heat will be developed, the mixture will become brown, and heavy carbonated hydrogen gas will be extricated without the application of external heat. When a moderate heat is applied, the action is very violent, and the gas is liberated very copiously, and may be received over water.

The gas obtained, is always mixed with a considerable quantity of sulphureous acid gas, from which it may be freed by agitating it in contact with lime-water, or a

solution of potash.

Remark.—In this operation the heat ought to be regulated with great care, and the retort holding the mixture ought to be very capacious, otherwise the matter will be forced over into the receiver. The heat of a candle, or lamp, is sufficient,

CARBONIC ACID GAS. Acidum Carbonicum. Fixed air. Carbonaecous acid. Acidal acid. Carbonic acid gas is the first elastic acriform fluid that was known. We find that the ancients were in some measure acquainted with it Van Helmont called it the gas of Must, or of the vintage, or gas sylvestre.

We are indebted to Dr. Black of Edinburgh for the knowledge of some of the most remarkable properties of this fluid. In the year 1755 he discovered the affinity between this gas and alkalies: and Bergman, in 1772, proved that it was an

acid.

Properties—Carbonic acid gas is invisible. It extinguishes flame. It is fatal to animal life. It exerts powerful effects on living vegetables. Its taste is pungent and acid. Its energy, as an acid, is but feeble, although distinct and certain. Neither light or caloric seem to produce any distinct effect upon it, except that the latter dilates it. It mixes without combining with oxygen gas. It unites with wa'er slowly. These two fluids, after considerable agitation, at last combine, and form a sub-acid fluid. The

colder the water, and the greater the pressure applied, the more carbonic acid gas will be absorbed. The water impregnated with it, sparkles upon agitation; it has a pungent acidulous taste, and reddens tincture of litmus. Heat again disengages the gas from the water. This gas precipitates lime, strontia, and barytes, from their solutions in water. It is greedily attracted by all the alkalies. It undergoes no alteration by light. Its specific weight is to that of atmospheric air, as 1500 to 1000. It may be poured out of one vessel into another. It is not acted upon by oxygen, nor is it altered by any of the simple combustible bodies at common temperatures; but phosphorus, iron, and lime, are capable of decomposing it, when assisted by heat. Methods of obtaining Carbonic Acid Gas.

Of all the gases, carbonic acid gas is that, perhaps, which is diffused in the greatest abundance throughou, nature. It

greatest abundance throughout nature. It is found in three different states:—1st, In that of gas; 2dly, In that of mixture; and 3dly, In that of combination. The various processes for obtaining it are the

following:

1. Put into a common glass-bottle, or retort, a little marble, ehalk, or limestone and pour on it sulphuric acid, diluted with about six times its weight of water, an effervescence will ensue, and earbonic acid gas will be liberated, which those who have an opportunity may collect over mereury; but a mercurial apparatus is not absolutely necessary, since the gas may be collected over water, if it is to be used immediately when procured.

In this instance the carbonic acid is disengaged from the state of combination, and reduced to the acriform state of gas. The marble, lime-stone, or chalk, consists of this acid and lime; on presenting to it sulphuric acid, a decomposition takes place, the sulphuric acid has a greater affinity to the lime than the car-

bonic acid has; it therefore unites to it, and forms sulphate of lime, disengaging at the same time, the carbonic acid in the state of gas, at the temperature of our at-

mosphere.

Remark.—Carbonic acid gas may, in this manner, be disengaged from all its combinations with alkales; by using indifferently any other dense acid, possessing a superior affinity to the alkali in the common acceptation of the word.

2. It may likewise be obtained from the same substances by the action of caloric.

For this purpose, reduce marble, or chalk, to powder; introduce it into a gunbarrel, which must be placed across a furnace; adapt a bent tube to its lower extremity, and insert it below a receiver in the pneumatic apparatus. Maintain a strong heat, till the barrel is brought to a state of

ignition, and at that temperature carbonic acid gas will be liberated in abundance.

In this case, a decomposition of the marble or carbonate of ame takes place, on account of the action of caloric, which at a high temperature breaks the affinity of the carbonic acid and lime; it unites with the first, and leaves the lime behind in that state which is generally called quick line.

5. Carbonic acid gas may also be obtained by burning charcoal in oxygen gas.

Take a bell-glass, filled with oxygen gas, resting inverted in a basin of mercury; pass up into it some bits of new-made charcoal, with some touch-paper affixed to then; set fire to them by means of a lens collecting the sun's rays, and carbonic acid will be produced by the combustion of the

Carbonic acid gas is often found occupying the lower parts of mines, caverus, tombs, and such other subterraneous places as contain materials for producing it. It is called choke, or chaik-damp. The grotto del Cane, near Naples, has long been famous for the quantity of carbonic acid gas produced there, which runs out at the opening like a stream of water. The quantity of carbonic acid gas generated in this cavern, is so great, that a dog, or any other animal, is immediately killed if his nose be thrust into it.

The carbonic acid, existing naturally in the state of gas, may be collected by filling bottles with water and emptying them into the atmosphere of this gas; the gas takes the place of the water, and fills the bottles, which must then be

Carbonic acid gas is likewise formed during fermentation; on account of its great weight, it occupies the apparently empty space, or upper part of the vessel, in which the fermenting process is going on. It may in this case, be collected in a

manner smilar to that above.

Carbonic acid gas is also obtained during the reduction of metallic oxyds, and during the deflagration of nitrates with combustible bodies. This gas is much esteemed in the cure of typhus fevers, and irritability and weakness of stomach producing vomit-Against the former diseases it is given by administering yeast, bottle porter, and the like; and for the latter it is disengaged from the carbonated alkali by lemon juice in a draught given while efferveseing

CARBUNCLE. (Dim. of carbo, a burning coal.) Carbo. Rubinus verus. Codesella. Erythema gangranosum. Granatristrum. Pruna. Persicus ignis of Avicenua. An inflammatory tumour which soon becomes gangrenous. See .Inthrax.

CARBUNCULUS. Sce Carbuncle. Cancarus. Carcaros. (From xxexxee,

o resound.) A kind of fever in which the

patient has a continual horror and trembling, with an uncesasing sounding in his

CARCAS. The Barbadoes nut-tree, the Cataputia,

CAREAX. (From Raga, a head.) A spe-

CARCER. Paracelsus means by it, a remedy proper for restraining the disorder by motions of body and mind, as in curing the chorea Sancti Viti.

CARCHESIUS. (Kaganous.) A mane of some bandages noticed by Galen, and described by Oribasius. Properly it is the top of a ship's mast.

CARCINOMA. (From ragents, a cancer, and using, to feed upon.) See Cancer. CARCINOS. (Kagniy 3, a cancer.) See

CARDAMANTICA. (From nagoapor, the nasturtium.) A species of sciatica cresses. CARDAMELEUM. A medicine of no note,

mentioned by Galen,

CARDAMINE. (From nagolia, the heart; because it acts as a cordial and strengthener, or from its having the taste of cardamum, that is, nasturtium, or cress.) Cuckoo flower.

1. The name of a genus of plants in the Linnæan system. Class, Tetradynamia. Or-

der, Siliquosa.

2. The pharmacopæial name of the common lady's smock, or cuckoo flower. Cardamine pratensis of Linnaus:—foliis pinnatis, foliolis radicalibus subrotundis, cantinis lanceolatis. This plant is also called Cardamantica. Nasturtium aquaticum Culi flos. Iberis sophia. It is the flower of this plant which has a place in the materia me-dica, upon the authority of Sir George Baker, who has published five cases, two of chorea Sancti Viti, one of spasmsodic asthma, and hemiphlegia, and a case of spasmodic affections of the lower limbs, wherein the flores cardamines were supposed to have been successfully used. A variety of virtues have been given to this plant, which do not deserve the attention of practitioners.

CARDAMINE PRATENSIS. The systematic name of the plant called cardamine in the pharmacopæias. See Cardamine.

CARDAMINES FLORES. See Cardamine.

CARDAMOMUM. (From καρθαμον, and αμωμον: because it partakes of the nature, and is like both the cardamum and amomum.) The cardamom seed, or grains of Paradise.

CARDAMOMUM MAJUS. A large, brown, somewhat triangular husk, the thickness of one's thumb, and pyramidial. A large, The seeds resemble the grana paradisi; their virtues are similar to those of the cardamomum minus.

CARDAMOMUM MEDIUM. seeds correspond, in every respect, with the lesser, except in size, they being twice as long, but no thicker than the cardamo -mum minus.

CARDAMOMUM MINUS. Officinal cardan ini. Amomum repens, seu le cardamome de la côte de Malabar, of Sonnerat. Eletturia cardamomum, of Maton in Act. Soc. Liu. Class, Monandria. Order, Monogynia. The seeds of this plant are imported in their capsules or husks, by which they are preserved, for they soon lose a part of their flavour when freed from this covering. On being chewed they impart a glowing aroma ic warmth, and grateful pungency; they are supposed gently to stimulate the stomach, and prove cordial, carminative, and antispasmodic, but without that irritation and heat which many of the other spicy aromatics are apt to produce. Simple and compound spirituous tinctures are prepared from them, and they are ordered as a spicy ingredient in many of the officinal compositions.

CARDAMONUM PIHERATUM. The grains

of Paradise.

CARDAMOMUM SIBERIENSE. The Ani-

sum Indicum.

CARDAMUM. (From xxgdx, the heart; because it comforts and strengthens the heart.) Garden cresses.

CARDIA. (From reag, the heart; so the Greeks called the heart.) The superior opening of the stomach.

CARDIACA. (From ungoin, the heart.)

1. Cordials. See Cordials.

2. The pharmacoperal name of motherwort. So named from the supposed relief it gives in fain-ings and disorders of the stomach. Agripalma gallis. Marrubium. Cardiaca crispa. Leonurus cardiaca of Lanavus:—fodis caulinis lanceolatis, trilobis. The leaves of this plant have a disagreeable smeil and a bitter taste, and are said to be serviceable in disorders of the stomach of children, to promot the uterine discharge, and to a lay p. lpitations of the heart.

CAHDIACA CONFECTIO. See Confectio aro-

matica.

Campiaca passio. The cardiac passion. Ancient writers frequently mention a disor or under this name, but the moderns always speck of it as a syncope.

CARDIACTS MORBUS. A name by which

the ancients called the typhus fever.

CARDIALGIA. (From napola, the cardia, and axyew, to be pained.) Pain at the The heartburn. Dr. Callen ranks it as a species of dyspepsia. burn is an uneasy sensation in the stomach, with anxiety, a heat more or less violent, and sometimes attended with oppression, faintness, an inclination to vomit, or a plentiful discharge of clear lymph, like saliva, This pain may arise from various and different causes; such as flatus; from sharp humours, either acid, bilious, or rancid; from worms gnawing and vellicating the coats of the stomach; from acrid and pungent food, such as spices, aromatics, &c; as also from rheumatic and gouty humours, or surfeits; from too free a use of tea, or watery fluids relaxing the stomach, &c.; from the natural mucus being abraded, particularly in the upper ordice of the stomach

CARDIALGIA INFLAMMATORIA. Inflam-

mation in the stomach.

Cardialgia sputatoria, i- e. pyrosis. See Purosis.

CANDIMELECH. (From ragedia, the heart, and meleck, Heb. a governor.) A fictuous term in Doiæus's Encyclopædia, by which he would express a particular active principle in the heart, appointed to what we call the vital functions.

CARDIMONA. A name for Cardialgia. Cardinal flowers, blue. See Lobelia.

CARDINAMENTUM. (From cardo, a hinge,) A sort of articulation like a hinge.

CARDIOGMUS. (From x2geluarax, to have a pain in the stomach.) The same as Cardialgia. Also an aneurism in the aorta, near the beart, which occasions pain in the præcordia.

Cardionchus. (From angola, the heart, and opass, a tumour.) An aneurism in the heart, or in the aorta near the heart.

Carpiotrotes. (From καρδία, the heart, and τιτεωσκω, to wound.) One who bath

a wound in his heart.

. CARDITIS. (From xagdia, the heart.) Inflammation of the heart. It is a genus of disease arranged by Cullen in the class pyrexiae, and order phlegmasiae. It is known by pyrexia, pain in the region of the stomach, great anxiety, difficulty of breathing, cough, irregular pulse, palpitation, and fainting, and the other symptoms of inflammation.

CARDO. (A hinge.) The articulation called Ginglymus; also the second vertebra

of the neck.

Cardonium. So Paracelsus calls wine medicated with herbs.

CARDOPATIA. The low carline thistle,

said to be diaphoretic,

CARDUUS. (à carere, quusi aptus carende lanz, being fit to tease wool; or from xiga, to abrade; so named from its roughness, which abrades and tears whatever it meets with) The thistle, or teasel. The name of a genus of plants in the Linnxan system. Class, Syngenesia. Order, Polygamia aqualis.

CARDUUS ACANTHUS. The bear's breech.

CARDUUS ALTILIS. The artichoke.

CARDUUS BENEDICTUS. Cuicus sylvestris. Blessed or holy thistle. Centaurea benedicta; calycibus duplicato spinosis lanatis involucratis, folis semi decurrentibus denticulato-spinosis of Linnæus. Class, Syngenesia. Order, Polygamia frustranea. This exotic plant, a native of Spain and some of the Archipelago islands, obtained the name of Benedictus, from its being supposed to possess extraordmary medicinal virtues. In loss of apetite, where the stomach was injured by irregularities, its good effects

have been frequently experienced. It is a powerful bitter tonic and adstringent. Bergius considers it as antacid, corroborant, stomachic, sudorific, diuretic, and eccoprotic. Ch momile flowers are now generally substituted for the carduus benedictus, and are thought to be of at least equal

CARDUUS HEMORRHOIDALIS. (So called because it is said to relieve the pains of the hæmorrhoids, if beat into a poultice and applier.) Also called carduus vinearum re-pens, sonchi folio, cirsum arvense, ceanothos. The common creeping way thistle. Serratula arvensis of Linuxus.

CAUDUUS LACTEUS. See Cardinis Maria. CARDUUS LACTEUS SYRIACUS. Spanish milk-thistle. Stomachic and ano-

CARDUUS MARIE. Carduus afois maculis notatus vulgaris, C. B. Common milk-thistle, or Lady's thistle. The seeds of this plant, Carduus marianus; foliis amplexicaulibus, hastato-pinnatifidis, spinosis; calicibus aphyllis; spinis caniliculatis, du-plicato-spinosis, of Linnaus, and the herb have been employed medicinally. former contains a bitter oil, and are re-commended as relaxants. The juice of the latter is said to be salutary in dropsies, in the dose of four ounces; and, according to Millar, to be efficacious against pungent

The systematic CARDUES MARIANUS. name of the officinal Carduns maria.

CARDUUS SATIVUS. The artichoke.

CARDUUS SOLSTITIALIS. The calcitrapa officinalis.

CARDULS TOMENTOSUS. The woolly thistle. The plant distinguished by this name\* in the pharmacopaias, is the Onopordium acanthium of Vinneus:—calycibus squaveosis; squamis patentibus; foilis avato oblongis, sinuatis. Is expressed juice has been recommended as a cure for cancer, either applied by moistening last with it, or mixing some simple farmaccous substance, so as to form a poultice, which should be in contact with the disease, and renewed twice

CAREHHARIA. (From xzgn, the head, and £zgoc, weight.) A painful and uneasy heavi-

ness of the head.

CARENUM. (From wage, the head.) Galen uses this word for the head

CAREUM VINUM Strong wine, CAREUM. From Carea, the country wheree they were brought) The caraway.

CAREX. (From cares, not quia riribus careat, but because, from its rouganess, it is fit ad carendum, to card, tease, or pull.) Sedge. The name of a genus of plants in the Linnean system. Class, Monoecia. Order, Triandria.

CAREX AREVARIA. The systematic name of the officinal sarsaparilla Germanica. See Sursaparilla Germanica.

(From Carica, the place CARICA.

where they are cultivated.) Ficus. Ficus vulgaris. Ficus communis. Yuxn of tle Greeks. The fig. The plant which affords this fruit is the Ficus Carica of Linnæus. Fresh figs, are, when completely ripe, soft, succutent, and easily digested, unless eaten in immoderale quantities, when they are apt to occasion flatulency, pain of the bowels, and dearrhosa. The dried fruit, which is sold in our shops, is pleasanter to the taste, and more wholsome and nutritive. They are directed in the decoctum hordei compositum, and in the electuarium lenitivum. Applied externally, they promote the suppuration of tumours; hence they have a place in maturing cataplasms; and are very convenient to apply to the gums, and, when boiled with milk, to the throat.

Carica Papara. Papaw tree. Every part of the p paw tree, except the tipe fruit, affords a misky jusce, which is used, in the Isle of France, as an eff ctual remedy for the tape worm. In Europe, however, whither it has been sent in the concrete state, it has not answered, perhaps from some change it had undergone, or not having been given in a sufficient dose.

CARICUM. (From Caricus, its inventor.) Carycum. An ointment for cleansing ulcers, composed of helleborc, lead, and cantharides.

CARIES. (From carah, Chald) Bottenness, or mortification of the bones.

CARIMA. The cassada bread.

CARINA. A name formerly applied to the back bone.

CARLUM TERRA. Lime.

CARIVILLANDI. A name of sarsaparilla

CARLINA. (From Carolus, Charles the Great, or Charlemagne; because it was believed that an angel shewed it to him, and that, by the use of it, his army was preserved from the plague.) Carline thistle. The name of a genus of plants in the Linnzan system. Class, Syngenesia. Order, Polygama aqualis. The officinal name of two kinds of plants. See Chamæmelon album and Cirlina gummifera.

CARLINA SCAULIS. The systematic name

of the chamemelon album.

CARLINA GUMMIFERA. Carduus pinea. Ixine Pine thistle. This plant is the Atracylis gumnifera of Linnaus. The root, when wounded, yields a milky, viscous juice, which concretes into tenacious masses, at first whitish, resembling wax, when much handled growing black; it is said to be chewed with the same views as mastich.

Cariine thistle. S & Chameleon album.

CARLO SAVETO RADIX. St. Charles's roct; so called by the Spaniards, on account of its great virtues. It is found in Mechaechan, a province in America. Its bark bath an aromatic flavour, with a bitter acrid taste. The root itself consists of slender fibres. The bark is sudoritic, and strengthens the gums and stomach.

CARMEN. (A verse; because charms usually consisted of a verse.) A charm; an

amulet.

Canmelite water; so named from its inventors; composed of baum, lemon-pecl, &c.

CARMINANTIA. See Carminatives.
CARMINATIVES. (Carminativa, sc. medicamenta. from carmen, a verse or charm; because practitioners, in ancient times, ascribed their operation to a charm or enchantment.) A term applied to those substances which allay pain, and disperflatulencies of the prima via. The principal carminatives are the semina cardamouni, anisi et carni; olca essentialia carui, anisi et juniperi; confectio aromatea; pulvis aromaticus; tinctura cardamomi; tinctura cinamomi composita; zinziber; tonics, bitters, and astringents.

CARNABADIUM. Caraway seed.

CARNEÆ COLUMNÆ. The fleshy pillars or columns in the cavities of the heart. See *Heart*.

CARNICULA. (Dim. of caro, carnis, the flesh) The fleshy substance which sur-

rounds the gunis.

CANTIFORMIS. (From caro, flesh, and forma, likeness) Having the appearance of flesh. It is commonly applied to an abscess where the flesh surrounding the orifice is hardened and of a firm consistence.

CARO Flesh. The red part or belly of

a muscle; also the pulp of fruit.

CARO ADNATA. The recent swelled testicle.

CARDLINA See Carlina.

Canopi. The amomum verum.

Carona. The name of a vessel that resembles an urisal.

Canosis. See Carus. Canora. See Daucus.

CAHOTIDIE ARTERIE, See Carotides.

CAROTID ARTERY. (From nagow, to cause to sleep; so called because, if tied with a ligature, they cause the animals to be comatose, and have the appearance of being asleep. The carotids are two considerable arteries that proceed, one on cach side of the cervical vertebia, to the head, to supply it with blood. The right carotid does not arise immediately from the arch of the aorta, but is given off from the arteria innominata. arises from the arch of the aorta. Each carotid is divided into external and internal, or that portion without and that within the cranium. The external gives off eight branches to the neck and face, viz. anteriorly, the superior thyroidcal, the sublingual, the inferior maxillary, the external maxillary; posteriorly, the internal maxillary, the occipital, the external auditory, and the temporal. The internal carotid or cerebral artery, gives off four branches within the cavity of the cranium; the

anterior cerebral, the posterior, the central artery of the optic nerve, and the internal orbital.

CAROUM. The caraway seed.

CARPASUS. (So named @422 TO XA25) @2010 Act : because it makes the person who eats it appear as if he was asleep.) An herb, the juice of which was formerly called opocarpason, opocarpathon, or opocalpason: according to Galen it resembles myrch; but is esteemed highly poisonous.

Carpathicus Balsamus. Oleum Germanis. Carpathicum. This balsam is obtained both by wounding the young branches of the Pinus cembra of Linnaus: —foliis quinis, levibus, and by boiling them. It is mostly diluted with turpentine, and comes to us in a very liquid and pellucid state, rather white.

CARPENTARIA. (From Earpentarius, a carpenter; and so named from its virtues in healing cuts and wounds made by a tool.) A vulnerary herb; but not properly

known what it is.

Carphaleus. (From wagow, to exsiccate,) Hippocrates uses this word to mean dry, opposed to moist.

CARPHUS. (From \*\*zep\*\*, a straw.) In Hippocrates it signifies a mote, or any small substance. A pustule of the smallest kind. Also the herb frangreek.

CARPIA. (From carpo, to pluck off, as lint is from linen cloth.) Lint. See Lint.

CARPISMUS. The wrist.

CARPOBALSAMUM. (From μαςπος, frait, and βαλσαμον, balsam.) See Balsamum Gileadense.

CARPOLOGAI. (From curpo, to pluck or pull gently.) Picking the clothes, as in dangerous fevers.

CARPUS. (Kagros, the wrist.) The wrist, or carpus. It is situated between the fore arm and hand. See Bones.

Carrot. See Daucus.

Carrot, candy. See Daucus Creticus. Carrot poultice. See Cataplasma dauci.

CARTHAMUS. (From xxbx1ga, to purge.) 1. The name of a genus of plants in the Linnwan system. Class, Syngenesia.

Order, Polygamia aqualis.

2. The pharmacopoial name of the saffron flower, Carthamus tinctorius of Linnæus:-foliis ovatis, integris, serrato aculeatis: called also Cnicus, Crocus Saracenicus, Carthamum officinarum, Carduus sativus. plant is cultivated in many places on account of its flowers, which are used as a yellow die. The seeds, freed from their shells, have been celebrated as a gentle cathartic in a dose of one or two drachms. They are also supposed to be diuretic and expectorant; particularly useful in humoral asthma, and similar complaints. The carthamus lanatus is considered in France, as a febrifuge and sudorific. The dried flowers are frequently mixed with saffror, to adulterate it.

CARTHAMUS TINCTORIES. The systematic name of the safflower plant. See Carthamus.

CARTHUSIANUS. (From the Monks of that order, who first invented it.) A name of the precipitated sulphur of antimony.

CARTILAGE. (Quasi carnilago; from caro, carmis, flesh.) A white clastic, glistering substance, growing to bones, and commonly called gristle. Cartilages are divided, by anatomits into obducent, which cover the moveable articulations of bones; inter-articular, which are situated between the articulations, and uniting cartilages, which unite one bone with another. Their use is to lubricate the articulations of bones, and to connect some bones by an immoveable connexion.

CARTILAGO ANNULARIS. See Car-

tilago cricoidea.

CARTILAGO ARYTÆNOIDEA.

CARTILAGO CRICOIDEA, The cricoid cartilage belongs to the larynx, and is situated between the thyroid and arytenoid cartilages and the trachea; it constitutes, as it were, the basis of the many annular cartilages of the trachea.

CARTILAGO ENSIFORMIS. Cartilago xyphoidea Ensiform cartilage. A cartilage shaped somewhat like a sword or dagger, attached to the lowermost part of the sternum, just at the pit of the stomach.

CARTILAGO SCUTIFORMIS. See Thyroid

cartilage,

CARTILAGO THYROLDEA. See Thyroid car-

CARTILAGO XYPHOIDEA.

ensi formis. CARUI. (Carnia, Arabian.) The cara-

See Cartilago

way. See Carum.

CARUM. (Kagos: so named from Caria, a province of Asia.) The caraway.

1. The name of a genus of plants in the Linnæan system. Class, Pentandria. Or-

der, Monogynia.

2. The pharmacopæial name of the caraway plant. It is also called Carvi Cuminum pratense. Caros. Carnon. And is the Carum carui of Linnæus. The seeds are well known to have a pleasant spicy smell, and a warm aromatic taste; and, on this account, are used for various economical purposes. They are esteemed to be carminative, cordial, and stomachic, and recommended in dyspepsia, flatulencies, and other symptoms attending hysterical and hypochondriacal disorders. An essential oil and distilled water are directed to be prepared from them by the London college.

CARUM CARUI. The systematic name

for the plant whose seeds are called cara-

way. See Carum.

(Diminutive of care, CARUNCLE. flesh.) Caruncula. A little fleshy excrescence; as the carunculæ myrtiformes, carunculæ lachrymales, &c.

CARUNCULA LACHRYMALIS. long considal gland, red externally, situated in the internal canthus of each eye, before the union of the eyelids. It appears to be formed of numerous sebaceous glands, from which many small hairs grow. The hardened smegma observable in this part of the eye in the morning, is separated by this carmincle.

CARUNCULE CUTICULARES ALE.

uymphæ.

CARUNCULE MAMMILLARES. The extre-

mities of the tubes in the nipple.

CARUNCULÆ MYRTIFORMES. When the hymen has been lacerated by attrition, there remains in this place two, three, or four caruncles, which have received the name of myrtiform.

CARUNCULE PAPILLARES. The protuberances within the pelvis of the kidney, formed by the papillous substance of the

CARUNCULOSA ISCHURIA. A suppression of urine, from caruncles in the ure-

Canuon. See Carum.

CARUS. (Kagos: from naga, the head, as being the part affected.) Caros. Carosis. 1. Insensibility and sleepiness, with quiet respiration.

2. A profound sleep, without fever. A

lethargy.

3. The name of the caraway-seed.

Carva. The cassia lignea.

CARYEDON. (From xagua, a nut.) rydon. A sort of fracture, where the bone is broken into small pieces, like the shell of a cracked nut.

CARYDON. See Carnedon.

CARYOCOSTINUM. (From xxeucv, the caryophyllus, and xosivos, composed of the costus.) An electuary, named from its in-

gredients.

CARYOPHYLLATA. (From καξυοφυλ-Nov, the carrophyllus; so named because it smells like the caryophyllus, or clove July flower.) Herba benedicta. Caryophyllus vulgaris. Garyophilla. Janamunda. Avens, or herb bennet. The root of this plant, Geum urbanum of Linnaus:-floribus erectis, fructibus globosis villosis, aristis uncinatis nudis, foliis lyratis, has been employed as a gentle styptic, corroborant, and sto-machic. It has a mildly austere, somewhat aromatic taste, and a very pleasant smell, of the clove kind. It is also esteemed, on the continent, as a febrifuge.

CARYOPHYLLOIDES CORTEX: See Culi-

CARYOPHYLLUS. (Καξυοφυλλον: from uzguor, a nut, and φυλλον, a leaf; so named because it smells like the leaves of the Indian nut, or clove-tree.) The clove-tree.

The name of a genus of plants in the Linnæan system. Class, Polyandria. Order, Monogynia.

CARYOPHYLLUM AROMATICUM,

The tree which affords this The clove. spice is the Eugenia caryophyllata of Wildenow, which grows in the East Indies, the Moluccas, &c. The clove is the unexpanded flower, or rather the calyx; it has a strong agreeable small, and a oitterish, hot, not very pungent, taste. The oil of cloves, commonly met with in the shops, and received from the Dutch, is highly acrimonious, and sophisticated. Clove is accounted the hottest and most acrid of the aromatics; and, by acting as a powerful stimulant to the muscular fibres, may, in some cases of atonic gout, paralysis, &c. supersede most others of the aromatic class; and the foreign oil, by its great acrimony, is also well adapted for several external purposes: it is directed by several pharmacopæias, and the clove itself enters many officinal preparations.

Tuni-CARYOPHYLLUM RUBRUM. Vetonica. Betonica. Coronaria. ryophillis hortensis. Clove pink. gilliflower. Clove July flower. This fragrant plant, Dianthus caryophyllus of Linnæus :- floribus solitariis, squamis calycinis subovatis, brevissimis, corollis crenatis, grows wild in several parts of England; but the flowers, which are pharmaceutically em-ployed, are usually produced in gardens: they have a pleasant aromatic smell, somewhat allied to that of clove spice: their taste is bitterish and sub-adstringent. These flowers were formerly in extensive use, but are now merely employed in form of syrup, as a useful and pleasant vehicle

for other medicines.

CARYOPHYLUS AROMATICUS AMERICANUS. The piper Jamaicensis.

CARYOPHYLLUS HORTENSIS.

phyllum rubrum.

CARYOPHYLLUS VULGARIS. The caryo-

The caryo-

phyllata.

CARYOTIS. (From Exeguor, a nut.) Caryota. Galen uses this word to mean a superior sort of dates, of the shape of a nut.

CASCARILLA. (Dim. of cascava, the bark, or shell. Span.) Chocarilla Eluteria. Eluteria. The tree that shords the cascarilla bark, is the Croton cascarilla of Linnæus. The bark comes to us in quills, covered upon the outside with a rough, whitish matter, and brownish on the inner side, exhibiting, when broken, a smooth, close, blackish brown surface. It has a lightly agreeable smell, and a moderately bitter taste, accompanied with a considerable aromatic warmth. It is a very excellent tonic, adstringent, and stomachic, and is deserving of a more general use than it has hitherto met with.

CASCHU. See Catechu.

Cashew nut See Anacardium occidentale.
Cashoo. An aromatic drug of Hindostan, said to possess pectoral virtues.

CASIA. See Cassia.

CASMINARIS. The cassamunia of Bengal.

Cassa. (Arab.) The thorax, or breast, Cassaba. S e Cassava.

Cassamum. The fruit of the balsam tree.

CASSAVA. Cassada. Cacavi. Cassare. Pain de Madagascar. Ricinus minor. Maniot. Yucca. Maniibar. Aipi. ma coxera. Aipipoca. Janipha. plant so called is the Jatropha manihot of Linnæus. The leaves are boiled, and eaten as we do spinage. The root abounds with a milky juice, and every part, when raw, is a fatal poison. It is remarkable that the poisonous quality is destroyed by heat: hence the juice is boiled with meat, pepper. &c. into a wholesome somp, and what remains after expressing the juice, is formed into cakes, or meal, the principal food of the inhabitants. This plant, which is a native of three quarters of the world, is one of the most advantageous gitts of Providence, entering into the composition of innumerable preparations of an economical

Cassada roots yield a great quantity of starch, called tapacea, exported in little lumps by the Brazilians, and now well known to us as diet for sick and weakly persons.

CASSADA. See Cassara.

CASSIA. (From the Arabic katsia, which is from katsa, to tear off; so called from the act of stripping the bark from the tree.) The name of a genus of plants in the Linnæan system. Class, Decandric. Order, Monogynia. Cassia and Seneca belong to this genus. See Cassia fistularis, and Senna.

CASSIA CARYOPHYLLATA. Clove bark tree. The bark of this tree, Myrtus caryophyllata of Lienæus:—pedunculis trifido-multiflorus, foliis ovatis, is a warm aromatic, of the smell of clovespice, but weaker, and with a little admixture of the cinnamon flavour. It may be used with the same views as cloves, or cinnamon.

Cassia fistula. The systematic name of the purging cassia. See Cassia fistularis. CASSIA FISTULARIS. Cassia nigra. Cassia fistula. Alexandrina. Chaiarxumbar. Canna Cussia solutiva. Tlai. Xiem. Purging cassia. This tree, Cassia fistula of Linnans:-foliis quinquejugis ovatus acuminatis glabris, petrolis eglandulatis, is a native of both Indies. The pods of the East-India cassia are of less diameter, smoother, and afford a blacker, sweeter, and more grateful pulp, than those which are brought from the West-Indies. Those pods which are the heaviest, and in which the seeds do not rattle on being shaken, are commonly the best, and contain the most pulp, which is the part medicinally employed, and to be obtained in the manner described in the pharmacopæias. The best pulp is of a bright shining black colour, and of a sweet taste, with a slight degree of acidity. It

has been long used as a laxative medicine, and being gentle in its operation, and seldom disturbing the bowels, is well adapted to children, and to delicate or pregnant women. Adults, however, find it of little effect, unless taken in a very large dose, as an ounce or more; and, therefore, to them this pulp is rarely given, but usually conjoined with some of the brisker purgatives. The officinal preparation of this drug, is the confectio cassiæ; it is also an ingredient in the confectio sennæ.

CASSIÆ ARAMENTUM. The pulp of cas-

Sia.

CASSLE FLORES. What are called cassia flowers in the shops, are the flowers of the true cinnamon tree, Laurus cinnamomum of Linnaus. They possess aromatic and adstringent virtues, and may be successfully employed in decoctions, &c. in all cases where cinnamon is recommended.

See Cinnamomum.

CASSIA LIGNEA. Cortex canella Malabarica. Cassialignea Malabarica. Xylocassia. Canella Malabarica et Javensis. Karva. Canella Cubana Arbor Judaica. Cussia canella. Canellifera Malabarica. Cortex crassior. Cimamomum Malabaricum. Calihacha canela. Wild cinnamon-tree. Malabar cinnamon-tree, or cassia lignea tree. Cassia lignea is the bark of the Laurus cassia of Linnaus :- foliis triplinerviis lanceolatis, whose leaves are called folia malabathri in the shops. The bark and leaves abound with the flavour of cinnamon, for which they may be substituted; but in much larger doses, as they are considerably weaker.

Cassia, purging. See Cassia fistularis.
Cassia senna. The systematic name of the plant which affords senna. See Senna.

CASSIÆ PULPA. See Cassia fistularis. CASSOB, An obsolete term for kali.

Casso Leta. Warm finnigations described by Marcellus.

CASSONADA. Sugar.

Cassymmentar. (Of uncertain derivation, perhaps Indian.) Casumunar. Casmina. Risagon. Bengale Indorum. The root, occasionally exhibited under one of these names, is brought from the East Indies. It comes over in irregular slices of various forms, some cut transversely, others longitudinally. The cortical part is marked with circles of a dusky brown colour: the internal part is paler, and unequally yellow. It possesses moderately warm, butter, and aromatic qualities, and a smell like ginger. It is recommended in hysterical, epileptie, and paralytic affections.

CASTANEA. (Castanea, Kaszwer: from Castana, a city in Thessaly, whence they were brought.) Lopima. Mota. Glans Jovis Theophrasti. Jupiter's acorn, and Sardinian acorn. The common chesnut. The fruit of this plant, Fagus castanea of

Linneus:—folis lanceolatis, acuminato-serratis, subtus nudis, are much esteemed as an article of luxury, after dinner. Toasting renders them more easy of digestion; but, notwithstanding, they must be considered as improper for weak stomachs. They are moderately nourishing, as containing sugar, and much farinaceous substance.

CASTANEA EQUINA. The horse-chesnut.

See Ihppocastanum.

Castanea flore albo. Coffee.

CASTLE-LEOD WATERS. A sulphureous spring in Rosshire, celebrated for the cure of cutaneous diseases and foul ulcers.

CASTOR FIBER. The generic name of the beaver. See Castoreum Russicum.

the beaver. See Castoreum Russicum. Castor. See Castoreum Russicum.

Castor oil. See Ricinus.

Custor, Russian. See Castoreum Russi-

CASTOREUM RUSSICUM. reum, from uzsug, the beaver, quasi pasug; from pasug, the belly; because of reum, the largeness of its belly; or à castrando, because he is said to castrate himself in order to escape the hunters.) Castoreum. Russian castor. A peculiar concrete substance, obtained from the Castor fiber of Linnxus, or beaver, an amphibious quadruped inhabiting some parts of Prussia, Russia, Germany, &c.; but the greatest number of these animals is met with in Canada. name of custoreum is given to two bags, situated in the inguinal regions of the male beaver, which contain a very odorous substance, soft, and almost fluid when recently cut from the animal, but which dries, and assumes a resinous consistence in process of This substance has an acrid, bitter and a nauseous taste; its smell is strong, aromatic, and even fortid. It is used medicinally, as a powerful antispasmodic in hysterical and hypochondriacal affections, and in convulsions, in doses of from 10 to S0 grains. It has also been successfully administered in epilepsy and tetanus. It is occasionally adulterated with dried blood, gum-ammoniacum, or galbanum, mixed with a little of the powder of castor, and some quantity of the fat of the beaver,

CASTORIUM. See Castoreum Russi-

cum.

CASTRATION. Celotonia. Orchotomia. A chirurgical operation, by which a testicle is removed from the body.

CASTRENSIS. (From castra, a camp.) A name applied to those diseases with which soldiers, encamped in marshy places, are afflicted.

CATABASIS. (From natabawa, (to descend.) A descent or operation down-

wards.

CATABIBASIS. (From καταδιδαζω, to eause to descend.) An exclusion, or expulsion of the humours downwards.

CATABLACEUSIS. (From xatashaneum, to be useless.) Hippocrates uses this word

# A .

to signify carelessness and negligence in the attendance on, and administration to the

CAT

CATABLENA. (From καταβαλλω, to throw round.) The outermost fillet, which se-

cures the rest of the bandages.

CATABRONCHESIS (From Raia, and Booy xos the throat; or nalabeogyzizw, to swallow.) The act of swallowing.

CATACAUMA. (From uzlanau, to burn.)

A burn, or scald.

CATACAUSIS. (From nalanaia, to burn.) The act of combustion, or burning.

CATACECLIMENUS. (From nalandivopal, to lie down.) Keeping the bed, from the violence of a disease.

GATACECRAMENUS. (From nalanegavvupu, to reduce to small particles.) Broken into small pieces. It is used of fractures.

CATACERASTICA. (From κεθακεζαννυμι, to mix together.) Medicines which obtund the acrimony of humours, by mixing

with them and reducing them.

CATACHLIDESIS. (From κλαχλιδίαω, to indulge in delicacies.) A gluttonous indulgence in sloth and delicacies, to the generation of diseases.

(From nalaxer, to CATACHRYSTON. anoint.) An unguent, or ointment.

CATACHRYSMA. An ointment.

CATACLASIS. (From nalandam, to break, or distort.) Distorted eyelids.

CATACLEIS. (From nala, beneath, and khus, the clavicle.) The subclavicle, or first rib, which is placed immediately under the clavicle.

CATACLINES. (From nalanning, to lie down.) One who, by disease, is fixed to

his bed.

CATACLISIS. (From nalanhwa, to lie down.) A lying down. It means also in-

CATACLYSMA. (From nalandula, to wash.)

A clyster

CATACLYSMUS. (From καλακλυζω, to wash.) An embrocation. A dashing of

water upon any part.

CATACHREMNOS. (From nala, and nenuthis word, a swoln and inflamed throat, from the exuberance of the parts.

CATACRUSIS. (From nalangew, to drive

back.) A regulsion of humours.

CATABOULESIS. (From uxlad 8200, to enslave.) The subduing of passions, as in a phrensy, or fever.

CATEGIZESIS. (From nalar, ila, to repel.) A revulsion or rushing back of hu-

mours, or wind in the intestines.

CATRONESIS. (From nalatorso, to irrigate.) Irrigation by a plentiful affusion of liquor on some part of the body.

CATAGMA. (From unla, and aya, to break.) A fracture. Galen says a solution of the bone is called catagma, and elcos is a solution of the continuity of he flesh: that when it happens to a cartilage, it has no name, though Hippocrates calls it ca-

CATAGMATICA. (From nalayma, a fracture.) Cataginatics. Remedies proper for cementing broken bones, or to promote

a callus. CATAGOGE. (From uxlayopus, to abide.) The seat or region of a disease or part.

CATAGYIOSIS. (From unlayuna, to debilitate.) An imbecility and enervation of the strength and limbs.

CATALEPSIS. (From καλαλαμβανευς, to seize, to hold.) Catoche. Catochus. Congelatio. Detentio. Encatalepsis; and by Hippocrates uphonia; by Antigenes anaudia: by Calius Aurelianus apprehensio. oppressio; comprehensio. Apoplexia cataleptica of Cullen. A sudden suppression of motion and sensation the body remaining in the same posture that it was in when

seized. Dr. Cullen says, he has never seen the catalepsy except when counterfeited; and is of opinion, that many of those cases related by other authors, have also been counterfeited. It is said to come on suddenly, being only preceded by some languor of body and mind, and to return by paroxysms. The patients are said to be for some minutes, sometimes (though rarely) for some hours, deprived of their senses, and all power of voluntary motion; but constantly retaining the position in which they were first seized, whether lying or sitting; and if the limbs be put into any other posture during the fit, they will keep the posture in which they are placed. When they recover from the paroxysm, they remember nothing of what passed during the time of it, but are like persons awakened out of a sleep.

CATALOTICA. (From uzlahoza, to grind down) Medicines to soften and make smooth the rough edges and crust of cica-

trices.

CATALYSIS. (Καταλυσις: from καταλυω, to dissolve or destroy.) It signifies a palsy, or such a resolution as happens before the death of the patient; also that dissolution which constitutes death.

CATAMARASMUS. (From Ralauagawa, to grow thin.) An emaciation, or resolution

of tumours.

CATAMASSESIS. (From nalamaggomas, to manducate.) The grinding of the teeth, and biting of the tongue; so common in

epileptic persons.

CATAMENIA. (From nala, according to, and pur the month.) Mensec. The monthly discharge of blood from the uterus of females, between the ages of 14 and 45. Many have questioned whether the catamenial discharge arose from a mere rupture of vessels, or whether it was owing to a secretory action. There can be little doubt of the truth of the latter. The secretory organ is composed of the arterial

vessels situated in the fundus of the uterus. The dissection of women who have died during the time of their menstruating, proves this. Sometimes, though very rarely, women, during pregnancy, menstruate; and when this happens, the discharge takes place from the arterial vessels of the va-During pregnancy and lactation, when the person is in good health, the catamenia, for the most part, cease to flow. The quantity a female menstruates at each time, is very varied; depending on climate, and a variety of other circumstances. It is commonly, in England, from five to six ounces: it rarely exceeds eight. Its duration is from three to four, and sometimes, though rarely, five days. With respect to the nature of the discharge, it differs very much from pure blood; it never coagulates, but is sometimes grumous, and membranes like the decidua are formed in difficult menstruations: in some women it always smells rank and peculiar; in others it is inodorous. The use of this monthly secretion is to render the uterus fit for the conception and nutrition of the fœtus; therefore girls rarely conceive before the catamenia appear, and women rarely after their entire cessation; but very easily soon after menstruation.

CATANANCE. Succory.

CATANIPHTHIS. (From Ralarvalae, to wash.) Washed, or sconred. It is used by Hippocrates of a diarrhoa washed and cleansed by boiled milk.

CATANTLEMA. (From xalavlaaa, to pour upon.) A lotion by infusion of water, or

medicated fluids.

CATANTLESIS. A medicated fluid.

CATAPASMA. (From @200w, to sprinkle.) Catapastum. Conspersio. Epipaston. Pasma symposmata. Aspersio. Aspergines. The ancient Greek physicians meant by this, any dry medicine reduced to powder, to be sprinkled on the body. Their various uses may be seen in Paulus of Egina, lib. vii. cap. xiii.

CATAPAUSIS. (From nalarauw, to rest, or cease.) That rest or cessation from pain which proceeds from the resolution of un-

easy tumours.

(From Rala, against, and CATAPELTES. wealn, a sheild.) This word means a sling, a granado, or battery; and is also used to signify the medicine which heals the wounds and bruises made by such an instrument.

CATALHORA. (From Katapego, to make sleepy.) Coma somnolentum. A preternatural propensity to sleep. A mild apoplexy.

CATAPHORA ARTHRITICA. Apoplexy from

Sanguineous apo-Сатарнова сома.

CATAPHORA EXANTHEMATICA. A lethargy in eruptive diseases.

Serous CATAPHORA HYDROCEPHALICA. apoplexy.

Apoplectic CATAPHORA SCORBUTICA. symptoms in scurvy.

CATAPHORA TIMOR, A lethargic dispo-

CATAPHHACTA (From nalapeasow, to fortify.) A han age on the thorax.

CATAPLASMA. (From αθαπλασσω, to spread like a plaister.) A pounice. following are among the most useful.

CATAPLASMA ALUMINIS. This application was formerly used to inflammation of the eyes, which was kept up from weakness of the vessels; it is now seldom used, a solution of alum being mostly substituted.

CATAPLASMA ACETOSE. Sorrel ponitice; Acctosæ, ibj. To be beaten in a mortar into pulp. A good application to scor-

butic ulcers.

CATAPLASMA DIRATEW. See Cutaplusma fermenti.

CATAPLASMA CICUTAL. Hemlock poultice. g. Herbæ cicutæ exfoliatæ, 5,jj, Aquæ fontanæ, ibjj. To be boiled till only a pint remains, when as much linseed meal as necessary is to be added. This is an excellent application to many cancerous and scrophulous ulcers, and other malignant ones; frequently producing great dimunition of the pain of such diseases, and improving their appearance. Justamond preferred the herb fresh bruised.

This is a warm CATAPLASMA CUMINI. and stimulating poultice, and was formerly much used as an arritating antiseptic application to gangrenous ulcers, and the like.

It is now seldom ordered.

CATAPLASMA BAUCI. Carrot poultice, R. Radicis dauce recentis, Ibj. Bruize it in a mortar into pulp. Some, perhaps with reason, recommend the carrots to be first boiled. The carrot poultice is employed as an application to ulcerated cancers, scrophulous sores of an irritable kind, and various inveterate malignant ulcers.

CATAPLASMA FERMENTI. Yest cataplasm. Take of flour a pound; yest half a pint. Mix and exopse to a gentle heat, until the mixture begins to rise. This is a celebrated application in cases of sloughing and

mortification.

CATAPLASMA LINI. Linseed poultice, R. Farinæ lini, Hbss. Aquæ ferventis, 16 jss. The powder is to be gradually sprinkled into the water, while they are quickly blended together with a spoon. This is the best and most convenient of all emollient poultices for common cases, and has, in a great measure, superseded the bread and milk one, so much in use formerly.

rataplasma lythargthi acetati. g. Aquæ lithargyri acetati, 5j. Aquæ distill. lbj. Micæ panis, q. s. Misce. Practitioners who place much confidence in the virtues of lead, often use this poultice in cases of

inflammation.

CATAPLASMA QUERCUS MARINI. This is prepared by bruizing a quantity of the marine plant, commonly called sca-tang, which is afterwards to be applied by way of a poultice. Its chief use is in cases of scrophula, white swellings, and glandular tumours more especially. When this vegetlabe cannot be obtained in its recent state, a common poultice of sea-water and oatmeal has been substituted by the late Mr-Hunter, and other surgeons of eminence.

CATAPLASMA SINAPEOS. See Culuplasma

sinapis.

Mustard cata-CATAPLASMA SINAPIS. plasm. Take of Mustard-sced, linseed, of each powdered half a pound; boiling vinc-gar, as much as is sufficient. Mix until it acquires the consistence of a cataplasm.

CATAPLEXIS. (From window, to strike.) Any sudden stupefaction, or deprivation of sensation, in any of the members, or organs.

CATAPOSIS. (From natarive, to swallow down.) According to Aretæus, it signifies the instruments of deglutition. Hence also catapotium.

CATATOTIUM. (Katamotion) A pill.

(From ψυχω, to refrigerate.) A refrigeration without shivering, either universal, or of some particular part. A chilliness, or, as Vogel defines it, an uneasy sense of cold in a muscular or cutaneous part.

(From натальто, to fall CATAPTOSIS. down.) It implies such a falling down as happens in apoplexies; or the spontaneous

falling down of a paralytic limb.

CATAPUTIA. (From καλαπυθω, to have an ill savour; or from the Italian, cacapuzza, which has the same meaning; so named Spurge. from its fætid smell.)

CATAPUTIA MAJOIL. See Ricinus.

CATAPUTIA MINOR. The plant so called in the pharmacopæias, is the Euphorbia lathyris; umbella, quadrifida, dichotoma, foliis oppositis integerrimis, of Linnaus. The seeds possess purgative properties; but if exhibited in an over dose, prove drastic and poisonous; a quality peculiar to all the euphorbiæ.

CATARACT. (Cataracta; from xara. gaσσω, to confound or disturb; because the sense of vision is confounded, if not destroy-

ed.) The Caligo lentis of Cullen.

Hippocrates calls it manyana. Galen, υποχυμα. The Arabians, gutta opuca. Celsus, suffusio. A species of blindness, arising almost always from an opacity of the crystalline lens, or its capsule, preventing the rays of light passing to the op-It commonly begins with a tic nervc. dimness of sight; and this generally continues a considerable time before any opacity can be observed in the lens. As the disease advances, the opacity becomes sensible, and the patient imagines there are particles of dust, or motes, upon the eye, or in the air, which are called musce volitantes. This opacity gradually increases till the person either becomes entirely blind, or

can mercly distinguish light from darkness. The disease commonly comes on rapidly, though sometimes its progress is slow and gradual. From a transparent state, it changes to a perfectly white, or light gray colour. In some very rare instances, a black cataract is found. The consistence also varies, being at one time hard, at another entirely dissolved. When the opake lens is either more indurated than in the natural state, or retains a tolerable degree of firmness, the case is termed, a firm or hard cataract. When the substance of the lens seems to be converted into a whitish or other kind of fluid, lodged in the capsule, the case is denominated a milky or fluid cataract. When the substance is of a midling consistence, neither hard nor fluid, but about as consistent as a thick jelly, or curds, the casc is named a soft or caseous cataract. When the anterior or posterior layer of the crystalline capsule becomes opake, after the lens itself has been removed from this little membranous sac, by a previous operation, the affection is named a secondary membranons cataract. There are many other distinctions made by authors. Cataract is seldom attended with pain; sometimes, however, every exposure to light creates uneasiness, owing probably to the inflammation at the bottom of the eye. The real cause of cataract is not yet well understood. Numbers of authors consider it as proceeding from a preternatural contraction of the vessels of the lens, arising from some external violence, though more commonly from some internal and occult cause. The cataract is distinguished from gutta serena, by the pupils in the latter being never affected with light, and from no opacity being observed in the lens It is distinguished from hypopyon, staphyloma, or any other disease in the fore part of the eye, by the evident marks which these affections produce, as well as by the pain attending their beginning. But it is difficult to determine when the opacity is in the lens, or in its capsule. If the retina (which is an expansion of the optic nerve in the inside of the eye) be not diseased, vision may, in most cases, be restored, by either depressing the diseased lens, or extracting it enterely, which is termed couching.

CATARRHEUMA. (From Ralaggeon, to flow from.) A catarrh, or defluxion of hu-

mours.

CATARRHEXIS. (From nalagenyoua, to pour out.) A violent and copious eruption, or effusion, joined with nothing: it is a copious evacuation from the belly, and sometimes alone it is of the same signification. In Vogel's Nosology, it is defined, a discharge of pure blood from the intestines, such as takes place in dysentery.

CATARRHECUS. (From ullagger, to flow from.) A word applied to diseases, pro-

ceeding from a discharge of phlegm.

CATARHHOPA PHYMATA. (Kataggona quata.) Tubercles tending downward; or, as Galen relates, those that have their apex on a depending part.

CATARRHOPOS NOUSOS. (Kataggonos ve-

cline, and opposed to the paroxysm. CATARRHUS. (From nalaggew, to flow down,) Coryza. A catarrh. An increased secretion of mucus from the membranes of the nose, fauces, and bronchiæ, with fever, and attended with sneezing, cough, thirst, lassitude, and want of appetite. It is a genus of disease in the class pyrexiæ, and order profluvia, of Cullen. There are two species of catarrh, viz. catarrhus à frigore, which is very common, and is called a cold in the head; and catarrlous à contagione, the influenza, which sometimes seizes a whole city. Catarrh is also symptomatic of several other diseases. Hence we have the catarrhus rubeolosus; tussis variolosa, verminosa, calculosa, phthisica, hysterica, à dentitione, gravidarum, metallicolarum, &c.

CATARRHUS A FRIGORE. Catarrh from cold.

CATARRIUS BELLINSULANUS. Muinps, or evnanche parotidæa.

CATARRHUS A CONTAGIO. The influenza.

CATARRIUS SUFFOCATIVUS. The croup, or cynanche trachealis.

CATARRHUS VESICE. Strangury, with

discharge of mucus.

CATARTISMUS. (From κΩαξηζα, to make perfect.) According to Galen, it is a translation of a bone from a preternatural to its natural situation.

CATASARCA. (From xala. and oage, flesh.)

The same as Anasarca.

CATASBESTIS. (From καλα, and σδεννυμι, to extinguish.) The resolution of tumours without suppuration.

Catasenasmus. (From ualarzala, to scarify.) Scarification.

scaring.) Scarincation.

CATASEISIS. (From uala, and out, to shake.) A concussion.

CATASPASMA. (From nalaotaw, to draw backwards.) A revulsion or retraction of

humours, or parts.

CATASTAGNOS. (From RATA, and 52 Za, to distil.) This is the name which the Greeks, in the time of Celsus, had for a distillation.

CATASTALTICUS. (From καταστελλα, to restrain, or στελλα, to contract.) It signifies styptic, astringent, repressing.

CATASTASIS. (Καταστασις.) The constitution, state, or condition of any thing.

CATATASIS. (From xalslawa, to extend.) In Hippocrates it means the extension of a fractured limb, or a dislocated one, in order to replace it. Also the actual replacing it in a proper situation.

CATAXIS. (From unlayse, to break.) A fracture. Also a division of parts by an

instrument.

CATECHOMENUS. (From zaleza, to resist.) Resisting and making meffectual the remedies which have been applied or

CATECHU. Catechu. It is said, that, in the Japanese language, kate signifies a tree, and chu, juice.) Terra Japonica. Japan earth. An extract prepared in India, it was supposed till lately, from the juice of the Mimosa catechn of Linnxus: -spinis stipularibus, foliis bipinnatis multijugis, glandulis partialium singulis, spicis axillaribus genunis seu ternis pedunculatis; by boiling the wood and eva-porating the decoction by the heat of the sun. But the shrub is now ascertamed to be an acacia, and is termed Acacia catechu. In its purest state, it is a dry, pulverable substance, outwardly of a reddish colour, internally of a shiring dark brown, tinged with a reddish hue; in the mouth it discovers considerable adstringency, succeeded by a sweetish mucilaginous taste. It may be advantageously employed for most purposes where an adstringent is indicated, and is particularly useful in alvine fluxes, where astringents are required. Besides this, it is employed also in uterine profluvia, in laxity and debility of the vicera in general; and it is an excellent topical adstringent, when suffered to dissolve leisurely in the mouth, for Lixities and ulcerations of the gums, aphthous ulcers in the month, and similar affections. This extract is the basis of several formulæ in our pharmacopæias, particularly of a tincture: but one of the best forms under which it can be exhibited, is that of a simple infusion in warm water with a proportion of cinnamon, for by this means it is at once freed of its impurities and improved by the addition of the aromatic. Fourcroy says that catechu is prepared from the seeds of

a kind of palm, called areca.

CATELATION. (From MATA, and MA, a blade of grass.) An instrument, having at the end a blade of grass, or made like a blade of grass, which was thrust into the nostrils to provoke a hæmorrhage when the head ached. It is mentioned by Are-

taus.

CATELLUS. (Dim. of catillus, a whelp.)
A young whelp. Also a chymical instrument called a cupel, which was formerly in the shape of a dog's head.

CATHERESIS. (From ππθαιζα, to take away.) The subtraction or taking away any part or thing from the body. Sometimes it means an evacuation, and Hippocrates uses it for such. A consumption of the body, as happens without manifest evacuation.

CATHERETICA. (From καθαιζω, to take away.) Medicines which consume or remove superfluous flesh.

CATHARMA. (From καθαιζω, to remove.) The excrements, or humours, purged of from the body.

CATHAUMUS. (From nasaigu, to remove.) A purgation of the excrements, or humours. A cure by incantation, or the royal touch.

(From xabage, to purge.) CATHARSIA. Cathartics, having a purging property.

(From nabasea, to take CATHARSIS. away.) A purge, or purgation of the excrements, or humours, either medically or naturally.

CATHARTICS. (Cathartica, sc. medicamenta: καθαρτικα: from καθαιρω, to purge.) Those medicines which, taken internally, increase the number of alvine evacuations. The different articles referred to this class of medicines are divided into five orders:

1. Stimulating cathartics, as jalap, aloes, and bitter apple, which are well calculated to discharge accumulations of serum, and are mostly selected for indolent and phlegmatic habits, and those who are hard to purge.

2. Refrigerating cathartics, as Glauber's salts, Epsom salts, sal polychrest, and cremor tartar. These are better adapted for plethoric habits, and those with an inflam-

matory diathesis.

3. Adstringent cathartics, as rhubarb and damask roses, which are mostly given to those whose bowels are weak and irritable, and subject to diarrheea.

4. Emollient cathartics, as manna, malva, castor oil, and olive oil, which may be given in preference to other cathartics, to

children and the very aged.

5. Narcotic cathartics, as tobacco, hyoseyamus, and digitalis. This order is never given but to the very strong and indolent, and to maniacal patients, as their operation

is very powerful.

Murray, in his Materia Medica, considers the different cathartics under the two divisions of laxatives and purgatives; the former being mild in their operation, and merely evacuating the contents of the intestines; the latter being more powerful, and even extending their stimulant operacion to the neighbouring parts. The following he chamerates among the principal laxatives :- Manna, Cassia fistularis, Tamarindus Indica, Ricinus communis, Sulphur, Magnesia. Under the head of purgatives, he names Cassia senna, Rhæum palma-tum, Convolvulus jalapa, Helleborus ni-ger, Brionia alba, Cucumis colocynthis, Momordica elaterium, Rhamnus catharticus, Aloe perfoliata, Convolvulus scammo- and xeilos, the lip.) The lower lip. nia, Gambogia gutta, Submurias liydrargyri, Sulphas magnesiæ, Sulphas sodæ, Sulphas potassæ, Supertartris potassæ, Tartris potassæ, Tartris potassæ et sodæ, Phosphas sodæ, Murias sodæ, Tercbinthina veneta, Nicotiana tabacum.

CATHARTICUS SAL. See Sulphas magne-

siæ, and Sulphas sodæ.

CATHARTICUS HISPANICUS SAL. A kind of Glauber's salt, produced near Madrid, from some springs.

CATHARTICUS GLAUBERI SAL. See Sul-

(From natizomai, to sit.) CATHEBRA. The anus, or rather, the whole of the buttocks, as being the part on which we sit.

CATHERETICA. (From nabaigo, to remove.) Corrosives. Medicines which, by corrosion, remove superfluous flesh.

CATHEFER. (From xabinai, to thrust into.) A long and hollow tube, that is introduced by surgeons into the urinary bladder, to remove the urine, when the person is unable to pass it. Catheters are either made of silver or of the elastic gum, That for the male urcthra is much longer than that for the female, and so curved, if made of silver, as to adapt itself to the

CATHETERISMUS. (From nabelne, a catheter.) The term given by P. Ægineta to the operation of introducing the

catheter.

(From καθιδευω, CATHIDRYSIS. place together.) The reduction of a fracture. The operation of setting a broken

CATHMIA. A name for litharge.

CATHODOS. (From nata, and ofos.) descent of humours.

CATHOLCEUS. (From nata, and ohnew, to draw over.) An oblong fillet, made to draw over and cover the whole bandage of the head.

CATHOLICON. (From мата, and омиюс, universal.) A panacea, or universal medicine. A term formerly applied to medicines that were supposed to purge all the humours.

CATHYPNIA. (From nara, and unvos, sleep.) A profound but unhealthy sleep.

CATIAS. (From καθιημι, to place in.) An incision knife, formerly used for opening an abscess in the uterus, and for extracting a dead focus.

CATILLUS. See Catellus.

CATINUM ALUMEN. A name given to

CATINUS. (Katavov.) A crucible.

Catmint. See Nepeta.

CATOCATHARTICA. (From KATO, down, wards, and xabasew, to purge.) that operate by stool.

(From κατεχω, to detain.) CATOCHE.

See Catalepsis.

(From κατω, beneath, CATOCHEILUM.

CATOCHUS. (From κατεχω, to detain.) A catalepsy. Also a tetanus or spasmodic disease in which the body is rigidly held in an upright posture.

CATOCHUS CERVINUS. Tetanus, particu-

larly affecting the neck.

CATOCHUS DIURNUS. An occasional tetanus.

CATOCHUS HOLOTONICUS. Another name for tetanus.

(Fr in karw, below, and CATONISHUS. apos, the should ... ) By this word, P. Ægineta expresses a method of reducing a luxated shoulder, by raising the patient over the shoulder of a strong man, that, by the weight of the body the dislocation may be reduced.

CATOPSIS. (From катотторы, to see clearly.) An acute and quick perception. The acuteness of the faculties which accompanies the latter stage- of en samption.

CATOPTER (From Rata and offtomat, to see, and, by metaphor, to probe.) A probe. An instrument called a speculum ani.

CATORCHITES. (From nata, and eggie the orchis.) A wine in which the orchis root has been infused.

CATORETICA. (From μετω, downwards, and geω, to flow.) Catoteretica. Catoterica. Medicines which purge by stool.

CATOTERETICA. See Catoretica.
CATULOTICA. (From MATENDO, to cicatrize.) Medicines that cicatrize wounds.

CATUTRIPALI. A name of the piper lon-

gum.

CAUCALIS. (From REMURION, a CIP; OF from fauxaxis, the daucus.) Bastard parsley, so named from the shape of its flower. Also, the wild carrot.

CAUCALOIDES (From caucalis, and essos, a likeness; from its likeness to the flower of the caucalis.) The patella is sometimes so called.

CAUDA. (From cado, to full; because it hangs or falls down behind.) A tail.

1. The tail of animals.

2. A name formerly given to the os coccygis, that being in tailed animals the beginning of the tail.

3. A fleshy substance, protuberating from the lips of the vegina of the pudendum muliebre, and resembling a tail, according to Ætins.

4. Many herbs are also named cauda, with the affixed name of some animal, whose tail the herb is supposed to be like; as cauda equina, horse-tail; cauda muris, mouse tail; and in many other instances.

The spinal marrow, CAUDA EQUINAat its termination about the second lumbar vertebra, gives off a large number of nerves, which, when unravelled, resemble the horse's

tail; hence the name. See also Equisetum. CAUDATIO. (From cauda, a tail.) An

clongation of the clitoris.

CAUL. The English name for the omentum. See Omentum.

CAULEDON. (From καυλος, a stalk.) A transverse fracture, when the bone is bro-

ken, like the stump of a tree.
CAULIFLOWER. A species of brassica, whose flow r is cut before the fructification The observations which have been made concerning cabbages are applicable here. Cauliflower is, however, a far more delicious vegetable.

CAULIS. (Kalab. A Chaldean word.)

1. The stem or stalk of a plant.

2. A cabbage.

3. It means too the penis of a man. CAULIS FLORIDA. Cauliflower.

CAULODES. (From REUNOS, the cabbage.)

The winte or green cabbage. CAULOTON. (From RAUNOS a stem: because it grows upon a stalk.) A name given to the beet.

CAUNA. (From Raise, to burn.) The heat of the body or the heat of the atmosphere, in a fever.

Caunga. A name of the areca.
Causis. (From \*210, to burn.) A burn; or rather, the act of combustion, or burn-

CAUSODES. (From name, to burn.) A term applied by Celsus to a burning fever.

CAUSIMA. (From Raise, to burn.) An ardent or burning heat and inflammation. A term used by Hippocrates.

CAUSTIC ALKALI. To so called. See Alkali The pure alkalis are

Caustic barley. See Cevadilla.

CAUSTICS (Caustica, sc. medicamenta; from xaio, to burn; because they always produce a burning sensation.) Eschurotics.

CAUSTICUM AMERICANUM. The ceva-

CAUSTICUM ANTIMONIALE. See Muriate

of antimony. CAUSTICUM COMMUNE FORTIUS. See Po-

tassa cum calce. CAUSTICUM LUNARE, Sec Nitras ar-

genti. Causus. (From xage, to burn.) highly ardent fever. According to Hippocrates, a fiery heat, insatiable thirst, a rough and black tongue, complexion yellowish, and the saliva bilious, are its peculiar characteristics. Others also are particular in describing it; but whether ancients or moderns, from what they relate, this fever is no other than a continued ardent fever in a billious constitution. In it the heat of the body is intense: the breath is particularly fiery; the extremities are cold; the pulse is frequent and small; the heat is more violent internally than externally, and the whole soon ends in recovery or death.

\*Causus, endemial. The name given, by Dr. Mesely, to the yellow fever of the West Indies.

CAUTERY. (From name, to burn.) Cauteries were divided, by the ancients, into actual and potential; but the term is now given only to the red-hot iron, or actual cautery. This was formerly the only means of preventing hemorrhages from divided arteries, till the invention of the ligature. It was also used in discases. with the same view as we employ a blister. Potential cautery was the name by which kali purum, or potassa, was di trigu shed in the former dispensatories of Edinburgh, Surgeons understand, by this term, any caustic application.

CAVA. The name of a vein, and also of

the pudendum muliebre. See Veins. CAVERNA. (From cavus, hollow.) Also the name of the pudendum cavern. muliebre.

CAVIARE. Caviarium. A food made of the hard roes of sturgeon, formed into cakes, and much esteemed by the Russians.

CAVICULA. (Dim. of cavilla.) See Cavilla.

CAVILLA. (From cavus.) The ankle, or hollow of the foot.

CAVITAS. (From cavus, hollow.) Any cavity, or hollowness. The auricle of the heart was formerly called the cavitas innominata, the hollow without a name.

Cayenne pepper. See Piper Indicum.

CAZABI. See Cassada.

CEASMA. (From xee, to split, or divide.) Ceasmus. A fissure, or fragment.

CEBER. (Arab.) The agallochum. Also

the capparis.

CEBIPIRA. (Indian.) A tree which grows in Brazil, decoctions of whose bark are used in baths and fomentations, to relieve pains in the limbs, and cutaneous dis-

CEDAR. See Cedrinum lignum.

CEDMA. (From nesaw, to disperse.) defluxion, or rheumatic affection, scattered over the parts about the hips.

CEDRA, ESSENTIA DE. See Bergamotte.

CEDRINUM LIGNUM. Cedar of Leba-Vinus cedrus of Linnæus. An odoriferous wood, more fragrant than that of the fir, but possessing similar virtues.

CEDRITES. (From xs/gos, the cedar-tree.) Wine in which the resin which distils from

the cedar-tree has been steeped.

CEDRIUM. Cedar. It is also a name for common tar, in old writings.

CEDROMELA. The fruit of the citrontree

CEDRONELLA, Turkey baum.

CEDROSTIS. (From nedgos, the cedar-tree.) A name of the white bryony, which smells like the cedar.

CEDRUS. (From Kedron, a valley where they grew abundantly.) The Pinus cedrus of Linnaus, or the cedar-tree.

CEDRUS AMERICANA. The arbor vitæ. CEDRUS BACCIFERA. The savine.

CEIRIA. (From nugw, to abrade.) The tape-worm; so called from its excoriating and abrading the intestines.

Celandine. See Chelidonium majus.

CELASTRUS. (From MENA, a dart or pole, which it represents.) Ceanothus Americanus of Linnæus. Some noted Indians depend more on this than on the lobelia, for the cure of syphilis, and use it in the same manner as lobelia.

CELE. (From unha.) A tumour caused by the protusion of any soft part. Hence the compound terms hydrocele, bubonocele. frustanea. Class, Syngenesia.

CELERY. The English name for a variety of the apium graveolens ...

Celiac artery. See Caliac artery.

CELIS. (From xxxxx, to burn.) A spot or blemish upon the skin, particularly that which is occasioned by a burn.

CELLA TURCICA. See Sella turcica. (Dim. of cella, a cell.) CELLULA. little cell or cavity.

CELLULÆ MASTOIDEÆ See Temporal

CELLULAR MEMBRANE. Membra-Tela cellulosa. Panniculus adina cellulosa posus. Membrana adiposa, pinguedinosa, et reticularis. The cellular structure of the body, composed of laminæ and fibres variously joined together, which is the connecting medium of every part of the body. It is by means of the communication of the cells of this membrane, that the butchers blow up their veal. The cellular membrane is, by some anatomists, distinguished into the reticular and adipose membrane. former is evidently dispersed throughout the whole body, except the substance of the brain. It makes a bed for the other solids of the body, covers them all, and unites them one to another. The adipose membrane consists of the reticular substance, and a particular apparatus for the secretion of oil, and is mostly found immediately under the skin of many parts, and about the kidneys.

CELOTOMIA. (From κηλη, hernia, and τεμνω, to cut.) The operation for hernia. Celsa. A term of Paracelsus's, to sign

nify what is called the beating of the life in a particular part.

CEMENTERIUM. A crucible.

(From ney xgos, millet.) CENCHRAMIS. A grain or seed of the fig.

CENCHRIUS. A species of Herpes that

resembles nex xgos, or millet.

CENEANGEIA. (From 18900, to empty, and 27705, a vessel.) The evacuation of blood, or other fluids, from their proper vessels.

CENIGDAM. Ceniplam. Cenigotam. Cenipolam. The name of an instrument anciently used for opening the head in epilepsies.

formerly of use in the venerial disease,

supposed to be mercurial.

CENOSIS. (From REVOS, empty.) cuation. It must be distinguished from Catharsis. Cenosis imports a general evacuation; Catharsis means the evacuation of a particular humour, which offends with respect to quality.

CENTAUREA. (So called from Chiron, the centaur, who is said to have employed one of its species to cure himself of a wound accidentally received, by letting one of the arrows of Hercules fall upon his foot.)

The name of a genus of plants in the Linnæan system, of the Order Polygamia

CENTAUREA BEHEN. The systematic name of the officinal behen album. See Behen album.

CENTAUREA BENEDICTA. The systematic name of the blessed thistle. See Carduus benedictus.

CENTAUREA CALCITRAPA. The systematic name of the calcitrapa. See Calci-

CENTAUREA CYANUS, The systematic name of the plant which affords the flores cyani. See Cyanus

CENTAUNIOIDES. The gratiola.

CENTAURIUM MAGNUM MAJUS. The great

CENTAURIUM. (From nevlaugos, a centaur; so called because it was teigned that Chiron cured Hercules's toot, which he had wounded with a poisonous arrow, with Centaurium minus vulgare. taurium parvum. Centaurium minus. Cen-Chironia centaurium of Linnæ-115 :- corollis quinquefidis infundibuliformibus, caule dichotomo, pestillo simplici. This plant is justly esteemed to be the most efficacious bitter of all the medicinal plants indigenous to this country. It has been recommended, by Cullen, as a substitute for gentain, and by several is thought to be a more useful medicine. The tops of the centaury plant are directed for use by the colleges of London and Edinburgh, and are most commonly given in infusion; but they may also be taken in powder, or prepared into an extract.

Centaury. See Centaurium.

CENTAURIUM MINUS. See Centaurium.

CUNTIMORBIA (From centum, a hundred, and morbus, a disease.) Nummularia, or moneywort; named from its supposed efficacy in the cure of a multitude of disorders.

CENTINODIA. (From centum, a hundred, and nodus, a knot.) The herb polygonum; so called from its many knots, or

CENTIPEDES. (From centum, a hundred, and pes, a foot.) Woodlice, named from

the multitude of their feet.

CENTRATIO. (From centrum, a centre.) The concentration and affinity of certain substances to each other. Paracelsus expresses by it the degenerating of a salme principle, and contracting a corrosive and exuleerating quality. Hence Centrum Salis. is said to be the principle and cause of

CENTRIUM. (From KEYTEA, to, prick.) A plaister recommended by Galen against

Stieltes and prieks in the side.

CENTRUM. (From \*\*175\*\*, to point or prick.) The middle point of a circle. In eliginistry, it is the residence or founda-tion of matter. In medicine, it is the point in which its virtue resides, In anatomy, the middle point of some parts is so

named, as centrum nerveum the middle or tendinous part of the dupliragm.

CENTRUM OVALE. When the two hemispheres of the brain are removed on a line with the level of the corpus callosum, the internal medullary part presents a somewhat oval centre; hence it is called centrum ovale Vieussenius supposed all the medullary fibres met at this place.

CENTRUM TENDINOSUM. The tendinous centre of the diaphragm is so called. See

Diaphragm.

CENTRUM NERVEUM. The centre of the diaphragm is so called. See Dia-

CENTUMNODIA. (From centum, a hundred, and nodus, a knot; so called from its many knots, or joints.) Common knotgrass. This plant, Polygonum aviculare of Linnæus, is never used in this country; it is said to be useful in stopping hæmorrhages, diarrhous, &c. but little credit is to be given to this account.

CENTUNCULUS. Bastard pimpernel. CEPA. (From MATOS, a woolcard, from

the likeness of its roots.) The onion. This bulbous root belongs to the Allium cepa of Linnaus :- scapo nudo inferne ventricoso longiore, foliis teretibus. Dr. Cullen says, onions are acrid and stimulating, and possess very little nutriment. With bilious constitutions they generally produce flatu-lency, thirst, head-ach, and febrile symp-toms; but where the temperament is phlegmatic, they are of infinite service, by stimulating the habit and promoting the natural secretions, particularly expectoration and urine. They are recommended in scorbutic cases, as possessing antiscorbutic properties. Externally, onions are employed in suppurating poultices, and suppression of urine in children is said to be relieved by applying them, roasted, to the pubes.

CEPEA. A species of onion which used to be esteemed for salads in spring, but is

now disregarded.

CEPHALEA. (From nepan, the head.) The flesh of the head, which covers the skull. Also a long continued pain of the cerebrum, and its membranes.

CEPHALALGIA. (From negann, the head, and axyos, pain.) Cephalea. The head-ach. It is symptomatic of very many diseases, but is rarely an original disease itself. When mild, it is called cephalalgia; when inveterate, cephalæn. When one side of the head only is affected, it takes the names of hemicrania, migrana, hemipagia, and megrim; in one of the temples only, crotaphos; and that which is fixed to a point, generally in the crown of the head, is distinguished by the name of clavus.

CEPHALALGIA CATARRHALIS. Head-ach,

with catarrh, from cold.

CEPHALALGIA INFLAMMATORIA. tis, or inflammation of the brain.

CEPHALALGIA SPASMODICA. Tire sick head-ach. A species of indigestion.

CEPHALARTICA. (From REGARN, the head, and aprison, to make pure.) Medicines which purge the head.

CEPHALE. (Kepann.) The head.

CEPHALIC VEIN. (Vena cephalica; so called, because the head was supposed to be relieved by opening it.) The anterior vein of the arm, that receives the cephalic of the thumb.

CEPHALICA. (From REPURA, the head.) Cephalics. Such remedies as are adapted for the cure of disorders of the head. Of this class are the snuffs, which produce a discharge from the mucous membrane of

the nose, &c.

CEPHALICA POLLICIS. A branch from the cephalic vein, sent off from about the lower extremity of the radius, running superficially between the thumb and the me-

CEPHALIEUS PULVIS. A powder prepar-

ed from asarum.

CEPHALINE. (From REPARI, the head.) The head of the tongue. That part of the tongue which is next the root and nearest the fauces.

CEPHALITIS. (From nepann the head.) Inflammation of the head. See Phrenitis.

CEPHALONOSUS. (From κηφαλη, the head, and νοσος, a disease.) This term is applied to the febris hungarica, in which the head is principally affected.

(From REDANK, CEPHALO-PHARYNGEUS. the head, and pagen &, the throat.) muscle of the pharyux, otherwise named constrictor pharyngis inferior; which

CEPHALOPONIA. (From REGAN, the head, and wever, pain.) Head-ach; heaviness of the h ad.

CEPINI. Vinegar.

CERA. Wax. Bees' wax. A solid concrete substance, collected from vegetables by bees; and extracted from their combs after the honey is got out, by heating and pressing them. With rectified spirit it forms, by the assistance of heat, a gelatinous liquid. It is perfectly insoluble in watery liquors. When melted, it assumes the appearance of oil, and in this state is easily combined with oils and liquid It is very inflammable, and burns totally away. In the state in which it is obtained from the combs, it is called yellow wax, cera flava; and this, when new, is of a lively yellow colour, somewhat tough, yet easy to break : by age it loses its fine colour, and becomes harder and more brittle. Yellow wax, after being reduced into thin cakes, and bleached by a long exposure to the sun and open air, is again mel'ed, and formed into round cakes. called virgin's wax, or white wax, cera alba, The chief medicinal use of wax, is in plaisters, unguents, and other like external applications, partly for giving the requisite consistence to other ingredients, and partly on account of its own emollient quality.

CERA ALBA. See Cera.

CERA DICARDO. The carduns pinea. Yellow wax-CERA FLAVA.

CEREE. (From aseas, a horn.) Rufus Ephesius calis the cornua of the ute-

Per together.) A name formerly applied to a pastil, or troch, by Galen.

CERAS. (Keezs, a horn.) A wild sort of

parsnip is so named from its shape.

CERASA NIGRA. (Kegaros, the cherrytree : from Kegasovin, a town in Pontus, whence Lucullus first brought them to Rome; or from ung, the heart; from its resemblance to it in shape and colour.) Eucoilia, because cherries keep the body open. The black cherry. The ripe fruit of the Prunus avium of Linnaus:-umbellis sessilibus, foliis ovato-lanceolatis, subtus pubescentibus, conduplicatis. The flavour of these is esteemed by many, and if not taken in too large quantities, they are extremely salutary. A gum exudes from the tree, whose properties are similar to those of gum arabic.

CERASA RUBRA. Cerasa sativa, or anglica. The red cherry. The ripe fruit of the Prunys cerasus of Linnaus :- umbellis subpedunculatis. foliis ovato-lanceolatis, glabris, conduplicatis. This species possesses a pleasan, acidulated, sweet flavour, and is extremely proper in fevers, scurvy, and bilous obstructions. Red cherries are mostly eaten as a luxury, and are very wholesome, except to those whose bowels

are remarkably irritable.

CERASIATUM. (From cerasus, a cherry.) A purging medicine in Libavius; so called because the juice of cherries is an ingredient.

Crasios. (From cerasus, a CERASIUS, cherry.) The name of two ointments in

Messue.

CERASMA. (From negannul, to mix.) A mixture of cold and warm water, when the warm is poured into the cold.

CERASUS. (From Kegasovan a town in Pontus, from whence Lucullus is said first to have brought them to Rome.) The

cherry-tree.

CERATE. (From cerum, wax.) Ceratum. The obsolete synonyms, are cerelea, ceromata, ceronia, cerota. Ceratomalgamata. Cerates take their name from the wax which enters into their composition, and to which they owe their consistence, which is intermediate between that of plaisters and that of ointments; though no very definite rule

for this consistence is, in fact, either given or observed.

CEHATIA. (From upas, a horn, which its fruit is supposed to resemble.) Ceratium. Ceratmia. The siliqua dulcis.

CERATIA DIPHYLLUS. Sce Courbaril.

CERATO-GLOSSUS. (From kepas, a horn, and platoa, a tongue.) A muscle, so named from its shape and inscrtion into the tongue. See Hyoglossus.

CEHATO-HYOIDEUS. (From the os hyo-

ides.) See Stylo-hyoiden.

CLIATOIDES. (From xegalos, the genitive of xegas, a horn.) See Cornea.

CERATO-MALGAMA. A cerate.

CEHATONIA SILIQUA. The systematic name of the plant which affords the sweet pod. See Siliqua dulcis.

CERATUM. See Cerate.

CEHATUM COMMUNE. Common cerate. Take of olive oil, six fluid onnces; yellow wax, four ounces. Having melted the wax, mix in the oil.

CERATUM ALBUM. See Ceratum cetacei. CEHATUM CALAMELANOS. By Calom. 3j. Cerat. calam. 3ss. Misce. Some practitioners are partial to this as a dressing for chancres.

CEHATUM CALAMINE. Formerly called ceratum lapidis calaminaris, and ceratam epuloticum. Calamine ceratc. Take of prepared calamine, yellow wax, of each half a pound; olive oil, a pint. Mix the oil with the melted wax; then remove it from the lire, and, as soon as it begins to thicken, add the calamine, and stir it constantly, until the mixture becomes cold. A composition of this kind was first meroduced under the name of Turner's cerate. Its virtue is desiccative, epulotic, and is well calculated to promote the cicatrization of ulcers.

CEHATUM CETACEL. Ceratum spermatis Cerutum album. Spermaceti cerate. Take of spermaccti, half an ounce; white wax, two ounces; olive oil, 4 fluid-ounces. Add the oil to the spermaceti and wax, previously melted together, until the mixture becomes cold. This cerate is cooling and emollient, and applied to excoriations, &c. and may be applied with advantage to all ulcers, where no stimulating substance can be applied, being extremely mild and unctuous.

Hemlock cerate. CERATUM CICUTAL . unguenti cicutæ lb.j. Spermatis ceti 3jj. Cera alba Ziii. Misce. One of the formula of St. Bartholomew's hospital, occasionally applied to cancerous, scrophulous, phagedenic, herpetic, and other inveterate sores.

See Ceratum re CERATUM CITHINUM. sine.

CERATUM EPULOTICUM. Sec Ceratum calamin.e.

CERATUM LAPIDIS CALAMINARIS. See Ceratum calamine.

CENATUM LITHARGYRI ACETATI COMPOSI-TIM. See Ceratum plumbi compositum

CERATUM LYTTE. Ceratum cantharidis. Cerate of bistering fly. Take of spermaceti cerate, six drachms; blistering flies, very fine powder, a drachm. Having softened the cerate by heat, add the flies, and mix them together.

CERATUM PLUMBI SUPERACETATIS. guentum cerussæ acetatæ. Cerate of superacetate of lead. Take of superacetate of lead, powdered, two drachms; white wax, two ounces; olive oil, a pint. Dissolve the wax in seven fluid-ounces of oil; then gradually add thereto the superacetate of lead, separately rubbed down with the remaining oil, and stir the mixture with a wooden slice, until the whole has united. This cerate is cooling and desiccative.

CERATUM PLUMBI COMPOSITUM. Ceratum lithargyri acetati compositum. Com-pound cerate of lead. Take of solution of lead, two fluid-onaces and a half; yellow wax, four ounces; olive oil, nine fluid ounces; campnor, half a drachm. Mix the wax previously melted, with eight fluid ounces of oil; then remove it from the fire, and, when it begins to thicken, add gradually the solution of acetate of lead, and constantly stir the mixture with a wooden slice, until it gets cold. Lastly, mix in the camphor, previously dissolved in the remainder of the oil. Its virtues are cooling, desiccative, resolvent against chronic rheumatism, &c. &c.; and as a proper application to superficial ulcers, which are inflamed.

CERATUM RESINE. Ceratum resina flave. Ceratum citrinum. Resin cerate. Take of yellow resin, yellow wax, of each a pound; olive oil, a pound. Melt the resin and wax together, over a slow fire; then add the oil, and strain the cerate, while hot, through a linen cloth. Digestive.

CENATUM SABINE. Savine cerate. Take of fresh leaves of savine, brused, a pound; yellow wax, half a pound; prepared lard, two pounds. Having melted together the wax and lard, boil therein the savine leaves, and strain through a linen cioth. This article is of late introduction, for the purpose of keeping up a discharge from blistered surfaces. It was first described by Mr. Crowther, and has since been received into extensive use, because it does not produce the inconveniencies that follow the constant application of the common blistering cerate. A thick white layer forms daily upon the part, which requires to be removed, that the cerate may be applied immediately to the surface from which the discharge is to be made.

CERATUM SAPONIS. Soap cerate. of hard soap, eight ounces; yellow wax, ten ounces; scini-vitreous oxyd of lead, powdered, a pound; olive oil, a pint; vinegar, a gallon. Boil the vinegar, with the oxyd of lead, over a slow fire, constantly stirring, until the union is complete; then add the soap, and boil it again in a similar manner, until the water is entirely evaporated; then mix in the wax, previously melted with the Resolvent; against srophulous tumours, &c. It is a convenient application in fractures, and may be used as an external dressing for nicers.

CERATUM SPERMATISCETI. See Ceratum

cetacei.

CERBERUS. (Keglepos.) A fanciful name given to the compound powder of scammony, because, like the dog Cerberus, it has three heads, or principal ingredients, each of which is emminently active.

CERCHNALEUM. (From nepxw, to make a noise.) A wheezing, or bubbling noise,

made by the trachea, in breathing.

CERCINOS. (From usexw, to wheeze.) Wheezing.

CERCHNODES. (From xeexw, to wheeze) One who labours under a dense breathing, accompanied with a wheezing noise.

CERCHODES. The same as cerclinodes.

CERCIS. (From usexw, to shriek) This word literally means the spoke of a wheel, and has its name from the noise which wheels often make. In anatomy it means the radius, a bone supposed to be like a spoke. Also a pestle, from its shape.

CERCOSIS. (From nepros, a tail.) A polypus of the uterus. It is sometimes ap-

plied to an enlargement of the clitoris. CEREA. (From cera, wax.) The cerumen aurium, or wax of the ear.

CEREALIA (Solemn feasts to the goddess Ceres.) All sorts of corn, of which bread or any nutritious substance is made, come under the head of cerealia, which term is applied by bromatologists as a ge-

CEREBELLA URINA. (Paracelsus thus distinguishes urme which is whitish, of the colour of the brain, and from which he pretended to judge of some of its dis-

tempers.

CEREBELLUM. (Dim. of cerebrum.) A somewhat round The little brain. viscus, of the same use as the brain; composed, like the brain, of a cortical and medullary substance, divided by a septum into a right and left lobe, and situated under the tentorium, in the inferior occipital In the cerebellum are to be observed the crura cerebelli, the fourth ventricle, the valvula magna cerebri, and the protuberantiæ vermiformis.

CEREBRUM. (Quasi carebrum; from raga, the head.) The brain. A large round viscus, divided superiorly into a right and left hemisphere, and inferiorly into six lobes, two anterior, two middle, and two posterior; situated within the cramium, and surrounded by the dura and pia mater, and tunica arachnoides. It is composed of a cortical substance, which is external; and a medullary, which is internal. It has three

cavities, called ventricles; two anterior, or lateral, which are divided from each other by the septum licidum, and in which is the choroid piexus, formed of blood-vessels; the third ventricle is a space between the thalami nervorum opticorum. The principal prominences of the brain are, the corpus callosum, a meduilary eminence, conspicuous upon laying aside the hemispheres of the brain; the corpora stricta, two striated protuberances, one in the anterior part of each lateral ventricle; the thalami nervorum opticorum, two wintish eminences behind the former, which terminate in the optic nerves; the corpora quadrigemina, four medullary projections called by the ancients, nates and testes; a little cerebrine tubercle lying upon the nates, called the pineal gland; and lastly, the crura cerebri, two medullary columns which proceed from the basis of the brain to the medulla oblonguta. The cerebral arteries are branches of the carotid and vertebral arteries. The venus of the head are called sinusses, which return their blood into the internal jugulars. The use of the brain is to give off nine pairs of nerves, through whose means the various senses are performed, and muscular motion excited.

The medulla CEREBRUM ELONGATUM.

oblongata.

CEREFOLIUM. (A corruption of chærophyllum.) Cherophyllum. Cherefolium. Chervil. This plant, Scandix cerefolium of Linnaus :- seminibus nitidis, ovato-subulatis; umbellis sessilibus, lateralibus, is a salubrious culmary herb, sufficiently grateful both to the palate and stomach, slightly aromatic, gently aperient, and diuretic.

The plant CEREFOLIUM HISPANICUM. called by us Sweet-cicely.

CEREFOLIUM SYLVESTRE. See Cerefo. lium.

CEREI MEDICATI. See Bougies.

CERELEUM. (From ungos, wax, and shator, oil.) A cerate, or liniment, composed of wax and oil. Also the oil of tar.

CEREVISIÆ FERMENTUM. Yeast.

CEREVISIA. (From ceres, corn, of which it is made ) Ale. Beer. Any liquor made from corn.

CEREVISIÆ CATAPLASMA. Into the grounds of strong beer stir as much oatmeal as will make it of a suitable consistence. This is sometimes employed as a stimulant and antiseptic to mortified parts.

CERIA. (From cereus, soft, taper.) riæ. The flat worms which breed in the

intestines.

CERION. (From ungion, a honey-comb.) A kind of achor.

CEHOMA. (From ungos, wax.) Ceronium. Terms used by the ancient physicians for an unguent, or cerate, though originally applied to a particular compesation which the wrestlers used in their are also diuretic and emetic. The dose to excreises.

(From xneos, wax, and CEROPISSUS. wiora, pitch.) A plaister composed of pitch and wax.

CERUTUM. (Kegator.) A cerate. CERUMEN AURIUM. (Cerumen; dim. of cera, wax.) Aurium sordes. Marmorata aurium, Cypsele. Cypselis fugile. The waxy secretions of the ears, situated in the meatus auditorius externus.

CERUSSA. (Arab.) Cerusse, or white lead. A subcarbonate of lead. See Sub-

curbonas plumbi.

See Super-acetus CERUSSA ACETATA. p!umbi.

CERVI SPINA. See Rhamnus catharti-

CERVICAL. (Cervicalis; from cervix, the neck.) Belonging to the neck; as cervical nerves, cervical muscles, &c.

CERVICAL ARTERIES. Arteriæ cervicales.

Branches of the subclavians.

CERVICAL VERTERRE. The seven uppermost of the vertebræ, which form the spine. See Vertebræ.

CERVICARIA. (From cervix, the neck; so named because it was supposed to be efficacions in disorders and aiments of the throat and neck.) The herb throat-wort.

CERVIX. (Quasi cerebri via; as being the channel of the spinal marrow.) The neck. That part of the body which is between the head and shoulders. The cervix uters is the neck of the uterus; or that part of it which is immediately above or beyond the os tincæ. This term is also applied to other parts, as cervix vesica, ossis, &c.

CESTRITES. (From RESTEON, betony.)

Wine impregnated with betony.

CESTRUM. (From x55gz, a dart; so called from the shape of its flowers, which resemble a dart; or because it was used to extract the broken ends of darts from wounds.) The herb betony.

CATERACII. (Bianchard says this word is corrupted from Pteryga, mingue, q. v. as peteryga, ceteryga, and ceterach) Scolo-Doradilla? Spleenwort. pendria vera. Milewaste. This small bushy plant, Asplenium ceterach of Linnaus :- frondibus pinnatifidis, lobis alternis confluentibus obtusis, grows upon old walls and rocks. It has an herbaceous, mucilaginous, roughish taste, and is recommended as a pectoral. In Spain it is given, with great success, in nephritic and calculous diseases.

CEVADILLA. (Din. of ceveda, barley. Spanish.) Cevadula Hispanorum. Sevadilla. Sabadilla. Hordeum causticum. Canis in-Sabadilla. Hordeum causticum. Ca tersector. Indian caustic barley. plant whose seeds are thus denominated, is a species of veratrum: they are powerfully caustic, and are administered with CHALYBEATE WATERS. Any mivery great success as a vermitage. They need water which abounds with steel.

a child, from two to four years old, is two grains; from hence to eight, five grains; from eight to twelve, ten grains.

Cayenne pepper. See Capsicum. Cu va. A Chinese name for tea. Симпородим. See Cerefolium. Симпорическим. (Ханофиялог

(Χαιροφυλλον: χαις», to rejoice, and φυλλον, a leaf; so called from the abundance of its leaves.) Chervil.

1. The name of a genus of plants in the Linnæan system. Class, Pentandria. Order, Digynia.

2. The pharmacopæial name of some plants. See Cicutaria and Cerefolium.

CHEROPHYLLUM SYLVESTRE. See Cicu-

CHACARILLE CORTEX. See Cascarilla. CHETA. (From Xee, to be diffused.) The human hair.

CHALASIS. (From xanae, to relax.) Relaxation.

CHALASTICA. (From xaxae, to relax.)

Medicines which relax.

CHALAZION. (From xanafa, a hailstone.) Chalaza. Chalazium Grando. An indolent, moveable tuberele, on the margin of the cyclid, ike a hailstone. A species of hordeolum. It is that well-known affection of the eye, called a stye, or stian. It is white, hard, and encysted, and differs from the crithe, another species, only in being moveable. Writers mention a division of Chalazon into scirrhous, cancerous, cystic, and earthy.

CHALBANE. (Καλθανη.) Galbanum. CHALBANTHUM. (From χαλκος, brass, and arbos, a flower.) Vitriol; or rather, vitriol calcined red. The flowers of brass. CHALCRION. A species of pimpinella.

CHALCOIDEUM OS. The os cuneiforme of

the tarsus,

CHALK. Creta. A carbonate of line, Pure chalk is a neutral salt, formed by the union of the cretaceous acid with lime. It is much used as an absorbent and antacid, to stop diarrhoas, accompanied with acidity. See Carbonas calcis.

CHALK STONES. A name given to the concretions of calcareous matter in the hands and feet of people violently afflicted

with the gout.

CHALICRATUM. (From Xaxis, an old word that signifies pure wine, and xegarrouns, to mix.) Wine mixed with water.

CHALINOS. Chalinus. That part of the cheeks, which, on each side, is contiguous to the angles of the mouth.

CHALYBEATE. (Chalybeata, sc. medicamenta; from chalybs, steel.) Of or belonging to iron. A term given to any medicine into which iron euters; as chalvbeate

mixture, pills, waters, &c. CHALYBEATE WATERS.

iron; such as the waters of Tunbridge, Spa, Pyrmont, Cheltenham, Scarborough, and Hartfel; and many others.

CHALYBIS RUBICO PREPARATA. See

Carbonas ferri.

CHALYBS. (From Chaiybes, a people in Pontus, who dug iron out of the earth.) Acies. Seel. The best, hardest, finest, and the closest-grained forged iron. As a medicine, it differs not from iron.

CHALYBS TARTARISATUS. The ferrum

tarta isatum.

CHAMEBALANUS. (From χαμαι, on the ground, and βαλαγος, a nut.) Wood peas. Earth nucs.

CHAMEBUXUS. (From xamai, on the ground, and over, the box-tree.) The

dwarf box-tree

CHAMECEDRUS. (From xama, on the groun i, and resigns the cedar tree.) Chamecedrys. A species of dwarf abrotanum.

CHAMECISSUS. (From χαμαι, on the ground, and κισσος, ivy.) Ground-ivy.

(From Xamai, CHAMÆDRYS. ground, and fevs, the oak; so called from its leaves resembling those of the oak.) Chamædrys minor repins, vulgaris. Quer-cula calamandrina. Trissago. Chamædrops of Paulus Agineta and Oribasius. This plant, creeping germander, small germander, and English treacle; Tencrium chamedrys of Linnæus :- foliis cuneiformi ovatis incisis crenatis, petiolatis; floribus terms; caulibus procumbentibus, subpilosis, has a moderately bitter and somewhat aromatic taste. It was in high repute amongst the ancients in intermittent fevers, rheumatism. and gout; and where an aromatic bitter is wanting, germander may be administered with success. The best time for gathering this herb is when the seeds are formed, and the tops are then preserable to the leaves. When dry, the dose is from 3ss to 3j. Either water or spirit will extract their virtue; but the watry infusion is more bitter. This plant is an ingredient in the once celebrated powder called from the Duke of Portland.

CHAMÆDRYS INCANA MARITIMA. The

marum syriacum.

CHAMEDRYS FRUTESCENS. A name for teucrium.

Chamædres Palustris. A name given to scordium,

CHAMÆDRYS SPURIA. A name given to veronica.

CHAMÆLEA. (From χαμαι, on the ground, and ελαια, the olive-tree.) Chamelea. The herb widow-wail, or Daphne alpina of Linnæus. A sort of dwarf olive-tree, said to be purgative in the dose of 3j. The mezereon is also so called, because it has leaves like the olive-tree.

CHAMÆLEAGNUS. (From χαμαι, on the ground, and ελαιαγνος, the wild olive.) The

myrtus brabantica.

CHAMÆLEMA. (From χαμαι, on the ground, and ηλεμα, ivy.) The ground-

ivy

CHAMÆLEON. (From  $\chi^{\alpha}\mu^{\alpha}u$ , on the ground, and  $\lambda\epsilon_{\alpha\theta}$ , a lion, i. e dwarf lion.) The chanæleon, an animal supposed to be able to change its colour at pleasure. Also the name of many thistles, so named from the variety and uncertainty of their colours.

CHAMELEON ALBUM. Carlina. Cardopatium. Carline thistle. Carlina acaulis of Linnaus:—caule unifloro, flore breviore. The root of this plant is bitter, and said to possess diaphoretic and anthelimintic virtues. It is also extolled by foreign physicians in the cure of acute, malignant, and chronic disorders.

CHAMÆLEON VERUM. The distaff

thistle.

CHAMELEUCE. (From  $\chi \alpha \mu \alpha t$ , on the ground, and  $\lambda \nu \nu \pi a$ , the herb colt's-foot.) Tussilago, or call's-foot.

CHAMÆLINUM. (From xamas, on the ground, and anos, fl. x.) Linum catharti-

cum, or purgang of flax.)

CHAMEMELUM. (From xapas, on the ground, and maker, an apple; because it grows upon the ground, and has the smell of an apple.) Chamamelum nobile. Chamomilla romana. Euanthemon of Galen. Anthemis of the last London pharmacopæia. Common chamomile. Anthemis nobilis of Linnæus:-foliis pinnato-compositis linearibus acutis subvillosis. Both the leaves and flowers of this indigenous plant have a strong, though not ungrateful smell, and a very bitter, nauseous taste: but the latter are the bitterer, and considerably more aromatic. They possess tonic and stomachic qualities, and are much employed to restore tone to the stomach and intestines, and as a pleasant and cheap bitter. have been long successfully used for the cure of intermittents, as well as of fevers of the irregular nervous kind, accompanied with visceral obstructions. The flowers have been found useful in hysterical affections, flatulent or spasmodic colics, and dysentery; but, from their laxative quality, Dr. Cullen tells us they proved hurtful in diarrheas. A simple infusion is frequently taken to excite vomiting, or for promoting the operation of emetics. Externally, they are used in the decoctum pro fomento, and are an ingredient in the decoctum pro enemate.

CHAMEMELUM CANARIENSE. The Chrysanthemum frutescens of Lonnæus.

CHA 4 EMELUM CHRYSANTHEMUM. The bupthalmum germancum.

CHAMEMELUM FETTIDUM. The Anthemis cotula of Linnaus.

CHAMEMELUM FLORE PLENO. Chamæmelum nobile flore multiplici. Double chamomile. A variety of the anthemis nobilis. See Chamæmelum. CHAMMMELUM NOUILE. See Chamame-

CHAMEMELUM VULGARE. Chamomilla nostras. Leucanthemam of Dioscorides. Common wild c rn, or dog's chamomile. The plant directed under this name in the pharmacopæias, is the Matricaria chamomilla of Lunaus :- receptaculis conicis ; radiis prientibus; squamis calycinis, margine aqualibus. Its virtues are similar to those of the enamæmelum, but in a much inferior

CHAM ÆMORUS, (From xamai, on the ground, and poets, the mulberry tree.) Chameruhus folius ribis Anglice. Rubus palustris lumilis. Vaccinium Lancastrense. Rubus alpinus humilis. Anglicus. Cloudberr es, and knot berries. The ripe fruit of this plant, Rubus chamemorus of Linnæus :- foliis simplicibus lobatis, caule interno unifloro, is prepared into a jam: and is recommended to allay thirst, &c. in levers, phthusical diseases, hamoptysis, &c. As an antiscorburic, it is said to excel the seurvy-grass and vegetables of that tribe in common use.

CHAMPEUCE. (From xapa, on the ground, and weeks, the pine tree.) Camphorata, or stinking ground-pine, formerly

said to be antirrheumatic.

CHAMÆPITYS (From χαμαι, the ground, and συτυς, the pine-tree.) Arthe-Arthretica Ajuga. Abiga. Iva arthritica. Holocyron, Ionia. Sideritis. Common ground-pine. This low hairy plant, Teucrinm chamapitys of Linnaus: -foliis trifidis, Linearibus, intergerrimis; Roribus sessilibus, lateralibus, solitariis; canle diffuso, has a moderately bitter taste, and a resinous, not disagreeable smell, somewhat like that of the pine. The tops, or leaves, are recommended as aperiouts and corroborants of the nervous system, and said to be particularly serviceable in female obstructions and paralytic disor-

CHAMMPITYS MOSCHATA. Iva moschata monspeliensium. Chamepytis anthyllis. The Teucrium iva of Linnaus. Freuch ground pine. It is weaker, but of similar virmes to chamæpity.

CHAMBELION. A name in Oribasius for

erysimum, or hedge mustard.

CHAMERAPHANUM. SO Paulns neta calls the upper part of the root of the

CHAMERAPHANUS. From xamas, on the ground, and expanoc, the radish.) The upper part of the root of apium, according to P. Ægineta. The smallage, or parsley. Also dwarf radish.

CHAMENTPHES. The palma minor.

CHAM ERODODENDRON. (From Xapai, on the ground, and estatistion, the rose laurel.) The Azelea pontica of Linnxus.

CHANERUBIS (From gapan, on the ground, and rubus, the bramble.) The chamæmorus.

CHAMESPARTIUM. (From xapai, on the ground, and σπαρτιον, Spanish broom.) The genista tincti re.

CHAMBERS The space between the capsule of the crystalline lens and the cornea of the eye, is divided by the iris into two spaces called chambers; the space before the iris is termed the auterior chamber; and that behind it, the posterior. They are filled with an aqueo: - flu d.

See Chamemelun CHAMOMILLA NOSTRAS.

vulgare.

CHAMONILLA ROMAN See Chamieme-

CHANCRE. (F: n nagnivos, cancer.) A sose which arise from the direct application of the vener porson to any part of the body. Of course it mostly occurs on the genitals. Such venered sores as break out from a general contamination of the system, in consequence of absorption, never have the term chancre applied to them.

Paracelsus CHAOMANTIA SIGNA. So calls those prognosties that are taken from observations of the air; and the skill of doing this, the same author calls Chaoman-

CHAOSDA. Paracelsus uses this word as an epithet for the plague.

CHARABE (Arab.) A name given to amber. See Succinum.

CHARADRA, (From χαζασσω, to excavate.) The bowels, or sink or the body.

Charantia. Purgue hazel-nut.
Charantia. The momordica elaterium. Charcoal, See Carbon.

CHARDONE. The Cinara spinosa.

CHARISTOLOCHIA. (From xxgis, jov. and λοχια, the flux of women after child-birth: so named from its supposed usefulness to women in childbirth.) The plant mugwort, or artemisia.

CHARME. (From xaipe, to rejoice.) Charmis. A cordial antidote mentioned by Galen.

CHARPIE. (I're ch.) Scraped linen, or

CHARTA. (Chaid.) Paper. The amnois, or interior fætal membrane, was called the charta virginea, from its likeness to a piece of fine paper.

CHARTHEUX, POUDRE DE. (So called because it was invented by some friars of the Carthusian orper.) A name of the kermes

mineral.

CHASME. (From xawa, to gabe.) Chas-O sificacion. Gapin

Chaste tree The Agr .astus.

CHATE, The cucui Lgyptia.

Check-hone. See . e ns. CHEESE. The cagulum of milk, When prepared to a rich milk, and well made, it is very ritious in small quantities: but most undigestible when hard and ill prepare , especial'y to weak stomach-.

Chellocace. (Brom xuxos, a lip, and

of the lips, or canker in the mouth.

CHEIMELTON. (From zuma, winter.)

Chilblains.

CHEIRANTHUS. (From xag, a hand, and avos, a flower; so named from the likeness of its blossoms to the fingers of the hand.) The name of a genus of plants in the Linnæan system. Class, Tetradynamia. Order, Siliquosa. The wall flower.

CHEIRANTHUS CHEIRI. The systematic

name of the wall-flower. See Cheiri.

Cheirapsia. (From zug, the hand, and arriousi, to scratch.) The act of scratching; particularly the scratching one

hand with another, as in the itch.

CHEIRI. (Cheiri, Arab.) Leucolum luteum. Viola lutea. Common yellow wall-flower. The flowers of this plant, Cheiranthus cheiri of Liunwus:—folis lanceolatis, acutis, glabris; ramis angulatis; eau'e fruticoso, are recommended as possessing nervine and deobstruent virtues. They have a moderately strong, pleasant smell, and a nauseous, hitter, somewhat pungent taste.

CHEIRIATER. (From xug, the hand, and expos, a physician. A surgeon whose office it is to remove maladies by opera-

tions of the hand

CHEIRISMA. (From χεριζομα, to labour with the hand.) Handling. Also a manual operation.

CHEIRIXIS. (From Xeigischau, to labour

with the hand. The art of surgery.

CHEIRONOMIA. (From Xugoropea, to exercise with the hands.) An exercise mentioned by Hippocrates, which consisted of gesticulations with the hands, like our dumb-bells.

Chela. (From golds, forceps; from zw., to take.) A forked probe, for drawing a polypus out of the nose. Fissures in the feet, or other places.

CHELE CANCRORUM. See Cancer. CHELIDON. The bend of the arm-

CHELIDONIUM MAJUS, (From Xet-Sow the swallow. It is so named from an opinion that it was pointed out as useful for the eyes by swallows, who are said to open the eyes of their young by it; or because it blossoms about the time when swallows appear.) Papaver corniculatum, luteum. Tetterwort, and great celandine, The herb and root of this plant, Chelidonium majus of Linnæus :- pedunculis umbellatis, have a faint, unpleasant smell, and a bitter, acrid, durable taste, which is stronger in the roots than the leaves. They are aperient and diuretic, and recommended in icterus, when not accompanied with inflammatory symptoms. The chelidonium should be administered with caution, as it is liable to irritate the stomach and bowels. Of the dried root, from 3ss to 3j is a dose; of the fresh root, infused in water, or wine, the dose may be about 3ss. The decoction of the fresh root is used in dropsy, cachexy, and cutaneous complaints. The fresh juice is used to destroy warts and films in the eyes; but, for the latter pur-

pose, it is diluted with milk.

CHELIDONIUM MINUS. Scrophularia minor. Chetidonia rotundifolia minor. Cursuma hæmorrhoidalis herba. Ranunculus vernus. Lesser celandine, and pilewort. The leaves and root of this plant, Ranunculus ficaria; foliis cordatis angulatis petiolatis, caule uniforo, of Linnæus, are used medicinally. The leaves are deemed antiscorbutic, and the root reckoned a specific, if beat into cataplasms, and applied to the piles.

CHELONE. (χελων».) The tortoise. An instrument for extending a limb, and so called because, in its slow motions, it represents a tortoise. This instrument is

mentioned in Oribasius.

Chelonion. (From general, the tortoise; so called from its resemblance to the shell of a tortoise.) A hump, or gibbosity in the back.

CHELTENHAM WATER. One of the most celebrated purging waters in England and the reputation of it is daily increasing, as it possesses both a saline and chalybeate principle. When first drawn it is clear and colourless, but somewhat brisk; has a saline, bitterish, chalybeate taste. It does not keep, nor bear transporting to any distance; the chalvbeate part being lost by precipitation of the iron, and in the open air it even turns foetid. The salts, however, remain. Its heat, in summer, was from 50° to 55°, or 59°, when the medium heat of the atmosphere was nearly 15° higher. On evaporation, it is found to contain a calcareous earth, mixed with ochre and a purging salt. A general survey of the component parts of this water, according to a variety of analyses, shows that it is decidedly saline, and contains much more salt than most mineral waters. By far the greater part of the salts are of a purgative kind, and therefore an action on the bowels is a constant effect, notwithstanding the considerable quantity of selenite and earthy carbonates which may be supposed to have a contrary tendency. Cheltenham water is, besides, one of the strongest chalybeates we are acquainted with. The iron is suspended entirely by the carbonic acid, of which gas the water contains about an eighth of its bulk; but, from the abundance of earthy carbonats, and oxyd of ron, not much of it is uncombined. It has, besides, a slight impregnation of sulphur, but so little, as to be scarcely appreciable, except by very delicate tests. The sensible effects produced by this water, are generally, on first taking it, a degree of drowsiness, and sometimes head-ach, but which soon go off spontaneously, even previous to the operation on the bowels. A moderate dose acts powerfully, and speedily, as a cathartic, without occa-

sioning griping, or leaving that faintness and langour which often follow the action of the rougher cathartics. It is principally on this account, but partly too from the salutary operation of the chalybeate, and perhaps the carbonic acid, that the Cheltenliam water may be, in most cases, persevered in, for a considerable length of time, uninterruptedly, without producing any inconvenience to the body; and during its use, the appetite will be improved, the digestive organs strengthened, and the whole constitution invigorated. A dose of this water, too small to operate directly on the bowels, will generally determine pretty powerfully to the kidneys. As a purge, this water is drank from one to three pints; in general, from half a pint to a quart is sufficient. Half a pint will contain half a drachm of neutral purging salts, four grains of earthy carbonats, and selenite, about one-third of a grain of oxyd of iron; together with an ounce in bulk of carbonic acid, and half an ounce of common air, with a little sulphurated hydrogen. Cheltenham water is used, with considerable benefit, in a number of diseases, especially of the chrome kind, and particularly those called bilious: hence it has been found of essential service in the cure of glandular obstruction, and especially those that affect the liver, and the other organs connected with the functions of the alimentary canal. Persons who have injured their biliary organs, by a long residence in hot climates, and who are suffering under the symptoms either of excess of bile or deficiency of bile, and an irregularity in its secretion, receive remarkable benefit from a course of this water, judiciously exhibited. Its use may be here continued, even during a considerable degree of debility; and from the great determination to the bowels it may be employed with advantage to check the incipient symptoms of dropsy, and general anasarca, which so often proceed from an obstruction of the liver. In scrophulous affections, the sea has the decided preference; in painful affections of the skin, called scorbutic eruptions, which make their appearance at stated intervals, producing a copious discharge of lymph, and an abundant desquamation, in common with other saline purgative springs, this is found to bring relief; but it requires to be persevered in for a considerable time, keeping up a constant determination to the bowels, and making use of warm bathing externally. The season for drinking the Cheltenham water is during the whole of the summer months.

(χελυς, a shell.) The breast is so called, as resembling, in shape and office, the shell of some fishes.

CHELTSCION. (From ZEAUS, the breast.) A dry, short cough, in which the muscles of the breast are very sore.

CHEMA. A measure mentioned by the

Greek physicians, supposed to contain two small spoonfuls.

CHEMIA. (Arab.) Chimia. Chymistry. CHYMICAL APPARATUS. A general expression, denoting the instruments, vessels, machinery, furniture, and utensils of a la-

CHYMISTRY. (xumiz, and sometimes xnua: chamia, from chama, to burn, Arab. this science being the examination of all substances by fire.) The learned are not yet agreed as to the most proper definition of chymistry. Boerhaave seems to have ranked it among the arts. According to Macquer, it is a science, whose object is to discover the nature and properties of all bodies by their analyses and combinations. Dr. Black says, it is a science which teaches, by experiments, the effects of heat and mixture on bodies; and Fourcroy defines it a science which teaches the mutual actions of all natural bodies on each other. "Chymistry," says Jacquin, "is that branch of natural philosophy which unfolds the nature of all material bodies, determines the number and properties of their component parts, and teaches us how those parts are united, and by what means they may be separated and recombined."
Mr. Heron defines it, "That science which investigates and explains the laws of that attraction which takes place between the minute component particles of natural bodies." The objects to which the attention of chymists is directed, compre-

pose the globe. CHEMOSIS. (From xiva, to gape; because it gives the appearance of a gap, or aperture.) Inflammation of the conjunctive membrane of the eye, in which the cellular structure, or white of the eye, is distended with a florid fluid, and elevated above the margin of the transparent cornea. In Cullen's Nosology, it is a variety of the ophthalmia membranarum, or an inflammation of the membranes of the eye.

hend the whole of the substances that com-

CHENOPODIO-MORUS. (From chenopodium and mogor, the mulberry; so called because it is a sort of chenopodium, with leaves like a mulberry.) The herb mulberry-blight,

or strawberry-spinach.

CHENOPODIUM. (From xnv, a goose, and wsc, a foot; so called from its supposed resemblance to a goose's foot ) The herb chenopody, goose's foot. The name of a genus of plants in the Linnaan system. Class, Pentandria. Order, Digy-

CHENOPODIUM AMBROSICIDES. The systematic name of the Mexican tea-plant. See Botrys Mexicana.

CHENOPODIUM ANTHELMINTICEM. seeds of this plant, Chenopodium authelminthum of Linnæus :- folis ovato-oblongis dentatis, racemis aphyllis, though in great esteem in America for the cure of worms, are never exhibited in this country. They are powdered and made into an electuary, with any proper syrup, or conserve.

CHENOPODIUM BOTRYS. The systematic name of the Jerusalem oak. See Botrys

oulgaris.

CHENOPODIUM BONUS HENRICUS, The systematic name of the English mercury. See Bonus henricus.

CHENOPODIUM VULVARIA. The systematic nam- for the stinking orach. See Airiplex fatida

CHERAS (From xew to pour out.) The

struma; or scrophuta.

CHEREFOLIUM. See Charophyllum.

CHERMES. (Arab.) A small berry, full of insects like worms: the junce of which was formerly made into a confection, called confectio alkermes, which has been long disused. Also the worm itself.

CHERMES MINERALIS. See Sulphuretum

antimonii præcipitatum.

CHERNIBIUM. Chernibion. In Hippocrates it signifies an urinal,

CHERONIA. (Fr m Xugwe, the Centaur.) See Centaurium.

Cherry. See Cerasa nigra and Cerasa

Cherry, bay. The Lauro-cerasns. Cherry, laurel. The Lauro-cerasus. Cherry, winter The Alkekengi.

CHERVILLUM. See Cerefohum. Chesnut, horse. See II. ppocustanum.

CHEUSIS. (From Xew, to pour out.) Li-

quation. Infusion.

CHEVASTRE. A double-headed roller, applied by its middle below the chin; then running on each side, it is crossed on the top of the head; then passing to the nape of the neck is there crossed: it then passes under the chin, where crossing, it is carried to the top of the head, &c. until it is all taken up.

CHEZANANCE. (From xezw, to go to stool, and avayum, necessity.) It signifies any thing that creates a necessity to go to stool; but, in P. Æsineta, it is the name of an ointment, with which the anus is to be

rubbed, for promoting stools.

CHIA (From X105, an island where they were formerly propagated ) A sweet fig of the island of Chio, or Scio. Also an earth from that island, formerly used in fevers.

CHIACUS. (From X105, the island of Scio.) An epithet of a collyrium, whose chief ingredient was wine of Chios.

CHIADUS. In Paracelsus it signifies the

same as furunculus.

Chian pepper See Capsicum.

Chian turpentino. Se- Chio turpentine.

the letter X, chi.) The name of a bandage,

bandage in Oribasius; so called from its resembling the letter X, chi.

CHIASTRE. The name of a bandage for the temporal artery. It is a double-headed roller, the middle of which is applied to the side of the head, opposite to that in which the artery is opened and, when brought round to the part affected, it is crossed upon the compress that is laid upon the wound, and then, the continuation is over the coronal suture, and under the chin: then crossing on the compress, the course is, at the first, round the head, &c. till the whole roller is taken up.

CHIBOU. A spurious species of gumelemi, spoken of by the faculty of Paris. but not known in England.

CHIBUR. Sulphur.

CHICHINA. Contracted from China china. See Cinchona

Сиснов. Chirces. The affectio bovina. or distemper of black cattle.

Chicken pox. See Varicella. Chickweed. See Alsine media.

CHILBLAIN. Pernio. An inflammation of the extreme parts of the body, from the application of cold; attended with a violent itching, and soon forming a gangrenous ulcer.

CHILI, BALSAM DE. Salmon speaks, but without any proof, of its being brought from Chili. The Barbadoes tar, in which are mixed a few drops of the oil of aniseed, is usually sold for it.

CHILIODYNAMON. (From xixio, a thousand, and foragus, virtue.) An epithet of the herb Polimonium. In Dioscorides, this name is given on account of its many virtues.

CHILON. (XELAGIV.) An inflamed and swelled lip.

CHILPELAGUA. A variety of capsicum. Chilterspin. A species of capsicum.

CHIMETHLON. A chilblain. CHIMIA. See Chemia.

CHIMIATER. (From chemia, chymistry, and sargee, a physician.) A physician who makes he science of chymistry subservient to the purposes of medicine.

CHIMOLEA LAXA. Paracelsus means, by this word, the sublimed powder which is separated from the flowers of saline ores.

CHINA. (So named from the country of China, from whence it was brought.) China orientulis. Sankioa. Gnaquara. Smilax aspera Chinensis. China root. It is obtained from the Smilax china of Linmans:-caule aculeato, teretiusculo; foliis inermis, ovato-cordatis, quinque nerviis. was formerly in esteem, as sarsaparilla now is, in the cure of the venereal disease, and cutaneous disorders.

Chian turpentino. Se- Chio turpentine. Chias china. A name given to the Chiasmes. (From xiaza, to form like Peruvian bark, a native of some parts in

whose shape is like the Greek letter X, chi. China occidentalis. China spuria Chiastos. The name of a cruciale nodosa. Smilax pseudo-China. Smilax Indica spinosa. American or West-Indian China. The root is chiefly brought from

Jamaica, in large round pieces, full of of the hand, where it is troubled with knots. In scrophulous disorders, it has been preferred to the oriental kind. In other cases it is of similar but inferior vir-

CHINA SUPPOSITA. Senecio madraspatanns Senescio pseudo-China of Lanaeus. Bastard China. It grows in Malabar. The root greatly resembles the China root in appearance and qualities.

CHINCHINA. See Cinchona.

See Cinchona CHINCHINA CARIBEA. Caribea.

There are CHINCHINA DE SANTA FE. several spec es of bark sent from Santa Fè: but neither their particular natures, nor the trees which afford them, are yet accurately

CHINCHINA JAMAICENSIS. See Cinchona

CHINCHINA RUBHA. See Cinchona oblongifolia

CHINCHINA DE ST. LUCIA. St. Lucia bark is collected from the Anchona floribunda of Swartz:-floribus paniculatis glabris, capsulis turbinatis levibus, foliis ellipticis acuminatis glabris; it has an adstringent, bi ter taste, somewhat like gentain. It is recommended in intermittents, putrid dysentery, and dyspepsia: it should always be joined with some aromatic.

Chincough. See Pertussis.

CHINENSE. The aurantium sinene, or Chinese orange.

CHINESE SMILAY. See China.

CHIO TURPENTINE. Terebinthina de Chio. Cyprus turpentine. Chian turpentine. This substance is classed among It is procured by wounding the resins. the bark of the trunk of the Pistachia terebinthus of Linnaus. The best Chio turpentine is about the consistence of honey, very tenacious, clear, and almost transparent; of a white colour, inclining to vellow, and a fragrant smell, moderately warm to the taste, but f ee from acrunony and bitterness. Its medicinal qualities are similar to those of the turpentines. See Turpentine.

In Paracelsus it is synonymous CHIOLI. with furniculus.

Curques. A name for the worms which get into the toes of the negroes, and which are destroyed by the oil which flows out of the cashew nut-shell.

CHIRAGRA. (From xup, the hand, and appa, a seizure.) The gout in the joints of the hand. See Arthrites.

(From xsig, the hand.) CHIRONES. Small pustules on the hand and feet, enclosed in which is a troublesome worm.

CHIRONIA. (From Chiron, the Centaur, its inventor.) 1 The name of a genus of plants in the Linnwan system. Class, Pentandria. Order, Monogynia. Centaury. See Centaurium.

2 (From xue, the hand.) An aff tin

chirones.

CHIRONIUM. (From Xiew, the Centaur, who is said to have been the first who healed them.) A malignant ulcer, callous on its edges, and difficult to cure.

CHITOTHECA. (From χig, the hand, and τίθημι, to put.) A glove of the scerfskin, with the nuls, which is brought off from the dead subject, after the cuticle is loosened by putrefaction, from the parts under it.

CHIRURGIA. (From xug, the hand, and egyov, a work; because surgical operations are performed by the hand.) Chirurgery, or surgery.

CHITON. (XITON.) A coat or membrane. CHIUM. (From XIOS, the Island where it was produced.) An ep.thet of wine made at Scio.

CHILASMA. (From XXIZIVA. to make warm.) A warm fomentation, called also thermasma

CHLORASMA. (From χλωςιαω, to become

green.) Cheorosis.

(From xxagos, green CHLOROSIS. pale; from the yellow-greenish look those have who are affected with it) Febris amatoria. Icterus albus. The green sickness. A genus of d sease in the class cachexia, and order impetigines of Cullen. It is a disease which affects young females who labour under a suppression of the menses. Heaviness, lis lesness to motion, fatigue on the least exercise, palpitations of the heart, pains in the back, loins, and hips, flatulency and acidities in the stomach and bowels, a preternatural appetite for chalk, lime, and varous other absorbents, together with many dyspeptic symptoms, usually attend on this disease. As it advances in its progress, the face becomes pale, or assumes a yellowish hue; the whole body is flaccid, and likewise pale; the feet are affected with ædematous swellings; the breathing is much hurried by any vigorous exertion of the body; the pulse is quick, but sm Il; and the person is apt to be affected with many of the symptoms of hysteria. To procure a flowof the menses, proves in some cases a very difficult matter; and where the disease has been of long standing, various morbid affections of the viscera are often brought on, which at length prove fatal. Dissections of those who have died of chlorosis, have usually shewn the ovaria to be in a scirrhous, or dropsical state. In some cases, the liver, spleen, and mesenteric glands, have likewise been found in a diseased state.

(From xvava, to grind, or rasp.) Chaff. Bran. Also fine wool, or lint, which is, as it were, rasped from lint-CHOKE DAMP. The name given by

miners to a noxious air, occasionally found in the bottom of mines and pits. It is heavier than common air, therefore lies chiefly at the bottom of the pits; it extinguishes flame, and is noxious to animals. It is probably carbonic acid. See Carbonic acid.

Choana. (From  $\chi_{\infty}$ , to pour out.) It is properly a funnel, but is used to signify the infundibulum of the kidney and brain.

Choanus. (χοανα, a funnel.) A furnace made like a funnel, for melting metals.

CHOCOLATE. (Dr. Alston says this word is compounded of two Indian words, choco, sound, and atte, water; because of the noise made in its preparation.) An article of diet prepared from the cocoanut; highly nourishing, particularly when boiled with milk and eggs. It is frequently recommended as a restorative in cases of emaciation and consumption.

Galen and P. Ægineti, from yourse, the

nave of a wheel.

Cherades. (From xotgos, a swine.) Cherades. The same as scrofula.

CHERADOLETHRON. (From χωιχος, a swine, and ολεθχος, destruction; so named fom its being dangerous if eaten by hogs.) Hogbane. A name in Ætius for the Xanthium, or louse-bur.

Choiras. (From  $\chi_{oigos}$ , a swine; so called because hogs are diseased with it.) The scrophula.

CHOLADES. (From  $\chi_{O\lambda n}$ , the bile.) So the smaller intestines are called, because they contain bile.

CHOLAGO. The same as cholas.

Cholagoga. (From xon, bile, and axw, to evacuate.) Cholegon. By cholagogues, the ancients meant only such purging medicines as expelled the internal faces, which resembled the cystic bile in their yellow colour, and other properties.

Cholas. (From  $\chi_{2\lambda n}$ , the bile.) All the cavity of the ilium is so called, because it contains the liver which is the

strainer of the gall.

CHOLE. (Xohn) The bile.

CHOLEDOCHUS DUCTUS. (Choledochus; from χολη, bile, and δεχομαι to receive; receiving or retaining the gall.) Ductus communis choledochus. The common biliary duct, which conveys both cystic and hepatic bile into the intestinum duodenum.

CHOLEGON. The same as cholagoga.

CHOLERA. (From  $\chi_{ON}$ , bile, and  $\rho_{EW}$ , to flow.) Diarrhæa cholerica. Felliflua passio. Cholera. A genus of disease arranged by Cullen in the class neuroses, and order spasmi. It is a purging and vomiting of bile, with anxiety, painful gripings, spasms of the abdominal muscles, and those of the thighs. There are two species of this genus: 1. Cholera spontanea, which happens, in hot seasons, without any manifest cause. 2. Cholera accidentalis, which

occurs after the use of food that digests slowly, and irritates. In warm climates it is met with in all seasons of the year. and its occurrence is very frequent: but in England, and other cold climates, it is apt to be most prevalent in the middle of summer, particularly in the month of August; and the violence of the disease has usually been observed to be greater in proportion to the intenseness of the heat. It usually comes on with soreness, pain, distension, and flatulency in the stomach and intestines. succeeded quickly by a severe and frequent vomiting, and purging of bi-lious matter, heat, thirst, a hurried respiration, and frequent but weak and fluttering pulse. When the disease is not violent these symptoms, after continuing for a day or two, cease gradually, leaving the patient in a debilitated and exhausted state; but where the disease proceeds with much violence there arises great depression of strength, with cold clammy sweats, considerable anxiety, a hurned and short respiration, and hiccups, with a sinking, and irregularity of the pulse, which quickly terminate in death; an event that not unfrequently happens within the space of 24

CHOLERICA. (From χολέςα, the cholera.) Medicines which relieve the cholera. Also a bilious flux of the bowels, without pain or fever.

Cholicele. (From  $\chi_{0\lambda n}$ , bile, and  $\kappa_{n\lambda n}$ , a tumour.) A swelling formed by the bile morbidly accumulated in the gall-bladder.

CHOLOMA. (From XGAOS, lame, or maimed.) Galen says that, in Hippocrates, it signifies any distortion of a limb. In a particular sense, it is taken for a halting or lameness in the leg.

Chondroglossus. (From xorder, a cartilage, and paworn, the tongue.) A muscle so named from its insertion, which is in the basis-or cartilaginous part of the tongue. See Hyoglossus.

chondrologia; from xordgos, a cartilage, and xordgos, a discourse.) A discourse or treatise on carti-

lages.

Chondro-pharyng zus. (From xodics, a cartilage, and \$\pi\_{\text{zy}}\xi\_{\text{t}}\$, the upper part of the fauces.) A muscle so named because it rises in the cartilaginous part of the tongue, and is inserted in the pharynx.

Chondros. (Xordgos.) A food of the ancients, the same as alica. Also any gru-

mous concretion, and a cartilage.

Chondrosyndesmus. (From xordges, a cartilage, and ourden, to tie together.) A cartilaginous ligament.

CHONDRUS. See Chondros.

CHONE. (Xwyn.) The infundibulum.

ook De Usu Partium, expresses by articularly the cavities of the eyes; but,

m others of his writings, he intimates by it any void space.

CHORDA. A cord. A tendon. A painful tension of the penis in venereal disease. See Chordee. Sometimes the intestines are called chordæ.

CHORDA MAGNA. A name of the tendo

CHORDA TYMPANI. A branch of the seventh pair of nerves that passes through the tympanum.

CHORDÆ TENDINIÆ. The tendinous and cord-like substances which connect the corneæ columnæ of the ventricles of the heart to the auricular valves.

CHORDÆ WILLISH. The small fibres which cross the sinuses of the dura mater. They are so termed, because Willis first described them.

Condarsus. (From xopon, a cord, and arla, to knit.) A sort of painful cholic, where the intestines appear to be twisted into knots, like pieces of string.

CHORDEE. (Chordé. French.) spasmodic contraction of the penis, that sometimes attends gonorrhæa, and is often

followed by a hæmorrhage.

CHOREA SANCTI VITI (Chorea, xogeia) from xogos, a chorus which of old accompanied dancing. It is called St. Vitus's dance, because some devotees of St. Vitus exercised themselves so long in dancing, that their intellects were disordered, and could only be restored by dancing again at the anniversary of St. Vitus.) St. Vitus's Convulsive motions of the limbs, as if the person were dancing. It is a genus of disease arranged by Cullon in the class neuroses, and order spasmi. These convulsive motions, most generally, are confined to one side, and affecting principally the arm and leg. When any motion is attempted to be made, various fibres of other muscles act which ought not; and thus a contrary effect is produced from what the patient intended. It is chiefly incident to young persons of both sexes, and makes its attack from between the age of ten and fifteen, occurring but seldom after that of puberty.

By some practitioners it has been considered rather as a paralytic affection than as a convulsive disorder and has been thought to arise from a relaxation of the muscles, which, being unable to perform their functions in moving the limbs, shake them irregularly by jerks. Chorea sancti Viti is occasioned by various irritations, as teething, worms, offensive smells, poisons, &c It arises likewise in consequence of violent affections of the mind, as horror, fear, and anger. In many cases it is produced by general weakness; and in a few, it takes place from sympathy, at seeing the disease in others.

The fits are sometimes preceded by a coldness of the feet and limbs, or a kind of tingling sensation, that ascends like cold

air up the spine, and there is a flatulent pain in the left hypochondrium, with obstinate costiveness. At other times, the accession begins with yawning, stretching, anxiety about the heart, palpitations, nausea, difficulty of swallowing, noise in the ears, giddiness and pains in the head and teeth; and then come on the convulsive motions.

These discover themselves at first by a kind of lameness, or instability of one of the legs, which the person draws after him in an odd and ridiculous manner; nor can he hold the arm of the same side still for a moment; for if he lays it on his breast, or any other part of his body, it is forced quickly from thence by an involuntary motion. If he is desirous of drinking, he uses many singular gesticulations before he can carry the cup to his head, and it is forced in various directions, till at length he gets it to his mouth; when he pours the liquor down his throat with great haste, as if he meant to afford amusement to the bystanders. Sometimes various attempts at running and leaping take place, and at others, the head and trunk of the body are affected with convulsive motions. many instances, the mind is affected with some degree of fatuity, and often shews the same eauseless emotions, such as weeping and laughing, which occur in hysteriae. When this disease arises in children, it usually ceases before the age of pubcrty; and in adults, is often carried off by a change from the former mode of living. Unless it passes into some other disease, such as epilepsy, it is never attended with

CHORION. (From xagea, to escape; because it always escapes from the uterus with the fœtus.) Shaggy chorion. The external membrane of the fætus in utero.

CHOROID MEMBRANE. (Membrana choridea; from xopion, the chorion, and eidoc, resemblance.) The second tunic of the eye, lying immediately under the selerotica, to which it is connected by vessels. The true knowledge of this membrane, is necessary to a perfect idea of the iris and uvea. The tunica choroidea commences at the optic nerve, and passes forwards, with the sclerotic coat, to the beginning of the cornea transparens, where it adheres very firmly to the sclerotic membrane, by means of a cellular membrane, in the form of a white fringe, called the ciliary circle. It then recedes from the sclerotica and cornea and ciliary circle, directly downwards and inwards, forming a round disk, which is variously coloured; hence blue, black eyes, &c. This coloured portion, reflected inwards, is termed the iris, and its posterior surface is termed uvea. The choroid membrane is highly vascular, and its external vessels are disposed like stars, and termed vasa vorticosa. The internal surface of this membrane is covered with a black pigment, called the pigment of the choroid membrane.

CHOROID PLEXUS Plexus choroidea A plexus of blood-vess is, situated in the lateral ventricles of the br in.

CHOR 110 TUNIC. See Choroid membrane.
CHRISIS. (From χειω, to anoint.) An inunction, or anoming of any part.

Christmas -ose. See Helleborus niger. Christum. (From xuo, to anoint.) An unguent, or ointment of any kind.

CHROMAS. A chromate, or salt, formed by the union of earthy, metallic, or alkaline bases, with chromic acid; as chromate of lead, &c.

CHROMATISMUS. (From χεωμαλίζω, to colour.) The morbid discontration of any of the secretions, as of the urine, or

blood.

CHROME. (From xgmux, colour; because its primary combina ions impart its colour to all secondary ones.) A white metal, inclining to a grey, very brittle, and crystallizable at an elevated temperature, in feathered filaments on the surface. Its internal fracture presents in some parts close grains, in other parts needles crossing each other. It is an ingredient in the fossil, known by that name in S beria.

Natural History .- This metal, which is extremely scarce, and exists only in the state of a metallic oxid, was discovered by Vanquelin. He found it in an ore called red-lead ore of Siberia, or chromate of le id The colour of this ore is red, with a shade of yellow; when reduced to po der, it is of a bright orange. Chrome has likewise been found in combination with iron, alumine, and silex, (chromate of iron and alumine,) in the department of Var, in France. It is met with in irregular masses. Its colour is brown; it has very little metallic lustre. Pontier has lately found chrome combined with iron (chromate of iron,) in a quarry near Gussin in the road to Cavalaire. It sometimes forms large masses. The emerald of Peru and spinel ruby owe their colours to this metal

Properties.—Chrome is obtained in small agglurinated masses of a white colour, inclining to yellow; it is very hard, extremely brittle and refractory, and crystal-

lizes into needlės.

Exposed to the heat of a blow-pipe, it is covered with a lilac-coloured crust, which becomes green on cooling. Heated by the same apparatus with borax, it does not melt; but a part, after being oxidated, is dissolved in this salt, and communicates to it a very beautiful green colour. Acids have only a weak action on this metal. The nitric is the only acid which produces any remarkable change, it converts it into an oxid. It is capable of combining with three different portions of oxigen, and forming three different oxids. It has not yet been combined with any combustible

body. It does not appear to decompose water. It is unalterable by the alkales. The other properties of this metal are not yet a certained, neither are its uses known; perhaps at may afford beautiful and durable colours to the painter or the enameller.

Method of obtaining Chrome. Chromeis obtained from its native combinations, by decomposing them by the alkaline carbonates, precipitating the chromic acid, and heating it strongly in a crucible.

The following method is recommended by Vauquelin Seventy-two parts of chromic acid are to be introduced into a charcoal crucible, placed within another of porcelain, filled with charcoal dust. The apparatus is then to be put in o a furnace, and subjected to a very strong heat. Metallic chrome will then be

found in the charcoal crucible. From

seventy-'wo parts, Vauquelin obtained forty-three of metal.

CHROMIC ACID. This is obtained by decomposing the chromat of lead by potash, and treating the chromat of potash with nitric or muriatic acid. It is of an orange-red colour, and a pungent metallic taste; very soluble in water, and crystallizes by gentle evaporation.

CHRONIC (From 250005, time) A term applied to diseases which are of long continuance, and mostly without fever. It is used in opposition to the term acute.

See Acute.

CHRUPSIA. (From xg22, colour, and o412, sight.) Visus coloratus. A disease of the eyes, in which the person perceives objects of a different colour from their natural.

CHRYSANTHEMUM. (From Ageorge, gold, and appeared, a flower.) 1. The name of a genus of plants in the Linnæ n system. Class, Syngenesia. Order, Polygamia. Sun flower, or marigold.

2. Many herbs are so called whose flowers are of a bright yellow colour.

CHRYSANTHEMUM LEUCANTHEMUM. The systematic name of the great ox eye-daisy. See Bellis major.

CHRYSE. (From xguoos, gold.) The

name of a yellow plaster.

CHRYSELECTRUM. (From xguoos, gold, and naexlgor, amber.) Amber of a golden yellow colour.

CHRYSIPPEA. (From Chrysippus, its inventor. A herb enumerated by Pliny.

CHRYSITIS. (From xgurss, gold.) Litharge. The yellow foam of lead. Also the herb yarrow, from the golden colour of its flower.

Chrysobalanus. (From χευσος, gold, and βαλανος, a nut; so named because of its colour, which, before it is dried, is yellow.) The nutmeg.

CHRYSOCOLLA. (From xguros, gold, and

колда, cement.) Gold solder.

CHRYSOCOMA. (From xguoss, gold, and xoun, hair: so called from its golden, hair-

like appearance.) The herb milfoil, or yarrow.

CHRYSOGONIA. (From xguros, gold, and yropas, to become.) The tincture of

gold

Chrysolachanon. (From 2000s, gold, and hazaror, the olus; so named from its having a yellow leaf, and a flower like the olus.) The herb orach, or atriplex.

CHRYSOSPLENIUM. (From χχυσος, gold, and ασπλευων, spleenwort.) The name of a genus of piants in the Linnaan system. Class, Decandria. Order, Digynia. Golden sax frage.

CHRYSULCUS. (From 280000, gold, and 1920, to take away.) The aqua regia is so called, as having the property to dissolve

CHYLARIA. (From XUNOS, chyle.) A discharge of a whitish nine us urine, of the

colour and consistence of chyle.

CHYLE. (XDAGE, Chylus.) The milk like liquor observed some hours after eating, in the lacteal vessels of the mesentery, and in the thoracic duct. It is separated by digestion from the chyme, and is that fluid substance from which the blood is formed.

The chyle is absorbed by the mouths of the lacteal vessels, which are in the greatest number in the jejunum and ilium, whilst the fex of the chyme, with the bile, are propelled into the large intestines. The clivle of the human body smells like milk; has a sweetish taste, a white colour, and a consistence thinger than blood and milk. Its specific gravity is lighter than that of the blood, and hence it is that chyle is occasionally seen swimming on the blood, if a vein be opened some hours after eating. The quality of the chyle is similar to that of milk; for, like it, it coagulates and ascesces; but sometimes its nature is altered from bad digested food or medicines: thus the chyle becomes blue, from eat ng indigo; yellow, from the yolk of eggs, &c. The quantity of chyle depends upon that of the ingesta, and their greater or less nourishing power: from five or six pounds of food, very little more than two pounds of chyle are elaborated

The constituent principles of chyle, are, 1. Water, which forms its greatest part. 2. Oily cream, which chymistry teaches to be hydrogen and carbon. 3. Cheese, which, by the vis vitals, is formed by the carbon and azot of the ingested food. 4 Earth, which is obtained from lacteal calcul, that are occasionally found in the receptaculum chyli and lacteals. 5. Animal lymph, which is mixed with the gastric and enteric juices.

The nutritive principles of vegetables, are starch; an albuminous principle, oil, vegetable gluten, and sugar. The nutritive principles of animal substances, are oil, jelly, and animal gluten; and hence the reason why the chyle, separated from vegetables, is of the same nature with that prepared from animal ingesta, that the

principles of both are dissolved into their elements, which are the same in animal and vegetable foods: thus the cream of the chyle is formed of earbon and hydrogen; and the cheese of the chyle, from the carbon and azot of both animal and vegetable substances.

The chyle is mixed with the albuminous and gelatinous lymph in the thoracic duct, which receives them from the lymphatics.

The uses of the chyle are, i. To supply the matter from which the blood and other fluids of our body are prepared; from which fluids the solid parts are formed. 2 By its ascescent nature, it somewhat restrains the putrescent tendency of the blood; hence the dreadful putridity of the humours from starving; and trus milk is an accillent remedy against seurvy. 3. By its very copious aqueous latex, it prevents the thickening of the fluids, and thus renders them fit for the various secretions. 4. The chyle secreted in the breasts of purperal women, under the name of milk, forms the most excellent nutriment of all aliments for new born infants.

CHYLAFICATION. (From chylus, and fig. to become.) Chylifactio. The process, carried on in the small intestines, and principally in the duodenum, by which the chyle is separated from the chyme.

CHYLISMA. (From ZUNOS, juice.) An

expressed juice.

CHYLOPOETIC. (Chylopoeticus; from zolos, chyle, and word, to make) Chylopoietic. Any thing connected with the formation of chyle; thus chylopoetic viscera, chylopoetic vessels, &c.

CHYLOSIS. (From χυλέζω, to express the juice from any thing.) Chylification, or

the changing the food into chyle.

CHYLOSTAGMA. (From xoxos, juice, and saxo, to distil.) The distillation or expression of any juice, or humid part from its dry one.

CHYPOSTAGMA DIAPHORETICUM MINDERERI. A distillation of Verice treacle and

mithridate.

CHYME. (Chymus; from χυμος, which signifies humour or juice.) The mgested mass of food, that passes from the stomach into the duodenum, and from which the chyle is prepared in the small intestines by the admixture of the bile, &c.

CHYMIA. Chymistry.

Chymiaten, A chymical physician, See Chimiater.

CHYMIATHIA. (From  $\chi \nu \mu \mu z$ , chymistry, and  $\mu z \rho \mu z$  to heal.) The art of curing diseases by-the application of chymistry to the uses of medicine.

CHYMOSIS. See Chemosis.

CHYPLEN RADIX. A cylindrical root, of the thickness of a goose-quill, brought from China. It has a bitterish taste, and imparts a yellow tinge to the salva. The Chinese hold It in great estimation as a stomachic, infused in wine.

CHYSIS. (From xuw, to pour out.) Fusion, or the reduction of solid bodies into fluid by heat.

CHYTLON. (From χυω, to pour out.) An

anointing with oil and water.

CIBALIS FISTULA. An obsolete term for

the esophagus.

CIBATIO. (From cibus, food.) In chymistry it means incorporation: also the taking of food.

CIBUR. An obsolete term for sulphur.

CICATRISANTIA. (Cicatrisantia, sc. remedia; from cicatrico, to skin over.) Such applications as dispose wounds and ulcers to dry up and heal, and to be covered with a skin

CICATRIX. (From cicatrico, to heal up or skin over.) A seam or scar upon the skin after the healing of a sore or ulcer.

CICER. (A plant so called. The Cicerones had their name from this pulse, as the Pisones had from the pisum or pea, and the Lentuli from the lens or lentil.)

1. The name of a genus of plants in the Linnæan system. Class, Diadelphia. Order, Decandria. The vetch.

2. The pharmacopoial name of the common cich or ciches. Erebinthus. Cicer arietinum of Linnæus :- foliis serratis. The seeds have been employed medicinally, but are now fallen into disuse. In some places they are toasted, and used as coffee; and in others, ground into a flour for bread. The colour of the aryllus of the seed is sometimes white, red, or black: hence the distinction into cicer album, rubrum, and nigrum.

CICER ARIETINUM. The systematic name

of the cicer plant.

CICERA. (From cicer, the vetch ) A

small pill of the size of a vetch.

CICERA TARTARI. Small pills composed of turpentine and cream of tartar, of the size of a vetch.

CICHORIUM. (Originally, according to Pliny, an Egyptian name, and adopted by the Greeks. It is written sometimes Kixoguar: whence Horace has-cichorea, levesque malve: sometimes Kixogior, or Kixuelor. It is supposed to have this name,

waga to Sia two xwelwo niew, from its creeping through the fields .- Others derive it from κιχεω, invenio; on account of its being so readily found, or so common.) Succory.

1 The name of a genus of plants in the Linnæan system Class, Syngenesia. Or-

der, Polygamia aqualis.

2. The pharmacopæial name of the wild This plant, called Cichoreum, Cichorium sylvestre vel officinarum, is the Cichorium intybus of Linewas :- floribus

zeminis, sessilibus; foliis runcinatis.

It belongs to the same family with the garden endive, and by some botanists has been upposed to be the same plant in its uncultivated state; but the endive commonly used as sallad is an annual, or at most a biennial plant, and its parent is now

known to be the cichorium endivia. Wild succory or cichory, abounds with a milky juice, of a penetrating bitterish taste, and of no remarkable smell or particular flavour: the roots arc more bitter than the leaves or stalks, and these much more so than the flowers. By culture in gardens and by blanching, it loses its bitterness, and may be eaten early in the spring in sallads. The roots, if gathered before the stem shoots up, are also eatable, and when dried may be made into bread. The roots and leaves of this plant are stated by Lewis to be very useful aperients, acting mildly and without irritation, tending rather to abate than to increase heat, and which may therefore be given with safety in hectic and inflammatory cases. Taken freely, they keep the belly open, or produce a gentle diarrhœa; and when thus continued for some time, they have often proved salutary in the beginning obstructions of the viscera, in jaundices, cachexies, hypochondriacal and other chronical disorders. A decoction of this herb, with others of the like kind, in whey, and rendered purgative by a suitable addition of polychrest salt, was found a useful remedy in cases of biliary calculi, and promises advan age in many complaints requiring what have been termed attenuants, and resolvents. The virtues of succory, like those of dandelion, reside in its misky juice; and we are warranted, says Dr. Woodville, in asserting that the expressed juice of both these plants, taken in large doses frequently repeated, has been found an efficacious remedy in phthysis pulmonalis, as well as the various other remedies above mentioned. The milky juice may be extracted by boiling in water, or by pressure. The wild and the garden sorts are used indifferently. If the root is cut into small pieces, dried, and roasted, it resembles coffee, and is sometimes a good substitute for it.

CICHORIUM ENDIVIA. The systematic

name of the endive. See Endivia. CICHORIUM INTYBUS

The systematic name of the wild chicory. Sce Cichorium. Cichory. Sce Cichorium.

Cichory, wild. See Cichorium.

CICINDELA. (A dim. of candelia: i. e. a little candle; so called from its light.) The glow-worm. Some think them anodyne, others lithontriptic, though as the editor of Motherby's Dictionary justly observes, probably neither.

CICINUM OLEUM. (From nini, the ricinus.) An oil, obtained by boiling the bruised seeds of the Jutropha cureas of Linnæus. It is somewhat similar in its properties to castor oil. See Ricinus.

CICLA. A name for the beta alba.

CICUTA. (Quasi cacuta, blind; because it destroys the sight of those who CICUTA. use it. Cicuta signifies the internode, or space between two joints of a reed: the hollow stem of any plant which the shepherds used for making their rural pipes.

Est mihi disparibus septem conjuncta cicutis fistu'a.- Virgil.) Hemlock.

1 The name of a genus of plants in the Linnwan system. Class, Pentandria. Or-

der, Digynia.

2. The name, in most pharmacopæias, of the common hemlock, or Comium maculatum of Lunnæus :- seminibus striatis. It is called by some camaran; by others abiotos; and according to Erotian, cambeion is an clei Stedian word for cicuta. Cicuta major fætida. Comum of the last London

pharmacopoia.

Hemlock is found in every part of England, and is distinguished from those plants which bear some rememblance to it, by the spotted stem. It is generally believed to be a very active poison. In a very moderate dose it is apt to occasion sickness and vertigo; in a larger quantity it produces anxie.y, cardialgia, vomiting, convulsions, coma, and death. Baron Stoerk was the first who brought hemlock into repute as a medicine of extraordinary efficacy; and although we have not in this country any direct facts, like those mentioned by Stoerk, proving that inveterate scirrhuses cancers, ulcers, and many other diseases hitherto decimed irreincdiable, were completely cured by the cicuta; we have however the testimonics of several eminent physicians, shewing that some complaints, which had resisted other powerful remedies, yielded to hemlock; and that even some disorders, which, if not really cancerous, were at least suspected to be of that tendency, were greatly benefitted by this remedy. In abronic rheumatisms, some glandular swellings, and in various fixed and periodical pains, the cicuta is now very generally employed; and from daily experience, it appears in such cases to be a very efficacious remedy. It has also been of singular use in the hooping-cough. Nor is it less efficacious when applied externally; a poultice made of oatmeal and the expressed juice, or a decoction of the extract, when the former cannot be obtained, allays the most excruciating torturous pains of a cancer, and thus gives rest to the distracted

The proper method of administering conium internally, is to begin with a few grams of the powder or inspissated juice, and gradually to increase the dose until a giddiness affects the head, a motion is felt in the eyes as if pressed outwards, with a slight sickness and trembling agitation of the body. One or more of these symptoms are the evidence of a full dose, which should be continued until they have ceased, and then after a few days the dose may be increased; for little advantage can be expected but by a continuance of the greatest quantity the patient can bear. In some constitutions even small desce greatly offend, occasioning spasms, heat and thirst; in

such instances it will be of no service. the powder of the dried leaves has been thought to act, and may be depended upon with more certainty than the extract, the following direction should be observed in the preparation; gather the plant about the end of June, when it is in flower; pick off the little leaves, and throw away the leafstalks: dry the small selected leaves in a hot sun, or in a tin or pewter dish before the fire. Preserve them in bags made of strong brown paper, or powder them and keep the powder in glass phias where the light is excluded; for light dissipates the beautiful green colour very soon, and thus the medicine loses its appearance, if not its efficacy: this mode is recommended by Dr. Withering. The extract should also be made of the plant gathered at this period. From 10 to 20 grains of the powder may be taken twice er thrice a day.

CICUTA AQUATICA. Cicutaria virosa. Sium majus alterum angustifolium. Sium erucæ folio. Long-leaved water hemlock and cowhane. This plant, Cicuta virosa of Linnaus :- umbellis opposit foliis; petiolis marginatis obtusis, is seldom employed medicinally in the present day. It is an active poison, and often eaten by mistake for the wild smallage, the Apium graveolens of Linnæus; when it produces tremors, vertigo, a violent burning at the stomach, epilepsy, convulsions, spasms of the jaw, a flowing of blood from the ears, tumefac-

tion of the abdomen, and death.

CICUTA VINOSA. The systematic name of the water hemiock. Sec Cicuta aqua-

CICUTARIA. (Cicutaria; from cicuta, hemlock.) Bastard hemlock. This plant, Cherophyllum sylvestre of Linnaus :- caule levi striato; geniculis tumidiusculis, is often mistaken for the true hemlock. with great propriety be banished from the list of officinals, as it possesses no remarkable property. See Cherophyllum.

CICUTARIA AQUATICA. A name for the

phellandrium aquaticum.

CICUTANIA VIROSA. Sec Cicuta aquatica.

CIDONIUM. See Cydonium.

CILIAR LIGAMENT. (From cileo, to move about.) Ligamentum ciliare. The circular portion that divides the choroid membrane from the iris, and which adheres to the selerotic membrane. It appears like a white circular ring. See Choroid membrane.

CILIARE LIGAMENTUM, See membrane.

CILIARIS MUSCULUS. That part of the musculus orbicularis palpebrarum which lies nearest the cilia, considered by Riolan as a distant muscle.

CHAUM. (From eileo, to move about.)

The hair on the eyelid or cyclash.

CILIARY PROCESSES. The white folds at the margin of the uvea in the eye, covered with a black matter, which proceeds from the uvea to the crystalline lens, upon which they lie.

CILLO. (From cilium, the eyelid.) One who is affected with a spasm or trembling

of the eyelids.

CILLOSIS. (From cilium, the eyelid.) A

spasmodic trembling of the eyelids.

CIMEX. (From resuzes, to inhabit; so called because they infect houses.) The wall-louse or bug. Cimex domesticus. Six or seven are given inwardly to cure the ague, just before the fits come on, and have the same effect with every thing nauseous and disgusting.

CIMOLIA ALBA. (From Kimolos, Cimolus, an island in the Cretan sea, where it is procured.) Tobacco-pipe clay. Its virtues are similar to those of the bolar earths; but it is never administered medicinally.

CIMOLIA PURPURESCENS. Fullers-earth. A bolar earth, of a grayish brown colour.

CINA CINA. See China china. CINA SEMEN. See Santonicum.

CINARA. (From xivew, to move; quasi movet ad venerem vel urinam.) Artichoke.

1 The name of a genus of plants in the Linnaan system. Class, Syngenesia. Or-

der, Polygamia aqualis.

2. The pharmacopæial name for the common artichoke. Alcocalum. Articocalus. Artischocas lævis. Costus nigra. Carduus sativus non spinosus. Cinara hortensis. Scolymus sativus. Carduns domesticus capite majore. Carduus altilis. 'The species thus called, and which is used in medicine, is the Cinara scolymus of Linnaus: -foliis subspinosis pinnatis indivisisque calycinis squamis oratis. A native of the southern parts of Europe, but cultivated here for culinary purposes. The leaves are bitter, and afford, by expression, a considerable quantity of juice, which, when strained, and mixed with an equal quantity of white wine, has been given successfully in dropsies, the dose of 3 or 4 table-spoonfuls every night and morning, but it is very uncertain in its operation.

CINCHONA. (Geoffroy states that the use of this bark was first learned from the following circumstance:—Some cinchona trees being thrown by the winds into a pool of water, lay there till the water became so bitter, that every body refused to drink it. However, one of the neighbouring inhabitants being seized with a violent paroxysm of fever, and finding no other water to quench his thirst, was forced to drink of this, by which he was perfectly cured. He afterwards related the circumstance to othere, and prevailed upon some of his friends, who were ill of fevers, to make use of the same remedy, with whom it proved equally successful. The use of this excellent remedy, however, was very little known till about the year 1638, when

a signal cure having been performed by it on the Spanish viceroy's lady, the Countess del Cinchon, at Linia, and it came into general use, and hence it was distinguished by the appellation of cortex cinchonæ, and pulvis comitessæ, or the Countess's powder. On the recovery of the Countess, she distributed a large quantity of the bark to the Jesuits, in whose hands it acquired still greater reputation, and by them it was first introduced into Europe, and thence called cortex, or pulvis jesuiticus, pulvis patrium; and also Cardinal del Lugo's powder, because that charitable prelate bought a large quantity of it at a great expense, for the use of the religious poor at Rome.) Cortex china, china or chinchina; kina kina, or kinkina; and quina quina, or quinquina.

1. The name of a genus of plants in the Linnaan system. Class, Pentandria. Order, Monogynia. Cinchona, or Peruvian

bark-tree.

2. The pharmacopoial name of several kinds of barks; the trees affording which grow wild in the hilly parts of Peru; the bark is stripped from the branches, trunk and root, and dried. Three kinds of it are now in use.

CORTEX CINCHONE CORDIFOLIE.

The plant which affords this species is the Cinchona cordifolia of Zer: the Cinchona officinalis of Linnœus: the Cinchona macrocarpa of Wildenow. Heart-leaved cinchona.

The bark of this tree is called yellow bark, because it approaches more to that colour than either of the others do, is in flat pieces, not convoluted like the pale, nor dark-coloured like the red; externally smooth, internally of a light cinnamon colour, friable and fibrous; has no peculiar odour different from the others, but a taste incomparably more bitter, with some degree of astringency.

CORTEX CINCHONÆ LANCIFOLIÆ.

This species is obtained from the Cinchona lancifolia of Zea. Lance-leaved cinchona. This is the Quilled bark, which comes in small quilled twigs, breaking close and smooth, friable between the teeth, covered with a rough coat of a brownish colour, internally smooth and of a light brown; its taste is bitter and slightly astringent; thavour slightly aromatic, with some degree of mustiness.

CORTEX CINCHONE OBLONGIFOLIE.

This knd is procured from the Cinchona colongifolia of Zea. Oblong-leaved cinchona. This bark is the red bark: it is in large thick pieces, externally covered with a brown rugged coat, internally more smooth and compact, but fibrous; of a dark-red colour; taste and smell similar to that of the cinchona lancifolia cortex, but the taste rather stronger.

From the general analysis of bark, it

appears to consist, besides the woody matter which composes the greater part of it, of gum, resin, gallic acid, of very small portions of tannin and essential oil, and of several salts, having principally lime for their basis. Sequin also supposed the existence of gelatin in it, but without sufficient proof. Cold water infused on pale bark for some hours acquires a bitter taste, with some share of its odour; when assisted by a moderate heat, the water takes up more of the active matter; by decoction, a fluid, deep-coloured, of a bitter styptic taste, is obtained, which, when cold, deposits a precipitate of resinous matter and gallic acid. By long decoction, the virtues of the bark are nearly destroyed, owing to the oxygenation of its active matter. Magnesia enables water to dissolve a larger portion of the principles of a bark, as does lime, though in an inferior degree. Alcohol is the most powerful solvent of its active Brandy and other spirits and wines afford also strong solutions, in proportion to the quantity of alcohol they contain. A saturated solution of ammonia is also a powerful solvent; vinegar is less so even than water. By distillation, water is slightly impregnated with the flavour of bark; it is doubtful whether any essential oil can be obtained.

The action of menstrua on the red bark is nearly the same, the solutions only being considerably stronger, or containing a larger quantity of resinous matter and of the

astringent principle.

The analysis of the yellow bark shows that its active principles are more concentrated than in either of the others, affording to water, alcohol, &c. tinctures much stronger, both in bitterness and astringency, especially in the former principle.

From the general analysis of these barks, it appears that they consist of nearly the same proximate principles, which vary in their proportions; the most active component parts are the resin, extractive matter and the gallic acid, and these in combination probably constitute the tonic quality of bark. In the best pale bark this active matter amounts to about one-eighth.

The red bark has been considered as superior to the pale, the yellow is represented, apparently with justice, as being more ac-

tive than either of the others.

The effects of Peruvian bark are those of a powerful and permanent tonic, so slow in its operation, that its stimulating property is scarcely perceptible by any alteration in the state of the pulse, or of the temperature of the body. In a large dose, it occasions nausea and head-ache; in some habits it operates as a laxative; in others it occasions costiveness. It is one of those medicines, the efficacy of which, in removing

disease, is much greater than could be expected, à priori, from its effects on the system in a healthy state.

Intermittent fever is the disease, for the cure of which bark was introduced into practice, and there is still no remedy which

equals it in power.

The disputes respecting the mode of administring it are now settled. It is given as early as possible, with perhaps the previous exhibition of an emetic, to evacuate the stomach; it is repeated in the dose of one scruple or half a drachm every second or third hour, during the interval of the paroxysm; and it may even be given during the hot fit, but it is then more apt to excite nausea.

In remittent fever it is given with equal freedom, even though the remission of the

fever may be obscure.

In some forms of continued fever which are connected with debility, as in typhus, cynanche maligna, confluent small-pox, &c. it is regarded as one of the most valuable remedies. It may be prejudicial, however, in those diseases, where the brain, or its membranes are inflamed, or where there is much irritation, marked by subsultus tendinum, and convulsive motions of the extremities; and in pure typhus it appears to be less useful in the beginning of the disease than in the convalescent stage.

Even in fevers of an opposite type, where there are marks of inflammatory action, particularly in acute rheumatism, bark has been found useful after blood-letting. In erysipelas, in gangrene, in extensive suppuration and venercal ulceration, the free use of burk is of the greatest advantage.

In the various forms of passive hæmorrlagy, in many other diseases of chronic debility, dyspepsia, hypochondriasis, paralysis, rickets, scrophula, dropsy, and in a variety of spasmodic affections, epilepsy, chorea, and bysteria, it is administered as a powerful and permanent tonic, either alone, or combined with other remedies suited to the particular case.

Its usual dose is half a drachm. The only inconvenience of a larger dose is its sitting uneasy on the stomach. It may therefore, if necessary, be frequently repeated, and in urgent cases may be taken to the extent of an ounce, or even two ounces, in

twenty-four hours.

The powder is more effectual than any of the preparations: it is given in wine, in any spirituous liquor; or, if it excite nausen, combined with an aromatic. The cold infusion is the least powerful, but most grateful; the decoction contains much more of the active matter of the bark, and is the preparation generally used when the powder is rejected; its dose is from two to four ounces. The spirituous tincture, though containing still more of the bark, cannot

be extensively used on account of the menstruum, but is principally employed, occasionally, and in small doses of two or three drachms, as a stomachic. The extract is a preparation of considerable power, when properly prepared, and is adapted to those cases, where the remedy requires to be continued for some time. It is then given in the form of pill, in a dose from five to fifteen grains.

CIN

Bark is likewise sometimes given in the form of encma; one scruple of the extract, or two drachins of the powder, being diffused in four ounces of starch mucilage. The decoction is also sometimes applied as a

fementation to ulcers.

The systematic CINCHONA CARIBRA. name of the Ceribæan bark-tree. It grows in Jamaica, where it is called the sea-side beech. According to Dr. Wright, the bark of this tree is not less efficacious than that of the cinchona of Peru, for which it will prove an useful substitute: but by the experiments of Dr. Skeete, it appears to have

less astringent power.

CINCHONA FLORIBUNDA. The systematic name of the plant which affords the Saint Lucé bark. Dr Withering considers this bark as greatly inferior to that of the other species of this genus. In its recent state it is considerably emetic and cathartic, properties which in some degree it retains on being dried; so that the stomach does not bear this bark in large doses, and in small ones its effects are not such as to give it any peculiar recommendation.

CINCHONA OFFICINALIS. The name of the officinal Peruvian bark.

chona.

CINCHONA SANCTA FE. Several species of cinchona have been lately discovered at Sanca. Fé, yielding barks both of the pale and red kind; and which, from their sensible quadities, are likely upon trial to become equally useful with those produced in the kingdom of Peru.

CINCHONA RUBRA. See Cinchona. CINCHONA FLAVA. See Cinchona.

CINCINNUS. The hair on the temples.

See Capillus.

(From κιγκλιζω, to move.) An involuntary nictitation or Cinclismus winking. Fogel.

CINERARIUM. (From cinis, asies.) The

ash-hole of a chymical instrument.

CINERES. (plur. of cinis, ashes.) Ashes. CINERES CLAVELLATI. (Clavellatus; from clarus, a wedge. The name of cineres clavellati originated from the little wedges or billets into which the wood was cut to make potash.) Alumen cutinum. Sal alkali fixum. fineres russici. Kali. Potassa gastrinum. Kali impurum. Impure potash or pearl ash. The name adopted in the new London pharmacopæia is potassa impura. It is from this salt the vari- It is called ous preparations of potash are made, in flowers.

The ancients called the ashes of burntwood lix, from whence the modern word lixivia. The English name pot sh is from the pots in which the lixivium was

CINERES RUSSICI Sec Cineres clavellati CINERITIOUS. (From cinis, ashes.) Of the colour of ashes. A name applied to the cortical substance of the brain, from its resemblance to an ash-colour.

CINERITIUM. (From cinis, ashes.) A cupel or test; so named from its being commonly made of the ashes of vegetables

or bones.

CINERULAM A name for spodium.

CINETUS. An epithet formerly applied to the diaphragm.

(From cingulum, a girdle; CINGULARIA. because it grows in that shape.) The lyco-

podium.

CINGULUM. (From cingo, to bind.)

girdle or belt about the loins.

CINGULUM MERCURIALE. A mereurial girdle, called also cingulum sapientia, and cingulum stultitiæ. It was an invention of Rolundus's; different directions are given for making it, but the following is one of the neatest: "Take three drams of quicksilver; shake it with two ounces of lemonjuice until the globules disappear; then separate the juice and mix with the extinguished quicksilver half the white of an egg; gum-dragon finely powdered, a scruple; and spread the whole on a belt of

CINGULUM SANCTI JOHANNIS. A name of the artemisia.

CINIFICATUM. A name for calcinatum.

CINNABAR. (Pliny says the Indians call by this name a mixture of the blood of the dragon and elephant, and also many substances which resemble it in colour, particularly the minium.) Minium purum. Minium Grecorum. Magnes epilepsia. Atzemafor. Amnion. Azamar. calls it anthrax. A red mineral substance composed of mercury combined with sulphur. It is either native or factitious The native is an ore of quicks liver moderately compact, and of an elegant strinted red colour. This kind of cinnabar, artificial cinnabar, employed as a factitious cinnabar, is a mixture of mercury and sulphur sublimed, and thus reduced to a fine red substance. The best is of a high colour and full of necdle-like spiculæ. See Sulphuretum hyrargyri rubrum. Cinnabar is often employed as a mild mercurial, and as an alterative. Hoffman greatly recommends it as a sed tive and antispasmodic. Others deny that cinnabar taken internally has any medicinal quality; and their opinion is grounded on the insolubility of it in any menstruum. is found in the Dutchy of Deuxponts, in the Palatinate, in Spain, South America, &c. It is called native vermillion, and cinnabar CINNABAR FACTITIA. See Sulphuretum hydrargyri rubrum.

CINVAHAR NATIVA. See Cinnabar.

CINNAHARIS Guzcorum. The sanguis draconis and ciunabar.

(From kinamon. CINNAMOMUM. Arab.) Cinnamon. The tree which affords the true cinnamon, which is its inner bark, is the Laurus cinnamonum of Jacquin :foliis trinerviis ovato-oblongis: nervis versus apicem evanescentibus. Cinnamon bark is one of the most grateful of the aromatics; of a fragrant smell, and a moderately pungent, glowing, but not fiery taste, accomwith considerable sweetness, and some degree of adstringency. It is one of the best cordial, carminative, and restorative spices we are in possession of, and is generally mixed with the diet of the sick. The essential oil, on account of its high price, is seldom used: a tincture, simple and spirituous water, are directed to be kept in the shops. The watery infusion of cinnamon is given with advantage to relieve nausea and check vomiting.

Cinquefoil. See Pentaphyllum.

Ciox. (Kiev, a column, from kie, to move.) The uvula was formerly so named from its pyramidal shape: also an enlargement of the uvula.

Cionis. (From nor, the uvula.) A discased enlargement and painful swelling of

the uvula.

CIRCÆA. (From Circe, the enchantress; so named from the opinion, that it was used by Circe in her enchanted preparations.) Enchanter's nightshade.

1. The name of a genus of plants in the Linnaun system. Class, Diaudria. Order,

Monogynia.

2. The name in some pharmacopæias for the Circea lutiana, which is now fallen

wholly into disuse.

CIRCOCELE. (From Rigner, varix, or a dilatation of a vein, and xnxn, a tumour.) Variocele. A varieose distension and enlargement of the spermatic veins; and whether considered on account of the pain, or on account of the wasting of the testicle, which now and then follows, it may truly be cilled a disease. It is frequently mistaken for a descent of a small portion of omentum. The uneasiness which it occasions, is a kind of pain in the back, generally relieved by suspension of the scrotum. It has been resembled to a collection of earthworms. It is most frequently confined to that part of the spermatic process, which is below the opening in the abdominal tendon; and the vessels generally become rather larger as they approach the There is one sure method of distingnishing between a circocele and omental hernia: place the patient in a horizontal posture, and empty the swelling by pressure upon the scrotum; then put the fingers firmly upon the upper part of the abdomi-

nal ring, and desire the patient to rise; if it is a hernia, the tumour cannot re-appear, as long as the pressure is continued at the ring; but if a circocele, the swelling returns with increased size, on account of the return of blood into the abdomen being prevented by the pressure.

Cracos. (From \*\*\* up to roll up) A ring. It is sometimes used for the splineter muscle, which is round like a ring.

CIRCULATION. (Circulatio; from circulo, to compass about.) A vital action performed by the heart in the following manner: the blood is returned into the right auricle of the heart by the descending and ascending venæ cavæ, which, when discended, contracts and sends its broad into the right ventricle; from the right ventricle it is propelied through the pulmonary artery, to circulate through, and undergo a change in, the lungs, being prevented from returning into the right auricle by the closing of the valves, which are situated there for that purpose. Having undergone this change in the lungs, it is brought to the left auricle of the heart by the four pulmonary veins, and from thence it is evacuated into the left ventricle. left ventricle, when distended, contracts, and throws the blood through the aorta to every part of the body, to be returned by the veins into the two venæ cavæ. prevented from passing back from the left ventricle into the airricle by a valvular apparatus; and the beginning of the pulmonary artery and aorta is also turnished with similar organs, to prevent its returning into the ventricles.—(See Heart.) It is by means of this important action, that every part of the body lives, becomes warm, and is nourished, the various secretions separated, and the chyle converted into blood. In the fætus the blood passes from the umbilical veins, partly into the vena portæ, and partly through the canalis venosus, into the ascending cava. lungs being contracted, a very small quantity circulates through them, and the greater part flows through the canalis arteriosus and foramen ovale to the left side of the heart, and into the aorta, and is carried back by the umbilical arteries to the pla-

CIRCULATOR. (From circulo, to compass about.) A wandering practiser in medicine. A quack. A mountebank.

CINCULATORIUM. (From circulo, to move round.) A chemical digering vessel in which the fluid performs a circulatory motion

CIRCULUS. (Dim. of circus, a circle.) A circle or ring. Any part of the body which is round or annular, as circulus coali. A round chemical and chirurgical instrument, sometimes called abbreviatorium by the old chymists.

CIRCULUS ARTERIOSUS IRIDIS.

artery which runs round the iris and forms a circle, is so termed.

CIRCULUS QUADRUPLEX. A bandage. CIRCUMCAULALIS. A name of the adnata

CIRCUMCISION. (Circumcisio, from circumscindo, to cut about.) The cutting off the prepuce from the glans penis; an ancient custom, still practised amongst the Jews.

CIRCUMFLEXUS. (Circumflexus, sc. muculus.) Tensor palati of Innes. cumflexus palati mollis of Albinus. Sphano. salpingo staphilinus, seu staphilinus externus of Winslow. Musculus tube nove of Valsalva. Palato-salpingeus of Douglass. Pterigo-staphylinus of Cowper, and Petrosalpingo-staphilin of Dumas. This muscle arises from the spinous process of the sphenoid bone, behind the foramen ovale, which transmits the third branch of the fifth pair of nerves, from the Eustachian tube, not far from its osseous part; it then runs down along the pterygoideus internus, passes over the hook of the internal plate of the pterygoid process by a round tendon, which soon spreads into a broad membrane. It is inserted into the velum pendulum palati, and the semilunar edge of the os palati, and extends as far as the suture which joins the two bones. Generally some of its posterior fibres join with the constrictor pharyngis superior, and palato-pharyngæus. Its use is to stretch the velum, to draw it downwards, and to a side towards the hook. It hath little effect upon the tube, being chiefly connected to its osseous part.

(From circumgyro, to CIRCUMGYRATIO. turn round.) Circumgyration, or the turn-

ing a limb round in its socket.

CIRCUMLITIO. (From circumling, to anoint all over.) A medicine used as a general unction or liniment to the part.

CIRCUMOSSALIS. (From circum, about, and os, a bone.) Surrounding a bone as the periosteum does; or surrounded by a bone.

Cincus. (From carka, to surround. Chald.) A circle or ring. A circular bandage, called also plinthius lacqueus.

CIRNESIS. (From upvaw, to mix.)

union of separate things.

CIRSIUM ARVENSE. (From x49005, a vein or swelling of a vein, which this herb was supposed to heal.) The carduus hæmorrhoidalis.

CIRSOCELE. See Circocele.

Cinsoines. (From upocs, a varix, and Resembling a varix: an eidos, likeness.) epithet applied by Rufus Ephesius to the upper part of the brain.

CIRSOS. (From μρσοω, to dilate.) A varix or preternatural distension of any part

of a vein.

Cissa. (From niova, a glutinous bird.)
A depraved appetite proceeding from previous gluttony and voracity.

(From x1550s, ivy, CISSAMPELOS. and αμπελος, the vine.) The name of a genus of plants in the Linuxan system. Class, Dioecia. Order, Monadelphia. The wild vine with leaves like ivy.
CISSAMPELOS PARIERA. The systematic

name of the pariera brava. See Pariera

brava.

(From Mosos, ivy.) The CISSINUM. name of a plaster mentiened by Ægineta. CISTA. (From xuman, to deposit.) A

cyst.

CISTERNA. (From cista, a cyst.) The fourth ventricle of the brain is so called from its cavity; also the lacteal vessels in women

CISTUS. (Kirlos, the derivation of which is uncertain.) The name of a genus of plants in the Linnzan system. Class, Polyandria. Order, Monogynia. Cistus.

(From kis, Heb.) CISTUS CRETICUS. Dorycinium. The Cisthorus. Cissarus. systematic name of the plant from which the laudanum of the shops is obtained. See

CISTUS HUMILIS. A name of parnassia or white liverwort.

CISTUS LADANIFERA. See Ladanum.

CISTUS LEDON. A name of Ledum palustre. See Rosmarinus.

CITHARUS. (From xidapa, a harp.) The breast is sometimes so named from its shape. CITRAGO. (From citrus, a citron, so called from its citron-like smell.) Citraria. Melissa or baum.

CITRAS. (From citrus, the citron.) A citrate. A salt formed by the union of the citric acid, or acid of lemons, with different bases; as the citrate of alumin, citrate of ammonia, citrate of potash.

CITREA. See Limon.

CITREUM. (From citrus.) Citron. Malus medica. Malus citria. The citrontree. Citrus medica of Linnæus. Its fruit is called Cedromela, which is larger and less succulent than the lemon; but in all other respects the citron and lemon trees agree. The lemon is a variety only of the citrus medica. The citron juice when sweetened with sugar is called by the Italians aigre di cedre.

CITRIC ACID. Acidum citricum. The juice of lemons. The citric acid may be obtained pure in concrete crystals, by the following method: Saturate boiling lemonjuice with pulverized chalk. The acid forms with lime a salt that is scarce soluble, and the mucilaginous and extractive substances remain dissolved in the supernatant liquor; the precipitate is to be washed with linkewarm water, till it ceases to deepen in colour; it dissolves nearly as well as sulphate of lime; it is then to be treated with as much sulphuric acid as is requisite to saturate the chalk, diluted in ten parts of water; and this mixture is to be boiled

for a few minutes. Afterwards, it must be tioned by Ruysch as one cause of infecuncooled and filtered; the sulphate of lime remains on the filter, and the liquor affords a crystallized acid by evaporation. See Li-

CITHINATIO. Complete digestion. CITHINULA. (A Dim. of citrus.) small citron.

See Limon. Citron.

Citrul, Sicilian. See Citrullus.

Jace brasi-CITRULLUS. Angura. Tetranguria. Sicilian citrul, or water-melon. The seeds of this plant, Cucurbita citrullus of Linnaus :- foliis multipartitis, were formerly used medicinally, but now only to re-produce the plant. Water-melon is cooling, and somewhat nutritious; but so soon begins to ferment, as to prove highly noxious to some stomachs, and bring on spasms, diarrhæas, cholera morbus, colics, &c.

CITRUS. 1. The name of a genus of plants in the Linnxan system. Polyade!phia. Order, Icosandria.

2. The name of the lemon. See Limon. CITRUS AUHANTIUM. The systematic name of the orange tree. Sec Aurantium. CITRUS MEDICA. The systematic name of the lemon-tree. See Limon.

CITTA. A voracious appetite.

CITTOSIS. See Chlorosis. Civet cut. See Zibethum.

CIVETTA. (From sebet, Arab.) Civet. An unctuous odoriferous drug now only used by perfumers

Clup. See Gonorrhaa.

CLARET. (Claretum; from clareo, to be clear.) A French wine, that may be given with great advantage, as a tonic and antiseptic, where red port wine disagrees with the patient; and in typhoid fevers of children and delicate females, it is far preferable as a common drink.

CLARETUM. See Claret. Also a wine impregnated with spices and sugar, called by some Vinum Hippocraticum. A Claretum purgatorium, composed of a vinous infusion of glass of antimony in cinnamon water with sugar, is mentioned by Schroeder

CLARIFICATIO. The depuration of any thing.

Clary. A name for the horminum.

CLASIS. (From xxxxx, to break.) Clasma. A fracture.

(From claudo, to shut.) CLAUSTRI M. Cleithrum gutturis. Any aperture which has a power of contracting itself, or closing its orifice by any means, as the passage of

CLAUSTRUM VIRGINITATIS. The hymeit. CLAUSURA. (From claudo, to shut.) An imperforation of any canal or cavity in the Lady. Thus clausurn uteri is a preternatural imperforation of the uterns; clausura tubarum Fallopiarum, a morbid imperforation of the Fallopian tubes, men-

CLAVATIO. (From clava, a club.) sort of articulation without motion, where the parts are, as it were, driven in with a hammer, like the teeth in the sockets. See Gomphosis.

CLAVELLATUS. (From clavus, a wedge.) A specific name of potash, or cineres clavellati; and so named from the little wedges, or billets, into which the wood

was cut to make it.

CLAVICLE. (Dim. of clavis; so called from its resemblance to an ancient key.) Collar-bone. The clavicle is placed at the root of the neck, and at the upper part of the breast. It extends across, from the tip of the shoulder to the upper part of the sternum; it is a round bone, a little flattened towards the end, which joins the scapula; it is curved like an Italic S, having one curve turned out towards the breast; it is useful as an arch, supporting the shoulders, preventing them from falling forwards upon the breast, and making the hands strong antagonists to each other; which, without this steadying, they could not liave been.

1. The thoracic end, that next the sternum, or what may be called the inner head of the clavicle, is round and flat, or button-like; and it is received into a suitable hollow on the upper piece of the sternum. It is not only like other joints surrounded by a capsule or purse; it is further provided with a small moveable cartilage, which, like a friction-wheel in machinery, saves the parts and facilitates the motions, and moves continually as the clavicle moves.

2. But the outward end of the clavicle is flattened, as it approaches the scapula, and the edge of that flatness is turned to the edge of the flattened acromion, so that they touch but in one single point. outer end of the clavicle, and the corresponding point of the acromion, are flattened and covered with a crust of cartilage; but the motion here is very slight and quite insensible; they are tied firmly by strong ligaments; and we may consider this as almost a fixed point; for there is little motion of the scapula upon the clavicle; but there is niuch motion of the clavicle upon the breast, for the clavicle serves as a shaft, or axis, firmly tied to the scapula, upon which the scapula moves and turns, being connected with the trunk only hy this single point, viz. the articulation of the clavicle with the breast-

CLAVICULUS. See Clavicle.

See Clavicle. CLAVICTEA.

CLAVIS. (From claude, to shut.) The same as clavicle.

CLAVUS. A nail. The sensation resembling the driving a nail into the head. A fixed pain in the forehead, which may be covered by one's thumb, giving a sensation like as if a nail were driven into the part. When connected with hysterics, it is called clawus hystericus. This term is also applied to corns, from their re-emblance to the head of a nail; and to an artificial palate, or diseased uterus.

CLI

CLAVUS HY TERICUS. See Clavus.

CLAYUS OCULOGUM. A staphyloma, or tumour on the cyclids.

Clay. See Alumina Cleavers. Sec Aparine.

CLEIDION Clidion. The epithet of a pastil, described by Galen and Paulus Ægineta; and it is the name also of an epithem described by Ætius.

CLEIDOMA (From RASISon, to close.) A

pastil, or torch. Also the clavicula.

CLEIDOMASTOIDEUS. (From aredama, the clavicle, and massondams, the massondams muscle.) See Sterro-cleidomastoideus.

CLETSAGRA. (Brom RASH, the clavicle, and ayea, a prey.) The gout in the articulation of the clavicles.

CLEITHRON. (From nauda, to shut.)

See Claustrum.

CLEMATIS. (From ANDIA, a tendril; so named from its climbing up trees, or any thing it can fasten open with its tendrils.) The name of a genus of plants in the Linnaun system. Class, Polyandria. Order, Polyginia.

CLEMATIS RECTA. The systematic name of the upright virgin's bower. See Flam-

mula Jovis.

CLEMATIS VITALBA. The systematic name of the traveller's-joy. See Vitalba.

CLEONIS COLLYBIUM. The name of a

collyrium described by Celsus.

CLEONIS GLUTEN. An astringent formula of myrrh, frankincense, and white of

egg

CLESYDRA. (From electron, to conceal, and usag, water.) Properly, an instrument to measure time by the dropping of water through a hole, from one vessel to another; but it is used to express a chymical vessel, perforated in the same manner. It is also an instrument mentioned by Paracelsus, contrived to convey suffumigations to the uterus, in hysterical cases.

CLIBANUS. (Quasi RANGAROS: from RANGAROS), to conceal.) A portable furnace, or still, in which the materials to be wrought

on are shut up.

CLIMACTER. (From κλιμαζα, to proceed gradually. The progression of the life of man. It is usually divided into pe-

riods of seven years.

CLIMAX. (From κλιμαζω, to proceed.) A name of some antidotes, which, in regular proportion, increased or diminished the ingredients of which it was composed. e. g. Chamedryos 3jij. Centaurii 3jj. Hyperici 3j.

Climbing birthwort. See Aristolochia

bed.) Any thing concerning a bed: thus ctinical lectures, notes, a clinical physician, &c.; which mean lectures given at the bed side, observations taken from patients when in bed, a physician who visits his patients in their bed, &c.

CLINOID. (Clinoideus; from NAMM, a bed, and who, resemblance) Resembling a bed. The four processes surrounding the sells turcica of the sphenoid bone are so called, of which two are anterior, and two

posterior.

CLINGWASTOIDEUS. A corruption of cleidomastoideus.

Clissus. A chymical term denoting inineral compound spirits; but antimony is considered as the basis clyssi. A spirit of antinomy is called clyssus.

CLITORIDIS MUSCULUS, See Erector clito-

ridis.

CLITORIS. (From xxua, to enclose, or hide; because it i hid by the labia pudendorum.) Columella. A small glandiform body, like a penis in miniature, and, like it, covered with a præpuce, or fore-skin. It is situated above the nymphæ, and before the opening of the urinary passage of women. Anatomy has discovered, that the clitoris is composed, like the penis, of a cavernous substance, and of a glans, which has no perforation, but is, like that of the penis, exquisitely sensible. The clitoris is the principal seat of pleasure: during coition it is distended with blood, and after the venereal orgasm it becomes flaccid and falls. Instances have occurred, where the clitoris was so enlarged as to enable the female to have venereal commerce with others; and, in Paris, this fact was made a public exhibition of to the faculty. Women thus formed appear to partake, in their general form, less of the female character, and are termed hermaphrodites. The ctitoris of children is larger, in proportion, than in full-grown women; it of en projects beyond the external labia at birth.

CLITORISMUS (From naulogus.) A mor-

bid enlargement of the clitoris.

CLONIC. (Prom πλογεω, to move to and fro.) Spasmi ctonici. See Convulsion.
CLONODES. (From πλογεω, to agritate.)

A strong unequal pulse.

Clove bark. See Cassia cargophyllata.
Clove gilliflower. See Cargophyllum ru-

Clove July flower. See Caryophyllum ru-brum.

um. Clove pink. See Caryophyllum rubrum. Clove. See Caryophyllum aromaticum.

CLUNESIA. (From clunes, the buttocks.) Proctalgia. An inflammation of the buttocks.

CLUSIA. (So called in memory of

Charles Clusius, an eminent botanist.) The name of a genus of plants in the Linnzan system. Class, Polygamia. Order, Monoe-Balsam-tree.

CLUTIA ELUTHERIA. The systematic name of the tree which was supposed to afford

the cascarilla bark.

CLUYTIA. (Named after Cluyt, and generally spelt clutius.) The name of a genus of plants in the Linnæan system. Class, Dioecia. Order, Gynandria.

CLUDON. (KAudav.) A fluctuation and

flatulency in the stomach.

CLYPEALIS. (From clypeus, a shield.) Formed like a shield, hence cartilago cly-

CLYSMUS. Clysma. (From κλυζω, to wash.)

A glyster.

Clistus. A term anciently used by the chymists for medicines made by the re-union of different principles, as oil, salt, and spirit, by long digestion; but it is not now practised, and the term is almost lost.

CLYSSUS ANTIMONII. Clyssus mineralis;

A weak acid of sulphur.

CLYSTER. (Clysterium. Erom κλυζω, to cleanse.) A glyster.

CNEWIA. Any part connected with the

CNEMODACTILEUS. (From kynun, the tibia, and faulures, a finger, or toe.) A muscle whose origin is in the tibia, and whose inscrtion is in the toes. Its office is to chevate the toes. See Extensor digitorum longus.

CNESIS. (From RVaw, to scratch.) Chesmu Cnesmos. A painful itching of any

CRICILATON. (From Krikos, cnichs, et exalor, oil.) Oil made of the seeds of cnicus. Its virtues are the same with those of ricinus,

but in an inferior degree.

Cricus. (From araw, to scritch) The plant used by Hippocrates by this name, is supposed to be the carthamus; but modern botanists exclude it from the species of this

CNICUS SYLVESTRIS. The Carduus bene-

dictus.

CNIDII cocci. See Coccognidia.

CNIDII GHANA. See Coccognidia.

Criposis (From widh, the netile.) itching sensation, such as is perceived by the nettle. A dry ophthalmy.

CNIPOTES. An itching. CNISMOS. See Cnesis. CNISMOS.

CNYMA. (From RVZW, to scrape, or grate.) In Hippocrates it signifies a rasure, punctur-, or vellication: also the same as ches-

mos, or enesis.

(From congulo, to COAGULANTIA. incrassate, or curdle.) Such medicines as coagulate the blood and juices flowing from it.

COAGULABLE LYMPH. Lympha coagulabilis. This substance has a great affinity to the white of eggs. It is a component part of the serum of the human blood. It may be obtained in considerable quantities by stirring the serum about with a stick, when it adheres to its sides. In certain diseased actions it is seperated from the blood, and is often found in very considerable quantities in the circumscribed cavities of the body. It has neither taste nor smell; it always possesses a white and opake colour; is of a glutinous consistence, and, if dried by a gentle heat, becomes horny. Its presence is detected by an admixture of the diluted mineral acids. See also Albumen.

COAGULATION. (Coagulatio; From con, and ago, to drive together.) The separation of the glutmous or viscid particles, contained in any fluid, from the more thin and not coagulable particles: thus, when milk curdles, the coagulable particles form the curd; and when acids are thrown into any fluid containing coagulable particles, they form what is called a congulum.

COAGULUM. A term applied frequently to blood and other fluids, when they as-

sume a jelly-like consistency.

COAGULUM ALUMINIS. This is made by beating the white of eggs with a little alum, until it forms a coagulum. It is recommended as an efficacious application to relaxations of the conjunctive membrane of

COALTERNÆ FEBRES. (From con, and alternus, alternate.) Fevers mentioned by Belini, which he describes as two fevers effecting the same patient, and the paroxysm of one approaching as that of the other subsides.

COARCTATIO. (From coarcto, to straiten.) The contraction, or dimunition of any thing. Applied to the pulse, it means a lessening in number.

COARTICULATIO. (From con, and articulatio, an amendation.) That sort of articu-

lation which has manifest motion.

COBALT. Cadmia metallica. A metal that has never been found pure in nature. We meet with it almost always either in the sate of an oxyd; alloyed with other metals in the form of a sulphuret; or combined with an acid.

Cobalt in the state of an oxyd forms the black cobalt ore This ore is found in Germany, either in powder of a black or grey colour, or in compact masses. In the last form, it exhibits at its fracture, rose coloured spots. There are several varieties of this ore.

Cotalt, alloyed with other metals, forms the dul' white cobalt ore. In this ore, which occurs either amorphous or crestalized, cobact is united to iron and arsenic. The colour of this ore, when fresh broken, is white or blueish-grey, sometimes with a shade of red It has a metallic lustre. Its texture is compact. Cobalt, united to

sulphur, forms the white Cobalt ore. It is met with in masses, or christallized in cubes, dodecahedra, and octahedra. Its colour is a tin-white, sometimes reddish-Cobalt combined with arsenic acid forms the red cobalt ore, arseniate of cobalt. It is found in masses of various Its colour is red, inclining to shanes.

orange. Cobalt, when in a pure state, is of a steelgrey colour, with a tinge of red, and a fine close grain. It has a granulated fracture, and is easily broken and pulverized. Its specific weight is hetween 7.700 and 7.811. It requires a very intense heat for its fusion, nearly equal to that necessary to melt castiron. When heated in contact with the air, it oxydates before fusion. Phosphorus renders it very fusible, and converts it into a phosphuret. It unites to sulphur with difficulty, but very well with the alkatine sulphurets by fusion. When alloyed with metals it renders them granulated, rigid, and brittle. It is attacked by the greater number of the acids, and unites with the boracic acid. Its solutions in different acids become green when heated; and from this property, it is used as an ink, which, when written with on paper, is invisible, but becomes visible when gently heated, and disappears when cold. It takes fire in oxygenated muriatic acid gas. It colours glass of a fine blue. It unites with platina, gold, iron, nickel, copper and arsenic, by fusion; but silver, lead, bismuth, and mercury, refusc to unite with it in the dry way. In its purest state, it is not only obedient to the magnet, but, if we may trust to the accuracy of some experiments made by Kohl and Wenzel, it may even receive a magnetical attractive power.

Nitrate of potash oxydates cobalt readi-It detonates by the blow of a hammer, when mixed with oxygenated muriate of potash. It produces fine colours in porcelain, enamels, artificial gems, &c.

COBHAM WATERS. Weak saline

purging waters at Cobham.

(From cobra, COBRA DE CAPELLO. the head, or covering. Span ) Crotalus horridus of Linnæus. The rattle-snake; horridus of Linnæus. the stone out of whose head is said to be an antidote to the poison of venomous animals.

COCCA ENIDIA. See Grana cnidia.

Coccarium. (From nonzov, a berry.) A

very small pill.

COCCINELLA. (Dim. from coccus, a berry; from its resemblance to a berry.) Coccinilla. Ficus India gruna. Scarabaolus hæmisphericus. Cochinelifera cochinilla. Coccus Americanus. Cochinelle. Coccus Indicus tinctorius. Cochineal. The female of a species of insect called Coccus cacti, that is found on, and collected in South America, from the Opuntia, or Indian fig- other, so as to form one conical bone,

tree. It possesses stimulating qualities, and is ordered by the College in he tinctura cardamomi composita and cinchone composita; but most probably, on account of the beautiful red colour which it imparts to them.

Cocco-BALSAMUM. The fruit of the true balsanı.

Coccognidia Grana cnidia. Cocci cnidii. The seeds of the Daphne mezereum are so termed. They are violently purgative. See Mezereum.

Coccos. See Grana cnidia.

Cocculi Indi Aromatici. The piper Jamaicense.

COCCULUS INDUS. Dim of MONNOS, a berry.) Coccus Indicus. Coccula officinarum. Cocci Orientales. The berry o called is rugous and kidney-shaped, and contains a white nucleus; it is the produce of the Menispermum cocculus: foliis cordatis, retusis mucronatis; caule lacero, of Linnxus. It is brought from Malabarand the East Indies. It is poisonous if swallowed, hringing on a nausea, fainting and convulsion. Mixed with paste it stupifies fishes, so that they will lie on the water, and not attempt to e-cape from the hand that takes them. The berries possess an inebriating quality; and are supposed to impart that power to most of the London porter.

COCCUM BAPHICUM. A name for cher-

mes

COCCUS. The name, in entomology, of a tribe of insects.

Coccus CACTI. The systematic name of the

cochineal animal. See Coccinella.
COCCYGEUS. (Coccygeus, sc. musculus; from nonnug: because it is inserted into the coccyx.) Ischio-cocigien of Dumas. muscle of the os coccygis, situated within the pelvis. It arises tendinous and fleshy, from the spinous process of the i-chium, and covers the inside of the sacro-ischiatic ligament: from this narrow heginning it gradually increases to form a thin fleshy belly, interspersed with tendinous fibres. It is inserted into the extremity of the os sacrum, and near the whole length of the os coccygis, laterally. Its use is to support and move the os coccygis forwards, and to tie it more firmly to the sacrum.

COCCYGIS OS. (From κοκκυξ, the cuckoo, whose bill it is said to represent.) Cauda. Ossis sacri acumen. Coccyx. This bone is a small appendage to the point of the sacrum, terminating this inverted cotumn with an acute point, and found in very different conditions in the several stages of life. In the child, it is merely cartilage, and we can find no point of hone; during youth, it is ossifying into distinct bones, which continue movcable upon each other till manhood; then the separate bones gradually unite with cach

COE

211

with bulgings and marks of the pieces of part of the spine which is adjacent to the which it was riginally composed; but still the last bone continues to move upon the joint of the sacrum, till, in advanced years, it is at last firmly united; later in women than in men, with whom it is often fixed at twenty or twenty-five. It is not, like the os sacrum, flat, but of a roundish form, convex without, and concave inwards; forming with the sacrum the lowest part of the pelvis behind. It has no holes like the sacrum; has no communication with the spinal canal, and transmits no nerves; but points forwards to support the lower parts of the rectum; thus it contracts the lower opening of the pelvis, so as to support effectually the rectum, bladder, and womb; and yet continues so moveable in women, as to recede in time of labour, allowing the head of the child to pass.

Coccygis os. Also the part in which the os

coccygis is placed.

COCHIA. (From xoxaw, to turn or make round.) An ancient name of some officinal

Cochineal. See Coccinella.

(From κοχαζω, to turn COCHLEA. round.) A cavity of the internal car, re-sembling the shell of a snail, in which are observed, the modiolns, or nucleus, extending from its basis to the apex, the scala tympani, scala restibuli, and spiral lamina.

Cochlea Terrestris. See Limax.

COCHLEARE. (From cochlea, a cockle, whose shell its bowl represents.) A spoonful. In prescriptions it is sometimes abbreviated thus, coch. Cockleare magnum, is a table-spoon; cochleare medium, a dessert or pap-spoon; and cochleare minimum, a teaspoon.

COCHLEARIA. (From cochleare, a spoon; so called from its resemblance.) The name of a genus of plants in the Lin-Class, Tetradynamia. næan system.

der, Siliculosa.

Cochleania armoracia. The systematic name of the horse-radish. See Raphanus rusticanus.

Cochlearia hortensis. Lemon schrvygrass. This indigenous plant, Cochlearia officinalis of Linnaus :- foliis radicalibus cordato-vubrotundis; caulinis oblongis subsinuatis, is cultivated in gardens for its medicinal qualities. Its expressed jnice has been long considered as the most effectual of the scorbutic plants.

COCHLEARIA OFFICINALIS. The systematic if me of the lemon-scurvy-grass. See

Cochlearia hortensis.

Cocnone (From xoxxxx, to turn round.) Galen explains this to be the juncture of the ischum, near the seat, or breech; whence, says he, all the adjacent parts about the seat are called by the same about the seat are called by the same chyl-sa, lactea; making the purulenta only name. Hesychius says, that cochone is the symptomatic. See Diarrhaa. It is at-

os sacrum.

COCOS. (So called from the Portuguese coco, or coquen, the three holes at the end of the cocoa-nut shell, giving it the resem-blance of a monkey's head.) The name of a genus of plants in the Linnzan system. Class, Monoecia. Order, Hexondria. The cocoa-nut tree.

The Cocos NUCIFERA. name of the plant whose fruit is the cocoa-

The systematic COCOS BUTTRACEA. name of the plant which affords the palm

Cocrion. (From coque, to boil) coction. Digestion In a medical sense, signifies that alteration, whatever it be, or however occasioned, which is made in the crude matter of a distemper, whereby it is either fitted for a discharge, or rendered harmless to the body. This is often brought about by nature; that is, by the vis vite, or the disposition or natural tendency of the matter itself, or else by proper reme-dies, which may so alter its bulk, figure, cohesion, or give it a particular determi-nation, so as to prevent any farther ill effects, or drive it quite out of the body. And, that time of a disease wherein this action is performing, is called its state of coction.

Cocustu. The name for courbard.

CODOCELE. (From καδια, a bulb, and кили, a tu:nour.) A bubo Cod ga pala. See Conessi cortex.

CECALIS. (From cacum, the blind gut, through which it runs.) A vein, heing a branch from the concave side of the vena mesaraica.

COLLA. (From ROLLOS, hollow.) The hollow pits above, and sometimes below the eyes. The hollow parts at the bottom of the feet.

Carlia. (From ROLLOS, hollow) A cavity in any part of the body. The belly. The womb.

CŒLIAC ARTERY. (Caliacus, belonging to the belly; from xouxia, the belly. Arteria caliaca. The first branch given off from the norta in the cavity of the abdomen. It sends branches to the diaphragm, stomach, liver, pylorus, duodenum, omentum, and spleen.

CŒLIAC PASSION. (Caliacus, belonging to the belly; from nonza, the belly.) Calica Chylosa. Calica luctea. There are very great differences among physicians, concerning the nature of this disease. Sauvages says it is a chronic flux, in which the aliment is discharged half digested. Dr. Cullen considers it as a species of diarrhæa, and mentions it in his third and fourth species, under the terms mucosa, tended with great pains in the stomach, resembling the pricking of pins; rumbling and flatus in the intestines; white stools, because deprived of bile; while the patient becomes weak and lean.

CŒLOMA. (From ROING, hollow.) ulcer in the tunica cornea of the eye.

CŒLOSTOMIA. (From noises, hollow, and sourt, the mouth.) A defect in speaking, when a person's speech is obscured by sounding as if his voice proceeded from a cavern.

CENOLOGIA. (From noives, common, and Aoros, discourse.) A consultation, or common consideration of a disease, by two or

more physicians.

CENOTES. (From nource, common.) The physicians of the methodic sect asserted that all diseases arose from relaxation, stricture, or a mixture of both. These were called canotes, viz. what diseases have in common.

The sulphate of cop-CERULEUS LAPIS.

per. Sec Sulphas cupri.

CETE. (From REMAIL, to lie down.) A

bed, or couch, for a sick person.

COFFEA. (The true name is Caffe, from Caffa, the province in South America, where the tree grows spontaneously in great abundance.) The name of a genus of plants in the Linnxan system. Class, Pentandria. Order, Monogynia. The coffee-tree.

COFFEE. (From kofuch, a mixing together Hebr.; so called from the pleasant potation which is made from its berry.) Jasminum Arabicum, Choava. The seeds of the Coffea Arabica; floribus quinquefidis, dispermis of Linnaus The coffee-tree is cultivated in Arabia, Persia, the East Indies, the Isle of Bourbon, and several parts of America. Good Turkey Coffee is by far the most salutary of all liquors drunk at meal-time. It possesses nervine and adstringent qualities, and may be drunk with advantage at all times, except when there is bile in the stomach. It is said to be a good antidote against an over-dose of opium, and to relieve obstinate spasmodic asthmas. For the latter purpose, the coffee ought to be of the best Mocco, newly burnt, and made very strong, immediately after grinding it. Sir John Pringle commonly ordered one ounce for a dose; which is to be repeated fresh, after the interval of a quarter or half an hour; and which he directed to be taken without milk or

If coffee be drunk warm within an hour after dinner, it is of singular use to those who have head-ach, from weakness in the stomach, contracted by sedentary habits, close attention, or accidental drunkenness. It is of service when the digestion is weak; and persons afflicted with the sick headach are much benefited by its use, in tumnale of Linnaus:-foliis planis lan-

some instances, though this effect is by no means uniform. Coffee is often imitated, by roasting tye with a few almonds.

The plant which af-COFFEE ARABICA

fords coffee. Ser Coffee.

CCHESION. (From con, and hereo, to stick together.) Vis cohesionis. Vis adhesionis. Vis attractionis. That force in the particles of matter whereby they are connected in such a way that they resist any attempt towards their removal or separation. It is a species of attraction. See Attraction. Conobarton. (A term invented

Paracelsus.) Cohobatio. Cohobium. hoph. The ancient chymists use this term to signify the distillation of a fluid poured afresh upon a substance of the same kind as that upon which it was before distilled, and repeating this operation several times, to make it more efficacious. For this purpose, the vessel called pelican was employed.

(Cohol. Heb.) | Castellus says Соног.. this word is used in Avicenna, to express dry collyria for the eyes, in fine powder.

COILIMA. (From noines, the bowels.) sudden swelling of the belly from wind.

Collostomia. (From nother, hollow, and 50μα, the mouth.) A defect of speaking, from the palate, or through the nose.

COINDICANTIA. (From con, and indico, to indicate.) Signs, or symptoms, are called coindicant, when, besides the usual incidental appearances, there occur others, as age, habit, season, &c.

A name for the terra Japo-COIRA. nica.

COITUS. (From voco, to go together.) The conjunction of the male and female in the act of procreation.

CULA. (From noxov, a joint.) The joints. COLATORIA LACTEA. Astruc says they were formerly called glands, and are situated in the third and internal tunic of the interns, and, that they are vesiculo-vascular bodies.

COLATORIUM. (From colo, to strain.) strainer of any kind.

COLATURE. (From colo, to strain.) filtered or strained liquor.

Colcaquanuitl. An American plant, commended in palsies and uterine disorders, according to Ray.

COLCESTRENSIS AQUA. Colchester water. This mineral water is of the bitter purging kind, similar to that of Epsom, but not so strong

COLCHICUM. (From Colchis, a city of Armenia; where this plant is supposed to have been common.) 1. The name of a genus of plants in the Linnman system. Class, Hexandria. Order, Trigynia.

2. The pharmacopæial name of the common meadow-saffron. Colchicum an-

reulatis erectis. A native of England. The sensible qualities of the fresh root are very various, according to the place of growth and season of the year. In autumn it is almost inert, but in the beginning of summer highly acrid; hence some have found it to be a corrosive poison, whilst others have eaten it in considerable quantity, without experiencing any effect. When it is possessed of acrimony, this is of the same nature with that of garlic and some other plants, and it is entirely de-The German phystroyed by drying. sicians have celebrated its virtues as diuretic, in hydrothorax and other dropsies; and in France it continues to be a favourite remedy; but it is, nevertheless, in this country unsuccessful, and at best a very uncertain remedy. The expressed juice is used, in Alsace, to destroy vermin in the heads of children. The officinal preparations of colchicum are, Syr. Colch. Autum. Edin, Pharm. The oxymel colchici of the former London pharmacopæia is now omitted, and the acetum colchici ordered in its room; the College observing that the honey may easily be added extempo-raneously, if it be thought requisite. The following is the formula of the present London Pharm, for preparing the acetum colchici, or vinegar of meadow-saffron: Take of meadow-saffron root sliced, an ounce; acetic acid, a pint; proof spirit, a fluid-onnce. Macerate the meadow-saffron root in the vinegar, in a covered glass ves-sel, for twenty-four hours; then press out the liquor and set it by, that the feculencies may subside; lastly, add the spirit to the clear liquor. The dose is from 3ss to

Colonicum Autumnale. The systematic name of the common meadow-saffron. See

Colchicum.

COLUMICUM TLLYRICUM. The plant supposed to afford the hermodacty's. See Hermodactylus.

COLCHICUM ZEVLANICUM. See Zedo-

COLCOTHAR VITRIOLI. Chalcitis. The remains of calcined martial vitriol.

COLD. A privation of heat. It is nothing positive, but somewhat of the negative kind. The human body contains within itself, as long as it is living, a principle of warmth: if any other body, being in contact with it, does at the same time impart to it more caloric or heat than it obtains from the human body, it is said to be warm; but if it receives from the human body more heat than it remits, it is said to be cold.

A cold is a popular name also for a catarrhous affection of the nostrils, throat, and

fauces. See Catarrhus.

COLD AFFUSION. A process formerly practised by physicians, but lately ntroduced by Dr. Currie, of Liverpool,

in the treatment of typhus fever, and which appears to possess a uniformity of success, which we look for in vain in almost any other branch of medical practice. The remedy consists merely in placing the patient in a bathing-tub, or other convenient vessel, and pouring a pailful of cold water upon his body; after which he is wiped dry, and again put to bed. It should be noted,

First, That it is the low contagious fever in which the cold affusion is to be employed. The first symptoms of which are a dull head-ach, with restlessness and shivering; pains in the back, and all over the body, the tongue foul, with great prostration of strength; the head-ach becoming more acute, the heat of the body, by the thermometer, 102° to 105° or mare; general restlessness, increasing to delirium, particularly in the night.

Secondly, That it is in the early stage of the disease we must employ the remedy; and generally in the state of the greatest heat

and exacerbation.

Thirdly, It is affusion, not immersion, that

must be employed

Since the first publication of Dr. Currie's work, the practice of affusion has been extended throughout England; and its efficacy has been established in some stages of the disease, from which the author had originally proscribed the practice of it. One of the cautionary injunctions which had been given for the affusion of cold water in fever was, never to employ it in cases where the patient had a sense of chilliness upon him, even if the thermometer, applied to the trunk of the body, ind.cated a preternatural degree of heat. In his last edition of Reports, however, Dr. Currie has given the particulars of a case of this description, in which the cold affusion was so managed as to produce a successful event.

In fevers arising from, or accompanied by, topical inflammation, his experience does not justify the use of cold affusion; though in a great variety of these cases, the warm affusion may be used with advantage. "And," says he, "though I have used the cold affusion in some instances, so late as the twelfth or fourteenth day of contagious fever, with safety and success, yet it can only be employed, at this advanced period, in the instances in which the heat keeps up steadily above the natural standard, and the respiration continues free. In such cases I have seen it appease agitation and restlessness, dissipate delirium, and, as it were, snatch the patient from impending dissolution. But it is in the early stages of fever (let me again repeat) that it ought always to be employed, if possible; and where, without any regard to the heat of the patient, it is had recourse to in the last stage of fever, after every other remedy has failed, and the case appears desperate, (of

which I have heard several instances,) can it appear surprising that the issue should

sometimes be unfavourable?"

Numerous communications from various practitioners, in the West and East Indies, in Egypt and America, also she with the efficacy of affusion in the raging fevers of hot countries.

COLES. (From xauxos, a stalk.) Colis. The penis.

Colewort. See Brassica.

COLI DEXTRUM LIGAMENTUM. Where the mesentery changes its name for that of mesocolon, (near the extremity of the ileum,) the particular lamina, which is turned to the right side, forms a small transverse fold which is thus named.

COLI SINISTRUM LIGAMENTUM. It is a contraction of the mesocolon, a little

below the left kidney.

COLICA. (From READON, colon, the name of one of the intestines.) The colic. The appellation of colic is commonly given to all pains in the abdomen, almost indiscriminately; but, from the different causes and circumstances of this disorder, it is differently denominated. When the pain is accompanied with a vomiting of bile, or with obstinate costiveness, it is called a bilious colic: if flatus causes the pain, that is, if attended with temporary distention, relieved by the discharge of wind, it takes the name of flatulent or windy colic; when accompanied with heat and inflammation, it takes the name of inflammatory colic, or enteritis. When this disease arises to a violent height, and is attended with a stercoraceous vomiting, obstinate costiveness, and an evacuation of faces by the mouth, it is called pussio iliaca, or iliac passion.

Dr. Callen places this genus of disease in the class neuroses, and order spasmi; and defines it pain of the abdomen, particularly round the umbilicus, attended with vomiting and costiveness. He enumerates

seven species.

1. Colica spasmodica, with retraction of the navel, and spasm of the muscles of the

belly.

2. Colica pictonum. This is called from the place where it is endemial; the Poictou, the Surinam, the Devonshire colic; from its victims, the plumbers' and the painters' colic; from its symptoms, the dry bellyach, the nervons and spasmodic colic. has been attributed to the poison of lead, and this is undoubtedly the cause, when it occurs to glaziers, painters, and those employed in lead works; but, though this is one, it is by no means the only cause. In Devonshire it certainly more often arises from the early cider, made of harsh, unripe fruit, and in the West Indies from new The characteristics of this disease are-obstinate costiveness, with a vomiting of an acrid or porraceous bile, pains about

the region of the navel, shooting from thence to each side with excessive violence. strong convulsive spasms in the intestmes, and a tendency to a paralysis of the extremities. It is occasioned by a long continued costiveness; by an accumulation of acrid bile; by cold, applied either to the extremities or to the belly itself; by a free use of unripe fruits, and by great irregu-larity in the mode of living. From its occurring frequently in Devoushire, and other cider councies, it has been supposed to arise from an impregnation of lead, received into the stomach; but this seems to be a mistake, as it is a very prevalent disease in the West Indies likewise, where no cider is made, and where there is only a very small quantity of lead in the mills employed to extract the juice from the sugar-canes. One or other of the causes just enumerated may justly be said always to give rise to this species of colic.

The disease comes on gradually, with a pain at the pit of the stomach, extending downwards to the intestines, accompanied with eructations, slight sickness at the stomach, thirst, anxiety, obstinate costiveness, and a quick contracted pulse. After a short time, the pains increase considerably in violence; the whole region of the belly is highly painful to the touch; the muscles of the abdomen are contracted into hard irregular knots, or lumps; the intestines themselves exhibit symptoms of violent spasm, insomuch that a glyster can hardly be injected, from the powerful contraction of the sphincter ani; and there is constant restlessness, with a frequent vomiting of an acrid or porraceous matter, but more particularly after taking either food, or medicine.

Upon a farther increase of the symptoms, or their not being quickly alleviated, the spasms become more frequent, as well as violent; the costiveness proves invincible, and an inflammation of the intestines ensues, which soon destroys the patient by gangrene. In an advanced stage of the disease, it is no uncommon occurrence for dysmia to take place, in a very high de-

gree.

The dry belly-ach is always attended with some degree of danger; but which is ever in proportion to the violence of the symptoms, and the duration of the disease. Even when it does not prove fatal, it is too apt to terminate in palsy, and to leave behind it contractions of the hands and feet, with an inability in their muscles to perform their office; and in this miserable state of existence the patient lingers out many wretched years.

Dissections of this disease usually shew the same morbid appearances as in common colic, only in a much higher degree.

3. Colica stercorea, which happens

COL from obstinate and long-continued costive-

4 Cohca accidentalis, called also cholera sicca, rom acrid undigested matters.

5. Colica meconialis, in infants, from a retention of meconium.

6. Colica callosa, from a sensation of a stricture in some part of the colon, and frequently of previous flatulence, gradually passing off; the liabit costive, or faces liquid, and in small quantity

7. Colica calculosa, from calculi formed in the intestines, attended with a fixed hardness in some part of the abdomen. It is distinguished by the previous discharge of

8. Colica flatulenta may be added to these species. It is distinguished by a sudden fullness, with pain and constipation, relieved by a discharge of wind from the

mouth, or anus.

The colic is distinguished from inflammation of the intestines by the pain being wringing, and not of a burning sensation; by the spasmodic contraction of the abdominal muscles; by the absence or trifling degree of fever; by the state of the pulse, and by the diminution of pain upon pressure.

The flatulent and inflammatory colic are thus distinguished from each other:-In the flatulent colic, the pain comes on by fits, flies from one part of the bowels to another, and is much abated by a discharge of wind, either upwards or downwards; but in the inflammatory colic the pain remains equable, and fixed and settled in one spot; the vomitings are severe, and frequently bilious; the belly is obstinately bound, and the pulse quick and feverish.

The colic should be distinguished from a fit of the gravel; stones passing through the ureters; rheumanic pains in the muscles of the belly; a beginning dysentery; the blind piles; and from a stone passing through the gall-duct. Gravel in the kidney produces often colic pains, not easily distinguishable; but when stones pass through the ureters, the testicle on that side is often a tracted, the leg is benumbed, a pain shoots down the inside of the thigh; symptoms occasioned by the stone passing through the ureter over the spermatic chord, or the sacro-sciatic nerve. Rheumatic pains in the muscles of the belly rarely affect so accurately the umbilical region, but dart in various directions, to the chest, or to the pelvis, and are attended with soreness, not confined to the abdomen. A beginning dysentery differs little from colic. The pain from the blind piles is confined to the rectum: and that from a stone in the gall-duct is felt in the pit of the stomach, occasionally shooting through the body to the back.

COLICA ACCIDENTALISA Colic from cru-

dities in the bowels.

COLICA ARTERIA SINISTRA. The lower mesenteric artery.

COLICA ARTERIA SUPERIOR. The upper mesenteric artery.

COLICA BILIOSA. Colic from excess of bile.

COLICA CALCULOSA. Colic from stony matters in the intestines.

COLICA CALLOSA. Colic from hardened and obstinate strictures.

Colica Damnoniorum. Colic peculiar to Devoushire. See Colica.

COLICA FEBRICOSA. Colic with fever.

COLICA FLATCLENTAL Colic from wind. COLICA GRAVIDARUM. Colic in pregnant

COLICA HYSTERICA. Hysteric colic.

Colica Lactantium. Colic peculiar to

Colica Lapponica. Colic peculiar to Laplanders.

COLICA MECONTALIS. Colic from meconium in infants.

COLICA MESENTERICA. Colic from eased mesentery.

COLICA NERVOSA. The nervous colic. COLICA PANCREATICA. Colic from diseased puncreas.

COLICA PHLOGISTICA. Colic with inflam-

COLICA PICTONUM. See Colica.

Colica PITUITOSA. The spasmodic

COLICA PLETHORICA. The inflammatory

COLICA PLUMBARIORUM. The colic of lead-workers.

Colica Pulsatilis. The inflammatory colic.

COLICA SATURNINA. The Devonshire colic. See Colica.

COLICA SCIERHOSA. The colic from scirihous tumours.

COLICA SPASMODICA. The spasmodic

COLICA STERCOREA. Colic from retained fæces.

COLICA VENA. A branch of the upper mesenteric artery.

COLICA VENA RECTA. The vein of the colon.

Colica VERMINOSA. The colic from worms.

The colic. COLICE.

Coliformis. (From cola, a strainer, and forma, a likeness; so called from its having many perforations, like a strainer.) Coliforme os. A name formerly given to the os cribrosum.

Coliphium. (From κωλον, a limb, and ιφι, strongly.) A kind of bread given to wrestlers. It was made of flour and bran together, and was thought to make men athletic

The same as coles. COLIS.

COLLAPSUS. (From collabor, to shrink

down.) A wasting or shrinking of the body, or strength.

COLLATENNA. A pecific vulnerary.

COLLATERALES. So Spigelius calls the erectores penis, from their collateral order of fibres.

COLLETICA. (From ROADZ, glue.) Con-

glutinating medicines.

COLLICIE. (From colligo, to collect.) The union of the ducts, which convey the humours of the eyes from the puncta lachrymalia to the cavity of the no-e.

COLLICULUM. (Dim. of collis, a hill.) The nympha, or prominency, without the

vagina of women.

COLLIGAMEN. (From colligo, to tie toge-

ther:) A ligament.

COLLIQUAMENTUM. (From colliqueo, to melt.) A term first made use of by Dr. Harvey, in his application of it to the first rudiments of an embryo in genera-

COLLIQUATIVE. (From colliquo, to melt.) Any excessive evacuation is so called which melts down, as it were, the strength of the body: hence colliquative perspiration; colliquative diarrhæa, &c.

Collisio. (From collido, to beat toge-

ther.) A contusion.

COLLIX. (From MONOV, food.) A troch,

or lozenge.

(From κολλαω, to glue COLLOHOMA. together.) The growing together of the eve-lids.

Collodes. (From nonna, glue.) Gluti-

(From κωλον, a member, as COLLUM. being one of the chief; or dim of columna, as being the pillar and support of the head.) The neck.

COLLUTORIUM. (From collug, to A gargarism or wash for the

mouth.

COLLUVIES. (From colluo, to cleanse.) Excrement. The discharge from Filth. an old ulcer.

COLLYRIS. (Konnugus, a little round cake; so called from its likeness to a cake.) A bump, or knob, which rises after a

blow. COLLYRIUM, (From xwxvw, to check, and pse, a defluxion; because it stops the defluxion.) Any medicine was formerly so called which was applied with that intention. The term is now only given to fluid applications for the eyes, or eye-

waters. COLOBOMA. (From MONNAW, to glue together) The growing together of the eyelids; also the want of a particular member

of the body.

In Celsus this word is COLOBOMATA. expressed by curta. Both the words signify a deficiency in some part of the body, particularly the ears, lips, or alæ of the nostriis.

COLOCASIA. (From 2020s, food, and

καζω, to adorn; so called from its use as a food, and the custom of wearing its flowers in wreaths.) The taba Ægyptia.

COLOCYNTHIS. (From xwxov, the colon, and \*1920, to move; because of its great purging powers.) .Alhandula of the Colocynthidis medulla. Arabians. Bitter apple. Bitter gourd. Bitter cucumber. The fruit which is the medicinal part of the Cucumis colocynthis; foliis multifidis, pomis globosis gla-bris is imported from Turkey. Its spongy membranous medulla, or pith, is directed for use; it has a nauseous, acrid, and in-tensely bitter taste; and is a powerful irritating cathartic. In doses of ten and twelve grains, it operates with great vehemence, frequently producing violent gripes, bloody stools, and disordering the whole system. It is recommended in various complaints, as worms, mania, dropsy, epilepsy, &c; but is seldom resorted to, except where other more mild remedies have been used without success, and then only in the form of the extractum colocynthidis compositum, and the pilule ex colocunthide cum aloë of the pharmacopanas.

COLOMBO. See Columbo. COLON. (Kwhov, quasi xothov: from xotλος, hollow; so called from its capacity, or from its generally being found empty, and full of wind, in dissection.) The ascending portion of the large intestine is so called. It proceeds towards the liver, by the name of the ascending portion of the colon; and having reached the liver, forms a transverse arch across to the other side. The colon then descends, forming what is termed its sigmoid flexure, into the pelvis, where the gut is called rectum. See Intestines.

COLOPHONIA. (Κολοφωνία, the city from whence it was first brought ) Resina nigra. The black resin which remains in the retort, after distilling the common resin with a strong fire. Paracelsus seems to mean by it what is now prescribed by the name of terebinthina cocta: but the ancients, and particularly Galen, seemed to understand by it a soft kind of mastich, from Chio, probably the same as our Chio turpentine.

COLOSTRUM. (From MONOS, food, or κολλωμαι, to agglutinate; so called, either because it is the first food of the young, or from its being at that time peculiarly glutinous.) Is the first milk in the breasts after delivery, according to some authors; but Bartholine applies it to an emulsion made by the solution of turpentine with the yolk of an egg

(From KWAWTHS, a lizard, Coloroides. and ados, likeness.) Variegated like the skin of a lizard. Ilippocrates applied it to the excrements.

COLOQUINTIDA. See Colocynthis.

Colrocele. (From nonros, the vagina,

and unas, a tumour.) A hernia forced into

Collegerosis. (From ROLTOS, the vagina, and wirte, to fall down.) A bearing down of the vagina.

Colt's foot. See Tussilago.

COLUBER BERUS. (Quod colit umbram, because it delights in shade.) The systematic name of a viper. See Vipera.

COLUBRINA VIRGINEANA. See Serpen-

COLUBRINUM LIGNUM. (Colubrinus; from coluber; so called from the snakelike contortions of its roots.) This species of snake-wood is brought from America. It is solid, ponderous, acrid, extremely bitter, and modorous; its bark is of a ferruginous colour, covered with cineritious spots.

Columbine. See Aquilegia COLUMBA. See Columbo.

COLUMBO, Colombo. Calomba. Colombo. The root formerly so called is now termed Calumba in the London pharmacopoia. It is imported from Colomba, in Ceylon, in circular, brown knobs, wrinkied on the outer surface, yellowish within, and consisting of cortical, woody, and medullary lamina. Its smell is aromatic; its taste pungent, and nauseously bitter. From Dr. Percival's experiments on the root, it appears that rectified spirit of wine extracts its virtues in the greatest perfection. The watery infusion is more perishable than that of other bitters. An ounce of the powdered root, half an ounce of orange-peel, two ounces of brandy, and fourteen ounces of water, macerated 12 hours without heat, and then filtered through paper, afford a sufficiently strong and tolerably pleasant infusion. The extract made first by spirit and then with water, and reduced by evaporation to a pilular consistence, is found to be equal, if not superior, in efficacy to the powder. As an antiseptic, Calumba root is inferior to the bark; but as a corrector of putrid bile, it is much superior to the bark; whence also it is probable that it would be of service in the West-India yellow fever. It also restrains alimentary fermentation, without impairing digestion; in which property it resembles mustard. It does not appear to have the least heating quality, and therefore may be used in plithisis pulmonalis, and in hectic cases, to strengthen digestion. It occasions no disturbance, and agrees very well with a milk diet, as it abates flatulence, and is indisposed to acidity. The London, Edinburgh, and Dublin Colleges, direct a tincture of Calumba root. The dose of the powdered root is half a drachm, which, in urgent cases, may be repeated every third or fourth hour.

See Columbo. COLUMBOBE.

COLUMELLA. (Dim. of columna, a column.) See I vula, and Clitoris.

COLUMBIUM. Mr. Hatchett describes the ore from which this metal is obtained, as being of a dark brownish grey externally, and more inclining to an iron grey internally; the longitudinal fracture he found lamellated; and the cross fracture had a fine grain. Its lustre was vitreous, slightly inclining in some parts to metallic; moderately hard and very brittle. The colour of the streak, or powder, was dark chocolate brown. The particles were not obedient to the magnet. Its specific gravity, at a temperature of 65° Fahr. Mr. Hatchett found to be 5 918.

A series of accurate experiments made by its discoverer, prove that this ore consists of iron, combined with a new metallic acid, which constitutes more than three-

fourths of the whole.

The smallness of the quantity Mr. Hatchett had to operate upon, has hitherto prevented us from seeing the metal in its metallic state; but the accuracy with which the properties of its acid have been investigated, leave no doubt of its being different from any of the acidifiable metals lutherto known.

COLUMELLARIS. (From columella. little column.) A name of the dens cani-

COLUMNA. A column, or pillar. Many parts of the body, which in their shape or office resemble columns, are so named; as columnæ carneæ, &c.

COLUMNA MASI. The lowest and fleshy part of the nose, which forms a part of the septum,

COLUMNA ORIS. A name for the uvula. COLUMN E CARNEE. Columnæ cordis. See Carneæ columnæ.

COLUMIUM. (Haga to ROLLAN TOV ESV: because it prevents a defluxion.) A tent to thrust into a sore, to prevent a defluxion of humours.

COMA. (From na, or new, to lie down.) A propensity to sleep. This word anciently meant any total suppression of the powers of sense; but now it means a lethargic drowsiness. The coma vigil is a disease where the patients are continually inclined to sleep, but cannot.

COMA SOMNOLENTUM. Is when the prtient continues in a profound sleep; and, when awakened, immediately relapses, without being able to keep open his eyes.

COMATA. (Kanata: from coma.) diminution of the powers of voluntary motion, with sleep, or the senses impaired. is an order of the class neuroses of Cullen's Nosology.

COMATOSE. Having a strong propen-

sity to sleep.

COMBUSTIO. (From comburo, to burn.) A burn, or scald.

COMIPER. See Cububa

COMBUSTION (From comburo, to burn.) Burning. Among the va ious opera. F F \*

tions of chymistry, none acts a more conspictions part than combustion; and in proportion to its utility in the science, the necessity of thoroughly investigating its nature and mode of action becomes more obvious to the philosophical chymist.

Lavoisier's Theory of Combustion.

Lavoisier's theory of combustion is founded upon the absorption of oxigen by a combustible body.

Taking this for granted, it follows that combustion is only the play of affinity between oxygen, the matter of heat, and a com-

bussible body.

When an incombustible body (a brick for instance) is heated, it undergoes no change, except an augmentation of bulk and temperature; and when left to itself, it soon regains its former state. But when a combustible body is heated to a certain degree, in the open air, it begins to become on a sudden intensely hot, and at last emits a copious stream of caloric and light to the surrounding bodies. During this emission, the burning body gradually wastes away. It either disappears entirely, or its physical properties become totally altered. principal change it suffers is that of being no longer capable of combustion. If either of these phenomena, namely, the emission of heat and light, and the waste of substance be wanting, we do not say that a body is undergoing combustion, or that it is burning. It follows, therefore, that every theory of combustion ought to explain the following facts:

1. Why a burning body is consumed, and

its individuality destroyed.

2. Why, during the progress of this alteration, heat and light are emitted.

For the elucidation of these objects, Lavoisier's theory has laid down the following laws:

1. Combustion cannot take place without the presence of oxygen, and is more rapid in proportion to the quantity of this agent in contact with the inflamed body.

2. In every act of combustion, the oxygen

present is consumed.

3. The weight of the products of every hody after combustion, corresponds with the weight of the body before combustion,

plus that of the oxygen consumed.

4. The oxygen absorbed by the combustible body may be recovered from the compound formed, and the weight regained will be equal to the weight which disappeared during the combustion.

5. In every instance of combustion, light

and heat, or fire, are liberated,

6. In a mited quantity of air, only a certain quantity of the combustible body can be burnt.

7. The air, wherein a body has been burnt, is rendered untit for containing combustion, or supporting animal life.

Though every case of combustion re-

quires that light and heat should be evolved, yet this process proceeds very differently in different circumstances; hence the terms ignition, or glowing heat; inflummation, or accension; and detonation, or explosion.

Ignition takes place when the combustible pody is not in an aëriform state.

Charcoal, pyrophorus, &c. furnish instances of this kind.

It seems as if the phenomenon of glowing was peculiar to those bodies which require a considerable quantity of oxygen to become converted into the gaseous state,

The disengagement of caloric and light is rendered more evident to the senses in

the act of

Inflammation, or accension. Here the combustible substances are more easily converted into an elastic or agriform state. Flame, therefore, consists of the inflammable matter in the act of combustion in the gaseous state. When all circumstances are favourable to the complete combustion of the products, the flame is perfect; if this is not the case, part of the combustible body, capable of being converted into the gaseous state, passes through the luminous flame unburnt, and exhibits the appearance of smoke. Soot, therefore, always indicates an imperfect combustion. Hence a common lamp smokes, an Argand's lamp yields no smoke

This degree of combustion is very accu-

rately exemplified in the

Fiame of Candles.—When a candle is first lichted, which must be done by the application of actual flame, a degree of heat is given to the wick, sufficient to destroy the affinity of its constituent parts; part of the tallow is instantly melted, volatilized, and decomposed; its hydrogen takes fire, and the candle burns. As this is destroyed by combustion, another portion melts, rises and supplies its place, and undergoes a like decomposition. In this way combustion is maintained. The tallow is liquified as it comes into the vicinity of the flame, and is, by the capitlary attraction of the wick, drawn up to supply the place of what is decomposed; the immelted tallow, by this means, forms a kind of cup.

The congeries of capillary tubes which form the wick is black, because the charcoal of the cotton becomes predominant, the circum ambient air is defended by the flame from oxidating it; it therefore remains, for a considerable time, in its natural state; but when the wick, by the continual consumption of tallow, becomes too long to support itself in a perpendicular position, its upper extremity projects nearly out of the coue of the flame, and there forms a support for an accumulation of soot, which is produced by the imperfect combustion. A candle in this situation, affords scarcely one-tenth of the light it

can give, and tallow candles, on this account, require continual snuffing.

But if the candle be made of wax, the wick does not long occupy its place in the middle of the flame; its thinness makes it bend on one side, when its length is too great for its vertical position; its extremity comes then into contact with the air, and is completely burnt, or decomposed, except so much of it as is defended by the continual afflux of the melted wax. This small wick, therefore, performs the office of snuffing itself. The difficult fusibility of wax enables us to use a thinner wick for it than can be used for tallow, which is more fusible. But wax being a substance which con ans much more oxygen than tallow, or oil, the light it affords is not so luminous.

Detonation is an instantaneous combustion, accompanied with a loud report; it takes place in general when the compound resulting from the union of two or more bodies, occupies less space than the substances did before their union; a vacuum is therefore formed, and the surrounding air rushing in from all sides to fill it up is the cause of the report.

Gun-powder, fulminating gold, silver, and mercury; oxygenated muriate at potals; and various other explosive compounds, are capable of producing very loud

detonations.

With respect to the disengagement of light and caloric.

By the older chymists, it was universally supposed that the light and heat emitted during combustion, proceeded from the inflammable body; and this opinion would indeed appear inquestionable, while the composition of the atmosphere was imper-The burning body apfectly known. peared luminous and felt hot, and no other agent was supposed to be concerned; the conclusion that the light and heat were evolved from the burning substance, was therefore unavoidable. But when the nature of the atmosphere was ascertained, and when it became evident that part of the air was absorbed during combustion, the former conclusion tell to the graund; for, when two bodies exert a mutual action on each other, it becomes à priori equally probable that the products may be derived from either of them; consequently, the light and heat evolved might proceed either from the one or the other. Whether they proceed from the atmosphere, or from the combustible body, they must be separated at the part where the combination takes place; that is, upon the surface of the burning body itself; and consequently it appeared luminous and heated, while the air being invisible escaped observation.

When the law of heat became known,

at least when it was ascertained that bodies in the aëriform state contain at the same temperature, and in equal quantities, either of mass or bulk, unequal quantities of heat, the conclusion became probable, that the caloric evolved in combustion proceeded rather from the oxygen gas of the atmosphere, than from the combustible body; since the former contains a much larger quantity than the latter. The caloric evolved was therefore supposed to be derived from the condensation of the oxygen gas in the new combination into which it entered.

Though approaching to the truth, this explanation is not strictly true. It is not merely from the oxygen gas being condensed that the caloric is evolved, because, in many cases of combustion, the product still exists in the gaseous state, and in others, the quantity of caloric evolved bears no proportion to the degree of condensation. Philosophers ascribed this to a change of capacity; for, in different bodies, the difference in the proportion of the capacities before and after combustion, is by no means uniform; and hence the difference in the quantities of caloric extricated in various cases of combustion.

This being premised, it remains to explain the origin of the light emitted during combustion; for although we take it for granted that the caloric is evolved from the oxygen gas, we cannot infer that the light

has the same origin.

It is very probable that light is a constituent part of inflammable bodies; for it is frequently evolved in combinations when the oxigen is merely transferred from one inflammable substance to another. In those cases it must proceed from the inflammable body. The accension of oils by the affusion of acids, the combustion of metals with sulphur, furnish instances of the kind.

It seems, therefore, probable, that the light is derived from the inflammable substance; and that the oxygen combining with the bases of these substances, disengages the light.

It may be concluded then, that light enters into the composition of all combustible bodies; but as we are unable to separate the light, so as to obtain these bodies pure,

we treat of them as simple bodies.

According to this theory, the combustion of pho-phorus in oxygen gas is therefore the effect of a double affinity. The basis of the oxygen gas unites with the phosphorus, to form phosphoric acid: and the light disengaged from the phosphorus, together with part of that of the oxygen gas, produces the vivil flame.

The quantity of light emitted by different bodies is supposed to depend on the quantity contained in them, and on the

proportion in which it is united to calo-

ric.

Such is the theory of combustion of Lavoisier, modified by Gren, Leonardi, Richter, and formerly taught in this capital by Dr. Crichton.

Thomsons's Theory of Combustion.

Though the preceding theory of combustion is simple and beautiful, it appears from what we are now going to state, to be

by no means satisfactory

It has misled chymists, by confining the term combustion to the act of oxigenation, and considering that all bodies, during their combustion, combine with oxygen, without at the same time recoilecting, that this latter effect may take place without any of the phenomena usually attendant on combustion; and that, though certainly all combustion pre-supposes the combination of oxygen with a base, yet this combination may be, and repeatedly is, effected where no combustion can possibly take place. Nothing can be more evident than the difference which, in numberless instances, prevails between the act of oxygenation in bodies and that of combustion, in as much as neither the phenomena attending on, nor the results arising from them, are the That a distinction therefore should be made between these processes is obvious; and it is on this account that Dr. Thomson has offered a theory, which considers this subject in a new point of view, and which bids fair to enable us to estimate the phenomena of combustion much better than has hitherto been done.

According to Dr. Thomson's theory, all the bodies concerned in combustion are either, 1. Combustibles—2. Supporters of

Combustion—3. Incombustibles.

I. Combustible bodies are those substances which are said, in common language, to burn. During the combustion, they appear to emit light and heat, and, at the same time, gradually waste away. When this change has reached its maximum, the process of combustion is at an end.

The class of combustibles is very numerous; but all the bodies belonging to it may be sub-divided into three sets, numely:

1. Simple combustibles. 2. Compound combustibles. 3. Combustible oxyds.

Simple Combustibles.

1. Sulphur.

Phosphorus.
 Diamond.

4. Hydrogen gas.

5. All the metals.

Compound Combustibles.

The compound combustibles consist of compounds, formed by the simple combustibles uniting together two and two, and arc of course much more numerous than the simple combustibles. They may be arranged under the five following heads:

1. Sulphurets.

- 2. Phosphurets.
- 3. Carburets.

4. Alloys.

5. Sulphurated, phosphorated, and carbonated hydrogen.

The combustible oxyds are either simple, having a single base, or compound, having more than one base. All the simple combustible oxyds are by combustion converted into acids.

The compound combustible oxyds are by

far the most numerous.

- II. The supporters of combustion are bodies which are not of themselves, strictly spe king, capable of undergoing combustion, but which are absolutely necessary for the process; for no combustible body can burn unless some one or other of them be present. Whenever they are excluded, combustion ceases. All the supporters of combustion known at present are the following six:
  - 1. Oxygen gas.

2. Air.

3. Gaseous oxyd of nitrogen.

4 Nitrous gas.

5. Nitric acid.

6. Oxygenated muriatic acid.

There are indeed certain substances besides these, which possess nearly the same properties; these shall be afterwards enumerated under the title of partial supporters.

They all contain one common principle,

namely, oxygen.

III. The incombustible bodies are neither capable of undergoing combustion themselves, nor of supporting the combustion of those bodies that are; they are therefore not immediately connected with combustion. At present we are acquainted with about thirteen incombustible bodies, not reckoning the compounds which they are capable of forming with each other. Those are,

Nitrogen gas.
 The alkalies.

3. The earths.

Some of the alkalies and earths possess certain properties in common with combustibles, and are capable of exhibiting phenomena somewhat analagous to combustion; which will be described afterwards under

the title of semi combustion.

III. In every case of combustion, there must therefore be present a combustible body, and a supporter of combustion. During combustion, the combustible always unites with the oxygen of the supporter. It is this combination which occasions the apparent waste and alteration of the combustible. The new compound thus formed is a product of combustion. Every product of combustion is either, 1. water, 2. an acid, or 3. a metallic oxyd. It is true, indeed, that other bodies sometimes make their appearance during combustion, but

these will be found, upon examination, not to be products, nor to have undergone combustion.

Thus one of the two characteristic marks which distinguish cumbustion, namely, the apparent waste and alteration of the combustible body, has been fully explained. For the explanation of it we are indebted to Lavoisier, as stated before.

But though the combination of the combustible with oxygen be a constant part of combination, yet the facility with which combustibles burn is not proportional to their

parent affinity for oxygen.

Phosphorus, for instance, burns more readily than charcoal; yet charcoal is capable of abtracting oxygen from phosphorus, and of course has a greater affinity for it. The combustible oxyds take fire more readily than some of the simple combustibles; thus charcoal burns more easily than diamond; alkohol, ether, and oils, are exceedingly combustible, whereas all the metals require very high temperatures when the supporter is air.

This greater combustibility of combustible oxyds is probably owing to the weaker affinity by which their particles are united. Hence they are more easily settled than homogeneous particles, and of course combine more readily with oxygen; those simple combustibles which melt easily, or which are in the state of elastic fluids, are also very combustible, because the cohesion between their particles is easily over-

come.

It is owing to the same inferiority in the collesion of heterogeneous particles, that some of the compound supporters occasion combustion in circumstances when the combustibles would not be acted on by simple

supporters.

Thus phosphorus burns in air at the comnon temperature; but it does not burn in oxigen gass unless its temperature be raised. In oxygenated muriatic acid gas, phosphorus burns rapidly at the common temperature of the air, and so do several of the metals; though they cannot be made to burn in air, except at a very high temperature. Thus also oils burn rapidly when mixed with nitrous acid. Nitrous gas and the gaseous oxyd of nitrogen, constitute ex-

ceptions to this rule.

IV. None of the products of combustion are combustible, according to the definition of combustion here given. This want of combustibility is not owing to their being saturated with oxygen; for several of them are capable of combining with an additional dose of it. But, during this combination, no caloric or light is ever emitted; and the compound formed differs essentially from a product of combustion; for, by this additional dose of oxygen, the product is converted into a supporter. Hence we see that combustion ought not to be confounded with

the combination of a body with oxygen, as was done formerly.

Combustion, indeed, cannot take place without the combination of oxygen; but oxygen may combine with bodies in different proportions without the phenomena of combustion; and the product obtained is capable of becoming converted into a supporter of combustion; for instance, if lead be melted, and kept so for some time, it becomes covered with a white pellicle, or white oxyd of lead, a product consisting of oxygen and lead; but if this white oxyd is suffered to be heated longer, it aborbs an additional quantity of oxygen, and becomes converted into a y llow powder, called yellow oxyd of lead. If this yellow oxyd be again exposed to heat, it absorbs still more oxygen, and becomes converted into red oxyd of lead. All these oxyds are therefore supporters. When the supporters thus formed by the combination of oxygen with products, are made to support combustion, they do not lose all their oxygen, but only the additional dose which constituted them supporters. Of course they are again reduced to their original state of products of combustion. Hence it follows, that they owe their properties as supporters, not to the whole of the oxygen which they contain, but to the additional dose which constituted them supporters. We may therefore call them partial supporters, indicating by the term, that part only of their oxygen is capable of supporting combustion, and not

All the partial supporters with which we are acquainted, contain a metallic basis; for metallic oxyds are the only products at present known, capable of combining with an additional dose of oxygen. It is a circumstance highly deserving attention, that when metals are capable of combining with several doses of oxygen, the product, or oxyd formed by combustion is seldom or never that which contains a maximum of oxygen.

Thus it is evident that several of the products of combustion are capable of combining with oxygen. The incombustibility of products, therefore, is not owing to their want of affinity for oxygen, but to some other

cause.

the whole.

5. No product of combustion is capable of supporting combustion. This is not occasioned by any want of affinity to combustible bodies; for several of them are capable of combining with an additional dose of their basis. But by this combination, they lose their properties as products, and are converted into combustibles. The process, therefore, differs essentially from combustion. Thus sulphuric acid, a product of combustion, by combining with an additional dose of sulphur, or its oxyd, is converted into sulphureous acid, a substance which, from several of its properties, the

doctor concludes to be combustible. Thus also phosphoric acid, a product of combustion, is capable of combining with phosphorated ydrogen, and of forming phosphorous acid a combustible body. When this last acid is heated in contact with a supporter, it undergoes combustion; but it is only the additional Jose of the combustible which burns, and the whole is converted into phosphoric acid. Hence we see that it is not the whole basis of these compounds which is combustible, but merely the additional dose. The compounds, therefore, formed by the union of a product and combustible, may be termed partial combustibles; indicating by the name, that a part only of the base is capable of undergoing combustion. Since the products of combustion are capable of combining with oxygen, but never exhibit the phenomena of combustion, except when they are in the state of partial combustibles, combustible bodies must contain a substance which they lose in burning, and to which they owe their combustibility; for, after they have lost it, they unite to oxygen without exhibiting the phenomena of combus-

Though the products of combustion are not capable of supporting combustion, they not unfrequently part with their oxygen just as supporters do, give it out to combustibles, and convert them into products: but during this process, no heat nor light is ever evolved. Water, for instance, gives out its oxygen to iron, and converts it into black oxyd, a product; and sulphuric acid gives out its oxygen to phosphorus, and converts it into phosphoric acid. Thus we see that the oxygen of products is capable of converting combustibles into products, just as the oxygen of supporters; but during the combustion of the last only, are heat and light emitted. The oxygen of supporters then contains something which the oxygen of products wants.

6. Whenever the whole of the oxygen is abstracted from products, the combustibility of their base is restored as completely as before combustion; but no substance is capable of abstracting the whole of the oxygen, except a combustible, or a purtial combustible. Water, for instance, is a product of combustion, whose base is hydrogen. To restore the combustibility of the hydrogen, we have only to mix water with iron or zinc filings, and an acid; the metal is oxydated, and the hydrogen gas is evolved as combustible as ever. But no substance, except a combustible, is capable of separating hydrogen gas from water, by combining with its oxygen. Thus we see that combustibles are capable of restoring the combustibility of the bases of products; but they themselves lose their combu tibility by the process, and are converted into products. Combustibility, therefore, may

be thrown at pleasure from one body to another.

From these facts it is obvious, that the products of combustion may be formed without combustion, but in these cases a new combustible is always evolved. The process is merely an interchange of combustibility; for the combustible is converted into a product only by means of a prodeut. Both the oxygen and the base of the product having undergone combustion. have lost something which is essential to combustion. The process is merely a double decomposition. The product yields its oxygen to the combustible, while at the same time the combustible gives out something to the base of the product; the combust bility of that base then is restored by the loss of its oxygen, and by the restoration of something which it receives from the other combustible thus converted into a product.

is indeed another method of forming the products of combustion without actual combustion in certain cases; but the phenomena are much more compli-This method is to expose them to cated. the action of some of the supporters dissolved in water; especially nitric acid. Thus most of the metallic oxyds may be formed without combustion by the action of that acid on the metals. But, in that case, a new supporter is always evolved. namely, nitrous gas; ammonia, a new combustible, is also usually formed; and, not unfrequently, the product is converted into a partial supporter.

7. No supporter can be produced by combustion, or by any equivalent process. As all the supporters, except oxygen gas, consist of oxygen combined with a base, it follows as a consequence, that oxygen may combine with a base without losing that ingredient, which occasions combustion. The act of combination of oxygen with a base, therefore, is by no means the same with combustion. If we take a view of the different supporters, we shall find that all of them which can be obtained artificially, are procured either from other supporters or by the agency of electricity.

1. Oxygen gas may be procured from nitric acid and oxygenated muriatic acid, two supporters; and from several of the partial supporters, as the black oxyd of manganese, the red oxyds of lead and of mercury. The action of heat is always necessary; but the process is very different from combustion.

II. Air, as far as is known at present, cannot be formed artificially. The gas, indeed, which comes over during part of the usual distillation of nitrate of petash and sulphucic acid, to obtain nitrous acid, resembles air very closely. But it is obtained from a supporter.

III. The GASHOUS OXYD OF NITHOGEN

has hitherto been only procured from ni- fulminating silver, fulminating mercury, trous gas and nitric acid (nitrate of ammonia,) both of which are supporters.

IV. Nitrous GAs can only be procured by the d-compositon of nitric acid, a sup-

V. Oxigenated muniatic acid can be formed by combining muriatic acid with the oxygen of the black oxyd of mangan se, the red oxyds of lead, iron, mercury; all of

which are partial supporters.

VI. NUTICIC ACID is formed spontaneously upon the surface of the earth, by processes with which we are but imperfectly acquainted; but which certainly have no resemblance to combustion. Its oxygen is probably furnished by the air, which is a supporter; at least, it has been observed, that nitrogen and oxygen, at high temperatures, are capable of forming nitric acid.

This formation of pitric acid by means of electricity, has been considered as a combusion, but for what reason it is not easy to say: the substance acted upon is not a combustible with a supporter, but a supporter alone. Electricity is so far from being equivalent to combustion, that it sometimes acts in a manner diametrically opposite; unburning, if we may use the expression, a substance which has already undergone combustion, and convering a product into a combustible and a supporter. Thus it decomposes water, and converts it into oxygen and hydrogen gas; therefore it must be capable of supplying the substances which the oxygen and combustible lose when they combine by combustion,

and form a product.

8. Several of the supporters and partial supporters are capable of combining with combustibles, without undergoing decomposition, or exhibiting the phenomena of combustion. In this manner, the yellow oxid of gold and the white oxyd of silver combine with ammonia; the red oxyd of mercury with oxalic acid; and oxygenated muriatic acid with ammonia. Thus also nitrate of potasli and oxigenated muriate of po ash may be combined, or at least intimately mixed with several combustible bodies, as in gun-powder, fulminating powder, &c. In all these compounds, the oxygen of the supporter and the combustible retain the ingredients which render them susceptible of combustion; hence the compound is still combustible. And in consequence of the imimate combination of the component parts, the least alteration is apt to destroy the equilibrium which subsists between them; the consequence is, combustion and the formation of a new compound. Hence these compounds burn with amazing facility, not only "hen heated, but when triturated, or struck smartly with a hammer. They have therefore received the name of detonating or fulminating

fulminat ng powder, &c.

9. Such are the properties of the com-bustibles, the supporters, and the products; and such the phenomena which they exhibit when made to act upon each other.

If we compare together the supporters and the products, we shall find that they resemble each other in many respects. Both of them contain oxygen, as an essential constituent part; both are capable of converting combustibles into products; and several of both combine with combustibles aid with additional doses of oxygen. But they differ from each other in their eff cts on combustibles. The former only produce combustion; whereas the products convert combustibles into products without combustion. Now, as the ultimate change produced upon combustibles by both these sets of codies is the same, and as the substance which combines with the combustibles is in both cases the same, namely oxygen, we must con-clude that this oxygen in the supporters contains something which the oxygen of the products wants, something which separates during the passage of the oxigen from the product to the combustible, and occasions the combustion, or emission of fire, which accompanies this passage. The oxigen of supporters then contains some ingredient which the oxygen of products wants. Many circumstances concur to render it probable that this ingredient is caloric.

The combustibles and the products also resemble each other. Both of them contain the same or a similar base; both frequently combine with combustibles, and likewise with oxygen; but they differ essentially in the phenomena which accompany their combination with oxygen. In the one case, fire is emitted, in the other not. If we recollect that no subtance but a combustible is capable of restoring combustibility to the base of a product, and that at its doing so it always loses its own combustibility; and if we recollect farther, that the base of a product does not exhibit the phenomena of combustion even when it combines with oxygen, we cannot avoid concluding, that all combustibles contain an ingredient which they lose when converted into products, and that this loss contributes to the fire which makes its appearance during the conversion. circumstances contribute to render it probable that this ingredient is light.

It we suppose that the exygen or supporters contains caloric as an essential ingredient, and that light is a component part of all combustibles, the phenoniena of combustion above enumerated, numerous and intricate as they are, admit of at easy and abvious explanation. The cospecient parts of the oxygen of supporters are two; bodies. Thus we have fulminating gold, namely, 1. a base, 2. caloric. The contponent parts of combustibles are likewise two; namely, 1. a base, 2. light. During combustion, the base of the oxygen combines with the base of the combustible, and forms the product; while, at the same time, the caloric of the oxygen combines with the light of the combustible, and the compound flies of in the form of fire. Thus combustion is a double decomposition; the oxygen and combustible divide themselves each into two portions, which combine in pairs; the one compound is the product, and the other the fire, which escapes.

Hence the reason that the oxygen of products is unfit for combustion. It wants its Hence the reason that combustion does not take place when oxygen combines with products, or with the base of These bodies contain no supporters. light. The caloric of the oxygen of course is not separated, and no fire appears. And this oxygen still retaining its caloric, is capable of producing combustion whenever a body is presented which contains light, and whose base has an affinity for oxygen. Hence also the reason why a combustible alone can restore combustibility to the base of a product. In all such cases, a double decomposition takes place. The oxygen of the product combines with the base of the combustible, while the light of the combustible combines with the base of the product.

But the application of this theory to all the different phenomena described above, is so obvious, that it is needless to give any more examples. Let us rather inquire, with the author, into the evidences which can be brought forward in its support.

10. As caloric and light are always emitted during combustion, it follows that they must have previously existed in the combustible, the supporter, or in both.

That the oxygen of the supporters contains either one or both of these substances, follows incontrovertibly from a fact already mentioned, namely, that the oxygen of products will not support combustion, while that of supporters will. Hence the oxygen of supporters must contain something which the oxygen of the products wants, and this something must be caloric,

or light, or both.

That the oxygen of some of the supporters at least contains caloric, as an ingredient, has been proved, in a satisfactory manner, by the experiments of Crawford, Lavoisier, and La Place. Thus the temperature of hot blooded animals is maintained by the decomposition of air. Now if the oxygen of one supporter contains caloric, the same ingredient must exist in the oxygen of every supporter, because all of them are obviously in the same state. Hence we conclude that the oxygen of every supporter contains caloric as an essential ingredient.

The light emitted during combustion, must either proceed from the combustible or the supporter. That it proceeds from the combustible, must appear pretty obvious, if we recollect that the colour of the light emitted during combustion varies, and that this variation usually depends, not upon the supporter, but upon the combustible. Thus charcoal burns with a red flame, sulphur with a bue or violet, zinc with a greenish white, &c.

The formation of combustibles in plants, obviously requires the presence and agency of light. The leaves of plants emit oxygen gas, when exposed to the sun's rays, but never in the shade, or in the dark.

Besides vegetation, we are acquainted with two other methods of unburning products, or of converting them into products and combustibles, by exposing them, in certain circumstances, to the agency of fire, or of electricity. The oxydes of lead, mercury, &c. when heated to redness, are decomposed, oxygen gas is emitted, and the pure metal remains behind. In this case, the necessary caloric and light must be furnished by the fire; a circumstance which explains why such reductions always require a red heat. When carbonic acid is made to pass repeatedly over red-hot charcoal, it combines with a portico of charcoal, and is converted into gaseous oxyd of carbon. If this gas be a combustible oxyd, the base of the carbonic acid and its oxygen must have been supplied with light and caloric from the fire; but if it be a partial combustible, it is merely a compound of carbonic acid and charcoal: which of the two it is, remains still to be ascer-

Electricity decomposes water, and converts it into oxygen gas and hydrogen gas; it must therefore supply the heat and the light which these bodies lost when convert-

ed into a product.

These facts, together with the exact correspondence of the theory given above with the phenomena of combustion, render it so probable, that Dr. Thomson has ventured to propose it as an additional step towards a full explanation of the theory of combustion. Every additional experiment has served to confirm it more and more. It even throws light upon the curious experiments of the accension of metals with sulphur, which succeed in vacuo, under mercury, in nitrogen gas, &c.

Dr. Thomson has noticed, that the same emission of caloric and light, or of fre, takes place when melted sulphur is made to combine with potash, or with lime, in a crucible or glass tube, and likewise when melted phosphorus is made to combine with lime heated to redness. He supposes that in all probability, barytes and strontia exhibit the same phenomenon when combined with melted sulphur or phosphorus; and

perhaps some of the metals when combined

with phosphorus.

The pi chomena Dr. Thomson explains thus: The sulphur and phosphorus are in the melted state, and therefore contain caloric as an ingredient; the alkalies, earths, and metals, which produce the phenomenon in question, contain light as an essential ingredient. The sulphur, or phosphorus combines with the base of the metal, earth, or alkali; while at the same time, the caloric, to which the sulphur or phosphorus owed its fluidity, combines with the light of the metal, earth or alkali; and the compound flies off under the form of fire.

Thus the process is exactly the same with combustion, excepting as far as regards the product. The melted sulphur, or phosphorus, acts the part of the sup-porter, while the metal, earth, or alkali, occupies the place of the combustible. The first furnishes caloric, the second light, while the base of each combines together. Hence we see that the base of sulphurets and phosphurets resembles the base of products in being destitute of light; the formation of these bodies exhibiting the separation of fire like combustion, but the product differing from a product of combustion in being destitute of oxygen, Dr. Thomson distinguishes the process by the title of semi-combustion; indicating by the term, that it possesses one half of the characteristic marks of combustion, but is destitute of the other half.

The only part of this theory which requires proof is, that light is a component part of the earths and alkalies. But as potash and lime are the only bodies of that nature, which we are certain to be capable of exhibiting the phenomena of semi-combustion, the proofs must of necessity be confined to them. That lime contains light as a component part, has been long Meyer and Pelletier observed long ago, that when water is poured upon lime, not only heat but light is emitted. Light is emitted also abundantly when sulphuric acid is poured upon magnesia, or upon lime, potash, or soda, freed from the water of crystallization. In all these cases, a semi-combustion takes place. The water and the acid being solidified, give out caloric, while the lime or potash gives out light.

That lime during its burning combines with light, and that light is a component part of lime, is demonstrated by the following experiment, for which we are in-

debted to Scheele.

Fluor spar (fluate of lime) has the property of phosphorescing strongly when heated, but the experiment does not succeed twice with the same specimen. After it has been once heated sufficiently, no subsequent heat will cause it so phosphorate, Now phosphorescence is merely the emis-

sion of light; light of course is a compouent part of fluor spar, and heat has the property of separating it. But the phosphorescing quality of the spar may be again recovered to it, or, which is the same thing, the light which the spar had lost may be re-

stored by the following process:

Decompose the fluate of lime by sulphuric acid, and preserve the fluoric acid separate. Boil the sulphate of lime thus formed with a sufficient quantity of carbonate of soda; a double decomposition takes place; sulphate of soda remains in solution, and carbonate of lime precipitates. Ignite this precipitate in a crucible, till it is reduced to lime, and combine it with the fluoric acid to which it was formerly united. The fluor spar thus regenerated, phosphoresces as at first. Hence the lime, during its ignition, must have combined with light.

That potash contains light, may be proved in the same manner as the existence of that body in lime. Now as potash is deprived of its carbonic acid by lime, the Doctor supposes that the process must be a double decomposition; namely, that the base of the lime combines with carbonic acid, while its light combines with the pot-

ash.

These remarks on semi-combustion might easily be much enlarged upon. For it is obvious, that whenever a liquid combines with a solid containing light, and the product is a solid body, something analogous to semi-combustion must take place. Hence the reason why water increases the violence of combustion when thrown sparingly into a common fire, &c.

COMEDONES. (From comedo, a glutton.)
A sort of worms which eat into the skin

and devour the flesh.

Comfrey. See Symphitum. Comisdi. The gum arabic.

COMISTE. The epilepsy. This name arose from the frequency of persons being seized with this disorder while in the assemblies called Comitia.

COMITISSA. (A countess.) Some preparations are distinguished by this name, as pulvis Comitissa de Cantia, the Countess of Kent's powder.

COMMAGENUM. (From Commagene, a place in Syria, whence it was brought.) Syrian ointment, mentioned by Galen.

COMMANDUCATIO. (From commanduco, to eat.) The act of mastication, or chewing.

COMMANSIM. (From commando, to eat.) A masticatory. A medicine put into the mouth chewed to promote a discharge of phlegm, or saliva.

Commendationius. (From commendo, to recommend.) An epithet of the traumatic balsam, Tinctura Benzoes composita, from its singular virtues and usefulness.

COMMI. Gum. When alone it signifies

G 6 \*

gum Arabic. The κομμι λευκον mentioned by Hippocrates in his De Morb. Mulieb.

is gum Arabic.

commissura. (From committo, to join together.) A suture, juncture, or joint. A term applied in anatomy to the corners of the lips, where they meet together; and also to certain parts of the brain which go across and join one hemisphere to the other.

COMMISSURA ANTERIOR CERE-BRI. The white nerve-like substance which crosses the anterior part of the third ventricle of the brain, immediately above the infundibulum, and between the anterior crura of the fornix; uniting one hemisphere

of the brain with the other.

COMMISSURA MAGNA CEREBRI.
The corpus callosum of the brain is so

termed by some writers.

COMMISSURA POSTERIOR CEREBRI. A white nerve-like substance, which passes from one hemisphere of the brain across to the other, immediately over the opening of the aquaduct of Sylvins, in the posterior part of the third ventricle of the brain, and above the corpora quadrigemina.

COMMUNICANT. (From communico, to make partake.) A term applied, by Bellini, to fevers of two kinds afflicting the same person, wherein as one goes off the

other immediately succeeds.

COMPAGES. (From compingo, to put together.) A suture, or joint. A commissure.

COMPARATIVE ANATOMY. Anatomia comparativa. Zootomy. The dissection of brute animals and fishes, to compare them with the human body.

COMPEBA. See Cubeba.

COMPLETION. A term used by the aucient writers in various acceptations; but latterly it signifies only the same as Plethora.

COMPLEXUS. (Complexus, sc. musc. from complector, to comprise.) Complexus seu biventer cervicis of Albinus. Dorso trachelon occipital of Dumas. A muscle situated on the back part of the neck, that draws the head backwards, and to one side; and when both act, they draw the head directly backward. It arises from the transverse processes of the seven superior vertebræ of the back, and four inferior of the neck, by as many distinct tendinous origins; in its ascent, it receives a fleshy slip from the spinous process of the first vertebræ of the back: from these different origins it runs upwards, and is every where intermixed with tendinous fibres. inserted, tendinous and fleshy, into the inferior edge of the protuberance in the middle of the os occipitis, and into a part of the curved line that runs forwards from that protuberance. It draws the head backwards,

COMPRESSION. (From comprimo, to

By this term, surgeons press together.) express a diseased state of the body, which is the effect of something pressing upon the It should be distinguished from concussion and inflammation. When the brain is compressed either by bone, extravasated blood, or any other fluid, there is a general insensibility, the eyes are half open, the pupil dilated and motionless, even when a candle is brought near the eye; the retina is insensible; the limbs relaxed; the breathing stertorous; the pulse slow, and, according to Mr. Abernethy, less subject to intermission than in cases of concussion. Nor is the patient ever sick, when the pressure on the brain and the general insensibility are considerable; for the very action of vomiting betrays an irritability in the stomach and œsophagus.

COMPRESSOR NARIS. (Compressor; from comprisno, to press agether) Reneaus wel nasalis of Douglas. Transversalis vel myritformis of Winslow. Dilatores alarum nasi of Cowper; and Maxillo narmal of Dumas. A muscle of the nose, that compresses the alæ towards the septum nasi, particularly when we want to smell acutely. It also corrugates the nose, and assists in expressing certain passions. It arises, by a narrow beginning, from the root of the ala nasi externally, and spreads into a number of thin, separate fibres, which run up along the cartilage in an oblique manner towards the

tremity of the os nasi, and nasal process of the superior maxillary bone.

COMPURETIO. (From compungo, to prick.) A puncture.

CONARIUM. (From xaros, a cone.) The pineal gland is so named, from its conical shape. See *Pineal gland*.

back of the nose, where it joins with its fellow, and is inserted into the narrow ex-

Concausa. (From con, with, and causa, a cause.) A cause which co-operates with another in the production of a disease.

CONCENTRANTIA. (From concentro, to concentrate.) Absorbents of acids are so called, because they remove the obstructions which keep asunder the affinities be-

tween the two powers.

CONCENTRATION. (From con, and centrum, having the same centre.) The volatilizing of part of the water of fluids in order to improve their strength. The matter to be concentrated, therefore, must be of superior gravity to water. This operation is performed on some acids, particularly the sulphuric and phosphoric. It is also employed in solutions of aikalis and neutral salts.

CONCEPTION. (Conceptio; from concipio, to conceive.) The impregnation of the ovulum in the female ovarium by the subtile prolific aura of the semen virile. In order to have a fruitful coltion, it is necessary that the semen be propelled into the uterus, or vagina, so that its fe-

cundating vapour shall be conveyed through the Fallopian tubes to the ovarium: it is also necessary that there be a certain state of the ovarium of the female in order to impregnate it; which is, that the ovum shall be mature, and embraced by the fimbrize of the Fallopian tube, to convey that vivifying principle to the ovum. See Generation.

CONCHA. (Concha, way xn, a liquid measure amongst the Athenians.) A term applied by anatomists to several parts of the body, as the hollow of the ear, the spongy bones of the nose, &c.

CONCILA AURICULE. See Auricula.

CONCHA AURIS. The hollow part of the

cartilage of the outer car.

CONCILE NARIUM. (Concha; a shell.) The turbinated portion of the ethnoid bone, and the inferior spongy bones of the nose, which are covered by the Schneiderian membrane, are so termed.

Concaus. (From κογχη, a shell; so named from their likeness to a shell.) The cra-

mum, and the cavity of the eye.

Concidentia. (From concide, to decay.) A decrease of bulk in the whole or any part of the body. A diminution of a tumour.

CONCOLGULATIO. (From con, and coagulo, to coagulate together.) The coagulation, or claystallization of different salts, first dissolved together in the same fluid.

Concocrio. From concoguo, to digest.) Digestion. That operation of nature upon morbid matter which renders it fit to be separated from the healthy fluids.

CONCHEMATIO. (From con, and cremo, to burn together.) The same as calcina-

CONCRETION. (From concresco, to grow together.)

1. The condensation of any fluid substance into a more solid consistence.

2. The growing together of parts which,

in a natural state, are separate.

Concursus. (From concurro, to meet together). The congenies or collection of

gether.) The congeries or collection of symptoms which constitute and distinguish

the particular disease.

CONCUSSION. From concutio, to shake together.) Concussion of the brain. Various alarming symptoms, followed sometimes by the most fatal consequences, are found to attend great violence offered to the head; and upon the strictest examination, both of the living and the dead, neither fissure, fracture, nor extravasation of any kind can be discovered. The same symptoms and the same events are met with, when the head has received no injury at all ab externo, but has only been violently shaken; nay, when only the body, or general frame, has seemed to have sustained the whole violence. The symptoms attending a concussion, are generally in proportion to the degree of violence which the brain itself has sustained, and which, indeed, is cognizable only by the symptoms. If the concussion be very great, all sense and power of motion are immediately aboushed, and death follows soon; but between this degree and that slight confusion (or stinning, as it is called,) which attends most violences done to the head, there are many stages. The following is Mr. Abernethy's description of the symptoms of concussion, and which, he is of opinion may be properly divided into three stages.

The first is, that state of insensibility derangement of the bodily powers which immediately succeeds the accident. While it lasts, the patient scarcely feels any injury that may be inflicted on him. His breathing is difficult, but in general without stertor; his pulse intermitting, and his extremities cold. But such a state cannot last long; it goes off gradually, and is succeeded by another, which is considered as the second stage of concussion. In this, the pulse and respiration become better, and though not regularly performed, are sufficient to maintain life, and to diffuse warmth over the extreme parts of the body. The feeling of the patient is now so far restored, that he is sensible of his skin being pinched; but he lies stupid and inattentive to slight external impressions. effects of concussion duminish, he becomes capable of replying to questions put to him in a loud tone of voice, especially when they refer to his chief suffering at the time, as pain in the head, &c.; otherwise he answers incoherently, and as if his intention was occupied by something else. As long as the stupor remains, the inflammation of the brain seems to be moderate; but as the former abates, the latter seldom fails to increase; and this constitutes the third stage, which is the most important of the series of effacts proceeding from a con-

These several stages vary considerably in their degree and duration; but more or less of each will be found to take place in every instance where, the brain has been violently shaken. Whether they bear any certain proportion to each other or not, is not known; indeed this will depend upon such a variety of circumstances in the constitution, the injury, and the aftertreatment, that it must be difficult to determine.

To distinguish between an extravasation and a commotion by the symptoms only, Mr. Pott says, is frequently a very difficult matter; sometimes an impossible one. The similarity of the effects in some cases, and the very small space of time which may intervene between the going off of the one and the accession of the other, render this a very nice exercise of the judgment. The first stunning, or deprivation of sense,

whether total or partial, may be from either, and no man can tell from which; but when these first symptoms have been removed, or have spontaneously disappeared, if such patient is again oppressed with drowsmess, or stupidity, or total or partial loss of sense, it then becomes probable that the first complaints were from commotion, and that the latter are from extravasation; and the greater the distance of time between the two, the greater is the probability not only that an extravasation is of the lampid kind, made gradatim, and within the lampin

Whoever seriously reflects on the nature of these two causes of evil within the cranium, and considers them as liable to frequent combination in the same subject, and at the same time considers that, in many instances, no degree of information can be obtained from the only person capable of giving it (the patient), will immediately be sens ble how very difficult a part a practioner has to act in many of these cases, and how very unjust it must be to call that ignorance which is only a just diffidence arising from the obscurity of the subject, and the impossibility of attaining materials to form a clear judgment.

CONDENSATION. (From condense, to make thick) A contraction of the pores of the skin, by means of astringent or cooling medicines. A thickening of any

Suid

CONDIMENTUM. (From condio, to preserve, or season.) A preserve, or sweet-meat.

CONDUCTIO. (From conduco, to draw along.) In Colius Aurelianus, it is a spasm, or convulsion, drawing the muscles out of

their proper positions.

CONDUCTOR. (From conduco, to lead, or guide.) A surged instrument, whose use is to direct the knift in certain operations. It is more commonly called a director.

conduct. (From 2016, an ancient cup, shaped like a joint.) A rounded eminence

of a bone in any of the joints.

CONDYLOMA. (From zerodulos, a tubercle, or knot.) Sarcoma. A soft, wartlike sxcre ence, that appears about the anus and pudendum of both sexes. There are several species of condylomata, which have received names from their appearances, as ficus, crysta, thymus, from their resemblance to a fig. &c.

CONGION In Hippocrates it imports the Cicuta. It is said to be thus named (from nama, to turn round,) because it produces: vertigo in those who take it in-

wardly

Conessi bark. See Conessi cortex.

CONESSI CORTEX. Codagopala. Cortex profluvii. The bark of the Nevium antidysentericum of Linnaus:—foliis oxa-

tis, acuminatis, petiolatis. It grows on the coast of Malabar. It is of a dark black colour externally, and generally covered with a white moss, or scurf. It is very little known in the shops; has an austere, hitter taste; and is recon.mended in diarrhœas, dysenteries, &c. as an adstringent.

CONFECTIO (From conficio, to make up.) A confection. In general it means any thing made up with sugar. This term, in the new London Pharmacopœia, includes those articles which were formerly called electuaries and conserves, between which there do not appear to be sufficient grounds

to make a distinction.

CONFECTIO AMYGDALE. Confection of Take of sweet almonds, an almond. ounce; Acacia gum powdered, a drachm; refined sugar, half an onnce. The almonds having been previously macerated in water, and their external coat removed, beat the whole together, until they are thoroughly incorporated. It has been objected to the almond mixture, which is an article of very general use, that it requires considerable time for its extemporaneous preparation, and that it spoils and cannot be kept when it is made. This will be obviated by the present form, which does keep for a sufficient length of time, and rubs down into the mixture immediately.

This prepara-CONFECTIO AROMATICA. tion was formerly called Confectio cardiaca. Confectio Raleighana. Take of cinnamon, bark, nutmegs, of each two ounces; cloves, an ounce; cardamom seeds, half an ounce; saffron dried, 2 ounces; prepared shells, 16 ounces; refined sugar powdered, two pounds; water, a pint. Reduce the dry substances, mixed together, to very fine powder; then add the water, and gradually mix the whole, until it is incorporated. This preparation is much simplified by the London college. It is an excellent medicine, possessing stimulant, antispasmodic, and adstringent virtues; and is exhibited with these views to children and adults, in a vast variety of diseases, mixed with other medicines. It may be given in doses of 10 grams to an ounce.

Confectio actiantil. Conserva corticis exterioris aurantii hispatensis. Conserva fluvedinis corticum auronitorum. Take of fresh external rind of oranges, separated by resping, a pound; refined sugar, three pounds. Brinse the rind with a wooden pestle, in a stone mortar; then, after adding the sugar, bruise it again, until the whole is thoroughly incorporated. This is well calculated to form the basis of a tonic and stomachic confection, and may be given alone in doses of from 2 to 5 drachms,

twice or three times a-day

Confectio candiaca. See Confectio are-

matica.

CONFECTIO CASSIE. Electuarium cas-Electuarium e cassia Confection of cassia. Take of fresh cassia pulp, half a pound; manna, two ounces; temarind pulp, an ounce; syrup of roses, half a pound. Bruise the manna; melt it in the syrup by a water-bath; then mix in the pulps, and evaporate down to a proper consistence. This is a very elegant, pleasant, and mild aperient for the feeble, and for children. Dose from 2 drachms to an

CONFECTIO OPII. Confectio opiata. Phi lonium Londinense Philonium Romanum. Confection of opium | Pake of hard opium powdered, six drachms; long pepper, an ounce; ginger-root, two ounces; c. rrawayseed, three ounces; syrup, a pint. together the opium and the syrup previously heated; then add the remaining articles reduced to powder, and mix. To the credit of modern pharmaey, this is the only one that remains of all those complicated and confused preparations called mithridate, theriaca, &c.; it more nearly approximates, in its composition, the philodered as an effectual substitute for them in practice. This very warm and stimulating confection is admirably calculated to relieve diarrhæa, spasms of the stomach and bowels, and is frequently ordered as a nervine, stimulant, and adstringent, in doses of from 10 grs. to half a drachin. About 36 grains contains one of opium.

CONFECTIO ROSA: CANINA. Conserva cynosbati, Conserva fructus cynosbati, Conserve of hips. Confection of dog-rose. Take of dog-rose pulp, a pound; refined sugar powdered, twenty ounces. Rub them together until they are thoroughly incorp rated. This preparation is cooling and adstringent; it is seldom given alone, but mostly joined to some other medicine, in the ferm of linetus, or electuary.

CONFECTIO ROSE GALLICE. Conserva ro-Conserva rosarum rubrarum. serve of red rose. Take of the petals of the red rose, before it is expanded, and without the claws, a pound; refined sugar, three pounds. Bruise the petals in a stone mortar; then, having added the sugar, beat them again toge her, until they are thoroughly incorporated. This is an excellent subastringent composition. Rubbed down with water, it forms an excellent drink, with some lemon juice, in hæmorrhagiac complaints; it may also be given with vitriolated zinc, in the form of an electuary.

Confectio Ruth. Electuarium e baccis lauri. Confection of rue. Take of rue leaves dried, carraway seeds, bay berries, of each an ounce and a half; sagapenuni, half an ounce; black pepper, two drachms; clarified honey, sixteen ounces. fine powder; then add the honey, and mix confederation.

the whole. Its use is confined to clys-

CONFECTIO SCAMMONEÆ. Electuarium scammonii Electuarium e scammonio. tuarium caryocostinum Confection of scammony. Take of scammony gum resin powdered, an ounce and a half; cloves bruised, ginger-root powdered, or escit 6 drachms; oil of carr way, half a dreenm; syrup of roses, as much as is sufficient. Rub the dry articles together, into very fine powder; next rub them again whilst the syrup , gradually added; then add he oil of carraway, and mix the whole well together. This is a strong stimulating cathartic, and calculated to remove worms from the prima via, with which view it is mostly exhibited. Dose from 355 to 3j.

Confectio senna. Electuarium seuna. Electuarium lenitivum. Confection of senna. Take of senna leaves, eight ounces; figs, a pound; tamarind pulp, pulp of prunes, cassia pulp, of each half a pound; coriander seeds, four ounces; liquorice root, three ounces; refined sugar, two pounds and a half. Powder the senna leaves with the coriander seeds, and separate, by sifting ten ounces of the nuxed powder. Boil the remainder with the figs and the liquorice-root, in four pints of water, until it be reduced to half; then press out and strain the inquor. Evaporate the liquor, until a pint and a half only remains of the whole; then add the sugar, to make syrup. Lastly, mix the pulps gradually with the syrup, and, having added the sifted powder, mix the whole together. This is a mild and elegant aperient, well adapted for pregnant women, and those whose bowels are easily moved Dose, 3ss to 3ss.

CONFERVA. (From confervee, to knit together.) 1. The name of a genus of plants in the Linnaan system. Cryptogamia. Order, Alga.

2. A kind of moss: named from its use

formerly in healing broken bones.

CONFERVA HELMINTHOCORTOS. rallina corsicana.

CONFERVA RIVALIS. This plant, Conferva rivalis of Linnaus:-filimentis simplicissimis aqualibus longissimis, has been recommended in cases of spasmodic asthma, phthisis, &c. on account of the great quantity of vital air it contains.

CONFIRMANTIA (From con, and firmo, to strengthen.) Restoratives; also medicines which fasten the teeth in their sockets.

Confluent small pox. See Variola.
Confluence of the small pox. It is much used by Hippocrates, and his interpreter Galen, in the same sense as we use consent and transpirable, from a notion that parts at a distance have mutual consent with one another, and that they are all perspirable by many subtle streams. Paracelsus, accord-Rub the dry articles together, into a very ing to his way, expressed the former by

CONFORMATION. (From conformo, to shape or fashion.) The natural shape and form of any thing, also a description of some diseases which arise from a bad formation of the parts.

CONFORTANTIA. (From conforto, to strengthen.) Cordial medicines. Strength-

eners.

CONFORTATIVA. The same.

Confusio. (From confundo, to mix together.) A confusion, or disorder in the eyes, proceeding from a rupture of the membranes, which include the humours, by which means they are all confounded together.

CONGELATI. (From congelo, to freeze.) Congelatici. Persons afflicted with a catalepsy are so called, by which all sensation

seems to be taken away.

CONGELATION. (From congelo, to freeze.) That change of liquid bodies which takes place when they pass to a solid state, by losing the caloric which kept them in a state of fluidity.

Congellativa. (From congelo, to congeal.) Medicines that inspissate humours,

and stop fluxions and rheums.

CONGENER. (From con, and genus, of the same kind.) Of the same kind; concurring in the same action. It is usually said of the muscles.

CONGESTION. (From congero, to amass.) A collection of blood or fluid; a swelling which rises gradually, and ripens slowly, in opposition to that which is soon

formed, and soon terminated.

CONGLOBATE GLAND. (From conglobo, to gather into a ball.) Glandula conglobata. Lymphatic gland. Globate gland. A round gland formed of a contortion of lymphatic vessels, connected together by cellular structure, having neither a cavity nor any excretory duct: such are the mesenteric, inguinal, axillary glands, &c. See Glands.

CONGLOMERATE GLAND. (From conglomero, to heap upon one.) Glandula conglomerata. A gland composed of a number of glomerate glands, whose excretory ducts all unite into one common duct: such are the salival, parotid glands, &c.

CONGLUTINANTIA. (From conglutino, to glue together.) Healing medicines; and such as unite parts disjointed

by accident.

Coxis. (Kovis.) Dust, fine powder, ashes, a nit in the hair, scurf from the head;

and sometimes it signifies lime.

CONIUM. (From xova, dust, according to Linnaus, or from xovax, circumago, on account of its inchriating and poisonous quality.) Hemlock.

1. The name of a genus of plants in the Lynnæan system. Class, Pentandria. Or-

der, Digynia.

2. The pharmacopæial name of the officinal hemlock. See Cicuta.

CONTUM MACULATUM. The systematic name for the cicuta of the pharmacopoias. See Cicuta.

CONJUNCTIVE MEMBRANE. Membrana conjunctiva. The thin, transparent, delicate membrane, that lines the interested from thence, over the anterior part of the bulb, to the edge of the other eyelid. That portion which covers the transparent cornea cannot, without much difficulty, be separated from it. Inflammation of this membrane is called oph-

CONNATUS. (From con, and nascor, to grow together.) Used much by Hippocrates for what is born with a person; the same with congenite.

CONNEXION. See Articulation.

CONNUTRITUS. (From con, and nutrior, to be nonrished with.) It is what becomes habitnal to a person from his particular nourishment, or what breaks out into a disease in process of time, which gradually had its foundation in the first aliments, as from sucking a distempered nurse, or the like.

Conquassation. In pharmacy it is a species of comminution, or an operation by which moist concrete substances, as recent vegetables, fruits, the softer parts of animals, &c. are agitated and bruised, till, partly by their proper succulence, or by an effusion of some liquor, they are reduced to a soft pulp.

Consent of parts. See Sympathy.

CONSERVA. (From conserve, to keep.) A conserve. A composition of some recent vegetable and sugar, beat together into an uniform mass of the consistence of honey; as conserve of hips, orange peel, &c. Conserves are called confections in the last edition of the London Pharmacopona. See Confectio.

Conserva absintilli Maritimi. Sec

Absinthum maritimum.

Conserva and. This is occasionally exhibited as a stimulant and diuretic. See Arum.

Conserva auranam hispalensis. See Confectio aurantii,

Conserva cynoseati. See Confectio rose caninæ.

CONSERVA LUJULE. A preparation of wood-sorrel, possessing acid, cooling, and antiseptic qualities. See Acetocella.

Conserva Mentile. This preparation of mint is given occasionally as a stomachic, in sickness and weakness of the stomach. See Mentha viridis.

Conserva prunt sylvestms. Astringent virtues are ascribed to this medicine, which is now seldom used but in private formulæ.

Conserva Rose. This conserve, rubbed down with water, to which is added

some lemon-juice, forms an excellent drink in hamorrhagic complaints. See Confectio

rosa galica.

CONSERVA SCILLE. A preparation of squill, which affords an excellent basis for an electuary, possessing expectorant and

CONSISTENTIA. (From consisto, to abide.) The state or aeme of a disease. The appearance or state of the humours and ex-

crements.

Consolida. (So called, quia consolidandi et conglutinandi vi pollet ; named from its power and use in agglutinating and joining together things broken.) Comfrey.

CONSOLIDA AUREA. Aurea cordis.

name of the chamacistus.

Consolida Majon. See Symphitum. Consolida Media. Bugula. Upright bugloss. Middle consound. This plant, Ajuga pyramidalis of Linnaus :-tetragonoporamidalis, villosa, foliis radicalibus maximis, possesses subadstringent and bitter qualities : and has been recommended in phthisis, aptha, and cynanche.

CONSOLIDA MINOR. See Prunella.

CONSOLIDA REGALIS. Calcatrippa. ny virtues are attributed to this plant, Delphinium consolida, of linnans:-nectariis monophyllis, caule subdiviso. The flowers are bitter, and a water distilled from them is recommended in ophthalmia. The herb has been administered in calculous cases, obstructed menses, and visceral diseases.

SARACENICA. Sec Virga CONSOLIDA

aurea

Consound. See Symphitum.

Consound middle. See Consolida media. CONSTIPATION. (From constipo, to crowd together.) Obstipatio. A person is said to be costive when the alvine excrements are not expelled daily, and when the faces are so hardened as not to receive their form from the impression of the rectum upon them.

CONSTRICTIVA. (From constringo, to

bind together.) Styptics.
CONSTRICTOR. (From constringe, to bind together.) A name given to those muscles which contract any opening of the body.

CONSTRICTOR ALE NASI. Scc Depres-

sor labii superioris alæque nasi.

CONSTRICTOR ANT. See Sphincter ani. CONSTRICTOR ISTHMI FAUCIUM. Glosso-staphilinus of Winslow, Douglas, and Cowper; and Glosso staphilin of Dumas. A muscle situated at the side of the entry of the fauces, that draws the velum pendalum palati towards the root of the tongue, which it raises at the same time, and with its fellow contracts the passage between the two arches, by which it shuts the opening of the fauces.

CONTRICTOR LAMIORUM. See Orbicularis

CONSTILICTOR MUSCULUS. See Buccina-

See **Orbicularis** CONSTRICTOR ORIS. oris.

CONSTRICTOR PALPEBRARUM.

bicularis palpebrarum.

CONSTRICTOR PHARYNGIS INFE-Crico pharyngeus. Thyro pharyngeus of Douglass and Winslow. Cricothyropharyngien of Dumas. A muscle si. tuated on the posterior part of the pharynx, It arises from the side of the thyriod car. tilage, near the attachment of the sternothage, hear the articles; and thyro-hyoidaus muscles; and from the cricoid cartilage, near the crico-thyroidaus; it is inserted into the white line, where it joins with its fellow, the superior fibres running obliquely upwards, covering nearly one-half of the middle constrictor, and terminating in a point: the inferior fibres run more transversely, and cover the beginning of the œsophagus. Its use is to compress that part of the pharynx which it covers, and to raise it with the larynx a little upwards.

CONSTRICTOR PHARYNGIS DIUS. Hyo-pharyngeus and cephalo-pharyngeus of Douglas and Winslow. Chondro-pharyngeus of Douglas. Syndesmo-pharyngeus of Winslow. Cephalo-pharyng.eus of Winslow and Douglas. Hyo-glosso basi pharyngien of Dumas. A muscle situated on the posterior part of the pharynx. It arises from the appendix of the os hyoides, from the corner of that bonc, and from the ligament which connects it to the thyroid cartilage; the fibres of the superior part, running obliquely upwards, and covering a considerable part of the supegior constrictor, terminate in a point; and is inserted into the middle of the cuneiform process of the os occipitis, before the foramen magnum, and joined to its fellow at a white line in the middle part of the pharynx. This muscle compresses that part of the pharynx which it covers, and draws

it and the os hyoides upwards.

CONSTRICTOR PHARYNGIS SUPE-RIOR. Glosso-pharyngeus. Mylo-pharyn-geus. Pterygo pharyngeus of Douglas and Winslow, and Pterigo syndesmo staphili pharyngien of Dumas. A muscle situated on the posterior part of the pharynx. It arises above, from the cunciform process of the os occipitis, before the foramen magnum, from the pterygoid process of the sphenoid bone, from the upper and under jaw, near the roots of the last dentes molares, and between the jaws. It is inserted in the middle of the pharynx. Its use is to compress the upper part of the pharvnx, and to draw it forwards and upwards.

CONSTRUCTOR VESICÆ URINARIÆ. Detrusor urine.

CONSTRICTORES PHARYNGEI. of the asophagus.

CONSTRICTORII. Diseases attended with constriction, or spasmodic diseases.

CONSTRINGENTIA. (From constringo, to bind together.) Astringent medicines.

CONSUMPTION. (From consumo, to waste away.) See Phthisis.

CONTABESCENTIA. (From contabesco, to pine or waste away.) An atrophy, or ner-

vous consumption

CONTAGION. (From contingo, to meet or touch each other.) Effluvia. Miasma. Virus. Lues. Infection. The very subtile particles arising from putrid or other substances, or from persons labouring under contagions diseases, which communicate the disease to others; thus the contagion of putrid fever, the effluvia of dead anmal or vegetable substances, the miasma of bogs and fens, the virus of small-pox, lues venerea, &c. &c. There does not appear to be any distinction between contagious and infections diseases. Would it not be proper to apply the term contagious to those which are communicated by contact only, as the venereal disease, itch, &c.; and infections, to those which are caught through the medium of the aumosphere, &c. without contact, as putrid fever, &c.

Contensio. (From cotineo, to restrain.) It is sometimes used to express a tension

or stricture.

CONTINENS FEBRIS. A continual or continent fever, which proceeds regularly in the same tenor, without either intermission or remission. This rarely if ever

happens.

CONTINUA FEBRIS. (From continuo, to persevere.) A continued fever, attended with exacerbations and slight remissions, but no intermission; sometimes called assidua.

Contensio., (From conterquee, to twist about.) A contersion, or twisting. In medicine this word has various significations, and is applied to Hiac passion, to luxation of the vertebra, head, and back, &c.

CONTRA-APERTURA. (From contra, against, and aperio, to open. A counter-opening. An opening made opposite to the one that

already exists.

CONTRACTILITY. Expansive elasticity A property in bodies, the effect of the cohesive power, by which their particles resume their former propinquity when the force ceases which was applied to separate them.

CONTRACTION. (From contrado, to draw together.) Contractura. Beriberia. A rigid contraction of the joints. It is a genus of disease in the class locales, and order dyscinesiæ of Cullen. The species

1. Contractura primaria, from a rigid contraction of the muscles, called also obstipitas; a word that, with any other

annexed, distinguishes the variety of the contraction. Or this species he forms four varieties. I. Contractura ab inflammatione, when it arises from inflammation. 2. Contractura à spasmo, called also tonic spasm and cranip, when it depends upon spasm. 3. Contractura ob antagonistas paraliticos, from the antagonist muscies losing their action. 4. Contractura ab acrimonia irritante, which is induced by some irritating cause.

2. Contractura articularis, originating

from a disease of the joint.

CONTRAFISSURA. (From contra, against, and findo, to cleave.) A crack in the skull, opposite to the part on which the blow was given

CONTRAHENSIA. (From contraho, to contract.) Medicines which shorten and strengthen the fibres. Astringents are the

only medicines of this nature.

CONTRA-INDICATION. (Contraindicatio; from contra, against, and indico, to shew.) A symptom attending a disease, which forbids the exhibition of a remedy which would otherwise be employed; for instance, bark and acids are usually given in putrid (evers; but if there be difficulty of breathing, or inflammation of the side, or of any viscus, they are contra-indications to their use.

CONTRA-LUNARIS. (From contra, and luna, the moon.) An epithet given by Dietericus to a woman who conceives during the menstrual discharge.

CONTRA-SEMEN. See Santonicum.

CONTRE COU. A species of fracture of the skull, called in Latin contra-fissura, in which the fracture happens in that part of the bone opposite to where the blow was received.

CONTRAYERVE RADIX. See Contra-

yerva.

CONTRAYERVA. (From contra, against, and yerva, a herb Span. i. e. a herb good against poison.) Drakena. Cyperus longus, odorus, peruanus. Bezoardica rudix. Dorstenia contrayerva of Linuxus.

The contrayerva was first brought into Europe about the year 1581, by Sir Francis Drake, whence its name Drakena. It is the root of a small plant found in Peru, and other parts of the Spanish West-Indies. Dr. Houlston observes, that the roots of different species of dorstenia are promiscuously gathered and exported for those of the contraverva, and, as all the species bear a great resemblance to each other they are generally used for medical purposes in this country. The tuberous parts of these roots are the strongest, and should be chosen for use. They have an agreeable aromatic smell; a rough, bitter, penetrating taste; and when chewed, they give out a sweetish kind of acrimony.

It is diaphoretic and antiseptic; for-

merly used in low nervous fevers, and those of the malignant kind; though taken freely, it does not produce much heat. It is, however, now seldom used, though, with the Peruvian bark in decoction, it is occasionally employed in ulcerated s re throats,

as a gargle.

Dr. Cullen observes, that this and serpentaria are powerful stimulants; and both have been employed in fevers in which de-bility prevailed. However, he thinks, wine may always supersede the stimulant powers of these medicines; and that debility is better remedied by the tonic and antiseptie powers of cold and Peruvian bark, than by any stimulants.

By the assistance of heat, both spirit and water extract all its virtues; but they carry little or nothing in distillation; extracts made by inspissating the decoction,

retain all the virtues of the root.

The London College forms the compound powder of contrayerva by combining five ounces of contrayerva root with a pound and a half of prepared shells. This powder was formerly made up in balls, and called lapis contrayervæ, employed in the decline of ardent fevers, and through the whole course of low and nervous ones. The radix serpentariæ virginiensis, in all cases, may be substituted for the contrayerva.

CONTRAVERVA ALBA. Contrayerva Ger-

manorum. A name for asclepias.

CONTRAVERVA . NOVA. Mexican contrayerva. This is the root of the Psoralea pentaphylla of Linnaus. It was introduced into Europe after the former, and is brought from Guiana as well as from Mexico. It is but little if any thing inferior to contrayerva.

CONTRAYERVA VIRGINIANA. See Ser-

pentaria.

CONTRITIO. The same as comminu-

(From CONTUSION. contundo, to knock together.) A bruise, or contused

CONVALESCENCE. That space from the departure of a disease, to the recovery

of the strength lost by it.

CONVALLARIA. (From convallis, a valley; named from its abounding in valleys and marshes.) The name of a genus of plants in the Linnxan system. Hexandria. Order, Monogynia.

The systema-CONVALLARIA MAJALIS. tic name of the lily of the valley. See

Islium convallium.

CONVALLABIA POLYGONATUM. The systematic name of Solomon's seal. See Sigil-

The su-CONVOLUTA SUPERIORA OSSA. perior turbinated bones of the nose.

Convoluta inferiora ossa. The lower tur vinated bones of the nose.

CONVOLVULUS. (From convolve, to roll together; so named from its spiral shape, and its twisting round other trees and shribs )

1. A name for the Iliaca passion.

The name of a genus of plants in the Lin æin system. Class, Pentandria Order, Monogynia, which afferds the Jalapa, meelioaeana, turbith, and scammony. whole genus usually abounds with plants containing a milky juice strongly cathartic and eaustie.

Convolvulus Americanus, The jalap

root.

CONVOLVULUS CANTABRICA. A name for the cantabrica.

Convolvulus colubrinus. The pariera brava.

CONVOLVULUS JALAPA. The systematic name of the jalap plant. See Jula-

CONVOLVULUS MAJOR ALBUS. juice of this plant, Convolvulus sepium of Linnaus :- foliis sagittatis postice truncatis pedunculis tetragonis, unifloris, is violently purgative, and given in dropsical affections. A poultice of the herb, made with oil, is recommended in white swellings of the knee-joint.

CONVOLVULUS MARITIMUS. The brassi-

ca maritima, or sea colewort.

CONVOLVULUS MECHOACAN. See Mechoacanne radix.

CONVOLVULUS SCAMMONIA. The systematic name of the seammony plant. See Scammonium.

Convolvulus serium. See Convolvulus major albus.

CONVOLVUICS SOLDANELLA. The systematic name of the sea convolvulus. Brassica marina.

Convolvulus Syntaeus. A name for the seammonium.

CONVOLVULUS TURPETHUM. The systematic name of the turbith plant.

Turpethum.

CONVULSION. (Convulsio; from convello, to pull together.) Hieranosos. Distentio nervorum. Clonic spasm. A diseased action of muscular fibres, known by alternate relaxations, with violent and involuntary contractions of the muscular parts, without sleep. Cullen arranges convalsion in the class neuroses, and order spasmi. Convulsions are universal or partial, and have obtained different names, according to the parts affected, or symptoms; as the risus sardoricus, when the inuseles of the face are affected; S. Vit is's dance, when the muscles of the arm are thrown into involuntary motions with lameness and rotations. The hysterical epilepsy, or other epilepsies, arising from different cause, are convulsive diseases of the universal kind: the muscles of the globe of the eye, throwing the eye into involuntary distortion once to the direction of the y ces of partial convulsion. principally

affected in all species of convulsions, are those immediately under the direction of the will; as those of the cyclids, eye, face, jaws, neck, superior and inferior extremities. The muscles of respiration, acting both voluntarily and involuntarily, are not unfrequently convulsed; as the diapliragm, intercostals, &c. The more immediate causes of convulsions are, 1. Either mental affection, or any irritating cause exciting a greater action in the arterial system of the brain and nerves. An increase of nervous energy, which seems to hold pace or be equi-potent with the increased arterial energy, excited in the brain. 3. This increased energy, conveying its augmented effects, without the direction of the will, to any muscles destined to voluntary mot on, over-irritates them. 4. The muscles, irritated by the increased nervous energy and arterial influx, con-tract more forcibly and involuntarily by their excited vis insita, conjointly with other causes, as long as the increased nervous energy continues. 5. This increased energy in the nervous system may be excited either by the mind, or by any acrimony in the blood, or other stimuli sufficiently irritating to increase the arterial action, nervous influence, and the vires insitæ of muscles. 6. After muscles have been once accustomed to act involuntarily, and with increased action, the same causes can readily produce the same effects on those organs. 7. All parts that have muscular fibres may be convulsed, sensations in the mind most capable of producing convulsions, are timidity, horror, anger, great sensibility of the soul, &c.

CONVULSIO ABDOMINIS. Convulsion of

the museles of the belly.

CONVULSIO CANINA. A wry mouth.
CONVULSIO CEREALIS. Cereal convulsion, is a singular disorder of the spasmodic convulsive kind, not common to this country, but mentioned by Cathenser under this title, from the peculiar tingling and for-mication perceived in the arms and legs. Motus spasmodicus of Hoffman. It is endemial in some places in Germany, but more a rural than urbanical disorder, said to arise from the use of spoiled corn.

Convulsio clonica. Convulsion with al-

ternate relaxation.

CONVULSIO GRAVIDARUM. Convulsion of pregnant women.

CONVULSIO HABITUALIS.

St. Viti. CONVULSIO HEMITOTONOS. Convulsion approaching to tetanus.

The chorea

CONVULSIO AB INANITIONE. Convulsion

from inanition.

Convulsio indica. Tetanus.

Convulsion CONVULSIO INTERMITTENS. occurring ' TOYUSIAS.

CON E Convulsion from stor

Convulsion CONVULSIO AR ONANISMO from self pollution.

Spasmodic pain-CONVULSIO RAPHANIA. ful disease of the joints.

CONVULSIO TONICA. Common or perma-

nent convulsion.

CONVULSIO UTERI. Abortion.

CONYZA. (From nows, dust; because its powder is sprinkled to kill fleas in places where they are troublesome.) The name of a genus of plants in the Linuxan system. Class, Syngenesia. Order, Polygamia superflua.

CONYZA ETHIOPICA. A name for the

elichrysum.

CONYZA COERULEA. The herb flea-bane. This acrid plant is exhibited on the continent in some diseases of the chest.

Conyza major. Conyza major vulga-Mas theophrasti. Conyza major of

Dioscorides. Greater flea-bane.

CONEZA MEDIA Arnica Suedensis. Inula dysenterica of Limwus :- foliis amplexicaulibus, cordato-oblongis; caule villoso, paniculato, squamis calycinis, setaceis. An acrid, subaromatic plant, possessing antidysenteric virtues. It is sometimes called arnica spuria.

CONYZA MINOR. Conyza minor flore globoso. Pulicaria. Conyza minima et media. Small flea-bane. The inula dysenterica. The cluef use of all the flea-banes is to destroy fleas and gnats, by burning. They are occasionally used as an antipsoric re-

medy.

COOPERTORIA. (From co operio, to co-Cartilago thyroidea. Called ver over.) also abicum.

COOSTRUM. The centre of the diaphragm.

COPAIBA. See Balsamum copaibæ. COPAIFERA. (From Copaira, the In-

dian name, and fero, to bear.) The name of a genus of plants in the Linnxan system. Class, Decandria. Order, Digynia.

The syste-COPALFERA OFFICINALIS. matic name of the plant from which the Copaiva balsam is obtained.

тит Сораіvæ.

COPAL. (The American name of all clear odoriferous gums.) Gum copal. This resinous substance is imported from Guinea, where it is found in the sand on the shore. It is of a yellow colour, faintly glistening, imperfectly transparent, and apt to break with a conchoidal fracture. It is tasteless, and, while cold, inodorous. It is used, dissolved in rectified spirit of wine, in laxities of the gums, with the same views as mastich.

Copaiva balsam. See Balsamum Copaiva.

COPELLA. See Cupella.
COPHER. A name for camphor.
COPHOS. (Κωφος, dumb.) Deaf or dumb. Also a dulness in any of the senses.

COPHOSIS. (From xapes. deaf.) difficulty of hearing. It is often symptomatic of some disease. See Dysecoea.

(Quasi as Cyprium; so named from the island of Cyprus, whence it was formerly brought.) A metal found in the earth, in various states. It is found native, (native copper,) possessing the red colour, malleability, and many of its other properties; it is, however, not quite pine, but generally mixed with a minute portion of gold, or silver.

This ore is found of an indeterminate figure, in solid and compact masses; sometimes in plates and threads, which assume a variety of forms. It crystallizes in cubes. It then is flexible. It has much metallic lustre. It is found in many parts of Eu-

rope.

Copper ores are very numerous. Copper combined with oxygen, forms oxyd of copper, or the earthy copper ore, (mountain blue.) United to carbonic acid, it constitutes the hepatic copper ores, (mountain green.) &c. The compact ore of this kind is termed malachite. It generally exhibits a very fine grass-green, emerald green, or apple-green colour. It is found in solid masses of an indeterminate shape. It has often a beautiful sattin-like appearance, or silky lustre.

Copper also exists mineralized by the muriatic acid, sulphuric acid, arsenic acid, &c. Copper mineralized with sulphur is called vitreous copper ore. Its colour is generally lead-gray. Combined with sulphur and iron, it forms the azure copper ore, and all the varieties of copper pyrites. Mmeralized with sulphur, arsenic, iron, and zinc, it constitutes the brown or blendose copper ores, of which there are many varieties. Copper mines are abundant in Britain,

Germany, &c.

Properties of Copper - Pure copper is of a rose-red colour, very sonorous, very tenacious, ductile, and malleable; of a considerable compactness; moderately hard and elastic. Its texture is granulated, and subject to blisters. It crystallizes in quadrilateral pyramids. Its specific gravity is between 7,788 and 8.584. When rubbed, it emits a disagreeable odour. It melts at 27° of Wedgwood's pyrometer. At a higher temperature, it burns with a beautiful green flame. It is a good conductor of caloric, of electricity, and of galvanism. Exposed to the air it becomes brown, and at last green, by absorbing carbonic acid. When heated, it turns blue, vellow, violet, and brown. It readily fises with phosphorus and unites to sulphur, when finely divided by mere trituration. It does not decompose water at the temperature of ig-nition. It is acted on by the greater num-ber of the acids. Nitric acid acts on cop-per with great vehemence. Sulphuret of potash combines with it in the dry and in the humid way. It is capable of alloying with the greater number of the metals, With zinc it forms the compound metals

called brass, pinchbeck, and others: with tin it forms bell-nietal and bronze. unites to the earths merely in vitrification. Liquid ammonia causes it to oxydate quickly when air is admitted. It decomposes muriate of ammonia, and red sulphurated oxyd of mercury, by heat. It is poisonous to the human constitution.

COP

Method of obtaining Copper.-Copper is procured from its ores, by different processes according to the nature of those ores. If they contain much sulphur, after being pounded and washed, they are roasted in the open air to dispel the sulphur. The ore is afterwards roasted once or twice more, and is melted in an open fire into a mass, called a mat of copper. In this state it still contains a large quantity of sulphur, which the workmen continue to expel by repeated roastings and fusion, till the metal acquires a certain degree of purity, and is called black copper, which is somewhat malleable, but still contains sulphur, iron, and in general some other impurities. order to get entirely rid of these, the copper is hastily fused with three times its weight of lead. The lead unites with the copper, and expels the iron; and the rest of the metals which happen to be mixed with the copper are thus expelled. The copper is afterwards refined, by keeping it heated in crucibles for a considerable time, so that it may throw up all the foreign substances it still contains in the form of scoriæ. It is examined from time to time by immersing iron rods into it, which become coloured with a small quantity of copper, and its purity is judged of by the brilliant redness of these specimens.

COPPERAS. A name given to blue, green, and white vitriol.

(From xorgoe, dung, and COPRAGOGA. aya, to bring away.) Copragogum. The name of a gently purging electuary, mentioned by Rulandus.

(From xorgos, excre-COPHIEMESIS, ment, and emea, to vomit.) A vomiting of

COPROCRITICA. (From nongos, excrement, and xgra, to separate.) Mild cathartic medicines.

(From xomeos, excre-COPROPHORIA. ment, and pogen, to bring away.) A purg-

Cornos, (Kongos.) The faces, or excrements.

COPROSTASIA. (From xorgos, faces, and isnui, to remain.) Costiveness, or a con-

striction of the belly.

COPTABIOM. (Korfin, a small cake.) Coptarium. A medicine in the shape of a very small cake, directed for disorders of the aspera arteria and lungs, and for many other intentions, by the arcients.

Corre. (Konin, a small cake.) It was the form of a medicine used by the ancients; also a cataplasm generally made of vegetable substances, and applied externally to the stomach, and internally on many occasions.

Copula. (Quasi compula; from compello, to restrain.) A name for a ligament.

COQUENTIA. (From coquo, to digest,) Medicines which promote concoction.

1. The heart. See Heart.

2. Gold.

3. An intense fire.

CORACINE. (From nogat, a crow; so named from its black colour.) A name for a lozenge, quoted by Galen from Asclepi-

CORACO-BRACHIALIS. (From nogaž, a crow, and Beaxtor, the arm.) Coraco-humeral of Dumas. Coraco-brachiaus. muscle, so called from its origin and insertion. It is situated on the humerus, before the scapula. It arises, tendinous and fleshy, from the fore-part of the coracoid process of the scapula, adhering, in its descent, to the short head of the biceps; inserted, tendinous and fleshy, about the middle of the internal part of the os humori, near the origin of the third head of the triceps, called brachialis externus, where it sends down a thin, tendinous expansion to the internal condyle of the os humeri. Its use is to raise the arm upwards and forwards.

CORACO-HYOIDEUS. (Coraco-hyoideus, sc. musculus, nogano voidaios: from nogaž, a crow, and vossoes, the bone called hyoides.)

See Omo-hyoideus.

CORACOID. (Corocoidens; from nogaž, a crow, and eidos, resemblance; besause it is shaped like the beak of a crow ) A name given to a process on the upper and anterior part of the scapula.

Coral, See Corallium.

CORALLINA. (Dim. of corallium; from nogn, a daughter, and ans, the sea; because it is generated in the sea.) Muscus maritimus. Corallina officinalis. Corallina alba. Sea coralline, and white wormseed. marine production, resembling a small plant without leaves, consisting of numerous brittle cretaceous substances. friable betwixt the fingers, and crackling between the teeth. Powdered, it is administered to children as an anth. Iminuic.

Helminthocor-CORALLINA CORSICANA. Conferva helmintho cortos. Corallena rubra. Corallina melito-corton. Lemi-Corsican worm weed. tho-corton. helmintho-corton of De La Tourette. plant has gained great repute in destroying all species of intestinal worms. Its virtues are extolled by many; but impartial experimentalists have frequently been disappointed of its efficacy. The Geneva Pharmacopæia directs a syrup to be made

CORALLINA MELITO-CORTON. lina corsicana.

CORALLINA RUBBA. See Corollina corsicana.

Coralline. Sec Corallina. Corulline, Corsican. See Corallina Corst-

cana.

CORALLIUM ALBUM. A hard, white, calcareous, brittle substance; the nidus of Class, Fermes. the Madrepora oculata. Order, Lithophyta It is sometimes exhibited as an absorbent earth.

CORALLIUM RUBRUM. (From xcpn, a daugnter, and axe, the sea; so named because it is generated in the sea.) Acmo. Azur. The red coral is mostly employed medicinally. It is a hard, brittle, calcareous substance, resembling the stalk of a plant, and is the habitation of the Isis nobilis. Class, Vermes. Order, Zoophitæ. When powdered, it is exhibited as an absorbent earth to children; but does not appear to claim any preference to common chalk.

CORALLODENDRON. (From ROGARAGO, CO. ral, and Serdeor, a tree; resembling in hardness and colour a piece of coral.) ral-tree of America; antivenereal.

CORALLOIDES SEPTFOIL. Tooth or coral-

wort: corroborant,

CORALLOIDES FUNGUS. (From Rogannion, coral, and afor, likeness.) Erotylus. Clavaria coralloides of Linnæus. It is said to be corroborant and astringent.

Conchonon. (From 20gn, the pupil of the eye, and 20gea, to purge; so called because it was thought to purge away rheum from the eyes.) The herb pimpernel, or chickweed.

Corda. See Chordee.

CORDA TYMPANI. The portio dura of the seventh pair of nerves, having entered the tympanum, sends a small branch to the stapes, and another more considerable one, which runs across the tympanum from behind forwards, passes between the long leg of the incus and the handle of the malleus, then goes out at the same place where the tendon of the anterior muscle of the malleus enters. It is called corda tympani, besause it crosses the tympanum as a cord crosses the bottom of a drum. Dr. Monro thinks that the corda tympani is formed by the second branch of the fifth pair, as well as by the portio dura of the seventh.

CORDÆ WILLISH. See Dura mater. CORDIALS. Medicines are generally so termed, which possess warm and stimulating properties, and that are given to raise

CORDIA MYXA. Schastina. The systematic name of the Sebesten plant. See Se-

CORDINEMA. (From naga, the head, and diview, to move about.) A head-ach, attended with a vertigo.

Corpolium. (From cor, the heart, and dolor, pain.) A name formerly applied to

cardialgia, or heart-burn.

Cone. (Kogn.) The pupil of the eye. (From nogen, to cleanse.) COREMATA. Medicines for cleansing the skin,

Coriander. See Coriandrum.

CORIANDRUM. (From 2021, a pupil, and 2012, a man; because of its roundness, like the pupil of a man's eye; or probably so called from 2021, cumex, a bug, because the green herb, seed and all, stinks intolerably of bugs.) Coriander.

1. The name of a genus of plants in the Linnaan system. Class, Pentandria. Or-

der, Digunia.

2 The pharmacopæial name of the officinal coriander. Gassibor. Corianon. The Coriandrum sativum of Lannaus :- fructibus This plant is a native of the South of Europe, where, in some places, it is said to grow in such abundance as frequently to choke the growth of wheat and other grain. From being cultivated here as a medicinal plant, it has for some time become naturalized to this country, where it is usually found in corn-fields, the sides of roads, and about dunghills. Every part of the plant, when fresh, has a very offensive odour, but, upon being dried, the seeds have a tolerable grateful smell, and their taste is moderately warm and slightly pungent. They give out their virtue to-tally to rectified spirit, but only partially to water. In distillation with water, they yield a small quantity of a yellowish essential oil, which smells strongly and pretty agreeably of the coriander.

Dioscorides asserts, that the seeds, when taken in a considerable quantity, produce deleterious effects; and, in some parts of Spain and Egypt, where the fresh herb is eaten as a cordial, instances of faturty, lethargy, &c. are observed to occur very frequently; but these qualities seem to have been unjustly ascribed to the coriander; and Dr. Withcring informs us, that he has known six drachms of the seeds taken at once, without any remarkable effect. These seeds, and indeed most of those of the umbelliferous plants, possess a stomachic and carminative power. They are directed in the infusum amarum, the infusum scnux tartarizatum, and some other compositions of the pharmacopæias; and, according to Dr. Cullen, the principal use of these seeds is, "that infused along with senna, they more powerfully correct the odour and taste of this than any other aromatic that I have employed, and are, I believe, equally powerful in obviating the griping that senna is very ready to pro-

duce."

Corian putty sativum. The systematic name of the plant called coriandrum in the pharmacopæiss. See Coruandrum.

Coulanon. See Coriandrum.

Coms. (From xago, to cleave, or cut; so called because it was said to heal wounds.) The herb hypericum.

Conis LUTEA. Coris legitima cretica. The hypericum saxatile, or bastard St. John's wort.

Coris Monspellensis. This plant is intensely bitter and nauseous, but apparently an active medicine, and employed, it is said, with success in syphilis.

CORK. The bark of the Quercus ruber of Limans, formerly employed as an astringent, but now disused. It affords an

acid.

CORN. Clavus. A hardened portion of cuticle, produced by pressure: so called because a piece can be picked out like a corn o' barley. Corns are sometimes connected with the periosteum.

Cornactini pulvis. Scammony, anti-

mony, and cream of tartar.

CORNEA OPACA. The sclerotic membrane of the eye is so called, because it is of a horny consistence and opake. See Sclerotic membrane.

CORNEA TRANSPARENS. Sclerotica ceratoides. The transparent portion of the sclerotic membrane, through which the rays of light pass, is so called, to distinguish it from that which is opake. See Sclerotic membrane.

CORNESTA. A chemical retort.

Cornflower. See Cyanus.

CORNICULA. (From cornu, a horn.) A cupping instrument, made of horn.

Connicularis. (From cornu, a horn.) Shaped like a horn; the coracoid process.

CORN-SALLAR. This is the Valeriana locusta of Linnaus. It is cultivated in our gardens, and eaten amongst the early sallads. It is a very wholesome succulent plant, possessing anti-scorbutic and gently aperient virtues.

CORNU AMMONIS. Cornu, arietis. When the pes hippocampi of the human brain is cut transversely through, the cortical substance is so disposed as to resemble a ram's horn. This is the true cornu ammonis, though the name is often applied to the pes hippocampi.

CORNU ARIETIS. See Cornu ammo-

CORNU. Cornu cervi. Hartshorn. The horns of several species of stag, as the cervus alces, cervus dama, cervus elaphus, and cervus turanda, are used medicinally. Boiled, they impart to the water a nutritious jelly, which is frequently served at table. Hartshorn jelly is made thus:—Boil half a pound of the shavings of hart's-horn, in six punts of water, to a quart; to the strained liquor add one ounce of the juice of lenon, or of Seville orange, four ounces of mountain winc, and half a pound of sugar; then boil the whole to a proper consistence. The chief use of the horns is for calcination, and to afford the liquor volatilis cornu

CORNU CERVI CALCINATUM. See Cornu

cervi and carbenate of ammonia.

CORNU USTUM. Burnt hartshorn shavings possess absorbent, antacid, and adstringent properties, and are given in form of decoc-

tion, as a common drink in diarrheas, py-

CORNUA. Warts. Horny excrescences, which mostly form on the joints of the toes. Similar diseased productions have been known to arise on the head, and other

Cornua uteri. Plectene. In comparative anatomy, the horns of the womb; the womb being in some animals triangular, and its angles resembling horns.

CORNUMUSA. A retort.
CORNUS. 1. The name of a genus of plants in the Linuxan system. Class, Tetrandria. Order, Monogynia.

2. The pharmocopæial name of the cornel tree. Cornus sanguinea of Linnaus. The fruit is moderately cooling and astringent.

CORNUTA. (From cornu; from its re-

sembrance to a horn.) A retort.
Corona ciliaris. The ciliar ligament. CORONA GLANDIS. The margin of

the glans penis.

CORONA IMPERIALIS. A name for crownimperial. The Turks use this plant as an emetic. The whole plant is considered poisonous.

CORONA REGIA. The melilotus.

CORONA SOLIS. Sun-flower. Called also chimalati. The Helianthus annuas of Linnæus. It has been noticed as heating, and an agreeable food. The seeds are made into bread.

CORONA VENERIS. Venereal blotches on

the forehead are so termed.

CORONAL SUTURE. (From corona, a crown, or garland; so named because the ancients wore their garlands in its direction.) Sutura coronalis. Sutura arcualis. suture of the head, that extends from one temple across to the other, uniting the two parietal bones with the frontal.

CORONAHIUS STOMACHICUS. Part of the

eighth pair of nerves.

CORONARY VESSELS. Vasa coronaria. The arteries and veins of the heart and stomach. The term coronary is here given from corona, a crown, surrounding any part in the manner of a crown.

CORONARY LIGAMENTS. corona, a crown.) Ligaments uniting the radius and ulna. The term ligamentum coronarium is also applied to a ligament of

the liver.

CORONE. (Kegorn, a crow; so named from its supposed likeness to a crow's bill.) The acute process of the lower jaw bone.

CORONOID. (Coronoideus; from negaof bones are so called, that have any re-semblance to a crow's beak, as coronoides apophysis ulnæ, coronoides apophysis maxillæ.

Conontres. (From negarn, a carrion crow, and reve, foot; the plant being said to resemble a crow's foot.) Coronopodium. Cornu. Cervinum. Stella terræ. Plantago. Buck's-horn plantain. The Plantago coronopus of Linnæus. Its medical victues are the same as those of the other plan-

CORPORA ALBICANTIA. albicantia Willisii.

CORPORA CAVERNOSA CLÍTORI. Two hollow crura, forming the clitoris.

CORPORA CAVERNOSA PENIS. Two spongy bodies that arise, one from each ascending portion of the ischium, and form the whole bulk of the penis above the urethra, and terminate obtusely behind its glans. See Penis.

CORPORA FIMBRIATA. The flattened terminations of the posterior crura of the fornix of the brain, which turn round into the inferior cavity of the lateral ventricle, and end in the pedes hippocampi.

CORPORA LOBOSA. Part of the cortical

part of the kidney.

CORPORA NERVEO-SPONGIOSA. The cor-

pora cavernosa penis.

Corpora NERVOSA. The corpora cavernosa clitoridis.

OLIVARIA. CORPORA The two external prominences of the medulla oblongata, that are shaped somewhat like an

CORPORA PYRAMIDALIA. Two internal prominences of the medulla oblongata, which are more of a pyramidal shape than the former.

CORPORA QUADRIGEMINA.

Tubercula quadrigemina.

CORPORA STRIATA. So named from their appearance. See Cerebrum.

CORPUS ANNULARE A synonym of

pons Varolii. See Pons Varolii.
CORPUS. The body. Many parts and substances are also distinguished by this name: as corpus callosum, corpus luteum, &c. See also Body.

CORPUS CALLOSUM. Commissura magna cerebri. The white medullary part joining the two hemispheres of the brain, and coming into view under the falx of the dura mater when the hemispheres are drawn from each other. On the surface of the corpus callosum two lines are conspicuous, called the raphe.

CORPUS GLANDULOSUM. The prostrate

gland.

CORPUS LUTEUM. The granulous papilla which is found in that part of the ovarium of females, from whence an ovum had proceeded; hence their presence determines that the female has been impregnated; and the number of the corpora lutea corresponds with the number of impreg-It is, however, asserted by a nations. modern writer, that corpora lutea have been detected in young virgins, where no impregnations could possibly have taken place.

Corpus Mucosum. See Rete mucosum.

CORPUS PAMPINIFORME. (Pampiniformis; from pumpinus, a tendril, and forma, likeness, resembling a tendril.) Corpus pyramidale. Applied to the spermatic chord, and thoracic duct; also to the plexus of veins surrounding the spermatic artery in the cavity of the abdomen.

Conpes RETICULARE. See Rete muco-

CORPUS SESAMOIDEUM. A little prominence at the entry of the pulmonary

CORPUS SPONGIOSUM URETHRÆ. Substantia spongiosa urethræ. This substance origispongiosum penis. nates before the prostate gland, surrounds the methra and forms the bulb; then proceeds to the end of the corpora cavernosa, and terminates in the glans penis, which it

The spermatic Corpus VARICOGUM.

chord.

Conrago. (From cor, the heart; it being supposed to have a good effect in comforting the heart.) See Borago.

(From neiga, to shave.) The That part of the jaws where the temples. beard grows, and which is used to shave.

CORROBORANTS. (Corroborantia, sc. medicamenta.) Medicines, or whatever gives strength to the body, as bark, wine, beef, cold bath, &c. &c. See Tomes.

Corrosive sublimate. See Oxymurias hy-

drargyri.

CORROSIVES. (Corrosiva, sc. medicamenta; from corrodo, to eat away.) See Escharotics

CORRUGATOR SUPERCILII. (From corrugo, to wrinkle.) Musculus supercilii of Winslow. Musculus frontalis verus, seu corrugator coiterii of Douglas, and Cutaneo sourcillier of Dumas. A small muscle situated on the forehead. When one muscle acts, it is drawn towards the other, and projects over the inner canthus of the eye. When both muscles act, they pull down the skin of the forehead and make it wrinkle, particularly between the eye-

CORTEX. This term is generally, though improperly, given to the Peruvian bark. It

apriles to any rind or bark

CORTEX ANGELINE. The bark of a tree growing in Grenada. A decoction of it is recommended as a vermifuge. It excites tormina, similar to jalap, and operates by

CORTEX ANGUSTURÆ. See Angus-

tura cortex.

CORTEX ANTISCORBUTICUS. The canella zel-tree. alba.

CORTEX AROMATICUS. The canella alba. CORTEX BELA-AVE. See Bela-aye cortex.

CARDINALIS DE LUGO.

Cardinal Lugo had testimonials of above a thousand cures performed by it in the year

CONTEX CEREBRI. The cortical substance of the brain.

CORTEX CHINÆ REGIUS. See Cinchona.

CORTEX CHINÆ SURINAMENSIS. This bark is remarkably bitter, and preferable to the other species in intermittent fevers.

CORTEX CHINCHINA. See Cinchona.

CORTEX ELUTHERIA. See Cascarilla cor-

CORTEX GEOFFROY JAMAICENSIS. Bulge-water-tree bark. The bark of the Geoffroya Jamaicensis; inermis foliolis lanceolutis, of Swartz. It is principally used in Jamaica, and with great success, as a vermifuge.

CORTEX LAVOLA. The bark bearing this name is supposed to be the produce of the tree which affords the anisum stellatum. Its

virtues are similar.

CORTEX MAGELLANICUS. See Winteranus cortex

CORTEX MASSOY. The produce of New Gumes, where it is beaten into a pultaceous mass with water, and rubbed upon the abdomen to allay tormina of the bowels. It partakes of the smell and flavour of cinna-

CORTEX PATRUM. The Peruvian bark. CORTEX PERUVIANUS. See Cinchona.

CORTEX PERUVIANUS FLAVUS. See Cin-

CORTEX PERUVIANUS RUBER. chona.

CORTEX POCCERFBÆ. This bark is sent from America; and is said to be serviceable in diarrhoas, dysenteries, and hepatic

CORTEX QUASSIÆ. See Quassia.

CORTEX WINTERANUS. See Winteranus cortex

CORTICAL. Cineritious substance. The external substance of the brain is of a darker colour than the internal, and surrounds the medullary substance, as the bark does the tree; hence it is termed cortical. also Kidney.

CORTUSA. The plant self-heal; bear's ear; sanicle. It is expectorant.

CORU CANARICA. A quincc-like tree of Malabar; it is antydysenteric.

CORYLUS. (Derivation uncertain; according to some, from ragua, a walnut.) 1. The name of a genus of plants in the Class, Monacia. Linnæan system.

der, Polyandria.

2. The pharmacopoial name of the ha-The nuts of this tree are much eaten in this country; they are hard of digestion, and often pass the bowels very little altered; if, however, they are well CORTEX CANELLE MALABRICE. An oil is also obtained from the wood of this The tree, Corylus aveilana of Linnaus:-sti-Peruvian bank was so called, because the pulis ovatis, obtusis, which is efficacions

against the tooth-ach, and is said to kill

CORYLUS AVELLANA. The hazel-nut tree. See Corylus.

CORYPHE. (Koguon.) The vertex of the head. The inner parts of the nails.

CORYZA. (Coryza, πορυζα: from παρα, the head, and ξεω, to boil.) An increased discharge of mucus from the nose. See Catarrh.

CORYZA CATARRHALIS. A catarrh from cold.

A catarrh with CORYZA FEBRICOSA. fever.

CORYZA PHLEGMATORRHAGIA. tarrh, with much discharge of mucus.

CORYZA PURULENTA. A catarrh, with discharge of matter.

CORYZA VARIOLOSA. A catarrh accompanying small-pox.

CORYZA VIRULENTA. A catarrh, with discharge of acrid mucus.

Cosculia. The grains of kermes.

COSMETIC. A term applied to remedies against blotches and freckles.

Cosmos. Rythmus. A regular series. In Hippocrates it is the order and series of critical days.

Cossis. Cossi. A worm that breeds in wood; also a little tubercle in the face, like the head of a worm.

Cossum. A malignant ulcer of the nose

mentioned by Paracelsus.

(A custodiendo; because the ribs surround and defend the vital parts.) A rib. The ribs are four-and-twenty in number, twelve on each side of the thorax. See Ribs.

COSTA PULMONARIA. Costa herba. name of the herb hawkweed.

(From costa, a rib, Costo-Hyoldeus. and hyoideus, belonging to the hyoidal bone.) A muscle so named from its origin and insertion. See Omo-hyoideus.

COSTUS. (From kasta, Arabian.) The name of a genus of plants in the Linnæan system. Class, Monandria. Order, Mono-

gynia.

Costus amanus. See Costus arabicus.

COSTUS ARABICUS. Costus indicus, ama-Sweet and bitter rus, dulcis, orientalis. costus. The root of this tree, Costus arabicus of Linnæus, possesses bitter and aromatic virtues, and is considered as a good stomachic. Formerly there were two other species, the bitter and sweet, distinguished for use. At present, the Arabic only is known, and that is seldom employed. It is, however, said to be stomachic, diaphoretic, and diuretic.

Costus conticosus. The canella alba. Costus hortorum minor. The agera-

COSTUS NIGRA. The artichoke.

COSTYLE. (KOTUAN, the name of an old measure.) The socket of the hip-hone.

COTARONIUM. A word coined by Paracelsus, implying a liquor into which all bodies, and even their elements, may be dissolved.

Coris. (From north, the head.) The back part of the head; sometimes the hol-

low of the neck.

COTULA FETIBA. (Cotula, dim. of cos, a whetstone, from the resemblance of its leaves to a whetstone; or from zolan, a hollow.) Chamamelum fatidum. Mayweed. Stinking camomile This plant, Anthemis cotula of Linnaus:-receptaculis conicis, paleis sataceis, seminibus nudis, has a very disagreeable smell; the leaves, a strong, acrid, bitterish taste; the flowers, however, are almost insipid. It is said to have been useful in hysterical affections, but is very seldom employed.

COTYLOID CAVITY. (Cotyloides; from 2070An, the name of an old measure, and 260c, resemblance.) The acetabulum.

See innominatum os.

COUCHING. See Cotyloid cavity. consists in removing the opaque lens out of the axis of vision, by means of a needle, constructed for the purpose. There are two couching needles, which now seem to be preferred to all others; the one used by Mr. Hey, and that employed by Professor

Couch-grass. See Gramen caninum.

COUGH. Tussis. A sonorous concussion of the thorax, produced by the sudden expulsion of the inspired air.

Coum. The meadow-saffron...

COUNTER-OPENING. Contra-apertura. An opening made in any part of an abscess opposite to one already in it. is often done in order to afford a readier egress to the collected pus.

Coup de soleil. An erysipelas from a

scorching sun.

COURAP. (Indian.) A distemper very common in Java, and other parts of the East-Indies, where there is a perpetual itching and discharge of matter. It is a herpes on the axilla, groins, breast, and face.

COURBARIL. The tree which produces

the gum anime. See Anime.

Counon DI. An evergreen tree of India, said to be antidysenteric.

Couror Moelli. A shrub of India, said to be antivenomous.

Couscos. An African food, much used about the river Senegal. It is a composition of the flower of millet, with some flesh, and what is there called lalo.

Cowhage. See Dolichos. Cow-itch. See Dolichos.

COWPER'S GLANDS. (Corvperi glandulæ; named from Cowper, who first described them.) Three large muciparous glands of the male, two of which are situated before the prostate gland under the accelerator muscles of the mme, and the third more forward, before the bulb of the arethra. They excrete a fluid, similar to that of the prostate gland, during the venereal orgasm.

COWPERI GLANDULE. See Comper's

glunds.

COVOLAM. The Crateva nurmelos of Linneus, whose feuit is astringent whilst numpe, but when ripe, of a delicious taste. The bark of the tree strengthens the stomach, and relieves hypochondriac languors.

COXA. The ischium is sometimes so called, and sometimes the os coccygis.

COXENDIX. (From coxa, the hip.) The ischium; the hip-joint.

CRABLOUSE. A species of pediculus which infests the axilia and pudenda.

CRAB-YAWS. A name in Jamaica for a kind of ulcer on the soles of the feet, with callous lips, so hard that it is difficult to cut them.

CRAMBE. (KgzµCn, the name given by Dioscorides, Galen, and others, to the cabbage; the derivation is uncertain.) The name of a genus of plants in the Linnæan system. Class, Tetradynamia. Order, Silviculosa. Cabbag.

CRAMBE MARITIMA. The systematic name for the sea-coal. See Sea-coal.

CRAMP. (From krempen, to contract. Germ.) A spasin of a muscle or muscles.

Cranesbill, bloody: See Geranium san-

gumum

CRANIUM. (Κεανιον, quasi καςανιον; from καςα, the head.) The scull, or superior part of the head. (See Caput.

CHANTERES. (From Egano, to perform.) A name given to the sapientia dentes and molares, from their office of masticating the food.

CRAPULA. (Kpaistuna.) A surfeit;

drunkenness.

CRASIS. (From resprepsion, to mix.) Mixture. A term applied to the humours of the body, when there is such an admixture of their principles as to constitute a healthy state: hence, in dropsies, senry, &c. the crasis, or healthy mixture of the principles of the blood, is destroyed.

Chastenon (Kgacrador, the hem of a garment; from kgsazar, to hang down) A relaxation of the uvula, when it hangs down in a thin, tong membrane, like the hem of a garment.

CRASSAMENTUM. (From crassus,

thick ) Se. Blood.

Chas that (From crassus, thick: so nam d from the thickness of its leaves.)
See Faba crassa.

CRATEGUS. (From \*gallot, strength: so called from the strength and hardness of its wood.) The wild service-tree, whose virtues are astringent.

GRATICULA. (From crates, a hurdle.)

The bars or grate which covers the ashhole in a chymical furnace.

Cream of turtar. See Supertartras po-

Cream of turtar. See Supertartras po-

CREMASTER. (From regiment, to suspend.) A muscle of the teacte, by which it is suspended, and drawn up and compressed, in the act of c tion. It arises from Poupard's figament, passes over the spermatic cord, and is lost in the certuar membrane of the scrotum, covering the testicles.

CREANUS. (From xg µres, a precipice, or shelving plac.) The lips of an ulcer is so called. At a Le lanum pudendi.

CREMOR. C eam. Any substance floating on the top, and skimmed off.

CREPITUS. (From crepo, to make a noise.) A puff or note noise: the cracking made by the joints when there is a defect of synovia.

CREPITUS LUPI. See Bovista.

Cress water. See Masturtium aquaticum. CRE: A PREPARATA. Prepared chalk is a carbonate of lime, and possesses antacid qualities: it is exhibited in form of electinary, maxture, or bolus, in pyrosis, cardialgia, acidities of the prima via, rhachitis, crusta lactea, &c. and is an antidote against white arsenic. See Carbonas calcus.

Cretaceous acid. See Carbonic acid.

Crete, dittany of See Dictamnus creticus. CRIBRIFORMIS. (From cribrum, a sieve, and forma, likeness; because it is perforated like a sieve.) See Ethmoid bone.

CITICO. Names compounded of this word belong to muscles which are attached

to the cricoid cartilage.

CRICO-ARYTÆNOIDEUS LATERA-LIS. Crico lateri-arithenoidien of Dumas-A nuscie of the glottis, that opens the rima by pulling the ligaments from each other.

CRICO ARYTÆNOIDEUS POSTICUS. Crico creti arithenoidien of Dumas. A muscle of the glottis, that opens the rima glottidis a little, and by pulling back the arytænoid cartilage, stretches the ligament so as to make it tense.

CHICO-PHARYNGEUS. See Constrictor pha-

ryngis inferior.

GRICO-THYROIDEUS. Crico-thyroidien of Dumas. The last of the second layer of muscles between the os hyoides and trunk, that pulls forwards and depresses the throid cartilage, or elevates and draws backwards the cricoid cartilage.

CRICOIDES. (From x2120c, a ring, and stock, resemblance.) A round ring like cartilage of the larynx is called the cricoid.

See Larynx.

term applied to urine, which deposits a sediment like bran.

CRINATUS. (From noner, the lily ) A term

given to a suffumigation mentioned by P. Egineta, composed chiefly of the roots of

CRINIS. The hair, Sec Capillus.

CRINOMERON. (From upivor, a lily, and An ointment composed Mupor, ointment.)

chiefly of lilies.

(From crinis, the hair.) CRINODES Comedones. Collections of a sebaccous fluid in the cutaneous follicles upon the face and breast, which appear like black spots, and when pressed out, look like small worms, or, as they are commonly called, maggots.

CRIGGENES. An epithet for certain troches, incutioned by P. Ægineta, and which he commends for cleansing sordid

ulcers.

CRIPSORCHIS. (From upunla, to conceal, and opxis, a testicle.) Having the testicle concealed, or which is not yet descended

into the scrotum.

CRISIS. (From upwa, to judge.) The dgmen. The sudden change of sympjudgmen. toms in acute diseases, from which the recovery or death is prognosticated judged of.

CRISPATURA. (From crispo, to curl ) spasmodic contraction, or curling of the

membranes and fibres.

(Quasi cerista; from uspac, a horn, or carista: from napa, the head, as being on the top of the head.) Any thing which has the appearance of a crest or comb upon the head of a cock, as crista Also a tubercle clitoridis, the nympha. about the anus; so called from its form.

CRISTA GALLI. An eminence of the ethinoid bonc, so called from its resem-Sec Ethmoid blance to a cock's comb.

CRITHAMUM. See Crithmum.

(From κρινω, to judge.) CRITHERION.

The same as crisis.

(Kpibn.) Barley. A stye or CRITHE. tumour on the evelid, in the shape and of

the size of a barley-corn.

CRITIMUM. (From κρινω, to secrete; so named from its supposed virtues in promoting a discharge of the urine and menses.) Samphire, or sea-fennel.

(From κριθη, barley, and CRITHODES. edos, resemblance.) Resembling a barleycorn. It is applied to small protuber-

CRITICAL. Determining the event of a disease. Many physicians have been of opinion, that there is something in the nature of fevers which generally determines them to be of a certain duration; and, therefore, that their terminations, whether salutary or fatal, happen at certain periods of the disease, rather than at others. periods, which were carefully marked by Hippocrates, are called critical days. The critical days, or those on which we suppose the termination of continued fevers especi-

ally to happen, are the third, fifth, seventh, ninth, eleventh, fourteenth, seventeenth, and twentieth

CROCIDIXIS. (From uponidiza, to gather wool.) Flocilatio. A fatal symptom in some diseases, where the patient gathers up the bed-clothes, and seems to pick up substances from them.

CROCINUM. (From uponos, saffron.) Oil of saffron, or a mixture of oil, myrrh and

CROCODES. (From sposes, saffron; so called from the quantity of saffron they contain.) A name of some old troches.

CROCOMAGMA. (From uponos, saffron, and mayna, the thick oil or dregs.) A troch made of oil of saffron and spices.

CROCUS. (Kponos of Theophrastus.) The story of the young Crocus, turned into this flower, may be seen in the fourth book of Ovid's Metamorphoses. Some derive this name from uponin, or ugous, a thread; whence

the stamens of flowers are called ngonowies, Others, again, derive it from Coriscus, a city and mountain of Cilicia, and others from crokin. Chald.) Saffron.

1. The name of a genus of plants in the Linnaan system. Class, Triandria. Order,

Monogynia. Saffron.

2. The pharmacopæial name of the prepared stigmats of the Crocus sativus of Linnæus :- spatha univalvi radicali, corolli tubo longissimo. Saffron has a powerful, penetrating, diffusive smell, and a warm, pungent, bitterish taste. Many virtues were formerly attributed to this medicine, but little confidence is now placed in it. The Edinburgh College directs a tincture, and that of London a syrup of this drug.

3. A term given by the older chymists to several preparations of metallic substances, from their resemblance: thus, cro-

cus martis, crocus veneris.

CROCUS ANTIMONII. Crocus metallorum. This preparation is a sulphurated oxyd of antimony, and therefore called oxydum stibii sulphuretum in the new chymical nomenclature. It possesses emetic and drastic cathartic powers, producing a violent diaphoresis afterwards.

CROCUS GERMANICUS. See Carthamus.

CROCUS INDICUS. See Curcuma. Crocus Mantis. Green vitriol exposed

to fire till red. CROCUS METALLORUM. See Crocus anti-

monii.

CROCUS OFFICINALIS. See Crocus.

CROCUS SARACENICUS. See Carthumus.

Chocus SATIVUS. See Crocus.

Crocus veneris. Copper calcined to a red powder.

CROMMYON. (Пара то та кора; ришу, всcause it makes the eyes wink.) An onion.

CROMMYOXYREGMA. (From κρομμυον, an omion, and ogus, acid, and payvujui, to break out.) An acid eructation accompanied with a taste resembling onions.

CROTAPHICA ARTERIA. The tendon of the temporal muscle.

CHOTAPHITES. (Crotaphites, sc. musculus; from upolaque, the temple.) See Temporalis.

CROTAPHIUM. (From κρόλω, to pulsate; so named from the pulsation which in the temples is eminently discernible.) Crotaphos. Crotaphus. A pain in the temples.

CROTAPHOS See Crotaphium. CROTAPHUS. See Crotaphium.

CROTCHET. A curved instrument with a sharp hook to extract the fœtus.

CROTON. (From κρθέω, to beat.)
1. An insect called a tick, from the noise

it makes by beating its head against wood.

2 A name of the ricinus or castor-oil-

berry, from its likeness to a tick.
3. The name of a genus of plants in the Linnman system. Class, Monoecia. Order,

Monadelphia.

CROTON BENZOE. Gum-Benjamin was

formerly so called.

CROTON CASCARILLE. The systematic name of the plant which affords the Cascarilla bark. See Cascarilla.

Choron Lacciferum. The systematic name of the plant upon which gum-lac is deposited.

Choron Tiglium. The tree which affords the pavaua wood and tiglii seeds. See Lignum payaus, and Tiglia strang.

See Lignum pavauæ, and Tiglia grana.
CROTON TINCTORIUM. The systematic
name of the lacmus plant. See Bezetta

cærulea.

CROTONE. (From \*\*spolor\*), the tick.) A fungus on trees produced by an insect like a tick; and by metaphor applied to tumours and small fungous excrescences on the periosteum.

Croup. See Cynanche.

Chousis. (From κρεω, to beat, or pulsate.) Pulsation.

Chousmata. (From upue, to pulsate.) Rheums or defluxions from the head.

Crowfoot. See Ranunculus.

Crowfoot cranesbill. See Geranium batrachiones.

CRUCIAL. Some parts of the body are so called when they cross one another, as the cincial ligaments of the thigh.

Cuttalis, Cross-like. Mugweed or

CRUCIBLE. (Crucibulum from crucio, to tornent; so named, because, in the language of old chymists, metals are tornented in it, and tortured, to yield up their powers and virtues.) A chemical vessel made mostly of earth to bear the greatest heat. They are of various shapes and composition.

Chuditas. (From crudus, raw.) It is applied to undigested substances in the stomach and humours in the body unpre-

pared for concoction.

CRUNION. (From upuroc, a torrent.) A

The tendon of medicine mentioned by Ætius, and named from the violence of its operation as a phites, sc. mus-

CRUOR. The red part of the blood. See Blood.

CRURA. The plural of crus, a leg or root; applied to some parts of the body, from their resemblance to a leg or root: thus, crura cerebri, crura cerebelli, the crura of the diaphregm, &c. &c.

CHURA CLITORIDIS. See Clitoris.

CRURA MEDULLE OBLONGATE. The roots

of the medulla oblongata.

CRURÆUS (From crus, a leg; so named, because it covers almost the whole foreside of the upper part of the leg, or thigh.) Cruralis. A muscle of the leg, situated on the forepart of the thigh. It arises, fleshy, from between the two trochanters of the os femoris, but nearer the lesser, firmly adhering to most of the forepart of the os femoris; and is inserted, tendinous, into the upper part of the patella, behind the rectus. Its use is to assist the vasti and rectus muscles in the extension of the leg.

CRURAL. Belonging to the crus, leg,

or lower extremity.

CRURAL HERNIA. Femoral hernia; A tumour under the groin, and in the upper part of the thigh, arising from a protusion of part of an abdominal viscus under Poupart's ligament. See Hernia cruralis.

. CRUNALIS. See Cruraus.

CRUETA. A shell; a scab; the scum or surface of a fluid.

CRUSTA LACTEA. A disease that mostly attacks some part of the face of infants at the breast. It is known by an eruption of broad pustules, fuil of a glutinous liquor, which form white scabs when they are ruptured. It is cured by mineral alteratives.

CRUSTA VILLOSA. The inner coat of the stomach and intestines has been so called.

CRUSTULA. (Dim. of crusta, a shell.) An ecchymosis or discoloration of the flesh from a bruise, where the skin is entire and covers it over like a shell.

CRUSTUMINATUM. (From Crustuminum, a town where they grew.)

1. A kind of Catherine pear.

2. A rob or electuary made of this pear and apples boiled up with honey.

Chymones, (From 2005, cold.) An epithet for a fever, wherein the external parts are cold.

CRYPSORCHIS. (From  $xpx\pi^2a$ , to conceal, and  $q\chi x_0$ , a testicle.) When the testicles are hid in the belly, or have not descended into the scrotum.

into the scrotum.

CRYPTÆ. (From \*gy=\tau\_w, to hide.) The little rounded appearances at the end of the small arteries of the cortical substance of the kidneys, that appear as if formed by

the artery being convoluted upon itself.

CUB CUC

CRYPTOPYICA ISCHURIA. A suppression of urine from a retraction of the penis within the body.

CRYSORCHIS. (Kousopysic.) A retraction or retrocession of one of the testicles, the

same as crypsorchis.

CRYSTALLI. Eruptions about the size of a lupine, white and transparent, which sometimes break out ail over the body. They are also called *Crystalline*, and by the Italians Taroli. They are probably

the pemphigus of modern writers.

CRYSTALLINE LENS. (Lens crystallina-crystallina, from its crystal-like appearance.) A lentiform pellucid part of the eve, enclosed in a membranous capsule, called the capsule of the crystalline I ns, and situated in a peculiar depression in the anterior part of the vitreous humour. Its use is to transmit and refract the focus of the rays of light to the vitreous humour.

CRYSTALLINUM. (From upusannos, a chrystal, so called from its transparency.)

White arsenic.

CRYSTALLIZATION. (From cristal. lus, a chrystal.) Crystallizatio, A property by which crystallizable bodies tend to assume a regular form, when placed in circumstances favourable to that particular disposition of their particles. Almost all minerals possess this property, but it is most eminent in saline substances. The circumstances which are favourable to the crystallization of salts, and without which it cannot take place, are two. 1. Their particles must be divided and separated by a fluid, in order that the corresponding faces of those particles may meet and unite. 2. In order that this union may take place, the fluid which separates the integrant parts of the salt must be gradually carried off, so that it may no longer divide them.

CRYSTALLUS. (From upuss, cold, and seλλω, to contract: i. e. contracted by cold into ice.) Chrystal. The ancients supposed that chrystals were water intensely frozen. It also means an eruption over the body of white transparent pustules. See Crys-

CTEDONES. (From xlvday, a rake.) The fibres are so called from their pectinated course.

CTEIS. (KTus.) A comb or rake. Ctenes, in the plural number, implies those teeth which are called incisores, from their likeness to a rake.

CUBEBR. (From cubabah, Arab ) Piper candatum. Cumamus. Cubebs, The dried berries of the Piper cubeba of Linnaus:foliis oblique ovatis, sen oblongis venosis acutis, spica solitaria pedunculata oppositifolio, fructibus pedicellatis. They are of an ashbrown colour, generally wrinkled, and resembling pepper, but furnished each with a slender stalk. They are a warm spice, of a

taste; imported from Java; and may be exhibited in all cases where warm spicy medicines are indicated, but they are inferior to pepper.

Cubebs. See Cubea.

CURITAL ARTERY. Arteria cubitalis. Arteria ulnaris. A branch of the brachial that proceeds in the fore-arm, and gives off the recurrent and inter-osseals, and forms the palmary arch, from which arise branches going to the fingers, called digi-

CUBITAL NERVE. Nervus cubitalis. Nerwas ulnaris. It arises from the brachial plexus, and proceeds along the ulna.

CUBITALIS MUSCULUS. An extensor mus-

cle of the fingers.

CUBITÆUS EXTERNUS. An extensor muscle of the fingers. CUBITÆUS INTERNUS. A flexor muscle

of the fingers.

CUBITI PROFUNDA VENA. A vein of the

CUBITUS. (From cubo, to he down; because the ancients used to lie down on that part at their meals.) The fore-arm, or that part between the bend of the arm, including the elbow and wrist.

CUBOIDES OS. (From nuclos, a cube or die, and usos, likeness.) A tarsal bone of the foot, so called from its resemblance.

Euckow flower. See Cardamine.

CUCULLARIS. (Cucullaris sc. musculus; from cucullus, a hood: so named, because it is shaped like a hood.) See Trapezius.

Cucullus. A hood. An odoriferous

cap for the head.

Cucumber. See Cucumis. Cucumber, bitter. See Colocynthis. Cucumber, squirting. See Cucumis agres-

Cucumber, wild. See Cucumus agreetis. CUCUMIS. (Quasi curvimeres, from their curvature. The cucumber. 1. The name of a genus of plants in the

Linnæan system. Class, Monoecia. Order,

Syngenesia. The cucumber.

2. The pharmacopoial name of the garden cucumber, Cucumis sativus of Linnæns:-foliorum angulis rectis; pomis oblongis scubris. It is cooling and aperient, but very apt to disagree with bilious stomachs. It should always be eaten with pepper and oil. The seeds were formerly used medicinally.

CUCUMIS AGRESTIS. Cucumis asini-Cucumis sylvestris. Elaterium officinarum. Boubalios. Guarerba orba. Wild or squirting cucumber. Momordica elaterium of Linnæus :- pomis hispidus cirrhis nullis. The dried juice of this plant is the elaterium of the shops. It has neither smell nor taste, and is the most powerful cathartic in the whole materia medica. Its efficacy in dropsies is said to be considerable; it, pleasant smell, and moderately pungent however, requires great caution in the exhibition. From the eighth to the half of a gram should be given at first, and repeated at proper intervals until it operates.

Cuccmis Asininus. See Cucumis agres-

CUCUMIS COLOCYNTHIS. The systematic name for the officinal bitter apple. See Colorynthis.

Cuccuis Melo. The systematic name of the meion plant. See Melo.

Ct. UMIS SATIVUS. The systematic name

of the cucumber plant. See Cucumis. CUCUMIS SYLVESTRIS. See Cucumis

agrestis. CUCUPHA. A hood. An odoriferous

cap for the head composed of aromatic drugs.

CUCURBITA. (A curvitate, according to Scaliger; the first syllable being dou-

bled, as in cacula, populus, &c)

1. The name of a genus of plants in the Linnæan system. Class, Monoecia. Order,

Syngenesia. The pumpion.

2. The pharmacopæial name of the common pumpion or gourd. The seeds of this plant, Cucurbita pepo; foliis lobatis, pomis levibus, are used indifferently with those of the Cucurbita lagenaria; folis subangulatis, tomentosis, basi subtus biglandulosis; pomis lignosis. They contain a large proportion of oil, which may be made into emutsions; but is superceded by that of sweet almonds.

S. A chymical distilling vessel shaped

like a gourd.

CUCURBITA CITRULLUS. The systematic name of the water-melon plant. See Citrul-

CUCCHBITA LAGENARIA. The systematic name of the bottle-gourd plant. See

UCURBITA PEPO» The systematic name of the common pumpion. See Cucurbita.

CUCURBITINUS. A species of worm, so called from its resemblance to the seed of the gourd. See Tania.

CUCURBITULA. (A diminitive of cucurbita, a gourd; so called from its shape.)

A cupping glass.

CUCURBITULA CRUENTA. A cupping glass with scarification to procure

CUCURBITULA CUM FERRO. cupping-glass with scarification to draw out blood.

CUCURBITULA SICCA. A cupping-

glass without scarification.

CUEMA. (From xue, to carry in the womb) The conception, or rather, as Hippocrates signifies by this word, when the complete rudiments of the fœtus are formed.

CULBICIO. A sort of stranguary, or

rather heat of urine.

Cullitlawan. Cor-CULILAWAN CORTEX. tex caryophylloides. The bark of the Laurus callilaran of Linneus:-folits tripli-

nerviis oppositis. It very much resembles ciunamon in appearance and properties.

CULINARY. (Culinarius, from culina, a kitchen.) Any thing belonging to the kitchen, as culinary salt, culinary herbs.

CULTER. (From colo, to cultivate.) A knife or shear. The third lobe of the liver is so called from its resemblance.

Culus. (From xxxos.) The anus or fundament.

CUMAMUS. See Cubebæ.

Cumin seeds. See Cuminum.

CUMINUM. (From xuw, to bring forth; because it was said to cure sterility.) minum. Fæniculum orientale.

1. The name of a genus of plants in the Linnæan system. Class, Heptandria. Or-

der, Digynia. The cumin plant.

2. The pharmacopoid name of the Cuminum cyminum of Linnæus. A native of Egypt and Ethiopia, but cultivated in Sicily and Malta, from whence it is brought to us. The seeds of cumin which are the only part of the plant in use, have a bitterish taste, accompanied with an aromatic flayour, but not agreeable. They are generally preferred to other seeds for external use in discussing indolent tumours, as the encysted scrophulous, &c. and give name both to a plaster and cataplasm in the pharm copæias.

CUMINUM ÆTHIOPICUM. A name for the

ammi verum.

CUMINUM CYMINUM. The systematic name of the cumin plant. See Cuminum.

CUNEALIS SUTURA. The suture by which the os sphenoides is joined to the os frontis.

CUNEIFORM. (Cuneiformis; from cuneus, a wedge, and forma, likeness.) Some parts of the body are so called, being shaped or fixed in, like a wedge : such are the sphænoid bone, and some bones of the wrist and tarsus.

CUNEOLUS. (From cuneo, to wedge.) A

crooked tent to put into a fistula.

CUPEL. (Kuppel, German.) Catellus cinereus. Cinertuim. Patella doci-mastica. Testa probatrix emploratrix, or domicastica. A chymical instrument, which suffers the baser metals to pass through it, when exposed to heat, and retains the pure metal. This process is termed cupellation.

CUPELLATION. (From kuppel, German.) The purifying of perfect metals by means of an addition of lead, which at a due heat becomes vitrified and promotes the vitrification and calcination of such imperfect metals as may be in the mixture, so that these last are carried off in the fusible glass that is formed, and the perfect metals are left nearly pure. The name of this operation is taken from the vessels made use of, which are called cupels.

Сирноs. (Кифоз.) Light, when applied to aliments, imports their being easily digested; when to distempers, that they are mild.

CUPRESSUS. (So called, and TE RULLY παρισσες τες ακρεμονας, because it produces equal branches.) Cypress.

1. The name of a genus of plants in the Linnzan system. Class, Monæcia. Order,

Monadelphia. The cypress-tree.

2. The pharmacopæial name of the Cupressus sempervirens of Linnaus :- foliis imbricatis squamis quadrangulis; cailed also cyparissus. Every part of the plant abounds with a bitter, aromatic, terebinthinate fluid; and is said to be the remedy against intermittents. Its wood is extremely durable, and constitutes the cases of Egyptian mummies.

The sys-CUPRESSUS SEMPERVIRENS. tematic name of the cupressus of the shops.

See Cupressus.

Aqua sap-CUPRI AMMONIATI AQUA. pharina. "Take of lime water, one pint; sal ammoniac, one drachm: let them stand together in a copper vessel until the ammonia is saturated."

CUPRI RUBIGO. Verdigris or rust of

CUPRUM. (Quasi æs Cyprium: so called from the island of Cyprus, whence it was formerly brought.) See Copper.

CUPRUM AMMONIACALE. Cuprum ammoniacum. Blue vitriot and prepared ammonia. An ammoniacal sulphat of cop-

CUPRUM VITRIOLATUM. See Sulphas

CURA AVENACEA. A decoction of oats and succory roots, in which a little nitre and sugar were dissolved, was formerly used in fevers, and was thus named.

CURCAS. The Barbadoes nut; a drastic

purge.

(From karkarah. Heb.) CURCULIO. The throat; the aspera arteria.

The large celandine; deob-CURCUM. struent.

CURCUMA. (From the Arabic curcum, or hercum.) Turmeric.

1. The name of a genus of plants in the Linnæan system. Class, Monandria. Order, Monogynia.

2. The pharmacopæial name of the turmeric-tree. Curcuma longa of Linnxus:foliis lanceolatis; nervis lateralibus numerossimis; called also, Crocus Indicus. Terra marita. Cannacorus radice croceo. Curcuma longa. Curcuma rotunda. Mayella. Kua kaha by the Indians. The Arabians call every root of a saffron colour by the name of curcim. The root of this plant is imported here in its dried state from the East Indies, in various forms. Externally it is of a pale yellow colour, wrinkled, solid, ponderous, and the inner substance of a deep saffron or gold colour: its odour is somewhat fragrant; to the taste it is bitterish, slightly acrid, exciting a moderate degree of warmth in the mouth, and on being chewed it tinges the saliva yellow. It is an ingredient in the composition of Curry powder, is valuable as a dyeing drug, and furnishes a chymical test of the presence of uncombined alkalies. It is now very seldom used medicinally, but retains a place in our pharmacopæias.

The turmeric plant. CURCUMA LONGA.

See Curcuma.

CURCUMA ROTUNDA, See Curcuma.

CURMI. (From negaw, to mix.) A drink made of bariey, according to Dioscorides.

Currants. See Ribes.

CURSUMA. Curtuma. The Ranunculus ficaria of Linnæus.

CURVATOR COCCUGIS. A muscle bending the coccyx.

(Corrupted from cassuta, ka-CURSUTA. The root of the Gentiana pursuth, Arah.) purea of Linnæus.

CUSCUTA. (According to Linnaus, a corruption from the Greek Karulas, or Ka-Solas, which is from the Arabic Chessuth, or Chasuth.) Dodder.

1. The name of a genus of plants in the Linnaan system. Class, Tetrandria. Or-

der, Digynia.

2. The pharmacopæial name of dodder

of thyme. See Epithymum. The systematic name of dodder of thyme. See Epithy-

CUSCUTA EUROPEA. The systematic name of a species of dodder of thyme. See Epithumum.

CUSPIDATUS. (From cuspis, a point.) See Teeth.

CUSPARIA. The general name given by Messrs. Humboldt and Boupland to the tree from which we obtain the Augustura bark. See Augustura.

Cuspis. (From caspa, Chald, a shell, or bone, with which spears were formerly pointed.) The glans penis was so called, from its likeness to the point of a spear. Also a bandage.

Custos oculis. An instrument to fix the

eye during an operation.

CUTAMBULI. (From cutis, the skin.) Cutaneous worms; scorbutic itching.

CUTANEUS MUSCULUS. The platysma myoides.

CUTANEOUS. (From cutis, the skin.)

Belonging to the skin.

CUTICLE. (Cuticula, dim. of cutis, the skin.) Epidermis. Scarf-skin. pellucid, insensible membrane, of a white colour, that covers and defends the true skin, with which it is connected by the hairs, exhaling and inhaling vessels, and the rete mucosum.

CUTIS. Derma, The true skin. thick, fibrous, vascular, and nervous membrane, that covers the whole external surface of the body, and is the situation of the organ of touch, exhalation, and inhalation.

CUTIS ANSERINA. (Anserina; from

unser, a goose.) The rough state the skin are directed by the London College to he is sometimes thrown into from the action of made into a mucilage, which is recommendcold, or other cause, in which it looks like the skin of the goose.

CUTIS VERA. The true skin under

CYANUS. (Kuaros, carulean, or sky-blue; so called from its colour.) Blue-bottle. Corn-flower. The flowers of this plant, Centaurea cyanus of Linnaus:-calycibus serratis; foliis linearibus, integerrimis, infimis dentatis, were formerly in frequent use; but their antiphlogistic, antispasmodic, cordial, aperient, diuretic, and other properties are now, with great propriety, forgotten.

CYAR. (From KEW, to pour out.) The lip of a vessel. The eye of a needle; and the orifice of the internal ear, from its likeness

to the eye of a needle.

Crasma. Spots on the skin of pregnant

CYATHISCUS. (From xualos, a cup.) The hollow part of a probe, formed in the shape of a small spoon, as an ear-picker.

CYBITOS. See Cubitus. CYHITUM. See Cubitus.

CYBITUS. Sec Cubitus.

CYNGIDES. See Cuboides.

CYCEUM. From xuxxw, to mix.) Cyceun. A mixture of the consistence of pap,

CYCIMA. (From KURZW, to mix.) So called from the mixture of the ore with lead, by which litharge is made.

CYCLAMEN. (From nunlos, circular; either on account of the round form of the leaves, or of the roots.) Cyclamen.

1 The name of a genus of plants in the Linnæan system. Class, Pentandria. Order, Monogynia.

2. The pharmacopæial name of the sow-

See Arthanita bread.

CYCLAMEN EUROPEUM. The systematic name of the sow-bread. See Arthanita.

CYCLISCUS. (From xuxxos, a circle.) An instrument in the form of a half moon, formerly used for scraping rotten bones.

CYCLISMUS. (From MUNAOS, a circle.)

CYCLOPHORIA. (From κυκλος, a circle, and φεζα, to bear.) The circulation of the blood, or other fluids.

CYCLOPION. (From KUKACO, to surround, and of, the eyc.) The white of the eye.

Crelos. A circle. Hippocrates uses this word to signify the cheeks, and the orbits of the cyes.

CYCLUS METASTNCRITTYUS. It is a long protracted course of remedies, persisted in with a view of restoring the particles of the health.

CYDONIUM MALUM. (From Cyclon, a town in Crete, where they grew.) The quince. The tree which affords this fruit is the Pyrus cydonia of Linnaus :- foliis integerrinus, foribus solituriis. Quince seeds seasons. It has been said, that it is most

ed in apthous affections, and excoriations of the mouth and fauces.

CYEMA. (From xuw, to bring forth ) Par-

CYLICHNIS. (From RULIE, a cup.) gallipot or vessel of any kind to hold medi-

CYLLOSIS. (From xuxxow, to make lame.) A tibia or leg bending outwards.

CYLINDRUS (From xx.ww, to roll round.) A cylinder. A tent for a wound, equal at

the top and bottom. CYLLUS. (From kullow, to make lame.) In Hippocrates, it is one affected with a kind of luxation, which bends outwards, and is hollowed inward. Such a defect in the tibia is called Cyllosis, and the person to whom it belongs is called, by the Latins, Varus, and is opposed to Valgus

CYMATORES. Is applied by Galen and some others to an unequal fluctuating

pulse.

(From number, hollow.) CYMBA. boat, or pinnace. A bone of the wrist is so called, from its supposed likeness to a skiff.

CYMINALIS. Gentian.

CYMINUM. See Cuminum.

CYNANCHE. (From num, a dog, and avxa, to suffocate, or strangle; so called from dogs being said to be subject to it.) Sore throat. A genus of disease in the class pyrexie, and order phlegmasie of Cullen. It is known by pain and redness of the throat, attended with a difficulty of swallowing and breathing. The species of this disease are-

1. Cynanche trachialis; called also cynanche laryngea. Suffocatio stridula angina perniciosa. Asthma infantum. Cynanche stridula. Morbus strangulatorius. rhus suffocatius Barbadensis. Angina polyposa sive membranacea. The croup. A disease that mostly attacks infants, who are suddenly seized with a difficulty of breathing and a crouping noise; it is an inflammation of the mucous membrane of the trichea, that induces the secretion of a very tenacious coagulable lymph, which lines the trachea and bronchia, and impedes respiration. The croup does not appear to be contagious, whatever some physicians may think to the contrary; but it sometimes prevails epidemically. It seems, however, peculiar to some families; and a child having once been attacked, is very liable to its returns. It is likewise pecu-liar to young children, and has never been body to such a state as is necessary to known to attack a person arrived at the age of puberty.

The application of cold seems to be the general cause which produces this disorucr. and therefore it occurs more frequently in the water and spring, than in the other prevalent near the sea coast; but it is frequently met with in inland situations, and particularly those which are marshy.

Some days previous to an attack of the disease, the child appears drowsy, inactive, and fretful; the cyes are somewhat suffused and heavy; and there is a cough, which, from the first, has a peculiar shrill sound; this, in the course of two days, becomes more violent and troublesome, and likewise more shrill. Every fit of coughing agitates the patient very much; the face is flushed and swelled, the eyes are pro uberant, a general tremor takes place, and there is a kind of convulsive endcavour to renew respiration at the close of each fit. As the disease advances, a constant difficulty of breathing prevails, accompanied with a welling and inflammation in the tonsits, uvula, and velum pendulum palati; and the head is thrown back, in the agony of attempting to escape suffoca-There is not only an unusual sound produced by the cough, (something between the yelping and barking of a dog.) but respiration is performed with a lussing noise, as if the trachea was closed up by some slight spongy substance. The cough is generally dry; but if any thing is spit up, it has either a purulent appearance, or seems to consist of films resembling portions of a membrane. Where great nausea and frequent retchings prevail, co-gulated matter of the same nature is brought up. With these symptoms, there is much thirst, and uneasy sense of heat over the whole body, a continual inclination to change from place to place, great restlessness, and frequency of the pulse.

In an odvanced stage of the disease, respiration becomes more stridulous, and is performed with still greater difficulty, being repeated at longer periods, and with greater exertions, until at last it ceases en-

tirely.

The croup generally proves fatal by suffocation, induced either by spasm affecting the glottis, or by a quantity of matter blocking up the bronchiæ; but when it terminates in health, it is hy a resolution of the inflammation, by a ceasing of the spasms, and by a free expectoration of the matter exuding from the trachea, or of the crusts formed there.

The discase has, in a few instances, terminated fatally within twenty-four hours after its attack; but it more usually happens, that where it proves fatal, it runs on to the fourth or fifth day. Where considerable portions of the membraneous films, formed on the surface of the trachea, are thrown up, life is sometimes protracted for a day or two longer than would otherwise have happened.

Dissections of children who have died of the croup ave always shewn a preternatural membrane, lining the whole internal

surface of the upper part of the traches, which may always be easily separated from the proper membrane. There is likewise usually found a good deal of muchs, with a mixture of pus, in the trachca and its ra-

2. Cynanche tonsillaris. The inflammatory quincy, called also angina inflammato-In this complaint the inflamination principally occupies the glands, such as the tonsils; but often extends through the whole mucous membrane of the fauces, so as essentially to interrupt the speech, respiration, and deglutition of the patient.

The causes which usually give rise to it are, exposure to cold, either from sudden vicissitudes of weather, from being placed in a partial current of air, wearing damp linen, sitting in wet rooms, or getting wet in the feet; all of which may give a sudden check to perspiration. It principally attacks those of a full and plethoric habit, and is chiefly confined to cold chmates, occurring usually in the spring and autumn; whereas the ulcerated sore throat chiefly attacks those of a weak irritable habit, and is most prevalent in warm climates. The former differs from the latter likewise in not being contagious. In many people their seems to be a particular tendency to this disease; as from every considerable application of cold it is readily induced.

An inflammatory sore throat discovers itself by a difficulty of swallowing and breathing, accompanied by a redness and tumour in one or both tonsils, dryness of the throat, foulness of the tongue, lancinating pains in the parts affected, a frequent but difficult excretion of mucus, and some small degree of fever. As the disease advances, the difficulty of swallowing and breathing becomes greater, the speech is very indistinct, the dryness of the throat and thirst mereuse, the tongue swells and is incrusted with a dark fur, and the pulse is full and frequent. In some cases, a few white sloughly spots are to be observed on the tonsils. If the inflammation proceeds to such a height as to put a total stop to respiration, the face will become livid, the pulse will sink, and the patient will quickly be destroyed.

The chief danger arising from this species of quincy is, the inflammation occupying both tonsils, and proceeding to such a degree as to prevent a sufficient quantity of nourishment for the support of nature from being taken, or its occasioning suffocation; but this seldom happens, and its usual termination is eather in resolution or suppuration. When proper steps are adopted, it will in general readily go off by the former.

Where the disease has proved fatal by suffocation, little more than a highly inflamed state of the parts affected, with som, murbid phenomena in the head, have

been observed on dissection.

3. Cynanche pharyngea. This species is so called when the pharynx is chiefly affected. Dr. Wilson, in his treatise on Febrile Diseases, includes in his definition of cynanche tonsillaris, that of cynanche pharyngea. These varieties of cynanche differ considerably when they are exquisitely formed. But the one is seldom present in any considerable degree without being attended with more or less of the other. Dr. Cullen declares, indeed, that he never saw a case of true cynanche pharyngea; that is, a case in which the inflammation was confined to the pharynx; it constantly spread in a greater or less degree to the tonsils and neighbouring parts. Besides the mode of treatment is, in almost every instance, the same in both cases. And if we admit the cynanche pharyngea to be a distinct variety, we must admit another, the cynanche æsoplingea; for the inflammation frequently attacks the æsophagus, and is sometimes even confined to it.

4. Cynanche paratidαa. The mumps A swelling under the jaw, extending over the neck; an inflammation of the parotid gland, rendering deglution difficult, declining the fourth day. Epidemie and

contagious.

5. Cynanche maligna. The malignant, putrid, or ulcerous sore throat. Called also cynanche gangrænosa. Agina ulcerosa. Febris epidemica cum angina ulcusculosa. Angina epilemica. Angina gangrænosa. Angina suffocativa. Angina maligna. This disease is readily to be distinguished from the inflammatory quincy, by the soreness and white speeks which appear in the fauces, together with the great debility of the system, and small fluttering pulse, which are not to be observed in the former. In the inflammatory sore throat there is always great difficulty of swallowing, a considerable degree of tumour, with a tendency in the parts affected to suppurate, and a hard, full pulse. Moreover in the former affection the disease is seated principally in the mucous membrane of the mouth and throat; whereas in the latter the inflammation chiefly occupies the glandular parts.

The putril sore throat often arises from a peculiar state of the atmosphere, and so becomes epidemical; making its attacks chiefly on children, and those of a weak relaxed habit. It is produced likewise by contagion, as it is found to run through a whole family, when it has once seized any person in it; and it proves often fatal, particularly to those in an infintile state.

It usually makes its attack with cold shiverings, anxiety, nausea, and vomiting, succeeded by heat and restlessness, debility and oppression at the chest. The face looks flushed, the eyes are red, and a stiffness is perceived in the neck, with a hoarseness of voice, and soreness in the throat; and, upon viewing the internal fauces, there appears a fiery redness in every part, with some slight degree of swelling in the tonsils, which, however, is by no means so great as to impede either respiration or deglutition.

The inflammation, after a short time, takes a peculiar termination; for, upon further inspection into the throat, a number of white specks, or sloughs, are to be observed on the tonsils and uvula, the breath is highly offensive, the tongue is covered with a thick brown fur, and the inside of the lips are beset with vesicles, containing an acrid matter, which, falling on the corners of the mouth and other parts, occasions execriations. With these symptoms there is likewise a coryza, which pours out a thin aerid matter, excoriating the nostrils. A purging often attends also, particularly in infants, and a thin aerid matter flows from the anus, excoriating this and the neighbouring parts.

From the first attack of the complaint, there is a considerable degree of fever, with a small, frequent and irregular pulse; and every evening there occurs a manifest exacerbation, and in the morning some slight remission, together with general loss of strength, and debility. In some cases the brain is affected with delirium, or coma.

About the second or third day, large patches of a searlet or fiery red colour, make their appearance about the face and neck, which, by degrees, become dispersed over every part of the body, even to the extremities of the fingers, which feel swelled and stiff. These eruptions, after continuing for about four days, then depart without producing any remission of the symptoms.

In bad cases, the sloughs corrode deeper and deeper, and spread throughout the whole of the alimentary tube, so as to terminate at last in gangrene; and the symptoms of irritation continuing to increase, together with a severe purging, the patient is at length cut off; which event happens usually before the seventh day, and in some

cases so early as on the third.

Where there is a great increase of the evening paroxysm of fever, with vast debility, irregularity in the pulse, much fetor of breath, and a livid appearance in the ulcers, with a purging, or hamorrhage, the disease will certainly terminate fatally but when the fever is moderate, and of a less putrid nature, and suffers a remission on the appearance of the efflorescence on the skin; and when this remission increases as it proceeds, together with a falling off of the cuticle in scales, it promises fair to terminate in a return of health.

From dissections it appears that, in this

disease, the fauces are inflamed, suppurated and gangrenous; and that the trachea and larynx are likewise in a state of inflammation, and lined with a viscid fetid matter. In many instances, the inflammatory affection extends to the lungs themselves. Large swellings of the lymphatic glands about the neck, occasioned by an absorption of the acrid matter poured out in the fauces, are now and then to be The same morbid appearances which are to be met with in putrid fever, present themselves in other parts of the

Common sore CYNANCHE PRUNELLA. throat.

CYNANCHE PURPURO-PAROTIDEA. A CYnanche maligna, or malignant sore throat. CYNANCHE STRIDULA. The croup. Cynanche.

CYNANCHE THYMICA. Sore throat from an enlargement of the thyroid gland.

CYNANCHE TONSILLARIS. See Cynanche. CYNANCHE TRACHEALIS. See Cynanche. CYNANCHE ULCEROSA. The malignant sore throat.

CYNANCHICA. (From EUVAY Xn, the quincy.) Medicines which relieve a quincy.

ČΥΝΑΝΤΕΠΟΡΙΑ. (From κυων, a dog, and ανθρωπος a man.) It is used by Bellini, De Morbis Capitis, to express a particular kind of melancholy, when men fancy themselves changed into dogs, and imitate their actions.

CYNARA SCOLYMUS. See Cinara.

CYNCHNIS. (Kuyxvis.) A vessel of any kind to hold medicines in.

CYNOCOCTANUM. (From xuva, a dog, and noslayor, the herb coctanum.) A species of aconitum, said to destroy dogs if they eat it.

CYNOCRAMBE. (From NUW, a dog, and κεμμών, cabbage; a herbe of the cabbage tribe, with which dogs are said to physic themselves.) Dog's mercury. Mercurialis perennis of Linnxus. A poisonous plant very common in our hedges. It produces vomiting and purging, and the person then

goes to sleep, from which he does not often awake

CYNOCYTISIS. (From KUWV, a dog, and и покоз, the cytisus; so named because it was said to cure the d stemper of dogs.)

The dog-rose. See Cynosbatus.

Cynopecros. (From κυων, a dog, and δατνω, to bite.) So Dioscorides calls a per-

son bit with a mad dog.

CYNODESMION. (From RUWY, a dog, and See, to bind; so named because in dogs it is very discernible and strong.) A ligature by which the prepuce is bound upon the glans. Sometimes it signifies the lower part of the prepuce.

(Kuvefortes: from nuw, a CYNODONTES. dog, and odes, a tooth.) The canine teeth.

CYNOGLOSSUM. (From NUWY, a dog, and γλωσσα, a tongue; so named from its supposed resemblance.) Hound's tongue.

1. The name of a genus of plants in the Linnæan system. Class, Pentandria. Or-

der, Monogynia.
2. The pharmacopæial name of the Lingua canina of some authors. Cynoglossum, officinale of Linnaus:-staminibus coralla brevioribus; foliis lato lanceolutis, tomentosis, sessilibus. It possesses narcotic powers, but is seldom employed medicinally. Acids are said to counteract the ill effects from an overdose more speedily than any thing else, after clearing the stomach.

CYNOGLOSSUM OFFICINALE. The systematic name for hound's tongue. See Cy-

noglassum

(From xuw, a dog, and CYNOLOPHUS. λόφος, a protuberance; so called because in dogs they are peculiarly eminent.) The asperities and prominences of the vertebra.

CYNOLYSSA. (From RUGY, a dog, and AUGON, madness.) Canine madness.

CYNOMORIUM. The name of a genus of plants in the Linnzan system. Class, Monæcia. Order, Monandria

CYNOMORIUM COCCINEUM. The systematic name of the fungus melitensis. See Fungus melitensis.

CYNOPASTUM. (From RUGY, a dog, and σπαω, to attract.) See Cynosbatus.

(From xuw, a dog, and CYNOREXIA. opegis, appetite.) A voracious or canine appetite. See Bulimia.

CYNOSBATOS. See Cynosbatus.

CYNOSBATUS. (From nuwr, a dog, and Balo, a thorn; so called because dogs are said to be attracted by its smell.) Cynor-rhodon Cynosbutos. The dog-rose, or wild brier, or hip tree. Rosa canina of Linnæus:-germinibus ovatis pedunculisque glabris, caule petrolisque aculeatis. The fruit of this tree, called heps, or hips, has a sourish taste, and obtains a place in the London pharmacopæias in the form of conserve. It is seldom employed but to give form to more active remedies, in pills, boluses, linctuses, &c,

CYOPHORIA. (From 2005, a fectus, and

of a woman. Gestation. The pregnancy

CYPARISSUS. See Cupressus.

CYPERUS. (From πυπαξος, a little round vessel which its roots are said to resemble.) Cyperus. The name of a genus of plants in the Linuxan system. Class, Triandria. Order, Monogynia.

CYPERUS LONGUS. The pharmacopoial name of the English galangale. Cyperus longus of Linnaus:—culmotriquetro folioso, umbella folioso supra-decomposita; pedunculs nudis, spicis alternis. The smell of the root of this plant is aromatic, and its taste warm, and sometimes bitter. It is now totally fallen into disuse.

CYPERUS ROTUNDUS. This species, the round cyperus, Cyperus rotundus of Linnuas:—culmo triqueto subnudo, umbella decomposita; spicis alternis linearibus, is generally preferred to the former, being a more gratefully aromatic bitter. It is chiefly used as a stomachic.

CYPHOMA. (From κυπλω, to bend.) gibbosity, or curvature of the spine.

Cypnosis. An incurvation of the spine.

Cypress spurge. See Esula minor.
CYPRINUM OLEUM. Flowers of cypress, calamus, cardamons, &c. boiled in olive

CYPRIUM. (From Kungos, Cyprus, an island where it is said formerly to have

island where it is said formerly to have abounded.) Copper. CYPRUS. The cypress-tree, or Eastern

CYPRUS. The cypress-tree, or Eastern privet; so called from the island of Cyprus, where it grew abundantly.

Cypselis. (From xu year, a bee-live.) The aperture of the ear; the ear-wax.

Cyrenisis. (Fr m κυζκναω, to mix.)
A mixture, or composition.

CYRTOMA. (From \*voglos, curved.) An unnatural convex tumour; tympanites.

CYRTONOSUS. (From uvglos, curved, and vocos, a disease.) The rickets, or curved spine.

Crasanus. (From 2000s, the anus.) The intestinuin rection is so called, because it reaches to the anus.

Cyssoris. (From xuous, the anus.) An inflammation of the anus.

CYSTEOLITHUS. (From μυσις, the bladder, and λιθος, a stone.) The stone in the bladder

Crsmus. (Koobos.) The anus.

CYSTIC. Belonging to the urinary or gall ladder.

CYSTIC DICT. Ductus cysticus. The membraneus canal that conveys the bile from the hepatic ductinto the gall-bladder.

CYSTICA. (From wsw, the bladder.)
Remedies for diseases of the bladder.

Cysted tumours. (From Rusis a bag.) Encysted tumours.

Crytiphlogia. (From κυσκ, the bladder, and φληφ, to burn.) An inflammation in the bladder.

CYSTIRRHAGIA. (From 20016, the blad-

der, and geo, to flow.) A discharge of blood rom he bladder.

CYSTIS (Kusk, a bag.) The bladder; any recep acle of morbid humours. See Urinary bladder.

CYSTIS CHOLEDOCHA. See Gall-bladder.

CYSTIS FELLEA. See Gall bladder.

CVSTITIS. (From xusus, the bladder.) Inflammation of the bladder. A genus of disease arranged by Cullen in the class, pyrexie, and order phlegmasie. It is known by great pain in the region of the bladder, attended with fever and hard pulse, a painful discharge of urine, and a frequent desire to make water. This is rarely a primary disease, and when it occurs, the above character of it will readily point it out. There is frequently also nausea a d vomiting, and, in some cases, delirium. It most generally arises in consequence of inflammation of the adjacent parts, or from calculi in the bladder.

CYSTOCELE, (From west, the bladder, and wan, a tumour.) An herma formed by the protusion of the urinary bladder.

CYSTOLITHICUS. (From xusic, the bladder, and xibue, a stone.) A suppression of urine from a stone in the bladder, is called ischuria cystolithica.

CYSTOPHLEGICUS. (From 20516, the bladder, nud φλεγω, to burn.) A suppression of urme from an inflanmation of the bladder, was formerly called ischuria cystophlegmatica.

Cystophlegmatica. (From 2051s, the bladder, and φλεγμα, phlegm.) A suppression of urine, from too much matter or mucus in the bladder, was called ischuria cystophlegmatica.

Cystoracetica. (From xusus, the bladder, and wgwxlss, the anus, or rectum.) A suppression of urine from pain in the bladder, caused by wind, inflammation of the rectum, hardened faces, &c. is called ischuria cystoproetica.

CYPTOPTO 18. (From 2050s, the bladder, and 2017/20, to fall.) A protusion of the inner membrane of the bladder, through the trethra.

Cystospasticus. (From κυσις, the bladder, and σλασμα, a spasm.) A suppression of urine, from a spasm in the sphineter of the bladder, was called ischura cystospastica.

Cystospyicus. (From 2050, the bladder, and 2000, pus.) A suppression of urine, from purulent matter in the bladder, was called ischuria cystospyica.

CYSTOTHROMBOIDES. (From xosis, the bladder, and beginson of urine, from a concretion of grumous blood in the bladder, was called ischuria cystothromboides.

CYSTOTOMIA. (From 2051), the bladder, and Isuau, to cut) The operation of cutting or piercing the bladder

CTTHION. An eye-wash.

CYTINUS. (From xua, to produce; so called from its fecundity.) The bud or

flower of the pomegranate.

CYTINUS HYPOCISTIS. The plant from whose fruit the succus hypocistidis is obtained. See Hypocistis.

CYTISO-GENISTA. Common broom. See Genista.

CYXICENUS. A plaster for wounds of the nerves.

CYZEMER. A painful swelling of the wrists.

## D.

This letter signifies vitriol in the old

chemical alphabet.

(From Saxva, to bite.) DACNERUS. Biting. Pungent. An epi het for a sharp collyrium, or eye-wash, composed of burnt copper, pepper, cadmia, myrrh, and opium.

DACRYDIUM. (From Sangu, a tear.)
The inspissated juice of scammony. It is in small drops, and therefore called a

tear.

DACRYGELOSIS. (From Sangua, to weep, and yenaw, to laugh.) A species of insanity, in which the patient weeps and laughs at the same time.

DACRYODES. (From Sangua, to weep.)

A sanious ulcer. A weeping sore.

DAETROMA. (From Sangua, to weep.)
A union of one or more of the puncta lachrymalia, causing an effusion of tears.

DACTYLETHRA. (From Sauluxos, a finger.) A species of bougies shaped like a finger,

to excite vomiting.

DACTYLETUS. (From Saxluxos, the date.)

The hermodactylus.

DACTYLIUS. (From faxluxos, a finger.) A round pastil troche, or lozenge, shaped

like a finger.

DACTYLUS. (A finger; so called from the likeness of its fruit to a finger.) The date. The oblong fruit of the Phanix dactulifera of Linnæus :- frondibus pinnatis; foliolis ensiformibus complicatis. Before they are ripe, dates are rather rough and astringent; but when perfectly matured, they are much of the nature of the fig. See Carica. Senegal dates are most esteemed, they having a more sugary, agreeable flavour than those of Ægypt and other places.

DEDIUM. (From Sais, a torch.) A small

torch or candle. A bougie.

DAMNATUS. (From damno, to condemn) Caput mortuum. The dry useless faces left in a vessel after the moisture has been distilled from it, is called terra damnata.

Daisy, common. See Bellis minor. Daisy, ox eye. See Bellis major. Damask rose. See Rosa centifolia.

DEMONOMANIA. (From δαιμον, a dæmon, and μανια, madness.) That species of melancholy, where the patient supposes himself to be possessed of devils.

Damson. The fruit of the Prunus da-

mascena, which, when perfectly ripe, affords a wholesome article for pies, tarts, &c. gently opening the body; but when damsons are not perfectly mature, they produce cholicy pains, diarrhæa, convulsions in children.

Dandelion, See Taraxacum. Dandrif. See Pityriasis. Dane-wort. See Ebulus.

DAPHNE. (Daphne, Sapre: from Saw, to burn, and φωνη, a noise; because of the noise it makes when burnt.) The name of a genus of plants in the Linnxan system. Class, Octandria. Order, Monogynia. The laurel, or bay-tree.

Daphne, flax-leaves. See Thymelaa.
Daphne GNIDIUM. The systematic name of the tree which affords the garou. See

Thymelæa.

DAPHNE LAUREOLA. The systematic name of the spurge laurel. See Laureola.

DAPHNE MEZERIUM. The systematic name of the mezereon. See Mezereum.

DAPHNELEON. (From δαφνη, the laurel, and ελαιον, oil.) The oil of bay-berries.

DAPHNITIS. (From δαφνη, the laurel)

A sort of cassia resembling the laurel.

DAPHNOIDES. (From δαφνη, the laurel, and ωδος, a likeness.) The herb spurge laurel.

DARSIN. (From darzin, Arab.) The grosser sort of cinnamon.

DARSIS. (From Segu, to excoriate.) An excoriation.

DARTOS. (From Segu, to excoriate; so called from its raw and excoriated appearance. The part so called, under the skin of the scrotum, is by some anatomists considered as a muscle, although it appears to be no more than a condensation of the cellular membrane lining the scrotum. It is by means of the dartos that the skin of the scrotum is corrugated and relaxed.

DASYMNA. (From Saous, rough.)

scabby roughness of the eye-lids.

DASYS. (Augus, rough.) A dry, parched tongue. Difficult respiration.

Date plum, Indian. See Indian date

Date. See Dactylus.

DATURA. (Blanchard says it is derived from the Indian word datire, of which he knows not the meaning.) The name of a genus of plants in the Linnæan system. Class, Pentandria. Order, Monogynia.

DATURA STRAMONIUM. The systematic name of the thorn apple. See Stramo-

nium.

steeped in must.

lieving the cholic, and discussing flatulen-The carrot.

1. The name of a genus of plants in the Linnean system. Class, Pentandria. Or-

der, Digynia.
2. The pharmacopæial name of the garden carrot. Daucus sylvestris. Pastinaca sylvestris tenuifolia officinarum. The cultivated root of the Daucus carota of Linnæus :--- seminibus hispidis, petiolis subtus nervosis, scraped and applied in the form of a poultice, it is an useful application to phagedenic ulcers, and to cancers and putrid sores. The seeds, which obtain a place in the materia medica, have a light aromatic smell, and a warm acrid taste, and are esteemed for their diuretic qualities, and for their utility in calculous and nephritic complaints, in which an infusion of three spoonfuls of the seeds in a pint of boiling water, has been recommended; or the seeds may be fermented in malt liquor, which receives from them an agreeable flavour, resem-bling that of lemon peel. The boiled root is said, by many, to be difficult of digestion; but this is the case only when the stomach is weak. It contains a considerable quantity of the saccharine principle, and is very nutritious.

DAUCUS ALSATICUS. The oreoselinum

pratense.

DAUCUS ANNUUS MINOR. The caucalis anthriscus.

DAUCUS CAROTA. The systematic name of the carrot plant. See Daucus.

DAUCUS CRETICUS. Myrrhus annua. Candy Carrot. The seeds of this plant, Athamanta cretensis of Linnaus :- foliolis linearibus planis, hirsutis; petalis bipartitis; semimibus oblongis, hirsutis, are brought from the isle of Candy; they have an aromatic smell, and a slightly biting taste; and are occasionally employed as carminatives and diu-

retics in diseases of the primæ viæ and urinary passages.

DAUCUS SATIVUS. A variety of the daucus carota, whose seeds are preferred by some practitioners.

DAUCUS SEPRINUS. Common chervil.

DAUCUS SYLVESTRIS. Wild carrot. or bird's nest. The seeds of the wild plant are said to be more efficacious than those of the garden carrot; they possess demulcent and aromatic qualities, and are given, in infusion, or decoction, in calculous com-

Dead nettle, See Labium album. Deadly nightshade. See Belladonna.

DEAFNESS. It is occasioned by any thing that proves injurious to the ear, as loud noises from the firing of cannon, violent colds, particularly affecting the head, Decocrum ALTHERE. Decoction of marsh inflammation or ulceration of the mem-mallows. Take of dried marsh mallow

DAUCUS. (Are the fault, from its re-In some instances it ensues in consequence of preceding diseases, such as fever, syphilis, &c. and in others it depends upon an original defect in the structure or formation of the ear. In the last instance the person is usually not only deaf but likewise dun.b. See Paracusis.

DEARTICULATIO. (From de, and articulus, a joint.) Articulation admitting evident

motion.

DEASCIATIO. (From de, and ascio, to chip, as with a hatchet.) A bone splintered on its side.

DECAMPRON. (From Sexa, ten, and mugor, An aromatic ointment, an omtment.) mentioned by Oribasius, containing ten ingredients.

DECIDENTIA. (From decido, to fall down.) Cataptosis. Any change prolong-

ing acute diseases.

DECIDUA. (Decidua, sc. membrana; from decido, to fall down.) Membrana decidua. A very thin and delicate membrane or tunic, which adheres to the gravid uterus, and is said to be a reflexion of the chorion, and, on that account, is called decidua reflexa. The tunica decidua comes away after delivery, in small pieces, mixed with the lochia.

DECIMANUS. (From decem, ten, and mane, the morning.) Returning every tenth day,

applied to some erratic fevers.

DECLIVIS. (From de, and clivis, a hill.) Declining, descending. A name of an abdominal muscle, because of its posture.

DECOUTUM. (From decoquo, to boil) A decoction. Any medicine made by boiling in a watery fluid. In a chemical point of view, it is a continued ebullition with water, to separate such parts of bodies as are only soluble at that degree of heat. The following are among the most approved decoctions.

DECOCTUM ALBUM. See Decoctum cor-

DECOCTUM ALOES COMPOSITUM. pound decoction of aloes. Take of extract of liquorice, half an ounce; subcarbonate of potash, two scruples; extract of spiked aloe powdered, myrrh powdered, saffron stigmata, of each a drachm; water, a pint. Boil down to twelve fluid ounces, and strain; then add compound tincture of cardamoms, four fluid ounces. This decoction. now first introduced in the London Pharmacopæia, is analagous to an article in very frequent use, invented by the late Dr. Devalingin, and sold under the name of beaume de vie. By the proportion of tincture, which is added, it will keep unchanged for any length of time.

brane, hard wax, or other substances inter- roots, 3iv; raisins of the sun stoned, 3ii;

water, Hvjj. Boil to five pounds; place apart the strained liquor, till the f ces have subdued, then pour off the clear. This preparation, directed in the Edinburgh Pharmacopæia, may be exhibited as a common drink in nephralagia, and many diseases of the urinary passages with advantage.

DECOCTUM ANTHEMIDIS. See Decoctum

chamæmeli.

DECOCTUM ASTRAGALI. Take of the root of the astragalus excapus, \$\frac{3}{2}\]; distilled water, \$\frac{1}{2}\]jj. These are to be boiled, till only a quart of fluid remain. The whole is to be taken, a little warmed, in the course of 24 hours. This remedy was tried very extensively in Germany, and said to evance very powerful effects, as an antisyphilitic

DECOCTUM BARDANÆ. Take of bardana root,  $3\sqrt{1}$ ; of distilled water,  $15\sqrt{1}$ . These are to be boiled till only two quarts remain. From a pint to a quart in a day is given, in those cases where sarsap rilla and other remedies that are called alterative are sup-

posed to be requisite.

DECOCTUM CHAMEMELI, Chamomile decoction. Take of chamomile flowers, \$\frac{3}{3}\$; carraway seeds, \$\frac{2}{3}\$ss; water, Hssv. Boil fifteen minutes, and strain. A very common and excellent vehicle for tonic powders, pills, &c. It is also in very frequent use

for fomentation and clysters.

DECOCTUN CINCHONA. Decoction of cinchona, commonly called decoction of Peruvian bark. Take of lance-leaved cinchona bark bruised, an ounce; water, a pint. Boil for ten minutes, in a vessel slightly covered, and strain the decoction while According to the option of the practitioner, the bark of either of the other species of cinchona, the cordifolia, or yellow, or the oblongifolia, or red, may be substituted for the lancifolia, or quilled; which is here directed. This way of administering the bark is very general, as all the other preparations may be mixed with it, as necessity requires. It is a very proper fomentation for prolapsus of the uterus and rectum.

Decoctum cornu. Decoctum album. Decoction of hartshorn. Take of burnt and prepared hartshorn, two ounces by weight; gum-arabic, 6 drachms by weight; distilled water, three pints. Boil, constantly stirring, to two pints, and strain. This decoction, which is omitted in the last edition of the London Pharmacopoxia, is a much weaker absorbent than the julep ecreta, but is much more agreeable to most people. It forms an excellent drink in fevers attended with diarrhoa, and acidities of the prima via.

DECOCTUM CYDONIE. Mucilago seminis cydonii mali. Mucilago seminum cydoniorum. Decoction of quince seeds. Take of quince seeds, two drachms; water, a pint. Boil over a gentle fire for ten minutes, then

strain. This decoction, in the new London Pharmacopæia, has been removed from among the mucilages, as being less dense than either of the others, and as being employed in larger doses, like other mucilaginous decoctions. In addition to gum, it contains other constituent parts of the seeds, and is, therefore, more apt to spoil than common mucilage, over which it possesses no other advantages than that it is more grateful, and sufficiently thin, without further dilution, to form the bulk of any liquid medicine. Its virtues are demulcent. Joined with syrup of mulberry, and a little borax, it is useful against aphthæ of the mouth and fauces.

Decoction of mezereon. Take of the bark of mezereon,  $\overline{3}jj$ ; liquorice root bruised,  $\overline{3}ss$ : water,  $\overline{1}bjjj$ . Boil it, with a gentle heat, down to two pounds, and strain it. From four to eight ounces of this decoction may be given four times a day, in some ob-tinate venereal and rheumatic affections. It ope-

rates chiefly by perspiration.

Decoctum dulcamaræ. Decoction of woody nightshade. Take of woody nightshade stalks, newly gathered, Zi; distilled water, Hiss. These are to be boiled away to a pint, and strained. The dose is half an ounce to two onnecs, mixed with an equal quantity of milk. This remedy is employed in inveterate cases of scrophula; in cancer and phagedæna; in lepra and other cutaneous affections; and in anomalous local diseases, originating in veneral lues.

Decoctum Geoffrææ inermis. Decoction of cabbage-tree plant. Take of bark of the cabbage-tree powdered, \$\frac{3}{3}\$; water, \$\frac{1}{3}\$; Boil it, with a gentle fire, down to one pound, and strain. This is a powerful anthelmistic. It may be given in doses of one table-spoonful to children, and four to adults. If disagreeable symptoms should arise from an over-dose, or from drinking cold water during its action, we must immediately purge with castor-oil, and dilute with acidulated drinks.

Decoctum Gualact officinalis composition. Decoctum Liquorum. Composited decoction of guaiacum, commonly called decoction of the woods. Take of guaiacum raspings, 5jjj; raisins stoned, 5jj; wasafras root, liquorice, each 5j; water, Ibx. Boil the guaiacum and raisins, with the water, over a gentle fire, to the consumption of one half; adding, towards the end, the sassafras and liquorice. Strain the liquorice without expression. This decoction possesses stimulant and diaphoretic qualities, and is generally exhibited in rheumatic and cutaneous diseases, which are dependent on a vitiated state of the humours. It may be taken by itself, to the quantity of a quarter of a pint, twice or thrice a day, or used as an assistant in a

255

tives; the patient, in either case, keeping warm, in order to promote the operation of the medicine.

DECOCTUM HELLEBORI ALBI. Decoction of hellebore. Take of the root of white helfebore powdered, by weight, 3j; distilled water, two pints; rectified spirits of wine, 3 jj by weight. Boil the water, with the root, to one pint; and the liquor being cold and strained, add to it the spirit. This decoction, in the last London Pharmacopolia is called decoctum veratri. It is, however, a very efficacious application externally, as a wash, in tinea capitis, lepra, psora, &c. When the skin is very tender and irritable, it should be diluted with an equal quantity of water.

DECOCTUM HORDEL. Decoctum hordei distichi, Apua hordeata. Take of pearl barley, 3 jj; water, four pints and a half. First wash away any adhering extraneous substances with cold water; next, having poured upon the barley half a pint of water, boil for a few minutes. Let this water be thrown away, and add the remainder of the water boiling; then boil down to two pints and strain. Barley water is a nutritive and softening drink, and the most proper of all liquors in inflammatory diseases. It is an excellent gargle in inflammatory sore throats, mixed with a little mitre.

DECOCTUM HORDET COMPOSITUM. Decoctum pectorale. Compound decoction of barley. Take of decoction of barley, two pints; figs sliced, 3 jj; liquorice root, sliced and bruised, \$\bar{z}\$ss; raisins stoned, \$\bar{z}\$jj; water, a pint. Boil down to two pints, and strain. From the pectoral and demuleent qualities of this deeoction, it may be administered as a common drink in fevers and other acute disorders, in catarrh, and several affections of the chest.

DECOCTUM HORDET CUM GUMMI. Barley water, Ibjj; gum arab. 3j. The gum is to be dissolved in the barley decoction whilst warm. It then forms a suitable diluent in strangury, dysury, &c. for the gum, finding a passage into the bladder in an unaltered state, mixes with the urine, and prevents the action of its neutral saits on the urinary canal.

DECOCTUM LICHENIS. Decoction of liver-Take of liverwort, one ounce; water, a pint and a half. Boil down and strain.

The dose is from \$\frac{3}{2}\$ to \$\frac{3}{2}\$ iv.

Decourse lobelle Take a handful of the roots of the lobelia syphilities; distilled water, lbxjj. These are to be boiled in the usual way, till only four quarts re-The very desirable property of curing the venereal disease has been attributed to this medicine; but it is not more to be depended on than guaiacum, or other vegetable substances, of which the same thing has been alleged. The effects of

course of incrcurial or anatomical altera- this decoction are purgative; and the manner of taking it, as described by Swediaur, is as follows. The patient is to begin with half a pint twice a day. The same quantity is then to be taken four times a day, and continued so long as its purgative effect is not too considerable. When the case is otherwise, it is to be discontinued for three or four days, and then had recourse to again till the cure is completed. As this is a remedy on the old system, and not admitted into our pharmaeopæias, little confidence ought to be placed in it.

DECOCTUM LUSITANIEUM. Take of sliced sarsaparilla, lignum sassafras, lignum santalum rubrum, officinal lignum guaiacum, of each one ounce and a half; of the root of mezereon, coriander seed, of each half an ounce; distilled water, ten pounds. These are to be boiled till only half the fluid remains. The dose is a quart or more in a day.

" Take of sliced sarsaparilla, lignum santalum rubrum, lignum santalum citrinum, of each Zjss; of the root of glycyrrhiza and mezereon, of each 3jj; of lignum rhodii, officinal lignum guaacum, and lignum sassafras, of each 3ss; of antimony, 3j; distilled water, Hiv." These ingredients are to be macerated for 24 hours, and afterwards boiled, till the fluid is reduced to half its original quantity. From one to four pints are given daily.

The late Mr. Hunter notices this and also the following formula, in his Treatise on the Venercal Disease.

" Take of sliced sarsaparilla, of the root of China, of each 3j; walnut peel dried, xx; antimony, 3jj; pumice stone, powdered, 3j; distilled water, Bbx. The powdered antimony and pumice stone are to be tied in separate pieces of rag, and boiled along with the other ingredients" This last decoction is reckoned to be the genuine Lisbon diet drink, whose qualities have been the subject of so much encomium.

DECOCTOM MALVE COMPOSITUM. tum pro enemate. Decoctum commune pro clystere. Compound decoction of mallows. Take of mullows dried, an ounce : chamomile flowers dried, half an ounce; water, a pint. Boil for a quarter of an hour, and strain. A very excellent form for an comolhent clyster. A variety of medicines may be added to answer particular indica-

DECOCTUM MEZEREI. See Decoctum daphnes mezerei.

DECOCTUM PAPAVERIS. Decoctum pro fo-Fotus communis. Decoction of poppy. Take of white poppy capsules bruised, Biv; water four pints. Boil for a quarter of an hour, and strain. This preparation possesses antiseptic properties, and may be directed with advantage in spacelus, &c.

DECOCTUM PRO ENEMATE. See Decoctum malvæ compositum.

DECOCTUM PRO FOMENTO. See Decoctum

papaveris.

DECOCTUM QUERCUS Decoction of oak bark. Take of oak bark, 3j; water, two pints. Boil down to a pint, and strain. This astringent decoction has lately been added to the Lond. Pharm. and is chiefly used for external purposes. It is a good remedy in prolapsus ani, and may be used also in some cases as an injection.

DECOCTUM SARSAPARILLE. Decoction of sarsaparilla. Take of sarsaparilla root, sliced, Ziv; boiling water, four pints. Macerate for four hours, in a vessel lightly covered, near the fire; then take out the sarsaparilla and bruise it. After it is bruised, put it again into the liquor, and macerate it in a similar manner for two hours more; then boil it down to two pints and strain.

This decoction is much extolled by some practitioners, in phthisis, and to restore the strength after a long course of

mercury.

DECOCTUM SARSAPARILLE COMPOSITUM. Compound decoction of sarsaparilla. Take of decoction of sarsaparilla, boiling, 4 pints; sassafras root sliced, guriacum wood shavings, liquorice root bruised, of each an ounce; mezereon root bark, Ziji. Boil for a quarter of an hour, and strain. The alterative property of the compound is very great; it is generally given after a course of mercury, where there have been nodes and indolent ulcerations, and with great benefit. The dose is from half a pint to a pint in twenty-four hours.

DECOCTUM SENEGE. Decoction of sene-Take of senega root, \$\frac{7}{3}j\$; water, two pints. Boil down to a pint, and strain. This is now first introduced in the London Pharm, as being a useful medicine especially in affections of the lungs, attended with debility and inordinate secretion.

DECOCTUM ULMI. Decoction of elm bark. Take of fresh elm bark bruised, four ounces; water, four pints. Boil down to two pints, and strain. This may be employed with great advantage as a collyrium in chronic ophthalmia. It is given internally in some cutaneous eruptions.

Decoctum veratri. See Decoctum hel-

lebori albi.

DECOLLATIO. (From decollo, to behead.) The loss of a part of the skull.

DECOMPOSITION. A separation of

parts. See Analysis.

DECORTICATION. (From de, from, and cortex, bark.) The stripping of any thing of its bark, husk, or shell: thus almonds, and the like, are decorticated, that is, deprived of their pellicle, when ordered for medicinal purposes.

DECREPITATION. (From decrepo, to crackle.) A kind of crackling noise, which takes place in bodies when heated: it is peculiar to some kinds of salts; which, from a state of solution, are crystallized so rapidly, that the crystals formed burst into minute pieces.

DECUSSATION. (From decutio, to divide.) When nerves, or muscular fibres. cross one another, they are said to decus-

sate each other.

DECUSSORIUM. (From decusso, to divide.) An instrument to depress the dura mater, after trepanning.

defendo, to pre-(From DEFENSIVA. serve.) Cordial medicines, or such as resist infection.

DEFERENS. (From defero, to convey: because it conveys the semen to the vesi-

culæ seminales.) See Vas deferens. DEFLAGRATION. (From deflagro, to burn.) Calcination. A chymical term, chiefly employed to express the burning or setting fire to any substance; as nitre, sulphur &cc.

DEFLUXION. (From defluo, to run off.) A falling down of humours Defluxio. from a superior to an inferior part. Many writers mean nothing more by it than inflammation.

DEGLUTITION. (From deglutio, to swallow down.) A natural action, by which the masticated bole or a fluid is conveyed from the mouth into the fauces, and from thence through the @sophagus into the stomach.

DEGMUS. (From Sanva, to bite.) biting pain in the orifice of the stomach.

DEJECTIO ALVINA. Discharge of excrement by stool.

(From dejicio, to cast out.) DEJECTORIA. Purging medicines.

Deinosis. (From Servow, to exaggerate.) An enlargement of the supercilia.

DELACHRYMATIVA. (From de, and lachryma, a tear.) Medicines which dry the eyes, first purging them of tears.

DELAPSIO. (From delabor, to slip down.) A falling down of the anus, uterus, or in-

testines.

DELETERIOUS. (Deleterius ; from SHASEW, to hurt, or injure.) stances are so called which are of a poisonous nature

DELIQUESCENCE. Deliquation, or the gradually melting down of crystallized salts, from exposure to the air.

DELIQUIUM ANIMI. (Deliquium; from delinquo, to leave.) See Syncope.
DELIRIUM. (From deliro, to rave.) A febrile symptom, consisting in the persons acting or talking unreasonably. It is to be

carefully distinguished from an alienation of the mind, without fever. DELOCATIO. (From de, from, and locus

a place. A dislocation, or putting any part out of its proper place.

DELPHINIUM. (From denomous, the dolphin.) Larkspin; so called from the likeness of its flower to the dolphin's head. The name of a genus of plants in the Linner in system. Class, Polyandria. Order, Trigyma.

DELPHINIUM CONSOLIDA. The systematic name of the consolida regalis. See

Consolida regalis.

DELPHINUM STAPHYSAGHIA. The systematic name of stave-acre. See Staphisagria.

Delphys, Δε φυς. The uterus, or pudendum muliebre.

DELTA. (The Greek letter, A.) The external pudendom numbebre is so called, from the tri ngular shape of its hair.

DELITOIDES. (From διλτα, the Greek letter Δ, and ω/σς, a likeness; shaped like the Greek delia.) Sous acromio-clavi-lumeral of Dumas. A muscle of the superior extremity, situated on the shoulder. It arises exactly opposite to the trapezius, from one third part of the clavicle, from the acromium and spine of the scapula, and is inserted, tendinous, into the middle of the os humeri, which bene it lifts up directly; and it assists with the supra-spinatus and coracobrachials in all the actions of the humerus, except the depression; it being convenient that the arm should be raised and sustained, in order to its moving on any side.

DEMENTIA: (From de, and mens, without mind.) Madness. Delirium. Absence

of intellect.

DEMULCENTS. (Demulcentia, sc. medicamenta; from demulceo, to soften.) Medicines suited to obviate and prevent the action of acrid and stimulant matters; and that not by correcting or changing their acrimony, but by involving it in a mild and viscid matter, which prevents — from acting upon the sensible parts of our bodies, or by covering the surface exposed to their action.

Where these substances are directly applied to the parts affected, it is easy to perceive how benefit may be derived from their application. But where they are received by the medium of the stomach, into the circulating system, it has been supposed that they can be of no utility, as they must lose that viscidity on which their lubricating quality depends. Hence it has been concluded that they can be of no service in gonorrhoa, and some similar affections. It is certain, however, says J. Murray, in his Elements of Materia Medica and Pharmacy, that many substances which undergo the process of digestion, are afterwards separated, in their entire state, from the blood, by particular secreting organs, especially by the kidneys; and it is possible, that mucilaginous substances, which are the principal demulcents, may be separated in this manner. There can be no doubt, however, but that a great

share of the relief devulcents (fford, in irritation or inflammation of the art of passages, is owing to the large quarties of water in which they are drivised, by which the urine is readered less stimulating from dilution. In general, demulcents may be considered merely as substances less stimulating than the fluids usually applied.

Catarrh, d'arrhoa, dys mery, calculus, and gonordoa, are the diseases in which demulcents are employed. As they are medicines of no great power, they may be taken in as large quantities as the stomach

can bear.

The particular demuleents may be reduced to the two divisions of mucilages and expressed oils. The principal demuleents are the acacia vera, astragalus tragacantha, linum instatissimum, althea officinalis, malva sylvestris, glycyrrhiza glabra, cycas circinalis, orelis mascula, maranta arundinacea, triticum hybernum, ichthyocolla, olca Europæa, amygdalus communis, cetaceum, and cera.

DENDROLIBANUS. (From Serseov, a tree, and oxisaros, frankincense.) The herb rose-

mary, or frankincense trce.

DENS. (Quasi edens; from edo, to eat, or from edos, dorler.) A tooth. See Teeth. Many herbs have this specific name, from their fancied resemblance to the tooth of some animal; as dens teonis, the dandelion; dens canis, dog's tooth, &c.

DENS LEONIS. See Taraxacum.

DENTAGRA. (Dentagra. οδοντωγεα: from δω, a tooth, and αγεα, a seizure.) The tooth-ach; also an instrument for drawing the teeth.

DENTARIA. (Dentaria, from dens, a tooth; so called because its root is denticulated.) Dentillaria. Tooth-work. This plant is to be distinguished from the pelletory of Spain, which is also called dentaria. It is the Plumbago Europæa of Linnus:—foliis amplexicualibus, lanceolatis scabris. The root was formerly esteemed, prepared in a variety of ways, as a cure for the toothach, wising from carees

DENTARPAGA. (From cles, a tooth, and αgπαζω, to fasten upon.) An instrument

for drawing of tecth.

DENTATA. See Dentatus.

DENTATUS. (From dens, a tooth; from its tooth-like process.) Dentata. Epistrophicus. The second vertebra of the neck. It differs from the other cervical vertebra, by having a tooth-like process at the upper part of the body. See Vertebra.

part of the body. See Vertebra.

DENTELLARIA. (From dentella, a little tooth; so called because its root is denticulated.) The herb tooth-wort. See Den-

taria.

DENTES INCISONES. See Tecth.

DENTES CANINI. See Canine teeth. DENTES LACTEL. The milk-teeth.

Teeth, and Dentition.
DENTES MOLARES. See Teeth.

\* L. L

DENTIFICEM. (From dons, a tooth, and done, to draw.) An instrument for drawing of teeth.

DENTIFRICE. (From dens, a tooth, and frizo, to rub.) A medicine to cican the

teeth

DENTI-CALPIUM. (From dens, a tooth, and scalps, to scrape.) An instrument for

scaling teeth.

DENTITION. (From dentio, to breed teeth.) The breeding or cutting of the teeth. The first dentition takes place about the sixth or seventh mouth, and the teeth are termed the primary or milk teeth. About the seventh year, these fail out, and are succeeded by others, which remain during life, and are called the secondary or peremial teeth. The last dentition takes place between the ages of twenty and five-and-twenty, when the four last grinders appear; they are called dentes sapientiae. See also Teeth.

DENTODUCUM. See Dentiducum.

DENUNATIO. (From denudo, to make

barc.) A laying bare the bone.

DEOBSTRUENTS. (Deobstruentia, sc. medicamenta; from de, and obstruo, to obstruct.) Medicines that are exhibited with a v.ew of removing any obstruction.

Deoppilativa. (From de, and oppilo, to stop.) Deoppilativa. Medicines which remove obstructions; deobstruct or aperi-

tive medicines.

DEPARTITIO. (From de, and partier, to

divide.) Scparating metals.

DEPERTURIO. (From dependo, to lose.)
Abortion, or the undue loss of the fætus.

DEFETIGO. (From de, and petigo, a running scab.) A ring-worm, or tetter. A scurf, or itch, where the sk n is rough.

DEPHLIEGRATIO. (From de, and phlegma, phlegm.) The operation of rectifying or freeing spirits from their watery parts.

DEPILATORY. (Depilatoria, sc. unguenta; from de, of, and pilus, the hair.)
Any application which removes the hairs from any part of the body; thus, a pitch cap pulls the hairs of the head out by the roots.

DEPLUMATIO. (From de, and pluma, a feather.) A disease of the eyelids, which

causes the hair to fall off.

DEFREMENSIO. (From deprehendo, to catch mawares.) The epilepsy is so called, from the suddenness with which persons are seized with it.

Depressio. (From deprime, to press down.) Depression. When the bones of the skull are forced inwards by fracture, they are said to be depressed.

DEPRESSOR. (From deprimo, to press down.) Several muscles are so termed, because they depress the part on which they act.

Defresson alm nasi. See Depressor labii superioris alaque nusi.

DEPRESSOR ANGULI ORIS. Trangularis of Winslow Depressor labiorum communis of Douglas. Depressor labiorum of Cowper. Sous-maxillo-labial of Dumas. A muscle of the mouth and hip, situated below the under hip. It arises, broad and fleshy, from the lower edge of the lower jaw, near the chin; and is inserted into the angle of the mouth, which it pulls downwards.

DEPRESSOR LABII INTERIORIS.
Quadratus of Winslow. Depressor labii inferioris proprius of Douglas and Cowper.
Mentonier labial of Dunas. A muscle of the mouth and lip, that pulls the under lip and skin of the side of the chin downwards.

and a little outwards.

LABII DEPRESSOR SUPERIORIS ALÆQUE NASI. Depressor alæ misi of Incisious andius of Winstow. Albinus. Depressor labii superioris proprius f Dou-Constrictores alarum nasi, ac de. pressores labii supersoris of Cowper. Max. illo-alveoli nasal of Dumas. A muscle of the mouth and lip, situated above the month, that draws the upper lip and ala nasi downwards and backwards. It arises, thin and fleshy, from the superior maxillary bone, immediately above the joining of the gums, with the two incisor teeth and cuspidatus; from thence it runs upwards, and is inserted into the upper lip and root of the ala of the nose.

DEPRESSOR LABII SUPERIORIS PROPRIUS. See Depressor labii superioris alæque nasi.

Depressor Lamorum communis. See Depressor anguli oris.

Dermesson oculi See Rectus inferior

Deprimens. See Rectus inferior oculi.
Depuration. (From depuro, to make clean.) Medicines which evacuate impurities.

DEPURATION. The freeing a liquor

or solid body from its foulness.

DEPURATORIUS. (From de, and purus, pure.) It is applied to fevers, which terminate in per-piration.

Denis. (Degis: from Segw, to excoriate.)

The skin.

off.) The doctrines of derivation and revulsion, talked of by the ancients, are now, in their sense of the terms, wholly exploded. Derivation means the drawing away any disease from its original seat to another part.

DERMA. (Aegua.) The skin.

Dermatores. (From Sigma, skin, and sides, a likeness.) Resembling skin, or leather, in its consistence. It is applied to the dura mater.

DERMATOLOGIA. (From δες μα, the skin, and λογος, a discourse.) A discourse or treatise on the skin.

DERTRON. (From Segs., skin.) The omentum, or perstongum, is so named, from its skin-like consistence.

DEESCENSORIUM. (From descendo, to A vessel in which the move downwards.) distillation by descent is performed.

Descensus (From descendo, to move downwards) The same chymists call it a distillation per descensum, by descent, when the fire is applied at the top and round the vessel whose orifice is at the bottom.

DESICCATIVA. (From desicco, to dry. up,) Such medicines as, being applied outwardly, dry up the humours and moisture running from a wound.

DESIFIENTIA. (From desipio, to dote.) A defect of reason. Symptomatic phrenzy. DESME. (From Sew, to bind up.) A bandage, or ligature.

Desmipsion. (From δετμη, a handful.) A small bundle, or little bandage.

Desmos. (From See, to bind up.) A bandage. An inflammatory stricture of a joint, after luxation.

DESPUMATION. (From despumo, to clarily ) The clarifying a fluid, or separat-

ing its foul parts from it.

DESQUAMATION. (From desquamo, to scale off.) The separating of lamina, or scales, from a bone. Exfoliation.

DESQUAMMATORIUM. (From desquamo, to cale off.) A trepan, or instrument to take a piece out of the scull.

DESTILLATION. See Distillation.

DESUDATIO, (From desudo, to sweat much.) An unnatural and morbid sweat-

DETENTIO. )From detineo, to stop, or hinder) Epilepsy is so called, from the suddenness with which the patient is seized.

DETERGENTS. (From detergo, to wipe away.) Medicines which cleanse and remove such viscid humours as adhere to and obstruct the vessels. Also such applications as clear away foulness from ulcers.

DEFONATION. (From detono, to make

a noise.) Explosion.

Detracton. (From detraho, to draw.) applied to a muscle, whose office is to draw the part to which it is attached.

DETRAHENS QUADRATUS. See Platysma myoides.

DETRUSOR URINÆ. (From Detrudo, to thrust out.) The name of a muscle whose office is to squeeze out the urine. The muscular coat of the urinary bladder was formerly so called.

DECTERI. (From & olegor, second; because it is discharged next after the fætus.) The

secundines, or after-birth.

DEUTEROPATHIA. (From Sediegos, cond, and mxtos, a suffering.) An affection or suffering by consent, where a second part suffers, from consent, with the part originally affected, as where the stomuch is disturbed through a wound in the head.

Devil's dung. See Assafatida.

DIABERUS. (From Subface, to strengthen; so caled, as afforcing the chief support to the foot) The ankle-bone.

DIABETES. (From &1, through, and &2x100, to pass.) An immoderate flow of urine. A genus of disease in the class neuroses, and order spasmi of Cullen. There are two species of this complaint: 1. Diabetes scrosus, in which there is a super bundant discharge of limped urine, of itusual minary taste. 2. Diabetes mellitus in which the urme is very sweet, and contains a great quantity of sugar. Great thirst, will a voracious appente, gradual emaciation of the whole body, and a frequent discharge of urine, containing a large proportion of s coharme and other matter, which is voided in a quantity far exceeding that of the aliment or third introduced, are the characteristics of this disease. Those of a shartered constitution, and those who are in the decline of life, are most subject to its attacks. It not unfrequently attends on hysteria, hypochondriasis, dyspepsia, and asthma; but it is alway, much milder when symptomatic, than when it appears as a primary affection.

Diabetes may be occasioned by the use of strong diuretic medicines, intemperance of life, and hard drinking; excess in venery, severe evacuations, or by any thing that tends to produce an impoverished state of the blood, or general debility. I has, however, taken place, in many instance-, with

out any obvious cause.

That which immediately gives rise to the disease, has ever been considered as obscure, and various theories have been alvanced on the occasion. It has been usual to consider diahetes as the effect of relaxation of the kidneys, or as depending on a general colliquation of the fluids. Dr. Rilcher, professor of medicine in the universily of Gaettengen, supposes the disease to be generally of a spasmodic nature, occasioned by a stimulus acting on the kidneys; hence a secretic aucta urine, and sometimes perversa is the consequence. Dr. Darwin thinks that it is owing to an inverted action of the urinary branch of the lymphatics; which doct, ine, although it did not escape the censure of the best ana. tomists and experienced physiologists, met, nevertheless, with a very favourable reception, on its being first announced. The late Dr. Cullen offered it as his opinion, that the proximate cause of this discose might be some fault in the assimilatory powers, or in those employed in converting alimentary matters into the proper animal fluids, which theory has since been adopted by Dr. Dobson, and still later by Dr. Rollo, surgeon general to the royal artil. The liver has been thought, by some, to be the chief source of the disease, but diabetes is hardly ever attended with any affection of this organ, as has been

proved by frequent dissections; and when observed, it is to be considered as acci-

The primary seat of the disease is, however far from being absolutely determined in favour of any hypothesis vet advanced, and, from the most attentive consideration of all the circumstances, the weight of evidence appears to induce the majority of pr ctitioners to consider diabetes as depending on a primary affection of the kidnevs.

Diabetes sometimes comes on slowly and imperceptibly, without any previous disorder; and it now and then arises to a considerable degree, and subsists long without being accompanied with evident disorder in any particular part of the system; the great inirst which always, and the voracions appetite which frequently occur in it, being often the only remarkable symptoms; but it more generally happens, that a considerable affection of the stomacl, precedes the coming on of the disease; and that, in its progress, besides the symptoms already mentioned, there is a great dryness in the skin, with a sense of weight in the kidneys, and a pain in the ureters, and the other urinary passages.

Under a long continuance of the disease, the body becomes much emaciated, the feet ædematous, great debility arises, the pulse is frequent and small, and an obscure fever, with all the appearance of hectic,

prevail.

The urine in diabetes, from being at first asipid, clear, and colourless, soon acqui es a sweetish or saccharine taste, its leading characteristic; and, when subjected to experiment, a considerable quantity of saccharine matter is to be extracted

In some instances, the quantity of urine is much greater than can be accounted for from all the sources united. Cases are recorded, in which 25 to 30 pints were discharged in the space of a natural day, for many successive weeks, and even months; and in which the whole ingesta, as was said, did not amount to half the weight of the To account for this overplus, it has been alleged that water is absorbed from the air by the surface of the body; as also that an extraordinary quantity of water is compounded in the lungs themselves.

Dissections of diabetes have usually shown the kidneys to be much affected. In some instances they have been found in a loose flabby state, much enlarged in size and of a pale ash colour; in others, they have been discovered much more vascular than in an healthy state, approaching a good deal to what takes place in inflammation, and containing, in their infundibula, a quantity of wnitish fluid, somewhat resembling pus, but without any sign of ulcera-

tion whatever. At the same time that these appearances have been observed in their interior, the superficial veins on their surface were found to be much fuller of blood than usual, forming a most beautiful net-work of vessels, the larger branches of which exhibited an absorbent appearance. In many eases of dissection, the whole of the mysentery has been discovered to be much diseased, and its glands remarkably enlarged; some of their being very hard, and of an irregular texture; others softer, and of a uniform spherical shape. Many of the lacteals have likewise been seen considerably enlarged. The liver, pancreas, spleen, and stomach, are in general perceived to be in a natural state; when they are not so, the occurrence is to be considered as accidental. The bladder, in many cases, is . found to contain a considerable quantity of muddy urme.

DIABETES HYSTERICUS. Large discharge

of urine in hysterical women.

DIABOLUS METALLORUM. Tin.

DIABOTANUM. (From Six and Gomann, a herb.) A plaster made of herbs.

DIACADMIAS. (From Siz, and xaduiz, cadmia.) The name of a plaster whose basis is

DIACALAMINTHES. (From Sia, and xaxaμινθης, calamint.) The name of an antidote, whose chief ingredient is cala-

DIACARCINUM. (From Siz and naguives, a crab.) The name of an antidote prepared from the flesh of crabs and cray-.

DIACARTON. (From Siz, and naguer, a nut.)

Rob of nuts, or wall nuts.

DIACASSIA. (From Siz, and narouz, cas-

sia.) Electuary of cassia.

DIACASTORIUM. (From & ia, and nasae, castor.) An antidote whose basis is cas-

DIACATHOLICON. (From Siz, and uzboxixos, universal.) The name of a purge, so called from its general usefulness.

DIACENTAURIUM. (From Sta, and revlaugion,

centaury.) The Duchess of Portland's powder is so called, because its chief ingredient is centaury.

DIACENTROTUM. From Siz, and newless, to prick.) A collyrium, so called from its pungency and stimulating qualities.

DIACHALCITIS. (From Siz yazude, chalcitis.) A plaster whose chief ingredient is

chalcitis.

Diachalsis. (From Suzzava, to be relax-A relaxation. The opening of the sutures of the head.

(From Siz, and yuz, the DIACHEIRISMUS hand.) Any operation performed by the hand.

(From dia, and xers. DIACHELIDONIUM Savior, cetandine.) A plaster whose chief ingredient was the herb celandine.

DIACHOREMA, (From Siaxweizw, separate from.) Diachoresis. Any excretion or excrement, but chiefly that by

Diacto ists. See Diachorema.

(From dia, and xpue, to DIACHRISTA. anomt ) Medicines to anoint sore or bruised parts.

DIACIRYSUM. (From Siz, and xpuros, gold.) A plaster for fractured limbs; so

named from its yellow colour.

Diaentium. (From δ<sub>1</sub>α, and χυλος, chyle.) The plaster of this name was formerly made of certain juices, but it now means an emollient digestive plaster.

DIACTESIS. (From Siz, and zue. to pour

out.) Fusien or melting.

DIACHTTICA. (From Suzue, to dissolve.) Medicines which discuss and dissolve tumours.

DIACINEMA. (From Siz, and zivea, to

move.) A light dislocation.

Diacissum. (From Siz. and ziooce, ivy.)

Dia rasis. (From Siz, and RASIG, to

break.) A small fracture

DIACLESMA. (From Siankulo, to week out.) \ gargarism, or wash for the mouth.

Dia Figureson. (From Siz, and non-numerior, plum. An electionry made of prunes.

DIACODIUM. (From dia, and nadia, a poppy head.) A composition made of the heads of poppies.

DIACOLOGYNTHIS. (From δια, and κολο-κυνθικ, the eologynth.) A preparation whose

chief ingredient is colocyuth.

DIACOMMA. (From Sianofle, to cut through.) Diacope. A deep cut or wound. DIACOPE. Sec Diacoma.

DI COPREGIA. (From Six, ROTTPOS, dung, and aix, a goat.) A preparation with goat's ding.

DIACORALLUM. (From Siz, and ROPERALION, coral. A preparation in which coral is a

chief ingredient.

Diacutsis. (From Sizapira, to distinguish.) The distinguishing diseases one from another by their symptoms.

DIACHOCIUM. (From Sia, and uponoc, s (fron.) A collyr.um in which is saffron

DIACURETHA. (From Siz, and RUPREMZ, turmeric.) An antidote in whice is turmeric or saffron.

DEACTHONIUM. (From Siz. and Rudavia, a numce.) Marmalade of quinces.

DIADAPHNIDION. (From Siz, and Sapric, the laurel tree.) A ilrawing-plaster in which were bay-berries.

DIADEMA. (From Stades, to surround.) A diadem or bar dage to put round the

DIADEXIS. (From Sudexques, to transfer.). Diadoche. A transposition of humours from one place to another.

DIADOCHE. See Diadexis.

DIADOSIS. (From Sadisficial, to distributc) The remission of a disorder.

DIERESIS. (From Spagesor, to divide or

separate.) A solution of continuity of the soft p rts of the human body.

DIARETICA, (From Sizipee, to divide.)

Corrosive medicines.

DIATA. (From Sixfixa, to nourish.) Diet; food. It means also the whole of the non-naturals. See Dict.

DIAGRAUCIUM. (From dia, and plausier, the blue juice of a herb.) An eye-water

made of the purging thistle.

DIAGNOSIS (From diagnatum to discern or distinguish.) The service which delivers the signs by which a disease may be distinguished from another disease; honce those symptoms which distinguish such affections are termed diagnostic.

Discuspion. Compled from discre-

dium or se a rmony

DETHIR RODACTELUM. (From dia, and spectationes the hermodactyl.) A purging med cir. whose basis is the hermedactyl.

BIAIREDN. (From Sir, and use, the hily.) An antidote in which is the root of the

DIAIUM. (From J.z., and 100, a violet.)

A pastil whose chief ingredient is visicis. Distacca. (From Siz, and Azzzz.) An

antidote in which is the lacca.

DIALAGOUM. (From Siz. and Azyec, a hare.) A medicine in which is the day of a hare.

DIALEMMA. (From Siz, and Auto, to leave.) The remission of a disease.

Dialepsis. (From dialetra, to leave a space.) An intermission. Also a space left between a band ge.

(From dia, and Maror DIALIBANUM frankineense.) A medicine in which frankincense is a chief ingredient.

DIALOES. (From dia, and aren, the aloe.) A medicine chiefly composed of aloes.

DIALTHEA. (From Sia, and anbaia, the mallow.) An ointment composed chiefly of mallows.

DIALYSIS. (From Suavo, to dissolve.) A solution of continuity, or a destruction of parts.

DIALYSES. An order in the class locales of Cullen's nosology.

DIALTTICA. (From Sizzue, to dissolve.) Medicines which heal wounds and fractures.

DIAMARGARITON. (From Sir, and Map. yaufle, pearl.) An antidote in which pearls are the chief ingredient.

DIAMASSEMA (From Sia and personal. to chew.) A masticatory, or substance put into the mouth, and chewed to excite a discharge of the saliva.

(From Siz, and zulez, am-DIAMBERA. ber.) An aromatic composition in which

was ambergris.

(From de, and mexor, a DIAMELON. A composition in which are quince.)

DIAMISTOS. (From dia, and pieve, misy.) A composition in which misy is an ingredient.

DIAMOND. The diamond, which was well known to the ancients, is principally found in the western peninsula of India, on the coast of Coromandel, in the kingdoms of Golconda and Visapour, in the island of

Borneo, and in the Brazils.

They are generally found bedded in vellow othre, or in rocks of free-stone, or quartz, and sometimes in the beds of running waters. When taken out of the earth they are incrusted with an exterior earthy covering, under which is another, consisting of carbonate of lime.

In the Brazils, it is supposed that diamonds might be obtained in greater quantities than at present, if the sufficient working of the diamond mines was not prohibited, in order to prevent that diminution of their commercial value, which a greater abun-

dance of them might occasion.

Brazilian diamonds are, in commercial estimation, inferior to the oriental oncs.

In the rough, diamonds are worth two pounds sterling the carat, or four grains, provided they are without blemish. The expense of cutting and polishing amounts to about four pounds more. The value however is far above what is now stated when they become considerable in size.

The usual method of calculating the value of diamonds is by squaring the number of carats, and then multiplying the amount by the price of a single carat; thus suppesing one carat to be 21. a diamond of 8 corats is worth 1281. being 8 × 8 × 2.

The famous Pigot diamond weighs 188

1.8th grains.

Physical Properties of Diamond.

Diamond is always crystallized but sometimes so imperfectly, that at first sight it might appear amorphous. The figure of diamond when perfect, is an eight-sided prism. There are also cubical, flat, and round diamonds. It is the oriental diamond which crystallizes into octobedra, and exhibits all the varieties of this primitive fi-The diamond of Brazil crystallizes into dodecahedra.

The texture of the diamond is lamellated, for it may be split or cleft with an instrument of well-tempered steel, by a swift blow in a particular direction. There are however some diamonds which do not appear to be formed of laminæ, but of twisted and interwoven fibres, like those of knots in wood. These exceed the others greatly in hardness, they cannot be cut or polished, and are therefore called by the lapidaries diamonds of nature.

The diamond is one of the hardest bodies known. It resists the most highly-tempered steel file, which circumstance renders it necessary to attack it with diamond powder. It takes an exquisite and lasting polish. It has a great refractive power, and hence its lustre, when cut into the form of a regular solid, is uncommonly great. . The usual colour of diamonds is a light gray, often inclining to yellow, at times lemon colour, violet, or black, seldomer rose-red, and still more rarely green or blue, but more frequently pale brown. The purest diamonds are perfectly transparent. The colourless diamond has a specific gravity which is in proportion to that of water as 3.512 to 1.000. according to Brisson. This varies however considerably. When rubbed it becomes positively electric, even before it has been cut by the lapidary.

Diamond is not acted upon by acids, or by any chymical agent, oxygen excepted; and this requires a very great increase of

temperature to produce any effect.

The diamond burns by astrong heat, with a sensible flame, like other combustible bodies, attracting oxygen and becoming wholly converted into carbonic acid gas

during that process.

It combines with iron by fusion, and converts, it like common charcoal, into steel; but diamond requires much more oxygen to burn in than common charcoal does, and even then it consumes but slowly, and ceases to burn the instant its temperature is, lowered.

It is considered by modern chymists as pure crystallized carbon. See Carbon.

DIAMORON. (From Sia, and Margor, a mulberry.) A preparat on of mulberries.

DIAMOSCHUM. (From Siz, and MOTXOS, musk.) An antidote in which musk is a. chief ingredient.

DIAMOTOSIS. (From Siz, and molos, lint.) The introduction of lint into an ulcer or

DIANA. (A name of the moon.) The chymical name for silver from its white shining appearance.

DIANANCASMUS. (From δια, and αναγ-καζω, to force.) The forcible restoration of a luxated part into its proper place. An instrument to reduce a distorted spine.

DIANTHUS. (From Die, Sie, Jove, and avocs, a flower; so called from the elegance and fragrance of its flowers.) The name of a genus of plants in the Linnwan system. Class, Decandria. Order, Digy-

DIANTHUS CARYOPHYLLUS. The systematic name of the clove-pink. See Caryophyllum rubrum.

DIAPASMA. (From διαπασσω, to sprinkle.) A medicine reduced to powder and sprinkled over the body, or any part.

DIAPEDESIS. (From Siamosaw, to leap through.) The transudation or escape of blood through the coats of an artery.

DIAPEGMA. (From Sianvyvum, to close together.) A surgical instrument for closing together broken bones.

DIAPENTE. (From Siz. and mevre, five.) A medicine composed of five ingredients.

DIAPHANOUS. (From Siz, through, and paive, to shine.) A term applied to any substance which is transparent; as the hyaloid membrane covering the vitreous humour of the eye, which is as transparent

DIAPHENICUM. (From Sia, and point a date.) A medicine made of dates.

DIAPHORA. (From Stapepa, to distinguish.) The distinction of diseases by their characteristic marks and symptoms.

DIAPHORESIS. (From Surgeges, to carry through.) Perspiration or increased cutaneous secretion.

DIAPHORETICS. (Diaphoretica, sc. medicamenta; from Suapogew, to carry through.) Medicines which, from being taken internally, increase the discharge by the skin. When this is carried so far as to be condensed on the surface, it forms sweat; and the medicines producing it are named sudorifics. Between diaphoretics and sudorifics there is no distinction; the operation is in both cases the same, and differs only in degree from augmentation of dose, or employment of assistant means. This class of medicines comprehends five orders: 1. Pungent diaphoretics, as the volatile salts and essential oil, which are well adapted for the aged; those in whose system there is little sensibility; those who are difficultly affected by other diaphoretics; and those whose stomachs will not bear large doses of medicines. 2. Calefacient diaphoretics, such as serpentaria, contrayerva, and guaiacum: these are given in cases where the circulation is low and languid. 3. Stimulant diaphoretics, as antimonial and mercurial preparations, which are best fitted for the vigorous and plethoric. 4. Antispasmodic diaphoretics, as opium, musk, and camphire, which are given to produce a diaphoresis, when the momentum of the blood is increased. 5. Diluent diaphoretics, as water, whey, &c. which are best cal-

DIAPHRAGMA (From Six, and opention, Septum transversum. to divide.) midrif, or diaphragm. A muscle that divides the thorax from the abdomen. is composed of two muscles; the first and superior of these arises from the sternum, and the ends of the last ribs on each Its fibres, from this semi-circular origination, tend towards their centre, and terminate in a tendon, or aponeurosis, which is termed the centrum tendinosum. The second and inferior muscle comes from the vertebræ of the loins by two productions, of which that on the right side comes from the first, second, and third vertebræ of the loins; that on the left side is somewhat shorter, and both these proportions join and make the lower part of the dianhragm, which joins its tendons with the tendon of the other, so that they make but one muscular partition. It is covered by the pleura on its upper side, and by the

culated for that habit in which a predis-

position to sweating is wanted; and in

which no diaphoresis takes place, although

there be evident causes to produce it.

peritonæum on the lower side. It is pierced in the middle, for the passage of the vena cava; in its lower part for the œsophagus, and the nerves, which go to the upper orifice of the stomach; and betwixt the productions of the inferior muscle, passes the aorta, the thoracic duct, and the vena azygos. It receives arteries and veins called phrenic or diphragmatic, from the cava and aorta; and sometimes on its lower part two branches from the vena adiposa, and two arteries from the lumbares. It has two nerves which come from the third vertebra of the neck, which pass through the cavity of the thorax, and are lost in its substance. In its natural situation the diaphragin is convex on the upper side towards the breast, and concave on its lower side towards the belly: therefore, when its fibres swell and contract, it must become plain on each side, and consequently the cavity of the breast is enlarged to give liberty to the lungs to receive air in inspiration; and the stomach and intestines are pressed for the distribution of their contents; hence the usc of this muscle is very considerable; it is the principal agent in respiration, particularly in inspiration; for when it is in action the cavity of the thorax is enlarged, particularly at the sides, where the lungs are chiefly situated; and as the lungs must always be contiguous to the inside of the thorax and upper side of the diaphragm the air rushes into them, in order to fill up the increased space. In expiration it is relaxed and pushed up by the pressure of the abdominal muscles upon the viscera of the abdomen; and at the same time that they press it upwards, they pull down the ribs, by which the cavity of the thorax is diminished, and the air suddenly pushed out of the lungs.

DIAPHRAGMATITIS. (From διαφραγμα, the diaphragm.) Diaphragmitis. Paraphrenitis. An inflammation of the diaphragm. See Paraphrenitis.

DIAPHEAGMITIS. See Paraphrenitis.

Diaphthora. (Front διαφθέρα, to corrupt.) An abortion where the fœtus is corrupted in the womb.

DIAPHYLACTICA. (From διαφυλασσω, to preserve.) Medicines which resist putrefaction or prevent infection.

DIAPHYSIS. (From διαφυα, to divide.) An interstice or partition between the joints.

DIAPISSELÆUM. (From δια, and σισσελαιον, the oil of pitch, or liquid pitch.) A composition in which is liquid pitch.

DIAPLASIS. (From διατλάσσα, to put together.) The replacing a luxated or fractured bone in its proper situation.

DIAPLASMA. (From διαπλασσα, to anoint.) An unction or fomentation applied to the whole body or any part.

DIAPNE. (From States, to blow through

or pass gently as the breath does.) An involuntary and insensible discharge of the

(From Sixtrea, to breathe through.) The transpiration of air through

the pores of the skin.

DIAPNOICA. (From Sizzrew, to trans i.e.) Diaphoretics or medicines which promote perspiration.

(From Sixworsw, to be in DIAPOREMA.

doubt.) Nervous anxiety.

DIAPORON (From da, and orapa, autumnal fruits.) A composition in which are several autumnal fruits, as quinces, medlars, and services.

DIAPRASSIUM. (From Siz. and mparticy, horehound.) A composition of horehound. DIAPRUNUM. (From Siz, and mpsvn, a

prune ) An electuary of prunes.

DIAPSORICUM. (From Su, and Japa, the itch or scurvy.) A medicine for the itch or scurvy

DIAPTERNES. (From Siz, and Tippez, the heel.) A composition of cow heels and

DIAPTEROSIS. (From Sex, and Alepov, a feather.) The cleaning the ears with a fea-

DIAPYEMA. (From Sia, and muoy, pus.)

A suppuration or absce-s.

DIAPYEMATA. (From Statumua, a suppuration.) Suppurating medicines.

DIAPPETICA. (From Siatunua, a suppu-

ration.) See Diapyemata.

DIARHUCHA. (From dia, and pages, a space.) The space between the foldings of a bandage.

DIARIUS. (From dies, a day.) A term applied to fevers which last but one day.

DIAROMATICUM. (From Sia, and apopua-Tixov, an aromatic.) A composition of spices.

Diarrhage. (From Siappnyvumi, to break asunder.) A fracture of the temple bones.

DIABRHODOMELI. (From Siagosov, a rose, and ment, honey.) Scammony, agaric, pepper and honey.

(From dia, and podov, a DIARRIGODON.

rose.) A composition of roses.

DIARRHŒA. (From diagesw, to flow through.) A purging. It is distinguished by frequent stools with the natural excrement, not contagious, and seldom attended with pyrexia. It is a genus of disease in the class neuroses, and order spasmi of Cullen, containing the following species: 1. Diarrhau crapulosa. The feculent diarrhaa, from crapulus, one who overloads his stomach. 2. Diarrha biliosa. The bilious, from an increased secretion of bile. 3. Diarrhau mucosa. The mucous, from a quantity of slime being voided. 4. Diarrhan hepatirrhan. The hepatic, in which there is a quantity of scrous matter, somewhat resembling flesh, voided; the liver ber 3 marriy affected. 5. Diarrhaa lienterica. The lientery; when the food passes

unchanged. 6. Diarrhau caliaca. The coliac passion: the food passes off in this affection in a white liquid state like chyle. 7. Durrhaa verminsa. Arising from worms.

DIARTHROSIS. (From Suppeou, to articulate.) A moveable councaion of bones. This genus has five species, viz. enarthrosis, arthrodia, ginglymus, trochoides, and amplivarthrosis.

DIASAPONIUM. (From Siz, and ourar,

soap.) An ointment of soap.

DIASATTRIUM. (From Sia, and ralupion, the orchis.) An ointment of the orchis-

Diascillium. (From dia, and oxida, the squill.) Oxymel and vinegar of squills.

Diascincus. (From dia, and out nos, the crocodile.) A name for the mithridate, in the composition of which there was a part of the crocodile.

DIASCORDIUM. (From Six, and ousplier, the water germander.) Electuary of scor-

Diasena. (From dia, and sena.) A medicine in which is seima.

DIASMYRNUM. (From Siz, and Guupyn, myrrh.) A collyrium containing myrrh.

DIASOSTICA. (From Suzala, to preserve.)

Medicines which preserve health,

DIASPERMATUM. (From dia, and oreque, seed.) A medicine composed chiefly of

DIASPHAGE. (From Siaopaža, to separate.) Diusphaxis. The interstice between two veins.

DIASPHYXIS. (From Siz. and opula, to

strike.) The pulsation of an artery.
DIASTASIS. (From διστημι, to separate.) Diastema. A separation.

1. A separat on of the ends of bones.

2. (From Surraya, to distend.) The extension of a fractured limb, in order to reduce it.

DIASTETUMA. (From dia, and seap, fat.) An ointment of the fat of animals.

DIASTEMA. See Diastusis.

DIASTOLE. (From Siz, and στελλω, to stretch.) The dilatation of the heart and ar-

(From Siasopica, to di-DIASTOMOSIS. late.) Any dilatation, or dilating instru-

DIASTREMMA. (From diaspeque, to turn aside.) Diastrophe. A distortion of any limb or part.

DIASTROPHE. See Diastremma.

DIATECOLITHUM. (From Siz, and Innoxibos, the Jew's stone.) An antidote containing lapis judaicus.

DIATERESIS. (From Six, and Tepew, to perforate.) A perforation or aperture.

DIATERETICA. (From Siz, and Tepew, to preserve.) Medicines which preserve health and prevent disease.

(From dia, and Terrapes, DATESSARON four ) A medicine compounded of four simple ingredients.

DIATETTIGUM. (From diz, and Netlig, a grasshopper.) A medicine in the composition of which were grasshoppers.

(From Sizenius, to dis-DIATHESIS. pose.) Any particular state of the body: thus, in inflammatory fever, there is an inflammatory diathesis, and, during putrid fever, a putrid diathesis.

DIATHESMUS. (From Statew, to run through.) A rupture through which some

fluid escapes.

DIATRAGACANTHUM. (From δια, and τραγακανθα, tragacanth.) A medicine composed of gum-tragacanth.

DIATRIUM. (From Sia, and Ipeis, three.) A medicine composed of three simple in-

gredients.

DIAXYLALOES. (From Siz, and Euraron, the lign aloe.) A medicine in which is

lignum aloes.

DIAZOMA. (From διαξωννυμι, to surround; because it surrounds the cavity of the tho-

rax.) The diaphragm.

Diazosten, (From Statewroun, to surround; because when the body is girded, the belt usually lies upon it.) A name of the twelfth vertebra of the back.

DICENTETUM. (From Siz, and nevlew, to stimulate.) A pungent stimulating col-

lyrium.

DICHASTERES. (From διχαξω, to divide, because they divide the foot.) A name of the fore-teeth.

DICHOPHYIA. (From fixz double, and φυω, to grow.) A distemper of the hairs, in which they split and grow forked.

DICROTIC. (Dicroticus, sc. pulsus; from dia, twice, and xexw, to strike.) term given to a pulse in which the artery rebounds after striking, so as to convey the sensation of a double pulsation.

DICTAMNITES. (From Sinlamvos, dittany.)

A wine medicated with dittany.

(From Dictamnus, a DICTAMNUS. city in Crete, on whose mountains it grows.) The name of a genus of plants in the Linnaun system. Class, Decandria. Order,

Monogynia. Dittany.

DICTAMNUS ALBUS. White fraxinella, or bastard dittany. Fraxinella. Dictamus albus; foliss pinnatis, caule simplici, of Linnaus. The root of this plant is the part directed for medicinal use; when fresh, it has a moderately strong, not disagreeable, smell. Formerly it was much used as a stomachic, tonic, and alexipharmic, and was supposed to be a medicine of much efficacy in removing uterine obstructions and destroying worms; but its medi-cinal powers became so little regarded by modern physicians, that it had fallen almost entirely into disuse, till Baron Stoerck brought it into notice, by publishing several cases of its success, viz. in tertian intermittents, worms (lumorici) and men-strual suppressions. In all these cases, he

employed the powdered root to the extent of a scruple twice a day. He also made use of a tincture, prepared of two ounces of the fresh root digested in 14 ounces of spirit of wine; of this, 22 to 50 drops two or three times a day, were successfully employed in epilepsies, and, when joined with steel, this root, we are told, was of great service to chlorotic patients. dictamnus undoubtedly, says Dr. Woodville, is a medicine of considerable power; but notwithstanding the account of it given by Stoerck, who seems to have paid little attention to its modus operandi, we may still say with Haller " nondum autem vires pro dignitate exploratus est," but is now fallen into

DICTAMNUS CRETICUS. Dittany of Crete. Origanum creticum. The leaves of this plant, Origanum dictamnus; foliis inferioribus tomentosis, spicis nutantibus, of Linnæus, are now rarely used; they have been recommended as emmenagogue and alexipharmic.

DIDYMÆA. (From δίδυμος, double.) A cataplasm; so called by Galen, from the

double use to which he put it.

DIDIMI. (From & idopos, double.) Twins. An old name of the testicles, and two eminences of the brain, from their double protuberance.

(Fom ola, and excanac, DIECBOLIUM. to cast out.) A medicine causing an abor-

DIELECTRON." (From Sta, and executor, amber.) A name of a troche, in which

amber is an ingredient. DIERVILLA. (Named in honour of Mr. Dierville, who first brought it from Arcadia.) The young branches of this species of honeysuckle, Lonicera diervilla racemis terminalibus, foliis serratis of Linnæus, are employed in North America as a certain remedy in gonorrhoa and suppression of

urine. It has not yet been exhibited in Europe.

DIET. The dietetic part of Diæta. medicine is no inconsiderable branch, and seems to require a much greater share of regard than it commonly meets with. A great variety of diseases might be removed by the observance of a proper diet and regimen, without the assistance of medicine, were it not for the impatience of the However, it may on all occasufferers. sions come in as a proper assistant to the cure, which sometimes cannot be perform-ed without a due observance of the nonnaturals. That food is, in general, thought the best and most conducive to long life, which is most simple, pure, and free from irritating, and such as approaches nearest to the nature of our own bodies in a healthy state, or capable of being easiest converted into their substance by the vis vitæ, after it has been duly prepared by

the art of cookery; but the nature, composition, virtues, and uses of particular atiments can never be learnt to satisfaction, without assistance of practical chym-

DIET DRINK. An alterative decoction employed daily in considerable quantities, at least from a pint to a quart. The decoction of sarsaparilla and mezereon, the Lisbon diet drink, is the most common and most useful.

DIETETICS. That part of medicine which considers the way of living with relation to food, or diet, suitable to any particular case

Diexonos. (From dia, and exosos, a way Diodos. In Hippocrates it to pass out.) means evacuation by stool.

DIFFLATIO. (From difflo, to blow away.)

Perspiration,

DIGASTRICUS. (Digastricus, sc. musc. from de, twice, and γαστηρ, a belly.) Biventer maxillæ of Albinus. Mastoido hy-genien of Dumas. A muscle so called from its having two bellies, situated externally between the lower jaw and os hyoides. It arises, by a fleshy belly, from the upper part of the processus mastoidæus, and descending, it contracts into a round tendon, which passes through the stylohyoid aus, and an annular ligament which is fastened to the os hyoides; then it grows fleshy again, and ascends towards the middle of the edge of the lower jaw, where it is inserted. Its use is to open the mouth by pulling the lower jaw downwards and backwards; and when the jaws are shut to raise the larynx, and consequently the pharynx, upwards, as in deglutition.

DIGERENTIA. (From digero, to digest.)
Medicines which promote the secretion of proper pus in wounds and ulcers.

DIGESTION. (Digestio, from digero,

to dissolve.)

1. An operation in which such matters as are intended to act slowly on each other, are exposed to a slow heat, continued for

2. The change that the food undergoes in the stomach, by which it is converted into chyme. The circumstances necessary to effect a healthy digestion of the food are: 1. A certain degree of heat of the stomach. 2. A free mixture of saliva with the food in the mouth. 3. A certain quantity of healthy gastric juice. 4. The natural peristaltic motion of the stomach. 5. The pressure of the contraction and relaxation of the abdominal muscles and diaphragm. From these circumstances, the particles of the food are softened, dissolved, diluted, and intimately mixed into a soft pap, called chyme, which passes through the pylorus of the stomach into the duodenum. The fluid which is termed gastric juice, is separated by the minute arteries opening into the cavity of the stomach.-

From various experi-See Gastric Juice. ments of physiologists, it is ascertained that the gastric juice reduces the aliments into an uniform pap or paste, even out of the body; that it acts in the same manner after death; and that it is the chief agent in the process of digestion.

Animals only are invested with organs of digestion; every one, from man to the polypus, presents an alimentary canal differently formed; the existence of a digestive apparatus, then, could be given as an essential character of animal life. In man this consists of a long canal extending from the mouth to the anus, into which open the excretory ducts of various glands, situated in the vicinity, that secrete liquors, necessary to alter, liquefy, and animalize alimen-

tary matter.

It would be useless to recapitulate the hypotheses formed to explain digestion; they may be reduced to coction, fermentation, trituration, putrefaction, and maceration of the food received into the cavity of the stomach. Physiologists are generally agreed, at present, in considering digestion in the stomach as a solution of the aliment by the gastric juice. This liquid, copiously poured on the internal surface of the stomach, when this viscus is irritated by the presence of food, is the production of arterial exhalation; it is neither an acid nor alkali, and seems to be of a nature nearly analogous to saliva; the gastric juice producing great properties of solutions, penetrates into the alimentary matter on all sides, separates and divides its particles, combines with it, changes its composition, and impresses qualities very different from those it possessed before this mixture. In fact, if a mouthful of wine or food be re-turned from the stomach some minutes after it has been received, the odour, taste, and all the qualities, both physical and chymical, of these substances, are so altered, that we can with difficulty distinguish them; and vinous liquors, more or less acid, are no longer susceptible of spirituous fermentation. The energy of the power of the gastric juice, perhaps exaggerated by some physiologysts, is sufficient to reduce to a soft mass the hardest bones, on which certain animals subsist: it is very probable that its chymical composition is different and variable, and that it is acid, alkaline, or saponaceous, according to the nature of the aliment. Although gastric juice is the most powerful agent of digestion in the stomach, its dissolvent power has need of assistance from the action of several secondary causes, as heat, which seems to augment and concentrate itself in the epigastric region. So long as the exertion of the stomach continues, there is a sort of intestine fermentation, which should not be, in the full sense, compared to the motion by which fermentative and putrescent substances are decomposed; there is also a moderate and peristaltic motion of the nauscular fibres of the stomach which press the aliment on all sides, and perform a slight trituration, while the gastric moisture softens and macerates the food before it is dissolved; it may then be affirmed that the process of digestion is at the same time chymical, vital, and mechanical: the authors, therefore, of various theories to explain this function, have erred by attributing to one cause only, as heat, fermentation, putrefaction, trituration, maceration, and the gastric juice, that which is the aggregate result of all those causes united.

The aliment remains a greater or less time in the stomach, agreeably to the facility or difficulty of the necessary changes taking place. Gosse of Geneva, has proved on himself, that the animal and vegetable fibre, the white of an egg boiled, white and tendinous parts, paste kneaded with butter, schaeeous substances, and those things which are not fermented, or very little fermentative, make greater resistance to the gastric juice, than the gelatinous parts of vegetables and animals, fermented bread, &c. that the latter class of substances require only an hour for their complete dissolution, while the digestion of the former was not completed at the end of several hours.

During the time of digestion, both orifices of the stomach are closed; no gas, disengaged from the aliment, ascends through the esopliagus, unless in cases of bad digestion: slight chills are felt; the pulse becomes quicker and stronger, and the powers of life seem diminished in some organs, to be carried to the seat of the digestive process. The parieties of the stomach soon begin to act: their circular fibres contract in different parts of its extent; these peristaltic oscillations, at first vague and uncertain, become more regular, and are directed from above downwards, from left to right, that is, from the cardia, towards the pylorus; its longitu linal fibres also contract, and thus approximate both terminations. In these different motions the stomach becomes parallel with the pylorns, and the angle formed by the duodenum is almost totally obliterated, which renders the passage of food casier. It has been remarked, that digestion proceeds better during sleep, when we lie on the right side than on the left, and this difference has been attributed to the compression made by the liver on the stomach. It should rather be considered, that on the right side, the passage of food is accelerated by its own gravity, the situation of the stomach is naturally oblique, from left to right, and becomes more so in consequence of changes induced by food.

The aperture of the pylorus is furnished with a muscular ring, covered by a duplicature of mucous membrane; this kind of sphincter keeps it closed during the time of digestion in the stomach, and does not give passage to the aliment until it has undergone a very material alteration. The pylorus, possessing a peculiar and extremely delicate sensibility, may be considered as a sort of vigilant centinel, that prevents any thing from passing that has not suffered proper changes. Many anthors quoted by Haller, have been well aware that the food did not pass from the stomach successively in the same manner as it was received, but agreeably to its greater or less facility of digestion.

It would appear that there is a real selection of food in the stomach, for those aliments that admit of an easy digestion are directed towards the pylorus, which gives passage to them; while, on the contrary, such as are not sufficiently digested are not permitted to pass, but kept back in the stomach. This delicate feeling, which we attribute to the pylorus, this exquisite sense, by which it exerts a kind of choice on the food that passes through, may be perhaps objected to; pieces of money, however, or other extraneous indigestible bodies, remain a longer or shorter time in the stomach before they go into the intestines, and present themselves several different times at the orifice of the pylorus, and do not get through till after it has been accustomed to their contact. It is the same with the gastric system as with a secreting gland; and in the same manner the 6mmencement of excretory ducts, possessed of a sort of elective sensibility, do not receive the secreted liquor before it has undergone necessary preparations in the glandular parenchyma; so the pylorus, which may be considered the excretory duct of the stomach, does not admit the food nor suffer it to pass into the intestines, until it has been sufficiently elaborated by the action of this organ.

In proportion as the stomach becomes empty, the spasm of the skin ceases, a moderate heat succeeds the shiverings, the pulse becomes more evident and elevated, the quantity of insensible perspiration increases; digestion then produces a general motion, analogous to a feverish paroxysm; and this digestive fever, described also by the ancients, is most casy to be observed in women of great sensibility. Nothing posi-tive can be established on the duration of digestion in the stomach. The aliments go out of the stomach with more or less celerity, in proportion as they offer a greater or less resistance to those powers which serve to dissolve them, and agreeably to the energy and strength of the stomach and activity of the gastric juice: five hours, however,

inay be considered the ordinary time of

The action of the parieties of the stomach ceases when this viscus is entirely liberated from the aliments that were in its cavity, but not before; the gastric juice, the secretion of which is not augmented by any stimulus, is no longer poured out by its arteries; and the parieties which come into contact with each other, are only lubricated by the mucous copiously secreted by its internal coat.

DIGESTIVES. (Digestiva, sc. medicamenta; from digero, to dissolve.) A term applied by surgeons to those substances which, when applied to an ulcer or wound, promote suppuration : such are the ceratum resinæ flavæ, unguentum elemi, warm poultices, fomentations, &c.

DIGESTIVUM SAL SYLVII. See Murias

potasse.

DIGITALIS. (From digitus, a finger; because its flower represents a finger.) 1. The name of a genus of plants in the Linnæan system. Class, Didynamia. Order,

.Ingiospermia. Fox-glove.

2. The pharmacopæial name of the common fox-glove. Digitalis purpurea of Linnæus :- calycudis foliolis ovatis acutis, corollis obtusis, labio superiore integro. leaves of this plant have a bitter nauseous taste, but no remarkable smell; they have been long used externally to ulcers and scrophulous tumours with considerable advantage. When properly dried, their colour is a lively green. They ought to be collected when the plant begins to blossom, to be dried quickly before the fire, and preserved unpowdered.

Of all the narcotics, digitalis is that which diminishes most powerfully the actions of the system; and it does so without occasioning any previous excitement. Even in the most moderate dose, it diminishes the force and frequency of the pulse, and, in a large dose, reduces it to a great extent, as from 70 beats to 40 or 35 in a minute, occasioning, at the same time, vertigo, indistinct vision, violent and durable sickness, with vomiting. In a still larger quantity, it induces convulsions, coldness of the body, and insensibility; symptoms which have sometimes terminated fatally. narcotic, fox-glove has been recommended in epilepsy, insanity, and in some acute inflammatory diseases. Lately it has been very extensively employed in phthisis, and the beneficial effects which it produces in that disease, are probably owing to its narcotic power, by which it reduces the force of the circulation through the lungs and general system. It is administered so as to produce this effect. One grain of the powdered leaves, or ten drops of the saturated tincture, may be given night and morning. This dose is increased one half every second day, till its action on the sys-

tein becomes apparent. As soon as the pulse begins to be diminished, the increase of dose must be made with more caution; and, whenever nausea is induced, it ought rather to be reduced, or, if necessary, intermitted for a short time. If the sickness become urgent, it is best relieved by stimulants, particularly large doses of brandy, with aromatics. The tincture has been supposed to be the best form of administering digitalis, when the remedy is designed to act as a narcotic: it is also more manageable in its dose and more uniform in its strength, than the dried leaves.

Besides its narcotic effects, digitalis acts as one of the most certain diuretics in dropsy, apparently from its power of promoting absorption. It has frequently succeeded where the other diuretics have failed. Dr. Withering has an undoubted claim to this discovery; and the numerous cases of dropsy related by him, and other practitioners of established reputation, afford incontestable evidence of its diuretic powers, and of its practicable importance in the cure of those disorders. From Dr. Withering's extensive experience of the use of the digitalis in dropsies, he has been able to judge of its success by the following circumstances :- "It seldom succeeds in men of great natural strength, of tense fibre, of warm skin, of florid complexion, or in those with a tight and cordy pulse. If the belly in ascites be tense, hard, and circumscribed, or the limbs in anasarca solid and resisting, we have but little hope. On the contrary, if the pulse be feeble, or intermitting, the countenance pale, the lips livid, the skin cold, the swollen belly soft and fluctuating, the anasarcous limbs readily pitting under the pressure of the finger, we may expect the diuretic effects to follow in a kindly manner." Of the inferences which he deduces, ner." Of the interences which he deduces, the fourth is, "that if it (digitalis) fails, there is but little chance of any other medicine succeeding." Although the digitalis is now generally admitted to be a very powerful diuretic, yet it is but justice to asknowledge that this medicine has more acknowledge that this medicine has more frequently failed than could have been reasonably expected from a comparison of the facts stated by Dr. Withering. dose of the dried leaves in powder, is from one to three grains twice a day. But if a liquid medicine be preferred, a drachm of the dried leaves is to be infused for four hours, in half a pint of boiling water, adding to the strained liquor an ounce of any spirituous water. One ounce of this infusion, given twice a day, is a medium dose. It is to be continued in these doses till it either acts upon the kidneys, the stomach, the pulse, (which as has been said, it has a remarkable power of lowering,) or the bowels.

The administration of this remedy re-

quires to be conducted with much caution. Its effects do not immediately appear; and when the doses are too frequent, or too quickly augmented, its action is concentrated so as to produce frequently the most violent symptoms. The general rules are, to begin with a small dose, to increase it gradually, till the action is apparent on the kidneys, stomach, intestines, or vascular system; and immediately suspending its exhibition, when its effects on any of these parts take place.

The symptoms arising from too large a dose of digitalis are, extreme sickness, verugo, indistinct vision, incessant vomiting, and a great reduction of the force of the circulation, terminating sometimes in syncope or convulsions. They are relieved by frequent and small doses of opium, brandy, aromatics, and strong bitters, and by a blister applied to the region of the stomach.

DIGITIUM. (From digitus, a finger.) A contraction of the finger-joint. A paronychia, or whitlow, or other sore upon the

tinger.

DIGITUS. (From digero, to direct.) A

finger.

Digitus manus. A finger. The fingers and thumb in each hand consist of fourteen bones, there being three to each finger; they are a little convex and round towards the back of the hand, but hollow and plain towards the palm, except the last, where the nails are. The order of their dispositions is called first, second, and third phalanx. The first is longer than the second, and the second longer than the third. What has been said of the fingers, applies to the toes also.

DIGITUS PEDIS. A toe. See Digitus ma-

nus.

DIGLOSSUM. (From \$\delta\_6\$, double, and \$\rangle \rangle \approx a\$ tongue; so called because above its leaf there grows a lesser leaf, like two tongues.) The laurus alexandrina. Galen speaks of a man born with two tongues.

DIGNOTIO. (From dignosco, to distin-

guish.) See Diagnosis.

DIREMATON. (From Sa, and aspa, blood.) An antidote in which is the blood of many animals.

Dinalon. (From Sia, and ake, salt.) A plaster prepared with salt and nitre, adapt-

ed to foul ulcers.

DIFFTES. (From Zeus, dios, Heaven, and artia, to fall: i.e. falling as rain.) An epithet applied by Hippocrates to semen, when it is discharged like a sudden shower of rain.

DILATATIO. (From dilato, to enlarge.) Dilatation, or enlargement. Diastole.

DILATOR. (From dilato, to enlarge.) The name of some muscles whose office is to open and enlarge parts.

DILATORES ALARUM NASI. See Leva-

tor

DILATORIUM. (From dilato, to enlarge.)

A surgical instrument for enlarging any part. A speculum oris.

Dill. See Anethum.

DILUENTS. (Diluentia, sc. medicamenta; from diluo, to wash away.) Those substances which increase the proportion of fluid in the blood. It is evident that this must be done by watery liquors. Water is indeed, properly speaking, the only diluent. Various additions are made to it, to render it pleasant, and frequently to give it a slightly demulcent quality. But these are not sufficiently important to require to be noticed, or to be classed as medicines.

Diluents are merely secondary remedies. They are given in acute inflammatory diseases, to lessen the stimulant quality of the blood. They are used to promote the action of diuretics in dropsy, and to favour

the operation of sweating.

DINICA. (From Stros, giddiness.) Medicines which relieve a giddiness.

DINOS. (From Sivea, to turn round.) A

vertigo, or giddiness.

Diocres. The name of a lozenge.

Dionos. (From Su, and ofoc, the way through.) Evacuation by stool.

DIMENANTIES. (From fix, and owarbu, the flower of the vine.) A remedy said to be good for cholera morbus, in which was the flower of the vine-tree.

Diognus. (From διακα, to persecute.)
A distressing palpitation of the heart.

DIONYSISCUS (From Διονυσος, Bacchus, was of old represented as having horns.) Certain bony excrescences, near the temples, were called dionysisci.

DIONYSONYMPHAS. (From Διονυσος, Bacchus, and νυμφα, a nymph.) A herb which, if bruised, smells of wine, and yet resists

drunkenness.

DIAFORUM. (From Siz, and orange, autumnal fruits.) A medicine composed of ripe fruits for quincy.

DIOPTRA. (From Surflowas, to see through.) Dioptron. Speculum ani oris, or uteri. Also the lapis specularis.

Dioptrica. (From Surloyas, to see through.) Dioptrics, or doctrine of the refraction of light.

DIOPTRISMUS. (From Storflough, to see through.) Dilatation of any natural passage.

DIOROBUM. (From Su, and ogshoc, a vetch.) A medicine, in the composition of which there are vetches.

DIGIRHOSIS. (From &ix, and oggos, the serum.) Diorosis. A dissolved state of the blood. A conversion of the humours into serum and water.

DIORTHROSIS. (From διορθέου, to direct.)

The reduction of a fracture.

DIOSCOREA. (Named in honour of Dioscorides.) The name of a genus of plants in the Linnman system. Class, Diacia. Order, Hexandria.

DIOSCOREA ALATA. See Yam.

DIOSCOREA BULBIFERA. See Yum.

DIS

DIOSCOREA SATIVA. See Yam.

DIOSCURI. (i. e. Διος Κυροι, the sons of Jupiter, or Castor and Pollux.) The parotids were so named from their twin-like equality in shape and position.

DIOSPYROS LOTUS. See Indian date

DIOXELEUM. (From Sia ogus, acid, and anasov, oil.) A medicine composed of oil and vinegar.

Dioxos. (From Siz, and ogos, acid.) A collyrium composed chiefly of vinegar.

DIPLISIASMUS. (From Sinhow, to double.) The re-exacerbation of a disease.

DIPLOE. (From διπλοω, to double.) Meditulluim. The spongy substance between the two tables of the skull.

DIPLOPIA. (From Simhos, double, and ease of the eye, in which the person sees an object double or triple. Dr. Cullen makes it a variety of the second species of pseudoblepsis, which he calls mutans, in which objects appear changed from what they really are: and the disease varies according to the variety of the remote cause.

DIPNOUS. (From  $\delta \iota_{\mathcal{E}}$ , twice, and  $\pi \nu \iota_{\mathcal{E}}$ , to breathe.) An epithet for wounds which are perforated quite through, and admit

the air at both ends.

DIPSACUS. (From ha, thirst; so called from the concave situation of its leaves, which hold water, by which the thirst of the traveller may be relieved.) Diapsacum.

1. The name of a genus of plants in the Linnæan system. Class, Syngenesia. der, Polygamia. The teasel.

2. A diabetes, from the continual thirst attending it.

DIFIRENUM. (From Sis, twice, and Tuent, a berry.) A berry, or kernel: a probe with two buttons.

DIPYRITES. (From Sis, twice, and rug, fire.) Dipyros. An epithet given by Hippocrates to bread twice baked, and which he recommended in dropsies.

DIRECTOR. (From dirigo, to direct.) A hollow instrument for guiding an incisor-knife; also the name of a muscle which lifts up the penis.

DIRECTORES PENIS. (From dirigo, to direct.) The same as erectores penis.

DIRINGA. A name, in the isle of Java,

for the calamus aromaticus.

Discessus. (From discedo, to depart.) The separation of any two bodies, before united by chymical operation.

Disciformis. (From discus, a quoit, and forma, likeness.) Resembling a disk, or quoit, in shape. It is applied to the knee-pan.

Discordes. (From Signos, a quoit.) Resembling a disk, or quoit, in shape. It is applied to the chrystalline humour of the eye.

DISCRIMEN. A small roller. A term applied to the diaphragm.

DISCUTIENTS. (Discutientia, sc. mcdicamenta; from discutio, to make in pieces.) Discusoria. Diachytica. A term in surgery applied to those substances which possess a power of repelling or resolving tumours.

DISEASE. Morbus. Any alteration from a perfect state of health is a disease. A disease is variously termed: when it pervades the whole system, and does not depend on any other disease, as an inflam-matory fever, for instance, it is called a general disease, to distinguish it from inflammation of the eye, or any other viscus, which is a partial or local one: and when it does not depend on another disease, it is termed an idiopathic disease, which may be either general or partial, to distinguish it from a symptomatic affection, which depends upon another disease, and is produced by consent of parts. See also Endemic, Epidemic, Sporadic, &c.

DISLOCATION. (From disloco, to put out of place.) Luxation. The secession of a bone of a moveable articulation from

its natural cavity.

DISPENSARY. (Dispensarium, from dispendo, to distribute.) The shop, or place, in which medicines are prepared. Also the name of an institution, in which the poor are supplied with medicines and advice.

DISPENSATORY. (Dispensatorium; from dispendo, to distribute.) Antidotarium. A book which treats of the composi-

tion of medicines.

DISSECTION. (From disseco, to cut asunder.) The cutting to pieces of any part of an animal, or vegetable, for the purpose of exmining its structure.

DISSEPTUM. (From dissepio, to inclose round.) The diaphragm, or membrane, which divides the cavity of the thorax from

the abdomen.

DISSOLVENTIA. (From dissolvo, to loosen.) Medicines which loosen and dissolve morbid concretions in the body. In chymistry it means menstrua.

DISSOLUTUS. (From dissolvo, to loosen.) Loose. An epithet applied to the dysen-

tery, or morbus dissolutus.

DISTENTIO. (From distendo, to stretch out.) Distention, or dilatation. A convulsion.

DISTICHIA. See Distichiasis.

DISTICHIASIS. (From Sistizia; from dis, double, and sixos, a row.) Distichiasis. Distichia. A disease of the eyelash, in which there is a double row of hairs, the one row growing outwards, the other inwards towards the eye.

DISTILLATION. (From distillo, to drop little by little.) Alsacta. Catustag. A chymical process, very similar to evaporation, instituted to separate the volatile from the fixed principles by means of heat. Distillatory vessels are either alemhics or retorts; the former consist of an

inferior vessel, called a cucurbit, designed to contain the matter to be examined, and having an upper part fixed to it, called the capital, or head. In this last, the vapours are condensed by the contact of the sur-rounding air, or, in other cases, by the assistance of cold water surrounding the head, and contained in a vessel called the refrigeratory. From the lower part of the capital proceeds a tube, called the nose, beak, or spout, through which the vapours, after condensation, are, by a proper figure of the capital, made to flow into a vessel called the receiver, which is usually spherical. These receivers have different names, according to their figure, being called mattrasses, balloons, &c. Retorts are a kind of hottle of glass, pottery, or metal, the bottom being spherical, and the upper part gradually diminishing into a neck, which is turned on one side.

DISTORTION. (From distorqueo, to wrest aside.) Distortio. A term applied to the eyes, when a person seems to turn them from the object he would look at, and is then called squinting, or strabismus. It also signifies the bending of a bone preternaturally to one side; as distortion of the

spine, or vertebra.

DISTORTOR. (From distorqueo, to wrest aside.) A muscle, whose office is to draw the mouth awry.

DISTORTOR ORIS. (From distorqueo, to wrest aside.) The zygomaticus mi-

DISTRICHIASIS. See Distichiasis.

DISTRIX. (From dis, double, and lgis, the hair.) A disease of the hair, when it splits and divides at the end.

Dittander. Sec Nasturtium hortense. Dittany, bastard. Sec Dictamnus al-

Dittany of Crete. See Dictamnus creti-

Dittany, white. See Dictamnus albus.
DIURESIS. (From &u, through, and pu, to flow.) An increased secretion of urine.

It is also applied to a diabetes.

DIURETICS. (Diuretica, sc. medicamenta, dispartica: from disports, a discharge of urine.) Those medicines or substances are so called which, when taken internally, augment the flow of urine from the kidneys. It is obvious that such an effect will be produced by any substance capable of stimulating the secreting vessels of the kidneys. All the saline diaretics seem to act in this mapper. They are received into the circulation; and passing off with the urine, stimulate the vessels, and increase the quantity secreted.

There are other diureties, the effect of which appears not to arise from direct application, but from an action excited in the stomach, and propagated by nervous communication to the secreting urinary vessels. The diuretic operation of squill,

and several other vegetables, appears to be of this kind.

There is still, perhaps, another mode in which certain substances produce a ditrectic effect; that is, by promoting absorption. When a large quantity of watery fluid is introduced into the circulating mass, it stimulates the secreting vessels of the kidneys, and is carried off by urine. If, therefore, absorption be promoted, and if a portion of serous fluid, perhaps previously effused, be taken up, the quantity of fluid secreted by the kidneys will be increased. In this way digitalis seems to act: its diuretic effect, it has been said, is greater when exhibited in dropsy than it is in health.

On the same principle, (the effect arising from stimulating the absorbent system,) may probably be explained the utility of mercury in promoting the action of several diareties.

The action of these remedics is promoted by drinking freely of mild dilectes. It is also influenced by the state of the surface of the body. If external heat be applied, diuresis is frequently prevented, and diaphoresis produced. Hence the doses of them should be given in the course of the day, and the patient, if possible, be kept out of bed.

The direct effects of diurctics are sufficiently evident. They discharge the watery part of the blood; and, by that discharge, they indirectly promote absorption

over the whole system.

Dropsy is the disease in which they are principally employed; and when they can be brought to act, the disease is removed with less injury to the patient than it can be by exciting any other evacuation. Their success is very precarious, the most powerful often failing; and, as the disease is sofrequently connected with organic affection, even the removal of the effused fluid, when it takes place, only palliates without effecting a cure.

Diuretics have been likewise occasionally used in calculous affections, in gonorrhoa, and with a view of diminishing piethora, or

checking profuse perspiration.

Murray, in his Elements of Materia Medica, classes the super-tartrite of potash, or oritre, the muriate of ammonia, or crude salammoniac, potash, and the acetate of potash, or kali acetatum, among the saline diuretics; and selects the following from the vegetable kingdom:—scilla maritima, digitalis purpurea, uicotisna tabacum, solannm dulcamara, lactuca virosa, colchicum autumnale, gratiola officinalis, spartium scopairum, juniperus communis, copaifera officinalis, pinus balsamea, and pinus larix; and the lytta vesicatoria from the animal kingdom.

In speaking of particular diuretics, Dr.

tioned by writers are of very little power, and are employed with very little success. Of the umbellata, the medicinal power resides especially in their seeds; but he never found any of them very efficacious. The semen dauci sylvestris has been commended as a diuretic; but its powers as such are not very remarkable. In like manner some of the plante stellate have been commended as diuretics; but none of them deserve our notice, except the rubia tinctorum, the root of which passes so much by the kidneys as to give its colour to the urine. Hence it may fairly be supposed to stimulate the secretories; but Dr. Cullen found its diuretic powers did not always appear, and never to any con siderable degree; and as in brute animals it has always appeared hurtful to the system, he does not think it fit to be employed to any extent in human diseases. The bardana, lithospermum, ononis, asparagus, enula campana, are all substances which seem to pass, in some measure, by the kidnevs; but their diuretic powers are hardly worth notice.

The principal articles included by Dr. Cullen, in his catalogue of diuretics, are dulcamara, digitalis, scilla; some of the alliaciæ and siliquosæ; the balsams and resins; cantharides, and the diuretic salts.

DIVAPORATIO. Evaporation.

DIVAPORATIO.

DIVARICATION. The crossing of any two things: thus when the muscular or tendinous fibres intersect each other at the different angles, they are said to divaricate.

DIVERSORIUM. (From diversor, to resort

to.) The receptaculum chyli.

DIVERTICULUM. A mal-formation or diseased appearance of a part, in which a portion goes out of the regular course; and thereby forms a diverticulum, or deviation from the usual course. It is generally applied to the alimentary

DIVERTICULUM NUCKII. The opening through which the round ligaments of the uterus pass. Nuck asserted that it remained open a long time after birth; to these openings he gave the name of diverti-

DIVINUS. A pompous epithet of many compositions, from their supposed excel-

DIVULSIO. (From divello, to pull asunder.) Urine, with a ragged and uneven

DOCIMASTIC ART. Ars docimastica. The art of examining tossils, in order to discover what metals, &c. they contain.

Dock-cresses. See Lampsana.

Dock, sour. See Acetosa.

Dock, water. See Hydrolapathum.

Dodder of thyme. See Epithymum. Dodecadactilus. (From Sodera, twelve, and faxluxos, a finger; so named, be-

Cullen says, the diuretic vegetables men- cause its length is about the breadth of twelve fingers.) The duodenum, an intestine so called. It must be observed, that at the time this name was given, anatomy consisted in the dissection of brutes; and the length was therefore probably adjudged from the gut of some animal, and not of man.

DODECAPHARMACUM. (From Sofera, twelve. and preguzator, a medicine.) An ointment consisting of twelve ingredients, for which reason it was called the ointment of the twelve apostles.

DODECATHEON. (From Sodnuz, twelve, and Tibnui, to put.) An antidote consisting

of twelve simples. Dog-rose. See Cynosbatus.

Dog's BANE, SYRIAN. This plant, Asclepias Syriaca of Linnxus, is particularly poisonous to dogs, and also to the human species. Boiling appears to destroy the poison in the young shoots, which are then said to be esculent, and flavoured like asparagus.

Dog's-grass. See Gramen caninum. Dog's mercury. See Cynocrambe.

Dog-stones. See Satyrion.
DOGMA. (From δοδω, to be of opinion.) An opinion founded on reason and experi-

DOLICHOS. (From Jonixos, long: so called from its long shape.) 1. The name of a genus of plants in the Linnzan system. Class, Diadelphia. Order, Decandria.

2. The pharmacopæial name of the cowhage. Dolichos pruriens of Linnaus :- volubilis, leguminibus racemosis, valvulis sub-carinatis hirtis, pedunculis ternis The pods of this plant are covered with sharp hairs which are the parts employed me-dicinally in form of electuary, as anthel-mintics. The manner in which these hairy spiculæ act, seems to be purely mechanical: for neither the tincture, nor the decoction possess the least anthelmintic

Dolichos soja. The plant which affords the soy. It is much cultivated in Japan, where it is called daidsu: and where the pods supply their kitchens for various purposes; but the two principal are, with a sort of butter, termed mise, and a pickle called sooju.

DOLICHOS PRURIERS. The systemame of the cowhage. See Dolichos.
DOLOR FACIEI. See Tic Doloureux. The systematic

DOLOUREUX TIC. See Tic doloureux. DORONICUM. (From dorongi, Arab.)

Leopard's bane. See Arnica. DORONICUM GERMANICUM. See Ar-

The syste-DORONICUM PARDALIANCHES. matic name of the Roman leopard's bane. See Doronicum romanum.

DORONICUM ROMANUM. Roman leo-pard's bane. Doronicum pardiliunches; foliis cordatis, obtusis, denticulatis ; radicaliour periolatis; caulinis amplexicaulibus, of forcibly as to break it; for the part left The root of this plant, if given in a full dose, possesses poisonous properties; but instances are related of its efficacy in epileptical and other nervous diseases. DORSAL. Belonging to the back.

Dousales Nervi. The nerves which pass out from the vertebra of the back.

Dorsi spinalis. See Spinalis dorsi.

DORSTENIA. (Named in honour of Dr. Dorsten.) A name of the contrayerva. DORSTENIA DRAKENA. The systematic

name for the contrayerva.

DORSTENIA HOUSTONII. See Contra-

DOTHIEN. A name for furunculus.

DOVERI PULVIS. See Pulvis ipecacuanlæ compositus.

Dove's foot. The geranium columbinum. DRABA. (From Sarow, to seize; so called from its sudden effect upon the nose of those who eat it.)

1. The name of a genus of plants in the Class, Tetradynamia. Linnæan system.

Order, Siliculosa.

2. A name of the lepiduim, or Arabian mustard, and Turkey cresses.

DRACO SYLVESTRIS. See Ptarmica.

DRACOCEPHALUM. (From Seaxwv, a dragon, and κεφαλη, a head.) The name of a genus of plants in the Linnæan system. Class, Didynamia. Order, Gymnos-

DRACOCEPHALUM CANARIENSE. The systematic name of the balm of Gilcad. See Moldavica.

DRACONIS SANGUIS. See Sanguis dra-

DRACONTIUM. (From δgαχαν, a dragon; so called because its roots resemble a dragon's tail ) Dracunculus polyphyllus. Colubrina dracontia. Erva de Sancta Ma-Gigarus serpentaria. Arum polyphylbem. Dragon's wort. Many-leaved arum? This plant is the Arum dracunculus of Linnaus. Its roots and leaves are extremely acrimonious, more so than the arum maculatum, with which it agrees in medicinal virtues.

DRACUNCULUS. (From Seanwy, a serpent.) The Guinea worm; called also vermiculus capillaris. These animalcules arc common in both Indies, in most parts honcy.) Honey-dew. Manna. of Africa, occasionally at Genoa, and other liot countries. These worms resemble the common worm, but are much larger; commonly found in the legs, but sometimes in the muscular part of the arms. They principally affect children, and their generation is not unlike that of the broad worms of the belly, hence their name tape-worm. While they move under the skin, they create no trouble : but, in length of time, the place near the dracunculus suppurates, and the animal puts forth its head. If it be drawn, it excites considerable uncasiness especially if drawn so chian tube.

within creates intolerable pain. worms are of different lengths. Edin. Med. Essays, mention is made of one that was three yards and a half in length.

DRAGACANTHA. See Tragacantha. Dragant gum. See Tragacantha. Dragon's blood. See Sanguis draconis. Dragon's wort. See Dracontium.

DRAKENA. See Contrayerva.

DRASTICA. (Drastica, sc. medicamenta seasoninos, active, brisk; from seaw, to effect.) A term generally applied to those medicines which are very violent in their action; thus, drastic purges, emetics, &c.

DRESDENSIS PULVIS. An oleo saccharum, containing the oil of cinnamon.

DROMA. The name of a plaster de-

scribed by Myrepsus.

DROPACISMUS. (From δεεπω, to remove.) Dropax. A stimulant plaster of pitch, wax, &c. to take off hair.

DROPSY. A collection of a serous fluid in the cellular membrane; in the viscera and the circumscribed cavities of the body. See Ascites, Anasarca, Hydroce-phalus, Hydrothorax, Hydrocele.

Dropsy of the belly. See Ascites.

Dropsy of the brain. See Hydrocephalus. Dropsy of the cellular membrane.

Dropsy of the chest. See Hydrothorax. Dropsy of the ovaria. See Ascites. Dropsy testicle. See Hydrocele.

Dropwort. See Enauthe, and Filipendula.

Dropwort hemlock. See Enanthe. Dropwort water. See Enanthe.

DROSERA. (From δροσικου, dewy; which is from δροσιος, dew; drops hanging on the leaves like dew.) The name of a genus of plants in the Linnean system. Class,

Pentandria Order, Hexagynia. Sun-dew. Duosera Rotundifolia. The systematic name of the sun-dew. See Ros solis.

DROSIOBOTANUM. (From Sgoros, dew, and Rolarn, a herb; so called from its being covered with an aromatic dew.) The herb betony. See Betonica.

DROSOMELI. (From Sgood, dew, and mexi,

Dry belly ach. See Colica pictonum.
DUCTILITY. A property by which
bodies are dilated by repeated or continued pressure. It is peculiar to metals.

Ducts, biliary. See Biliary ducts.

DUCTUS ARTERIOSUS. A great inesculation found only in the fœtus, and very young children, betwixt the pulmonary artery and the aorta. In adults it is closed up.

DUCTUS AD NASUM. Sec Canalis nasalis.

DUCTUS AURIS PALATINUS. The eustaDUCTUS BILIARIS. Sec Choledochus duc-

DUCTUS COMMUNIS CHOLEDO-CHUS. See Choledochus ductus.

DUCTUS HEPATICUS. See Hepatic

DUCTUS LACHRYMALIS. Sec Lachrymal ducts.

Ductus ga-LACTIFERI. lactoferi. The excretory ducts of the glandular substance composing the female The milk passes along these ducts breast.

to the nipple.

DUCTUS PANCREATICUS. The pancreatic duct. It is white and small, and arises from the sharp extremity of the pancreas runs through the middle of the gland towards the duodenum, into which it pours its contents by an opening common to it and the ductus communis choledochus.

DUCTUS SALIVALES. The excretory ducts of the salivary glands, which

convey the saliva into the mouth.

DUCTUS STENONIS. The Stenonian duct, which was so called after its discoverer Steno. It arises from all the small excretory ducts of the parotid gland, and passes transversely over the masseter muscle, penetrates the buccinator, and opens into the mouth.

DUCTUS THORACICUS. See Thora-

cic duct.

DUCTUS VENOSUS. When the vena cava passes the liver in the fætus, it sends off the ductus venosus which communicates with the sinus of the vena portæ; but, in adults, becomes a flat ligament.

WARTHONIANUS. The excretory duct of the maxillary glands; so

named after its discoverer.

and acidus, sour.) An ox dulcis, sweet, An oxymel. A medicine composed of a sweet and sour ingredient.

DULCAMARA. (From dulcis, sweet, and amarus, bitter.) Salanum scandens. Glycypicros, sive umaradulcis. Solanum lignosum. Στευχνος of Theophrastes. Woody Solanum dulcamara of Linnightshade næus :- caule inermi frutescente flexuoso, foliis superioribus hastatis racemis cymosis. The roots and stalks of this nightshade, upon being chewed, first cause a sensation of bitterness, which is soon followed by a considerable degree of sweetness; and hence the plant obtained the name of bit-The berries have not yet been applied to medical use; they seem to act powerfully upon the primæ viæ, exciting violent vomiting and purging. Thirty of them were given to a dog, which soon became mad, and died in the space of three hours; and, upon opening his stomach, the berries were discovered to have undergone no change by the powers of digestion; bere can, therefore, be little doubt of the 'eterious effects of these berries: and,

as they are very common in the hedges. and may be easily mistaken, by children, for red currants, which they somewhat resemble, this circumstance is the more worthy of notice. The stipites, or younger branches, are directed for use in the Edinburgh Pharm, and they may be employed either fresh or dried, making a proportionate allowance in the dose of the latter for some diminution of its powers by drying. In autumn, when the leaves are fallen, the sensible qualities of the plant are said to be the strongest; and, on this account, it should be gathered in autumn rather than spring. Dulcamara does not manifest those narcotic qualities which are common to many of the nightshades; it is, however, very generally admitted to be a medicine of considerable efficacy. Murray says it promotes all the secretions; Haller observes, that it partakes of the milder powers of the nightshade joined to a resolvent and saponaceous quality; and the opinion of Bergius seems to coincide with that of Murray :- "Virtus : pellens urinam, sudorem, menses, lochia, sputa; mundificans." The diseases in which we find it recommended by different authors, are extremely various; but Bergius confines its use to rheumatism, retentio mensium, et lochiorum. Dulcamara appears also by the experiments of Razoux and others, to have been used with advantage in some obstinate cutaneous affections. Dr. Cullen says, "We have employed only the stipites, or slender twigs of this shrub, but as we have collected them, they come out very unequal, some parcels of them being very mild and inert, and others of them considerably acrid. In the latter state, we have employed a decoction of them in the cure of rheumatism, sometimes with advantage, but at other times without any Though the dulcamara is here inserted in the catalogue of diuretics, it has never appeared to us as powerful in this way; for, in all the trials made here, it has hardly ever been observed to be in any measure diuretic." This plant is generally given in decoction, or infusion, and to prevent its exciting nausea, it is ordered to be diluted with milk, and to begin with small doses, as large doses have been found to produce very dangerous symptoms. Razoux directs the following: & Stipitum dulcam. rec. drac ss in aquæ font. unc. 16 This was taken coquatur ad unc 8. in the dose of three or four drachms, diluted with an equal quantity of milk, every four hours. Linnaus directs two drachms, or half an ounce of the dried stipites, to be infused half an hour in boiling water, and then to be boiled ten minutes; and of this decoction he gives two tea-cups full morning and evening. For the formula of this plant according to the London Pharm. see Decoctum dulcamarie.

Dung, devil's. See Assafatido.

Duo. (Δυω, two.) Some compositions consisting of two ingredients, are distinguished by this term, as pilulæ ex duobus.

DUODENUM. (From duodenus, consisting of twelve: so called because it was supposed not to exceed the breadth of twelve fingers; but as the ancients dissected only animals, this does not hold good in the human subject.) The first portion of the small intestines. See Intestines.

DUPLICANA. (From duplex, double.) A

name of the double tertian fever.

DURA MATER. (From durus, hard, and mater, a mother; called dura, from its comparative hardness with the pia mater, and mater, from its being supposed to be the source of all the other membranes.) Dura meninx. Dermatodes. A thick and somewhat opaque and insensible membrane, formed of two layers, that surrounds and defends the brain, and adheres strongly to the internal surface of the cranium. It has three considerable processes, the falciform, the tentorium, and the septum cerebelli; and several sinusses, of which the longitudinal, lateral, and inferior longitudinal, are the principal. Upon the external surface of the dura mater, there are little holes, from which emerge fleshy-coloured papillæ, and which, upon examining the skull-cap will be found to have corresponding fover. These are the external glandulæ Pacchioni. They are in number from ten to fifteen on each side, and are chiefly lateral to the course of the lon-gitudinal sinus. The arteries which supply this membrane with vessels for its own nourishment, for that of the contiguous bone, and for the perpetual exudation of the fluid, or halitus rather, which moistens or bedews its internal surface, may be divided into anterior, middle, and postcrior. The first proceeds from the opthalmic and ethinoidal branches; the second from the internal maxillary and superior pharyngeal; the posterior from the occipital and vertebral arteries.

The principal artery of the dura mater, named by way of dictinction, the great artery of the dura mater, is derived from the internal maxillary artery, a branch of the external carotid. It is called the spinalis, or spheno-spinalis, from its passing into the head through the spinons hole of the spheno.d bone, or meniagea media, from its relative situation, as it rises in the great middle fossa of the skull. This artery, though it sometimes enters the skull in two branches, usually enters in one considerable branch, and divides, soon after it reaches the dura mater, into three or four branches, of which the anterior is the largest; and these spread their ramifications beautifully upon the dura mater, over all that part which is opposite to the anterior, middle, and posterior lobes of the

brain. Its larger trunks run upon the internal surface of the parietal bone, and are sometimes for a considerable space buried in its substance. The extreme branches of this artery extend so as to inosculate with the anterior and posterior arteries of the dura mater, and through the bones, (chiefly parietal and temporal bones.) They inosculate with the temporal and occipital arteries. The meningeal artery has been known to become aneurismal, and dis-tended at intervals; it has formed an aneurism, destroying the bones and causing epilepsy.

DURA MENINX. Before the time of Galen, the term meninx was common to ail the membranes of the body; afterwards it was appropriated to those of the brain. See

Dura mater.

Dwale. See Belladonna. Dwarf elder. See Ebulus.

DYOTA. (From Sue, two, and es, wlos, an ear.) A chymical instrument with two ears, or handles.

DYSÆSTHESIA. (From Sug, difficulty, and air baroual, to feel or perceive. Impair-

DYSANAGOGUS. (From Sus, with difficulty, and avaya, to subduc.) Viscid expec-

DYSCATAPOTIA. (From Sus, and nalativa, to drink.) A difficulty of swallowing liquids, which Dr. Mead thinks a more proper term than that used for canine madness. viz. hydrophobia; as it is more particularly descriptive of the affection under which the unhappy patients labour; for in reality, they dread water from the difficulty of swallowing it.

DYSCINESIA. (From Sue, bad, and MINEW, to move.) Bad or imperfect motion.
DYSCINESIÆ. An order in the class locales of Cullen's nosology; cmbracing discase in which the motion is impeded, or depraved, from an imperfection of the

Dyscophosis. (From due, with difficulty, and xwoow, to be deaf.) A defect in the sense of hearing.

DYSCRASIA. (From Sus, with difficulty, and negativous, to mix. A bad habit of body.

DYSECOEA. (From Sue, difficult, and anon, hearing.) Cophosis. Deafness. Hearing diminished, or destroyed. A genus of disease in the class locales, and order dysesthesiæ of Cullen, containing two species: Dysecoëa organica, which arises from wax in the meatus, injuries of the membrane, or inflammation and obtruction of the tube; Dysecoea atonica, when without any discernible injury of the organ.

DYSELCIA. (From Pos, with difficulty, and DYSEMETUS. (From Sus, with difficulty,

and euter, to vomit.) A person not easily made to vomit.

DYSENTERY. (From Jus, difficulty, and alexa, the bowels.) Dysenteria. solutus morbus. Diarrhea carnosa. finx. A genus of desease in the class pyrexia, and order profluvia of Cullen's noselogy. It is known by contagious pyrexia; frequent griping stools; tenesmus: stools, chiefly mucous, sometimes mixed with blood, the natural faces being retained or voided in small, compact, hard substances, known by the name of scybala; loss of appetite, and nausea. It occurs chiefly in summer and autumn, and is often occasioned by much moisture succeeding quickly intense heat, or great drought; whereby the perspiration is suddenly checked, and a determination made to the intestines. It is likewise occasioned by a use of unwholsome and putrid food, and by noxious exhalations and vapours; hence it appears often in armies encamped in the neighbourhood of low marshy grounds, and proves highly destructive; but the cause which most usually gives rise to it, is a specific contagion; and when it once makes its appearance, where numbers of people are collected together, it not unfrequently, spreads with great rapidity. A peculiar disposition in the atmosphere seems often to predispose, or give rise to the dysentery, in which case it prevails epidemically.

It frequently occurs about the same time with autumnal intermittent and remittent evers, and with these it is often complicated.

The disease, however, is much more prevalent in warm climates than in cold ones; and in the months of August, September, and October, which is the rainy season of the year in the East Indies, it is very apt to break out and to become very general among the negroes on the different plantations in the colonies. The body having been rendered irritable by the great heat of the summer, and being exposed suddenly to much moisture with open pores, the blood is thereby thrown from the exterior vessels upon the interior, so as to give rise to dysenteries.

An attack of dysentery is sometimes preceded by loss of appetite, costiveness, flatulency, sickness at the stomach, and a slight vomiting, and comes on with slight chills, succeeded by heat in the skin, and frequency of the pulse. These symptoms are in general the forerunners of the griping and increased evacuation which afterwards

occur.

When the inflammation begins to occupy the lower part of the intestinal tube, the stools become more frequent, and less abundant; and, in passing through the inflamed parts, they occasion great pain, so that every evacuation is preceded by a severe griping, as also a rumbling noise.

The motions vary both in colour and consistence, being sometimes composed of

frothy mucus streaked with blood, and at other times of an acrid watery humour, like the washings of meat, and with a very fetid smell. Sometimes pure blood is voided; now and then lumps of coagulated mucus, resembling bits of cheese, are to be observed in the evacuations, and in some instances a quantity of purulent matter is passed.

Sometimes what is voided consists merely of a mucous matter, without any appearance of blood, exhibiting that disease which is known by the name of dysenteria alba, or

morbus mucosus.

Whilst the stools consist of these various matters, and are voided frequently, it is seldom that we can perceive any natural faces among them, and when we do, they appear in small hard balls, called scybala, which being passed, the patient is sure to experience some temporary relief from the

griping and tenesmus.

It frequently happens, from the violent efforts which are made to discharge the irritating matters, that a portion of the gut is forced beyond the verge of the anus, which, in the progress of the disease, proves a troublesome and distressing symptom; as does likewise the tenesmus, there being a constant inclination to go to stool, without the ability of voiding any thing, except perhaps a little mucus.

More or less pyrexia usually attends with the symptoms which have been described, throughout the whole of the disease, where it is inclined to terminate fatally, and is either of an inflammatory or putrid tendency. In the other case, the febrile state wholly disappears after a time, while the proper dysenteric symptoms probably will be of

long continuance.

When the symptoms run high, produce great loss of strength, and are accompanied with a putrid tendency and a fetid and involuntary discharge, the disease often terminates fatally in the course of a few days; but when they are more moderate, it is often protracted to a considerable length of time, and so goes off at last by a gentle perspiration, diffused equally over the whole body; the fever, thirst, and griping then ceasing, and the stools becoming of a natural colour and consistence. When the disease is of long standing, and has become habitual, it seldom admits of an easy cure; and when it attacks a person labouring under an advanced stage of scurvy, or pulmonary consumption, or whose constitution has been much impaired by any other disorder, it is sure to prove fatal. sometimes appears at the same time with autumnal intermittent and remittent fevers, as has been observed, and is then more complicated and difficult to remove.

Upon opening the bodies of those who die of dysentery, the internal coat of the intestines (but more particularly of the colon and rectum) appears to be affected larity attendant on it is, that it may, and with inflammation and its consequences, such as ulceration, gangrene, and contractions. The peritonæum and other coverings of the abdomen, seem likewise, in many instances, to be affected by inflammation.

DYSEPULOTICUS. (From No, with difficulty, and erunow, to cicatrize.) Dysepulotus. An inveterate ulcer difficult to be healed.

DYSESTHESIÆ. The name of an order of diseases in the class locales of Cullen's nosological arrangement; embracing those diseases in which the senses are injured or destroyed by the imperfections of the organs.

DYSHEMORRHOIS. (From As, with difficulty, and appression, the piles.) Suppression of bleeding piles

DYSLOCHIA. (From Sus, difficulty, and λοχια, the lochia.) A suppression of the

lochia.

DYSMENORRHÆA. (From Jus, with difficulty, and unvoggora, the menses.) difficult or painful menstruation, accompanied with severe pains in the back, loins, and bottom of the belly.

Dysones. (From Sus, bad, and of, to smell.) A bad smell. Fætid. Hippocrates applies it to a fætid disorder of the small intestines. Also the name of a malagma and acopon in Galen and Paulus Ægineta.

DYSOPIA. (From Sus, bad, and wy, an eye.) Parorasis. Difficult sight. Sight depraved, requiring one certain quantity of light, one particular distance, or one position. A genus of discase in the class locales, and order dysæsthesiæ of Cullen, containing the five following species: 1. Dysopia tenebrarum, called also amblylopia crepuscularis, requiring objects to be placed in a strong light. 2 Dysopia luminis, likewise termed amblyopia meridiana, objects only discernible in a weak light. 3. Dysopia dissitorum, in which distant objects are not perceived. 4. Dysopia proximorum, or dysopia amblyopia, in which objects too near are not perceived. 5. Dysopia luteralis, called also amblyopia luscorum, in which objects are not seen, unless placed in an oblique position.

DYSOREXIA. (From Sus, bad, and A bad or depraved apegific, appetite)

DYSOREXIÆ. The name of an order in the class locales of Cullen's nosology, which he divides into two sections, appetitus er-

roner and deficientes

DYSPEPSIA. (From Suc, bad, and worther, to concoct.) Aprepsia. Indigestion. Dr. Cullen arranges this genus of disease in the class neuroses, and order adynamia. It chiefly arises in persons between thirty and forty years of age, and is principally to be met with in those who devote much time to study, or who lead either a very sedentary or irregular life. A great singu-

often does, continue a great length of time, without any aggravation or remission of the

symptoms.

Great grief and uneasiness of mind, intense study, profuse evacuations, excess in venery, hard drinking, particularly of spirituous liquors, and of tea, tobacco, opium, and other narcotics, immoderate repletion, and over distention of the stomach, a deficiency in the secretion of the bile or gastric juice, and the being much exposed to moist and cold air, when without exercise, are the causes which usually occasion dyspepsia.

A long train of nervous symptoms generally attend on this disease, such as a loss of appetite, nausea, heart-burn, flatulency, acid cructations, a gnawing in the stomach when empty, a sense of constriction and uneasiness in the throat, with pain in the side, or sternum, so that the patient at times can only lay on his right side; great costiveness, habitual chilliness, paleness of the countenance, languor, unwillingness to move about, lowness of spirits, palpitations, and disturbed sleep.

The number of these symptoms varies in different cases, with some being felt only in part; in others being accompanied even with additional ones, equally unpleasant, such as severe transient pains in the head and breast, and various affections of the sight, as blindness, double vision, &c.

Dyspepsia never proves fatal, unless when, by a very long continuance it produces great general debility and weakness; and so passes into some other disease, such as dropsy; but it is at all times very difficult to remove, but more particularly so in

warm climates.

The morbid appearances to be observed on dissections of this disease, are principally confined to that part of the stomach which is called the pylorus; which is often found either in a contracted, scirrhous, or ulcerated state. In every instance the stomach is perceived to be considerably distended with air.

DYSPERMATISMUS. (From Suc, bad, and σπερμα, seed.) Agenesia. Slow, or impeded emission of semen during coition, insufficient for the purpose of generation. A genus of disease in the class locales, and order epischeses of Cullen. The species are: 1. Dyspermatismus urethralis, when the obstruction is in the urethra. 2. Dyspermatismus nodosus, when a tumour is formed in either corpus cavernosum penis. 3. Dyspermatismus proputialis, when the impediment is from a straightness of the orifice of the prapuce. 4. Dyspermatismus mucosus, when the urethra is obstructed by a viscid mucus. 5. Dyspermatismus hypertonicus, when there is an excess of erection of the penis. 6. Dyspermatismus epilepticus, from epileptic fits coming on during

coition. 7. Dyspermatismus ephractodes, from a want of vigour in the genitals. 8. Dyspermatismus refluus, in which the semen is thrown back into the urinary bladder.

DYSPHAGIA. (From δυς, with difficulty, and φαγω, to eat.) A difficulty of

deglutition.

DYSPHONIA. (From  $\delta u_s$ , bad, and  $\varphi \omega v_n$ , the voice.) A difficulty of speaking.

DYSPNŒA. (From Suc, difficult, тина, to breathe.) Dyspnoon. Difficult respiration, without sense of stricture, and accompanied with cough through the whole course of the disease. A genus of disease in the class neuroses, and order spasmi of Cullen. He distinguishes eight species. 1. Dyspnea catarrhalis, when with a cough there are copious discharges of viscid mucus, called also asthma catarrhale, pneumodes, pneumonicum, and pituitosum. 2. Dyspnæa sicca, when there is a cough without any considerable discharge. 3. Dyspnæa aerea, when the disease is much increased by slight changes of the weather. 4. Dyspnza terrea, when carthy or calculous matters are spit up. 5. Dyspnæu aquosa, when there is a scarcity of urinc and œdematous feet, without any symptoms of a dropsy in the chest. 6. Dyspnæa pinguedinosa, from corpulency. 7. Dyspnea thoracica, when parts surrounding the chest are injured or deformed. 8. Dyspnæa extrinseca, from manifest external causes.

Dyspnoon. See Dyspnea.

DYSRACHITIS. The name of a plaster in Galen.

DYSTHYMIA. (From Sus, bad, and Bupos,

mind.) Insanity.

Drsrochia. (From Sus, with difficulty, and rula, to bring forth.) Difficult labour or childbirth.

DYSTECHIASIS. (From dus, bad, and souxes, order.) An irregular disposition of

the hairs in the eyelids.

DYSURIA. (From Jus, difficult, and sgev, urine.) Stillicidium. Ardor urine. Culbicio. A suppression or difficulty in discharging the urine. A total suppression is called ischuria; a partial suppression, dysuria; and this may be with or without heat. When there are frequent, painful, or uneasy urgings to discharge the urine, and it passes off only by drops, or in very small quantities, the discharge is called strangury. When a sense of pain, or heat, attends the discharge, it

passes with difficulty, and is styled heat of the urine. The dysuria is acute, or chronic. Dr. Cullen places this disease in the class locales, and order epischeses, containing six species: 1. Dysuria ardens, a sense of heat, without any manifest disorder of the bladder. 2. Dysuria spasmodica, from 3. Dysuria compressionis, from a compression of the neighbouring parts. 4. Dysuria phlogistica, from violent inflammation. 5. Dysuria calculosa, from stone in the bladder. 6. Dysuria mucosa, from an abundant secretion of mucus. The causes which give rise to these diseases are, an inflammation of the urethra, occasioned either by venereal sores, or by a use of acrid injections, tumour, ulcer of the prostate gland, inflammation of the kidneys, or bladder, considerable enlargements of the hemorrhoidal veins, a lodgment of indurated faces in the rectum, spasm at the neck of the bladder, the absorption of cantharides, applied externally or taken internally, and excess in drinking either spirituous or vinous liquors; but particles of gravel, sticking at the neck of the bladder, or lodging in the urethra, and thereby producing irritation, prove the most frequent cause. Gouty matter falling on the neck of the bladder, will sometimes occasion these complaints.

In dysury, there is a frequent inclination to make water, with a smarting pain, licat, and difficulty in voiding it, together with a sense of fulness in the region of the blad-The symptoms often vary, however, according to the cause which has given rise to it. If it proceeds from a calculus in the kidney or ureter, besides the affections mentioned, it will be accompanied with nausea, vomiting, and acute pains in the loins and region of the ureter and kidney of the side affected. When a stone in the bladder, or gravel in the urethra, is the cause, an acute pain will be felt at the end of the penis, particularly on voiding the last drops of urine, and the stream of water will either be divided into two, or be discharged in a twisted manner, not unlike a cork-screw. If a scirrlius of the prostate gland has occasioned the suppression or difficulty of urine, a hard indolent tumour, unattended with any acute pain, may readily be felt in the perinæum, or by intro-

ducing the finger in ano.

## E.

FAR. Auris. The organ of hearing is situated at the side of the head, and is divided into external and internal ear. The auricula, commonly called the ear, constitutes the external, and contains several eminences and depressions, as the helix, an-

tihelix, tragus, antitragus, concha auricule, scapha, and lobulus. The external auditory passage, containing the wax, proceeds from its middle down to the membrane of the tympanum, which divides the external from the internal parts of this organ. Behind

the membrana tympani is an irregular cavity, the cavity of the tympanum, in which are four little bones, the malleus, incus, stapes, and os orbiculare; and four openings one of the Eustachian tube, mastoid sinus, fenestra ovalis, and fenestra rotunda. The tympanum is terminated by the labarynth. The labyrinth is terminated by the labarying. The labyrinth is the remaining part of the internal earth, consisting of the cochlea vestibulum, and semicircular canals. The arteries of the ear are the external and internal auditory. The veins empty themselves into the external jugulars. The muscles of the ear are divided into three laberary, the common proper and internal series. classes: the common, proper, and inter-The common muscles are, the attollens aurem, anterior auris and retrahentes auris, which move the whole ear. The proper are, helicis major, helicis minor, tragicus, antitragicus, and transversus auris; these affect the parts only to which they are connected. The muscles of the internal ear are, laxator tympani, tensor tympani, and stapedius, which belong to the ossicula auditus. The nerves of the external ear are branches of the nervus auditorius durus, and those of the internal ear, are branches of the nervus auditorius mollis.

EARTH. Terra. Though there seems to be an almost infinite variety of earthy substances scattered on the surface of this globe, yet when we examine them with a chymical eye, we find, not without surprise, that all the earth and stones which we tread under our feet, and which compose the largest rocks, as well as the numerous different specimens which adorn the cabinets of the curious, are composed of a very few simple or elementary earths, in number no more than seven: viz.-Silex, alumine, glucine, zircon, agustine, yttria, and magnesia.

These are all the simple earths hitherto known: none of them have yet been decomposed, nor has the smallest proof been brought that they are compound; we must therefore consider them as simple bodies, which nature presents to us completely formed, though one or more of them enters into the composition of a great many bodies. They have a variety of properties which are common to all:-they are dry, incombustible bodies. They are insoluble in water and alcohol, or nearly so. They have little or no taste. Their specific gra-vity does not exceed 4.9. When perfectly pure, they assume the form of a white powder, harsh to the touch. They are infusible. They are capable of combining with are likewise disposed to unite with the alkalis, with sulphur, and phosphorus; with metallic oxyds, and with each other, either by fusion or solution in water.

Every one of these characters is not perhaps rigorously applicable to each of these bodies; but they all possess a sufficient number of them to render it useful to arrange them under one class.

Stones differ from earths principally in cohesion and hardness, and therefore are included under the same general name.

Earth, absorbent. See Absorbents.

Earth, aluminous. Earth which contains alu:nina. See Alumene.

Earth, animal calcareous. This term is applied to crab's claws, &c. which are calcareous earth, and obtained from the animal kingdom.

Earth, argillaceous. See Alumine.

EARTH-BATH. A remedy recommended by some writers on the continent, as a specific in consumption. In this country it produced to the patients very distressing sensations of cold; in some it seemed to be productive of bad effects; and it does not appear that, in any consumptive cases, good effects were ever derived from its use

Earth, bolar. See Bole.

EARTH, FULLERS'. Cimolia purpurescens. A compact bolar earth, commonly of a greyish colour. It is sometimes applied by the common people to inflamed breasts, legs, &c. with a view of cooling them.

zs, &c. with a rice.
Earth, heavy. See Barytes.
Earth, Japan. See Catechu,
Careal calcareous. Those calcareous earths which are obtained from the mineral kingdom. The term is applied in opposition to those obtained from animals.

Earth-nut. See Pig-nut.

EARTH, SEALED. Terra sigillata. cakes of bolar earths, which are stamped with impressions. They were formerly in high estimation as absorbents, but now fallen into disuse.

Lambricus terrestris. EARTH-WORM. Vermis terrestris. These insects are supposed to possess a diuretic and antispasmodic virtue, with which views they are occasionally employed in foreign countries.

EAR-WAY. Cerumen aurium. A waxy secretion found in the meatus auditorius externus, into which it is separated by the glands around that canal.

EATON'S STYPTIC. French brandy highly impregnated with calcined green vitriol. A remedy for checking hamorrhages.

EAU-DE-LUCE. See Spiritus ammoniæ succinatus.

This is composed of EAU-DE-RABEL. one part of sulphureous acid to three of rectified spirit of wine. It is much used in France, when diluted, in the cure of gonorrhœas, leuconhœa, &c.

EBEL. The seeds of sage, or of juniper. EBENUM. Indian ebony. It is supposed to be opthalmic.

A name in I angius for EBESMECH. quicksilver.

EBISCUS. The hibiscus, or marsh mal-

EBRIECATUM. (From ebrio, to be drunk.) By this term Paracelsus expresses loss of sense by drunkenness.

EBRIECATUR CELESTE. By this term Paracelsus means that kind of enthusiasm which is affected by many heathen priests.

EBSEMECH. A name in Languis for quick-

EBULLITION. (From ebullio, to bubble up.) Ebullitio. Boiling. This con-Boiling. This consists in the change which a fluid undergoes from a state of liquidity to that of an aëriform fluid, or gas, in consequence of the application of heat, which dilates and con-

verts it into vapour.

EBULUS. (From ebullio, to make boil; so called because of its supposed use in purifying the humours of the body.) Cha-Sambucus humilis. Sambucus herbacea. Dwarf elder, or dane-wort. The root, interior bark, leaves, flowers, berries, and seeds of this herbaceous plant, Sambucus ebulus; cyniestrifidis, stipulis foliaceis, caule herbaceo, of Linnæus, have all been administered medicinally, in moderate doses, as resolvents and deobstruents, and, in larger doses, as hydragogues. The plant is chiefly employed by the poor of this country, amongst whom it is in common use as a purgative, but Dr. Cullen speaks of it as a violent remedy.

ECBOLICA. (From excande, to cast out.) Medicines which were formerly said to

cause abortion.

(From eneadaw, to cast out.) ECBOLIOS.

Miscarriage.

ECBRASMATA. (From exceaça, to be very hot.) Ecchymata. Painful fiery pimples in the face, or surface of the body.

ECHRASMUS. (From enterator, to become

hot.) Fermentation.

ECHYRSOMATA. (From ex, and Bugoa, the skin.) Protuberances of the bones at the joints, which appear through the skin-

ECCATHARTICA. (From εκκαθαιζω, to purge outwards.) According to Gorræus, eccathartics are medicines which open the pores of the skin; but in general they are understood to be deobstruents. Sometimes expectorants are thus called, and also purgatives.

ECCHYLOMA. (From ex, and yuxos, juice.)

An extract.

ECCHYMATA. (From sixva, to pour out.)

See Ecbrasmata.

ECCHYMOMA. (Εκχυμωμα; from εκχυω, to pour out.) Ecchymosis. Sometimes called crustula and sugillatio. travasation. A black and blue swelling, either from a bruise or extravasation of blood. A genus of disease in the class locales, and order tumores of Cullen.

ECCHYMOMA ARTERIOSUM.

aneurism.

Ecchymosis. See Ecchymoma.

Ecclisis. (From sundiva, to turn aside.) A luxation or dislocation.

Eccore. (From sknowlw, to cut off.) The cutting off any part.

Eccopeus. (From exxorta, to cut off.) An ancient instrument, the raspatory, used in trepanning.

Eccoprotica. (From sx, and xompos, dung.) Opening medicines, whose operation is very

gentle; such as manna, senna, &c.

Eccrinocritica. (From execute, to secrete, and newa, to judge.) Judgments formed from the secretions.

ECCRINOLOGIA. Eccrinologica. (From experve, to secrete, and hopes, a discourse.)

The doctrine of secretions.

Eccrisis. (From exagno, to secrete.) A secretion of any kind.

Eccymosis. See Ecchymoma.

(From exdegw, to excoriate.) Ecdora. An excoriation; and particularly used for an excoriation of the urethra.

ECDORIA. (From sudego, to excoriate.) Medicines which excoriate and burn through

the skin.

ECHECOLLON. (From εχω, to have, and κολλα, glue.) Echecollum. Any topical glutinous remedy.

Echernosis. So Hippocrates calls the

white briony.

ECHINIDES. In Hippocrates it is mentioned as what he used for purging the womb with.

ECHINOPHTHALMIA. (From nxivos, a hedge-hog, and opanuia, an inflammation of the eye.) An inflammation of the hairy part of the eyelids, where the hairs bristle out like the quills of an echinus, or hedge-

ECHINOPODIUM. (From exivos, a hedgehog, and mes, a foot; so named because its flowers resemble the foot of an urchin.)

A species of broom, or genista.

Echinopus. (Fom exivos, as beset with prickles.) Crocodilion. Acanthalruca. Scabiosa cardiafolia. Sphærocephula elatior. Globe thistle. Echinops spherocephalus of Linuxus. It is raised in our gardens. The root and seeds are moderately diuretic, but

ECHIUM. (From εχις, a viper; so called because it was said to heal the stings of vipers.) The name of a genus of plants in the Linnæan system. Class, Pentandria. Order, Monogynia. Viper's bugloss. tepileptic.

ECHIUM ÆGYPTIACUM. Wall bugloss;

vulnerary, sudorific.

Есноs. (Εχος, sound.) In Hippocrates it signifies the same as the tinnitus aurium, or noise in the ears.

Echysis. (From εχυω, to pour out.) A fainting, or swooning.

Eclampsia. (From εκλαμπω, to shine.) See Eclampsis.

ECLAMPSIS. (From επλαμπω, to shine.) Eclampsia. It signifies a splendour, brightness, effulgence, flashing of light, scintilla-It is a flashing light, or those sparklings which strike the eyes of epileptic patients. Colius Aurelianus calls them circuli ignei, scintillations, or fiery circles. Though only a symptom of the epilepsy Hippocrates puts it for epilepsy itself.

ECLECTICA. (From waya, to elect.) Archigenus and some others selected from all other sects what appeared to them to be the best and most rational; hence they were called Eclectics, and their medicine

Eclectic medicine.

ECLECTOS. (From εκλειχω, to lick np.) A linetus, or soft medicine to be licked

ECLEGNA. (From exauxa, to lick.) Is a form of medicine made by the incorporation of oils and syrups, and which is to be taken upon a liquorice stick; the same as Linctus.

Eclysis. (From εκλύω, to dissolve.) Ec-

lectos. An universal famitness.

ECNAGNA. (From εκμασσω, to form together.) A mass of substances kneaded together.

ECPEPIESMENOS. (From example, to press out.) An epithet for ulcers with protube-

rating lips.

Econnactic. (From expenses, to remove obstructions.) Are such medicines as incide and render more thin tough humours, so as to promote their discharge

ECPHRACTICA. (From εκφεασσω, to remove obstructions.) Deobstruent medi-

Ecrimanis. (From εκφεασσω, to remove obstruction.) A diaphoresis; an openiog of the pores.

ECPHYAS. (From &, and oue, to produce.) An appendix, or excrescince. Some call the appendicula vermiformis thus.

Flatus from the bladder ECPRYSE.

through the urethra, and from

Ecpaysesis. (From εκφυσαω, to breathe through.) A quick expulsion of the air from the lungs.

ECPHYSIS, (From exqua, to produce.)

Ap apophysis, or appendix. A process. Есргеяма. (From ватиза, to press out.) A fracture of the skull, in which the bones

press inwardly.

Ecrissmos. (From extelo, to press out.) A disorder of the eye, in which the globe is almost pressed out of the socket by an afflux of humours.

ECPLEROMA. (From ENTANPOW, to fill) In Hippocrates they are hard balls of leather, or other substances, adapted to fill the arm-pits, while by the help of the heels, placed against the balls, and repressing the same, the luxated os humeri is reduced into its place.

ECPLEXIS. (From extanosa, to terrify or astonish.) A stupor, or astonishment,

from sudden external accidents.

ECPNOE. (From encover, to breathe.) Expiration; that part of respiration in which the air is expelled from the lungs.

Есртома. (From εκπιπθω, to fall out.)

1. A luxation of a bone.

2. The exclusion of the secundines.

3. Speaking of corrupt parts, it signifies falling off.

4. An hernia in the scrotum.

5. A falling down of the womb.

ECPYCTICA. (From εκπυκαζω, to condense.) Incrassants. Medicines that render the fluids more solid.

ECPYEMA. (From ex, and muce, pus.) A copious collection of pus or matter, from the suppuration of a tumour.

ECREGMA. (From exenyrums, to break.) A

rupture.

Ecrexis. (From εηγυμι, to break.) A rupture. Hippocrates expresses by it a rupture or laceration of the womb.

ECRHYTHMOS. (From εκ, and gυθμος, harmony.) A term applied to the pulse, and

signifies that it is disorderly or irregular.
Ε Ε του Ε. (From εικερω, to flow out.) An efflux, or the course by which any humour which requires purging is evacuated.

Ecnuelles. The French name for scro-

phula.

ECRUSIS. (From execu, to flow out.) In Hippocrates it is an efflux of the semen before it receives the conformation of a fœtus. and therefore is called an efflux, to distinguish it from abortion.

Ecsarcoma. (From ex, and oaet, flesh.)

A fleshy excrescence.

ECSTASIS. (Εκςασις: from ιξισημαι, to he out of one's senses.) An exstacy, or trance. In Hippocrates it signifies a delirium. Dr. Cullen ranks it as a kind of apoplexy. Sec Exstacis.

ECTHELYNSIS. (From subnduva, to render effeminate.) Sofiness. It is applied to the skin and flesh, when lax and soft, and to bandages, when not sufficiently tight.

ECTHLIMMA. (From εκθλίω, to press out against.) An ulceration caused by

pressure of the skin.

ECTHLIFSIS. (From εκθλιβω, to press out against.) Elision, or expression. It is spoken of swelled eyes, when they dart forth sparks of light.

ECTHYMA. (From εκθυω, to break out.)

A pustule, or cutaneous eruption.

ECTHYMATA. (From extue, to break out.) Pimples, pustules, or cutaneous eruptions.

(From Minne, to pull ECTILIOTICA. out.) Medicines which eradicate tubercles, or corns, or destroy superfluous

ECTOPIA. (From exlores, out of place.) Displaced.

ECTOPLE. Parts displaced. An order in the class locales of Cullen's nosology.

ECTRAPELOGASTROS. (From selectional, 0 0 \*

to degenerate, and passes, a belly.) One who has a monstrous belly, or whose appe-

tite is voraciously large.

ECTRIMA. (From salgica, to rub off.) An attrition, or galling. In Hippocrates it is an exulceration of the skin about the os sacrum.

ECTROFE. (From ω/ζετα, to divert, pervert, or invert.) It is any duct by which the humours are diverted and drawn off. In P. Ægineta it is the same as Ectropium.

ECTROPHIUS. (From εκεχεφω, to invert.)
An epithet for any medicine that makes

the blind piles appear outwardly.

ECTROPIUM. (From ωλίζετα, to evert ) An eversion of the eyelids so that their in-

ternal surface is outermost.

There are two species of this disease; one produced by an unnatural swelling of the lining of the eyelids, which not only pushes their edges from the eyeball, but also presses them so forcibly, that they become everted; the other arising from a contraction of the skin, covering the eyelid, or of that in the vicinity, by which means the edge of the eyelid is first removed for some distance from the eye, and afterwards turned completely outward, together with the whole of the affected eyelid.

The morbid swelling of the lining of the eyelids, which causes the first species of ectropium, arises mostly from a congenial laxity of this membrane, afterwards increased by obstinate chronic ophthalmies, particularly of a scrophulous nature, in relaxed, unhealthy subjects; or else the disease originates from the small-pox affecting

the eyes.

While the disease is confined to the lower eye-lid, as it most commonly is, the liping of this part may be observed rising in the form of a semilunar fold, of a pale red colour, like the fungous granulations of wounds and intervening between the eye and eyelid, which latter it in some measure everts. When the swelling is afterwards occasioned by the lining of both the eyelids, the disease assumes an annular shape, in the centre of which the eyeball seems sunk, while the circumference of the ring presses and everts the edges of the two eye-lids, so as to cause both great uneasiness and deformity. In each of the above cases, on pressing the skin of the eye-lids with the point of the finger, it becomes manifest that they are very capable of being elongated, and would readily yield, so as entirely to cover the eye-ball, were they not prevented by the intervening swelling of their membranous lining.

Besides the very considerable deformity which the disease produces, it occasions a continual discharge of tears over the check, and what is worse, a dryness of the eye-ball,

frequent exasperated attacks of chronic ophthalmy, incapacity to bear the light, and lastly, opacity and ulceration of the cornea.

The second species of ectropium, or that arising from a contraction of the integnments of the eyelids, or neighbouring parts, is not unfrequently a consequence of puckered scars, produced by the confluent small-pox, deep burns, or the excision of cancerous or encysted tumours, without saving a sufficient quantity of the skin; or lastly, the disorder is the effect of malignant carbuncles, or any kind of wound attended with much loss of substance. Each of these causes is quite enough to bring on such a contraction of the skin of the eyelids as to draw the parts towards the arches of the orbits, so as to remove them from the eye-ball and turn their edges outward. No sooner has this circumstance happened, than it is often followed by another one equally unpleasant, namely a swelling of the internal membrane of the affected eyelids, which afterwards has a great share in completing the eversion. The lining of the eye-lids, though trivially everted, being continually exposed to the air, and irritation of extraneous substances, scou swells, and rises up like fungus. One side of this fungus-like tumour, covers a part of the eye-ball, the other pushes the eye-lid so considerably outward, that its edge is not unfrequently in contact with the margin of the orbit. The complaints induced by this second species of ectropium are the same as those brought on by the first; it being noticed, however, that in both cases, whenever the disease is very inveterate, the fungous swelling of the inside of the eye-lids becomes hard, coriaceous, and as it were

Although, in both species of ectropium, the lining of the eye-lids, seems equally swollen, yet the surgeon can easily distinguish to which of the two species the disease belongs. For, in the first, the skin of the eyelids, and adjoining parts, is not deformed with scars; and by pressing the everted eyelid with the point of the finger, the part would with ease cover the eye, were it not for the intervening fungous swelling. But in the second species of ectropium, besides the obvious cicatrix and contraction of the skin of the eye-lids, or adjacent parts, when an effort is made to cover the eye with the everted eyelid, by pressing upon the latter part with the point of the finger, it does not give way so as completely to cover the globe, or only yields, as it ought to do, for a certain extent; or it does not move in the least from its unnatural position, by reason of the integuments of the eye-lids having been so extensively destroyed, that their margin has become adherent to the arch of the orbit.

Ecrnosis. (Exteuris: from extile worke, to A miscarriage. miscarry.)

Ectrosis. (From exillewine, to miscarry.)

An abortion.

ECTROTICA. (From extilearna, to miscarry.) Ectyrotica. Medicines which cause abortion.

ECTYLOTICA. See Ecullotica.

ECTYROTICA. See Ectrotica. Eczema. (From εκζεω, to boil out.) Eczesma A hot painful eruption, or pus-

Mr. Pearson calls the erythema mercuriale, eczema mercuriale.

EDELPHUS. Prognosis from the nature of elements.

EDENA THIFOLIA. The poison-tree of America.

Edes. A name for amber.

EDESSENUM. Pelarium. An eye-water of tragacanth, arabic, acacia, opium, &c.

EDETZ. Amber.

Edic. Edich. Edir. An old name for

EDRA. A fracture; also the lower part of the rectum.

EDULCORANTIA. (From edulco, to make sweet. Edulcorants. Sweeteners. Me-dicines which absorb the vicious humours of the body, sweeten the fluids, and deprive

them of their acrimony.

EFFERVESCENCE. (From effervesco, to grow hot.) Effervescentia. That agitation which is produced by mixing an acid and an alkali together. A small degree

of ebullition.

Effices. An old name for ceruss. Effica. Freckles.

EFFLORESCENCE. (From effloresco, to blow as a flower.) Efforescentia. 1. A preternatural redness of the skin.

2. In chymistry it means that phenomenon which takes place upon crystals, producing a white powder when exposed to air.

EFFLUVIUM. (From effluo, to spread abroad.) See Contagion.

Effractura. (From effringo, to break down. Ecpiesma. A species of fracture, in which the bone is much depressed by the

EFFUSION. (From effundo, to pour out.) Effusio. In surgery it means the escape of any fluid out of the vessel, or viscus, naturally containing it, and its lodgment in another cavity, in the cellular substance, or in the substance of parts. Effusion also sometimes signifies the natural secretion of fluids from the vessels; thus surgeons frequently speak of the coagulable lymph being effused on different surfaces.

Egenies. (From egero, to carry out.) Egestio. An excretion, or evacuation.

EGG. Ovum. The eggs of poultry are chiefly used as food: the different parts are likewise employed in pharmacy and in medicine. The calcined shell is esteemed as an absorbent. The oil of the egg is softening, and is used externally to burns

and chaps. The yolk of the egg renders oil misciple with water, and is triturated with the same view with resinous and other substances. Raw eggs have been much recommended as a popular remedy for jaundice.

EGREGORSIS. (From eyznyogew, to watch.)
A watchfulness. A morbid want of sleep.

EJACULANTIA. (From ejaculo, to cast out.) Ejaculatoria. The vessels which convey the seminal matter secreted in the testicles to the penis. These are the epididymis, and the vasa deferentia; the vesiculæ seminales are the receptacles of the semen.

EJECTIO. (From ejicio, to cast out.) Excretio. The discharging of humours or excrements.

EILAMIS. (From EIREW, to involve.) A

membrane involving the brain.

EILEMA. (From sidew, to form convolutions.) In Hippocrates it signifies painful convolutions of the intestines from flatu-lence. Sometimes it signifies a covering. Vogel says it is a fixed pain in the bowels, as if a nail was driven in.

EILEON. (From einew, to wind.) Gorraus says it is a name of the intestinum

EILEOS. (From eldew, to form convolu-

tions.) The iliac passion.

EISBOLE. (From us, into, and βαλλω, to cast) It signifies strictly an injection, but is used to express the access of a distemper, or of a particular paroxysm.

EISPNOE. (From es, into, and week, to breathe) Inspiration of air.

ELA CALLI. An Indian cathartic shrub, the Euphorbia neriifolia of Linnaus.

ELEAGNON. (From shator, oil, and apros, chaste.) The agnus castus was formerly so called.

ELEOSACCHARUM. (From examor, oil, and σακχαριον, sugar.) Λ mixture of essential oil with sugar.

ELEOSELINUM. (From ελος, a lake, and σελιγον, parsley.) Water parsley.

ELAIS GUINEENSIS. A species of palm which grows spontaneously on the coast of Guinea, but is much cultivated in the West Indies. From this tree is obtained the palm oil which is considered as an emollient and strengthener of all kinds of weakne-s of the limbs. It also is recommended against bruises, strains, cramps, pains, swellings, &c.

ELAMBICATIO. A method of analyzing

mineral waters.

ELANULA. An old name for alum.

ELAPHOBOSCUM. (From ελαφος, a stag, and βοσκω, to eat; so called, because deer eat them greedily.) The wild parsnip. See Pastinaca.

ELAPHOSCORODON. (From ELAPOS, the stag, and σκοροδον garlic.) Stag's or viper's garlic.

ELAQUIR. Red vitriol.

ELAS MARIS. Burnt lead.

ELASMA. (From ELAUVO, a lamina or plate of any kind.) A term used to express a clyster-pipe.

Elastic fluid. See Gas.
Elastic gum. See Indian-rubber.
ELASTICITY. A force in bodies, by which they endeavour to restore themselves to the posture from whence they were displaced by any external force. solve this property, many have recourse to the universal law of nature, attraction, by which the parts of solid and firm bodies are caused to cohere together: whereby, when hard bodies are struck or bent, so that the component parts are a little moved from one another, but not quite disjoined or broken off, nor separated so far as to be out of the power of attracting force, by which they cohere together, they certainly must, on the cessation of the external violence, spring back with a very great velocity to their former state; but in this circumstance the atmospherical pressure will account for it as well; because such a violence, if it be not great enough to separate the constituent particles of a body far enough to let in any foreign matter, must occasion many va-cuola between the separated surfaces, so that upon the removal they will close again by the pressure of the aërial fluid upon the external parts, i. e. the body will come again into its natural posture. The included air, likewise, in most bodies, gives that power of resilition upon their percussion.

If two bodies perfectly elastic strike one against another, there will be or remain in each the same relative velocity as before, i. e. they will recede with the same velocity as they met together with. For the compressive force, or the magnitude of the stroke in any given bodies, arises from the relative velocity of those bodies, and is proportional to it: and bodies perfectly elastic will restore themselves completely to the figure they had before the shock; or, in other words, the restitutive force is equal to the compressive, and therefore must be equal to the force with which they came together, and consequently they must by elasticity recede again from each other with the same velocity. Hence, taking equal times before and after the shock, the distances between the bodies will be equal: and therefore the distances of times from the common centre of gravity will, in the same times, be equal. And hence the laws of percussion of bodies perfectly elastic are easily deduced.

ELATERIUM. (From Exaura, to stimulate or agitate: so named from its great purgative qualities.) See Cucumis agrestis.

ELATHERIA. A name for the cascarilla

bark.

ELATINE. (From shaltar, smaller, being

the smaller species.) Fluellen, or female speedwell. Antirrhinum elatine of Linnæus. The leaves of this plant have a roughish bitter taste, but no smell. It was formerly much used against scurvy and old ulcerations, but now wholly forgotten.

ELATITES. Bloodstone.

ELCOSIS. (From samos, an ulcer.) disease attended with fetid, carious, and chronic ulcers. The term is seldom used.

Elder. See Sambucus.

Elder dwarf. See Ebulus. Elecampane. See Enula campana.

ELECTRICITY. (Electricitas, electrum, exentpov, from exentag, the sun. because of its bright shining colour; or from enew, to draw, because of its magnetic power.) A property which certain bodies possess when rubbed, heated, or excited, whereby they attract remote bodies, and frequently emit sparks or streams of light. The ancients first observed this property in amber, which they called electrum, and hence arose the word electricity. The efficacy of electricity in the cure of several diseases has been supported by many very respectable authorities, especially in paralytic diseases. It considerably augments the circulation of the blood, and excites the action of the absorbents.

ELECTRODES. (From naulgov, amber.) An epithet for stools which shine like amber

ELECTRUM MINERALE. The tincture of. metals. It is made of tin and copper, to which some add gold, and double its quantity of martial regulus of antimony, melted together; from these there results a metallic mass, to which some chymists have given the name of electrum minerale. This mass is powdered and detonated with nitre and charcoal to a kind of scoria; it is powdered again whilst hot, and then digested in spirit of wine, whence a tincture is obtained of a fine red colour.

ELECTUARIUM. An electuary. The London Pharmacopæia refers those articles which were formerly called electuaries to

confections and conserves.

ELECTUARIUM ANTIMONII. B. Electuarii sennæ, one ounce ; guaiaci gummi, hydrargyri cum sulphure antimonii ppti. sing. half an ounce; syrupi simplicis q. s. misce. Of this electuary from a dram to about two drams is given twice a day, in those cutaneous diseases which go under the general name of scorbutic. It is usually accompanied with the decoctions of elm, bark, or sarsaparilla.

ELECTUARIUM CASSIE. See Confectio

cassia.

ELECTUARIUM CATECHU. Confectio Japonica. Electuary of catechu, commonly called Japonic confection. Take of mi-mosa catechu, four ounces; kino, three ounces; cinnamon, nutmeg, each, one ounce; opium diffused in a sufficient quantity of Spanish white wine one drachm and a

half; syrup of dried roses boiled to the consistence of honey, two pounds and a quarter. Reduce the solids to powder, and liaving mixed them with the opium and syrup, make them into an electuary. A very useful astringent, and perhaps the most efficacious way of giving the catechu to advantage. Ten scruples of this electuary contain one grain of opium.

ELECTUARIUM CINCHONAL CUM NATRO. y natri ppti zjj; pulveris cinchonæ unc; mucilagini gummi arabaci q. s. misce. this composition mucilage is preferred to syrup, on account of its covering the taste of the bark much more advantageously. It should, for this purpose, however, be made thin, otherwise it will increase the

bulk of the electuary too much.

This remedy will be found an excellent substitute for the burnt sponge, whose powers as a remedy in scrophula, are known solely to depend on the proportion of natron contained in it. The dose is two drachms, twice or thrice a day.

ELECTUARIUM OPIATUM. See Confectio

ELELISPHACOS. (From ελελιζω, to distort, and opaxos, sage; so named from the spiral coiling of its leaves and branches.) A species of sage.

ELEMBRAT. An obsolete term for alka-

line salts.

ELEMENTS. Radicals. First principles. The minutest particles of any substance, which can no further be divided or decomposed by chymical analysis. Many substances cannot be farther decomposed by the chymist into constituent parts, but this does not entitle the ranking them among the elements. Though they are as yet decomposed, it does not follow that they are undecomposable; as, perhaps, neither our senses nor our instruments will ever reach those substances which by their nature admit of no sort of decomposition. The bodies which are known to us at present, however, as simple substances, amount to forty-one; some of these may be sensibly exhibited in their simple state, uncombined with other matters: these are termed ostensible, producible, simple substances, to distinguish them from those whose existence or presence is only inferred from facts, and are called unustensible, unproducible, simple substances. The following is a list of simple substances at present known.

Unproducible, simple Substances. Phlogiston, or 10. Boracce, Phlogiston, or 11. Rad. of gold. 10. Boracic, radical. 12. —— platina. 13. —— silver. 2. Oxygen. 3. Hydrogen. 4. Azotic. 14. — mercury. 5. Carbonic. 15. — lead. 16. --- copper. 6. Sulphur.

7. Phosphor. 17. \_\_\_\_ iron. 8. Muriatic. 18. —— tin.

9. Fluoric. 19. -- zinc.

20.	Rad. of bismuth.	26. Rad. of molybd.
21.	antim.	27. — wolfranc.

ELEMI. (It is said this is the Ethiopian name.) Gum elemi. The parent plant of this resin is supposed to be the Amyris elemifera of Linnæus :- foliis ternis quinatopinnatisque subtus tomentosis. Elemi is brought here from the Spanish West Indies: it is most esteemed when sofush, somewhat transparent, of a pale whitish colour, inclining a little to green, and of a strong, though not unpleasant smell. It is only used in ointments and plasters, and is a powerful digestive.

ELEMI UNGUENTUM. See Unguentum

elemi compositum.

ELEMNIFERA CURASSAVICA ARBOR. The gum elemi-tree.

ELENGI. A tree of Malabar. Cardiac. ELEOCHRYSUM. (From naioc, the sun, and χευσος, gold; so called from their shining yellow appearance) Eliochrysum. Goldilocks. See Eliochrysum.

ELEOSILINUM. (From exos, a lake, and

σελινον, parsley.) See Apium.

ELEPHANTIA. (From ελεφας, an elephant; so called from the great enlargement of the body in "this disorder.) A species of anasarca.

ELEPHANTIA ARABUM. In Dr. Cullen's nosologyit is synonymous with elephantiasis. The term is, however, occasionally confined to this disease when it affects the feet.

ELEPHANTIASIS. (From exeque, an elephant; so named from the legs of people affected with this disorder growing scaly, rough, and wonderfully large, at an advanced period, like the legs of an ele-Elephas. Elephantia. morbus vel malum. Phaniceus morbus. A disease that attacks the whole body, but mostly affects the feet, which appear somewhat like those of the elephant. It is known by the skin being thick, rough, wrinkly, unctuous, and void of hair, and mostly without the sense of feeling. It is said to be contagious. Cullen makes it a genus of disease in the class cachexia, and order impetigines.

Elephantiasis has generally been supposed to arise in consequence of some slight attack of fever, on the cessation of which the morbid matter falls on the leg, and occasions a distention and tumefaction of the limb, which is afterwards overspread

with uneven lumps, and deep fissures. By some authors it has been considered as a species of leprosy; but it often subsists for many years without being accompanied with any of the symptoms which characterize that disease.

It sometimes comes on gradually, without much previous indisposition; but more generally, the person is seized with a coldness and shivering, pains in the head, back, and loins, and some degree of nausea. A slight fever then ensues, and a severe pain is felt in one of the inguinal glands, which, after a short time, becomes hard, swelled, and inflamed. No suppuration, however, ensues; but a red streak may be observed running down the thigh from the swelled gland to the leg. As the inflammation increases in all the parts, the fever gradually abates, and perhaps, after two or three days continuance, goes off. It however, returns again at uncertain periods, leaving the leg greatly swelled with varicose turgid veins, the skin rough and rugged, and a thickened membrana cellulosa. Scales appear also on the surface, which do not fall off, but are enlarged by the increasing thickness of the membranes; uneven lumps, with deep fissures, are formed, and the leg and foot become at last of an enormous

A person may labour under this disease many years, without finding much alteration in the general health, except during the continuance of the attacks; and perhaps the chief inconvenience he will experience is the enormous bulky leg which he drags about with him. The incumbrance has, indeed, induced many who have laboured under this disease to submit to an amputation; but the operation seldom proves a radical cure, as the other leg frequently becomes affected.

Hillary observes, that he never saw both legs swelled at the same time. Instances where they have alike acquired a frightful and produgious size, have, however, frequently fallen under the observation of other

physicians.

ELEPHANTINUM EMPLASTRUM. A plaster described by Oribasius. Celsus describes one of the same name, but very different in

qualities.

ELEPHAS. (Ελεφας, the elephant.) The disease called elephantiasis; also aqua fortis.

ELEESNA. An obsolete term for black

lead

ELESMATIS. An old term for burnt lead.

ELETTARI PRIMUM. See Amomum ve-

ELEUTHERIA BARK. See Cascarilla. ELEUTHERIE CORTEX. See Cascarilla.

ELEVATIO. (From elevo, to lift up.) Elevation. Sublimation.

ELEVATOR. (From elevo, to lift up) A muscle is so called whose office is to lift

up the part to which it is attached. Also a chirurgical instrument elevatorium, with which surgeons raise any depressed portion of bone, but chiefly those of the cranium.

ELEVATOR LABII INFERIORIS PROPRIUS.

See Levator labii inferioris.

ELEVATOR LABII SUPERIORIS PROPRIUS. See Levator labii superioris alæque nasi.

ELEVATOR LABIORUM. See Levator anguli oris.

ELEVATOR MASI ALARUM. Muscles of the alæ of the nose.

ELEVATOR PALPEBRE SUPERIORIS.

Levator palpebra superioris.

ELEVATOR SCAPULE. See Levator sca-

pulæ.

ELEVATORIUM. (From elevo, to lift up.)

An instrument to raise a depression in the skull.

ELIBANUM. See Olibanum.
ELICHRYSUM. (From 61.00, the sun, and Xguros, gold; so called from their shining yellow appearance.) Stechas citrina. Goldilocks. This small downy plant is the Gnaphalium stechas of Linnæus. The flowers are warm, pungent, and bitter, and said to possess aperient and corroborant virtues.

ELIDRION. Mastich; a mixture of

brass.

ELIGMA. An old name for a linctus.

ELIGMALI. (From ελαιον, and μελι, honey.) A sweet purging oil like honey.

ELIOSELINUM. See Eleoselinum.
ELITHROIDES. The vaginal coat of the

testicle.

ELIXATIO. (From elixo, to boil.) The

act of seething, or boiling.

ELIXIR. (From elekser, an Arabic word signifying quintessence.) A term fermerly applied to many preparations similar to compound tinctures. It is now very little employed.

ELIXIR OF HEALTH. Elixir salutis A term formerly applied to what is now called compound tincture of senna. See *Tinctura* 

senne composita.

ELIXIR PAREGORICUM. Paregoric elixir. See Pinctura opii camphorata.

ELIXIR PROPRIETATIS. A preparation of

ELIXIR SACRUM. See Tinctura rhæi cum

eloe.

ELIXIR SALUTIS. See Tinct. sennæ comp.

ELIXIR STOMACHICUM. Stomachic elixir. See Tinctura gentianæ composita.

ELIXIVATIO. (From elixo, to boil, or from lixivium, lye.) The extraction of a fixed salt from vegetables, by an affusion of water.

ELLEBORUM. See Helleborus albus.

Elm. See Ulmus.

FLMINTHES. (From with, to involve, from its contortions.) Worms.

Elm-leaved sumach. See Sumach.

ELODES. (From shoe, a swamp.) A

EMB term given to a sweating fever, from its ponis sing, 3j. M. For bruises with inflamgreat moisture.

ELONGATIO. (From elongo, to lengthen out.) An imperfect luxation, where the li-

gament is only lengthened, and the bone not put out of its socket.

ELUTRIATION. (From elutriatio, to

cleanse.) Washing over. It is the pouring a liquor out of one vessel into another, in order to separate the subsiding matter from the clear and fluid part.

ELUVIES (From eluo, to cleanse.) The effluvium from a swampy place. Also the

humour discharged in fluor albus. ELUXATIO. (From eluxo, to put out of in the Pharmacopæia Chirurgica.

joint.) A luxation, or dislocation.

ELYMAGROSTIS. (From ελαμος, the herb panic, and αγξαικ, wild.) Wild panic.

ELYMUS. (Ελαμος.) The herb panic.

ELYTROCELE (From ελυπξον, the va-

gina, and RALA, a tumour.) A hernia in the

vagma.

ELYTROIDES. (Elytroides; from EAU-Tgov, a sheath, and edos, form.) Like a sheath. The tunica vaginalis is so called by some writers, because it includes the testes like a sheath.

ELYTHON. (From ελυω, to involve.)
The vagina. A sheath. The membranes which involve the spinal marrow are called clytra, exulga.

EMARGINATIO. (From emargino, cleanse the edges.) The cleansing of the edges of wounds from scurf and filth.

EMASCULATUS. (From emasculo, to render impotent.) Having the testicles in the belly, and not fallen into the scrotum.

EMBAMMA. (From EMGAMOw, to immerge in.) A medicated pickle to dip the food

EMBOLE. (From EMERANA, to put in.) The reduction or setting of a dislocated

Embolum. (From εμβαλλώ, to cast out; so named because it ejects the semen.) The penis.

EMBREGNA. (From εμεζεχω, to make wet.) A fluid application to any part of the body.

EMBROCATIO ALUMINIS. & Aluminis 3jj. Aceti spiritus vinosi tenuioris, sing. lbss. For chilblains and diseased joints.

EMBROCATIO AMMONIM. B embrocationis ammonim acetata cum sapone 3jj. Aquæ ammoniæ puræ 3jj. For sprains and bruises.

EMBROCATIO AMMONIE ACETATE CAM-PHORATE. 'R, solutionis saponis cum camphora, aquae ammoniae acetatæ sing. 5j.
Aquæ ammoniæ puræ 5ss. For sprains and bruises. It is also frequently applied to disperse chilblains which have not suppurated. It is said to be the same as steers' opodeldoc.

EMRROCATIO AMMONIÆ ACETATE. Be.

EMBROCATIO CANTHARIDIS CUM CAM-PHORA. & cantharidis. Spiritus camphoræ sing,  $\tilde{z}_j$ . M. This may be used in any case in which the object is to stimulate the skin. The absorption of cantharides, however, may bring on a strangury.

EMBROCATION. (From sulesta, to moisten, or soak in.) Embroche. Embrocatio. A fluid application to rub any part of the body with. Many use the term, however, as synonymous with liniment. The following embrocations are noticed

EMBROCHE. See Embrocation.
EMBRYO. (From embegue, to bud forth.)
The fatus in utero is so called before the fifth month of pregnancy, because its growth resembles that of the budding of a

EMBRYOTHLASTES. (From Embevar, the fœtus, and θλαω, to break.) Embryorectes. A chrochet, or instrument for breaking the bones of a dead fœtus to promote its de-

EMBRYOTOMY. (From Euceucy, a fætus, and τεμνα, to cut.) Embryotomia. The separating of any part of the fœtus whilst in utero, to extract it.

EMBRYULCUS. (From εμεξυων, a foctus, and ελκω, to draw.) A blunt hook, or forceps, for drawing the child from the womb.

EMERUS. Scorpion senna. A laxative. EMESIA. (From εμενε, to vomit.) Emesma. Emesis. The act of vomiting. Medicines which cause vomiting.

EMETICS. (Emetica, sc. medicamenta; from euece, to vomit.) Substances capable of exciting vomiting, independent of any effect arising from the mere quantity of matter introduced into the stomach, or of any nauscous taste or flavour.

The susceptibility of vomiting is very different in different individuals, and is often considerably varied by disease.

Emetics are employed in many diseases. When any morbid affection depends upon, or is connected with, over distention of the stomach, or the presence of acrid, indigestible matters, vomiting gives speedy re-lief. Hence its utility in impaired appetite, acidity in the stomach, in intoxication,

and where poisons have been swallowed.

From the pressure of the abdominal viscera in vomiting, emetics have been considered as serviceable in jaundice, arising from biliary calculi obstructing the ducts.

The expectorant power of emetics, and their utility in catarrh and phthisis, have been ascribed to a similar pressure ex-

tended to the thoracic viscera.

In the different varieties of febrile affections, much advantage is derived from exciting vomiting, especially in the very comaque animonie acetata. Solutionis sa- mencement of the disease. In high inflammatory fever it is considered as dangerous, and in the advanced stage of typhus it is prejudicial.

Emetics, given in such doses as only to excite mausea, have been found useful in

restraining hamorrhage.

Different species of dropsy have been cured by vomiting, from its having excited absorption. To the same effect, perhaps, is owing the dispersion of swelled testicle, bubo, and other swellings, which have occasionally resulted from this operation.

The operation of vomiting is dangerous, or hurtful, in the following cases: where there is determination of the blood to the head, especially in plethoric habits; in visceral inflammation; in the advanced stage of pregnancy; in hernia and prolapsus uteri; and wherever there exsists extreme general debility. The frequent use of emetics weakens the tone of the stomach. An emetic should always be administered in the fluid form. Its operation may be promoted by drinking any tepid diulent, or bitter infusion.

The individual emetics may be arranged under those derived from the vegetable, and those from the mineral kingdom. From the vegetable kingdom are numbered ipecacuana, scilla maritima, anthemis nobilis, sinapis alba, asarum Europæum, nicotiana tabacum. From the mineral kingdom, antimony, sulphat of zinc and copper, and the subacetat of copper. To these may be added ammonia and its hydrothese may be added

sulphuret.

EMETOCATHARTICUS. (From εμεω, to vomit, and καθαιζω, to purge.) Purging both by vomit and stool.

EMINENTIÆ QUADRIGEMINÆ. See Tu-

bercula quadrigemina.

EMMENAGOGUES. (Emmenagoga, sc. medicamenta, εμμηναγωγα: from ομμενια, the menses, and αγω, to move.) Those medicines that possess a power of promoting that monthly discharge of blood by the uterus, which, from a law of the animal economy, should take place in certain conditions of the female system. The articles belonging to this class may be referred to four orders:

 Stimulating emmenagoguee, as hydrargyrite and antimonial preparations, which are principally adapted for the young, and those with peculiar insensibility of the

iterus

2. Irritating emmenagogues, as aloes, savine, and Spanish flues: these are to be preferred in torpid and chlorotic habits.

3. Tonic emmenagogues, as ferruginous preparations, cold bath, and exercise, which are advantageously selected for the lax and phlegmatic.

4. Antispasmodic emmenagogues, as assafoetida, castor, and pediluvia: the constitutions to which these are more especially suited are the delicate, the weak, and the irritable.

EMMENIA. (From ev, in, and unv, a month.)

The menstrual flux.

EMOLLIENTS. (Emollientia, sc. medicamenta; from emollio, to soften.) Those substances which possess a power of relaxing the living and animal fibre, without producing that effect from any mechanical action. The different articles belonging to this class of medicines may be comprehended under the following orders:

1. Humectant emollients, as warm water and tepid vapours, which are fitted for the robust and these in the prime of life.

2. Relaxing emollients, as althea, malva, &c. These may be employed in all constitutions, while, at the same time, they do not claim a preference to others from any particular habit of body.

3. Lubricating emollients, as blund oils, fat, and lard. The same observation will hold of this order as was made of the last

mentioned.

4. Atonic emollients, as opium and pedij luvia: these are applicable to any constitution, but are to be preferred in liabits where the effects of this class are required over the system in general.

EMPEIRIA. (From ev, and wuge, to endeavour.) Professional experience.

EMPHEROMENUS. (From εμφεςα, to bear.) Urine, or other substance, which has a sediment.

EMPHRACTICA. (From εμφgατία, to obstruct.) Medicines which applied to the

skin, shut up the pores.

EMPHYSEMA. (From εμφυσαω, to inflate.) Pneumatosis. Air in the cellular membrane. In general it is confined to one place; but in a few lases it spreads universally over the whole body, and occasions a considerable degree of swelling: It sometimes arises spontaneously, which is, however, a very rare occurrence, or comes on immediately after delivery, without any evident cause; but it is most generally induced by some wound or injury done to the thorax, and which affects the lungs; in which case, the air passes from these, through the wound, into the surrounding cellular membrane, and from thence spreads over the whole body.

Emphysema is attended with an evident crackling noise, and elasticity upon pressure; and sometimes with much difficulty of breathing, oppression, and anxiety.

We are to consider it as a disease by no means unattended with danger; but more probably from the causes which give rise to it, than any hazard from the complaint itself.

EMPIRIC. (Empiricus, emarqueo: from ev, in, and weiga, experience.) One who practises the healing art upon experience, and not theory. This is the true meaning of the word empiric: but it is now applied, in a very opposite sense, to those who de-

viate from the line of conduct pursued by scientific and regular practitioners, and you! nosterms, or sound their own praise in the public papers.

EMPLASTICA. (From \$\rho \pi \rho 2000, to obstruct.) Medicines which, spread upon

the skin, stop the pores.

EMPLASTRUM. (From εμπλασσω, to spread upon.) A plaster. Plasters are composed of unctuous substances, united either to powders or metallic oxyds, &c. They ought to be of such a consistence as not to stick to the fingers when cold, but to become solt, so as to be spread out, in a moderate degree of heat, and in that of human body, to continue tenacious enough to adhere to the skin. They owe their consistence either to metallic oxyds, especially those of lead, or to wax, resin, &c. They are usually kept in rolls wrapped in paper, and spread, when wanted for use, apon thin leather; if the plaster be not of itself sufficiently adhesive, it is to be surrounded at its margin by a boundary of resin plaster.

EMPLASTRUM AMMONIACI. Take of purified anmoniacum, five ounces; acetic acid half a pint. Dissolve the ammoniacum in the acid, then evaporate the liquor in an iron vessel, by means of a water-bath, constantly stirring it, until it acquires a proper consistence. This plaster is now first introduced in the London Pharmacopena; it adheres well to the skin, without irritating it, and without producing inconvenience

by its smell.

EMPLASTRUM AMMONIACI CUM HYDRAR-OVRO. "Take of purified ammoniacum, a pound; purified mercury, three ounces; sulphurated oil, a drachm." Rub the mercury with the sulphurated oil until the globules disappear; then add by degrees the ammoniacum, previously melted, and mix the whole together. This mixture of ammoniacum hydrargyrus and sulphur, is said to possess resolvent virtues; and the plaster is recommended with this view to be applied to nodes, tophs, indurated glands, and tumours.

EMPLASTRUM ASSECTION. Emplastrum antithystericum. Plaster of assacutida. Take of plaster of semi-vitrified oxyd of lead, asafectida, each two parts; galbanum, vellow wax, each one part. This plaster is said to possess anodyne and antisposmodic virtues. It is, therefore, occasionally directed to be applied to the umbilical re-

gion in Insterical cases.

EMPLASTRUM CANTHARIDIS. See Emplas-

trum lyttle.

EMPLASTRUM CERÆ Wax plaster. Emplastrum attrahens. Take of yellow wax, prepared suct, of each three pounds; yellow resin, a pound. Mix them together and strain. This is a gently drawing preparation, calculated to promote a moderate discharge from the blistered surface,

with which intention it is mostly used. Where the stronger preparations irritate, this will be found in general to agree.

EMPLASTRUM CUMINI. Cumin plaster. "Take of cumin-seeds, carraway-seeds, bay-berries, of each three ounces; dried pitch, three pounds; yellow wax, three ounces." Having melted the dried pitch and wax together, add the remaining articles, previously powdered, and mix. A warm stomachic plaster, which when applied to the stomach, expels flatulency. To indolent scrophulous tumours, where the object is to promote suppuration, this

is an efficacions plaster.

GALBANI COMPOSITUM. EMPLASTRUM Compound Galbanum plaster, formerly call d emplastrum lithargyri compositum and diachylon magnum cum gummi. Take of galbanum gum resin, eight ounces. Lead plaster, three pounds; common turpentine, ten drachms; resin of the spruce fir, three ounces. Having melted the galbanum gum resin with the turpentine, mix in first the powdered resin of the spruce fir, and then the lead plaster, previously melted by a slow fire, and mix the whole. This plaster is used as a warm digestive and suppurative, calculated to promote maturation of indolent or scirrhous tumours, and to allay the pains of sciatica, arthrodynia,

EMPLASTRUM EVERLABOVEL, Mercucial plaster. Emplastrum lithurgyri cum hydrargyro "Take of purified mercury, three ounces; sulphurated oil, a fluid drachm; lead plaster, a pound." Rub themercury with the sulphurated oil, until the globules disappear; then add by degrees the lead plaster, melted, and mix the whole.

EMPLASTRUM LADANI COMPOSITUM. This may be used with the same intentions as the enmin plaster, to which it is in no way superior, though composed of more expensive materials. Formerly it was considered as a very elegant stomach plaster, but is now disused.

EMPLASTRUM LITHARGYRI. Diachylon. "Take of semi-vitreous oxyd of lead, in very fine pounder, five pounds; olive oil, a gallon; water, two pints." Boil them with a slow fire, constantly stirring until the oil and litharge unite, so as to form a plaster. Excoriations of the skin, slight burns, and the like may be covered with this plaster: but it is in more genearl use, as a defensitive, where the skin becomes red from lying a long time on the part.

EMPLASTRUM LITHARGYRI COMPOSITUM,

See Emplastrum Galbani compositum

EMPLASTRUM LITHARGYRI CUM RISINA,

See Emplastrum resinæ.

EMPLASTRUM LYTTE, Blistering flyplastrum vesicatorium Take of blistering flies, in very fine powder, a pound; was plaster, a pound and a half; prepared fat, a pound. Having melted the plaster and fat together, and removed them from the fire, a little before they become solid sprinkle in the blistering flies, and mix the whole together. See Blister and Cantharides.

EMPLASTRUM OF II. Plaster of opium. Take of opium, powdered, half an ounce; resin of the spruce fir, powdered, three ounces; lead plaster, a pound." Having melted the plaster, mix in the resin of the spruce fir and opium, and mix the whole. Opium is sand to produce somewhat, though in a smaller degree, its specific effect when

applied externally.

EMPLASTRUM PICIS COMPOSITUM. Compound pitch pla-ter. Emplastrum picis Burgundice. "Take of dried pitch, two pounds; resin of spruce fir, a pound; yellow resin, yellow wax, of each four ounces; expressed oil of nutmegs, an ounce." Having melted together the pitch, resin, and wax, add first the resin of the spruce fir, then the oil of nutmegs, and mix the whole together. From the slight degree of redness this stimulating application produces, it is adapted to gently irritate the skin, and thus relieve rheumatic pains. Applied to the temples it is sometimes of use in pains of the head.

EMPLASTRUM PLUMBI. Lead plaster. Emplastrum lithargyri. Emplastrum commune. Diachylon simplex. This plaster is of great importance, as forming the basis, by additions to which many other plasters are prepared. See Emplastrum lithargyri.

EMPLASTIUM RESINÆ. Resin plaster.

Emplastrum lithargyri cum resina. "Take of yellow resin, hair a pound; lead plaster, three pounds. Having melted the lead plaster over a slow fire, add the resin in powder, and mix." The adhesive, or sticking plaster, is chiefly used for keeping on other dressings, and for retaining the edges of recent wounds together.

EMPLASTRUM SAPONIS. Soap plaster. Take of hard soap sliced, half a pound; lead plaster, three pounds. Having melted the plaster, mix in the soap; then boil it down to a proper consistence. Discutient properties are attributed to this elegant plaster, with which view it is applied to lymphatic and other indolent tumours. It forms an admirable defensitive and soft application, spread on linen, to surround a fractured limb.

EMPLASTRUM TRURIS COMPOSITUM, Compound frankincense plaster. Take of trankincense, half a pound; dragon's blood, three ounces; litharge plaster, two pounds. To the melted lead plaster add the rest powdered. This plaster is said to posses strengthening, as well as adhesive powers. By keeping the skin firm, it may give tone to the relaxed muscles it surrounds, but cannot, in any other way, impart more

strength than the common adhestve plas-

wee, to blow.) An inflation of the sto-

(From sv, in, and

EMPNEUMATOSIS.

mach, or any other v scus.

EMPORIUM. (Prom εμπτερα, to negotiate.)

A mar.. The brain is so called, as being the place where all rational and sensitive transactions are collected.

EMPRION. (From e, and erguer, a saw.) Serrated. An epithet of a purse, in which the artery at different times is unequally

distended.

EMPROSTHOTONOS. (From εμπηςεσθεν, before, or forwards, and ταινο, to down.) A chonic spasm of several muscles, so as to keep the body in a fixed position and bent forward. Cullen considers it as a species of tetanus.

EMPTYSIS. (From emplow, to spit out.) A discharge of blood from the mouth and

fauces.

EMPYEMA. (From e), within, and woo, pus.) A collection of pus in the cavity of the thorax. It is one of the terminations of pleuritis. There is reason for believing that matter is contained in the cavity of the chest, when, after a pleurisy, or inflammation in the thorax, the patient has a difficulty of breathing, particularly on lying on the side opposite the affected one; and when an odematous swelling is externally perceptible.

EMPKEMATA. (From sv, and wuov, pus.)

Suppurating medicines.

EMPYREUMA. (From εμπυζευω, to kindle, from πυζ. fire.) The offensive smell that distilled waters and other substances receive from being exposed too much to fire.

EMPYREUMATIC. (Empyreumatica; from εμπυςεωφ, to kindle.) Smelling as it were burn; thus empyreumatic oils are those distilled with a great heat, and im-

pregnated with a smeil of the fire.

EMULGENT. (Emulgenia; from emulgeo, to melt out; applied to the vens and arteries which go from the aorta and vena cava to the kidneys, because the ancients supposed they strained, and, as it were, milked the serum through the kidneys.) The vessels of the kidneys are so termed. The cmulgent artery is a branch of the aorta. The emulgent velo evacuates its blood into the ascending cava.

EMULSIO ANYGOALE COMMUNIS. Almond emulsion. Take of almonds, one onnee; water, two pounds and a half. Beat the blanched almonds in a stone mortar, gradually pouring on them the water; then strain off the liquor. It possesses cooling and demulcent properties.

cooling and demulcent properties.

EMULSIO ARABICA. This is made in the same manner as the almond emulsion, only adding two ounces, white bearing the almonds mucitage, of gum arabic. This cooling and demulcent emulsion, ordered

m the Edinburgh Pharmacopæia, may be drank ad libitum to mitigate ardor urinæ, whether from the venereal virus or any other cause. In difficult and paintul micturition, and strangury, it is of inficite service.

EMULSIO CAMPHONATA. "Take of camphor, one scruple; sweet almonds, blanched, two drachms; double refined sugar, one drachm; water, six onnecs." This is to be made in the same manner as the common cumulsion. It is calculated for the stomachs of those who can only bear small quantities of camphire.

EMULSION. (Emulsio; from emulgio, to malk.) A soft and somewhat oily medi-

cine, resembling milk.

Emulsion, almond. See Emulsio amygdale

communis

Emulsion, Arabic. See Emulsio arabica. Emulsion, camphorated. See Emulsio camphorata.

Emulsion of asafatida. See Mistura

asufatide.

Emulsion of gum-ammoniac. See Mistura ammoniaci.

EMUNCTORY. (From enungo, to drain off.) The excretory duets of the body are so termed; thus the exhaling arteries of the skin constitute the great enunctory of the body.

ENEMA. (From 19, and 11/12, blood.)
Enemos So Hipp crates and Galen call
such topical medicines as are appropriated

to bleeding wounds.

Engonema. (From ey, and diagea, to lift up) The pendulous substance which floats in the middle of the urine.

ENAMEL. See Teeth.

ENANTHESIS. (From ey, and arlaw, to meet.) The near approach of ascending

and descend ng vessels.

ENARTHRÖSIS. (From &, in, and aggor, a joint.) The ball and socket-joint. A species of diarthrosis, or moveable connexion of bones, in which the round head of one is received into the deeper eavity of another, so as to admit of inotion in every direction; as the head of the os femoris with the acetabulum of the os innominatum. See Articulation.

ENCANTHIS. (From en, and \*\*xxf0ss, the angle of the eye.) A disease of the carencula lachrymalis, of which there are two species. Encanthis benigna, and Enternal Ent

canthis maligna seu inveterata.

The eneanthis, at its commencement, is nothing more than a small, soft, red, and sometimes rather livid excrescence, which grows from the carimcula lachy malis, and, at the same time, from the neighbouring seminular fold of the conjunctiva. This excrescence, on its first appearance, is commonly granulated, like a mulberry, or sof a ragged and fringed structure. Afterwards, when it has acquired a certain size, one part of it represents a granulated

tumour, while the rest appears like a smooth, whitish, or ash-coloured substance, streaked with varicose vessels, sometimes advancing as far over the conjunctiva, covering the side of the eye next to the nose, as where the cornea and sclerotica unite.

The encanthis keeps up a chronic ophthalmy, impedes the action of the eyelids, and prevents, in particular, the complete closure of the eye. Besides, partly by compressing and partly by displacing the orifices of the puncta lachrymalis, it obstructs the free passage of the tears into the nose. The invetorate encanthis is ordinarily of a very considerable magnitude; its roots extend beyond the caruncula lachrymalis and semilinar fold to the membranous lining of one or both eyelids. The patient experiences very serious inconvenience from its origin and interposition between the commissure of the eye-lids, which it necessarily keeps asunder on the side towards the nose. Sometimes the disease assumes a cancerous malignancy. This character is evinced by the dull red, and, as it were leaden colour of the excrescence; by its exceeding hardness, and the lancinating pains which occur in it, and extend to the foreliead, the whole eye-ball and the temple, especially when the tumour has been slightly touched. It is also shewn, by the propensity of the excrescence to bleed, by the partial ulcerations on its surface, which emit a funguous substance, and a thin and exceedingly acrid discharge.

ENCATALEPSIS. (From ev, and καλαλειτω,

to leave.) A catalepsy.

ENCATHISMA. (From εν, and καθημι, to sit in.) A semicupium. A bath for half the body.

ENCAUMA. (From ey, in, and RAIA, to burn) Encausis. A pustule produced from a burn.

Encausis. (From &, and zzie, to burn.)

A burn, or scald

ENCEPHALOCELE. (From space action, the brain, and and, a tumour.) A rupture of the brain.

ENCEPHALON. (From ε, in, and κεφαλλ, the head.) Encephalum. By some writers the cerebrum only is so called; and others express by this term the contents of the cranium.

Excerts. (From ev, and ungos, wax.) A roll of wax for making plasters.

Encenosis. (From ev, and kingow, to wax.) The covering of a plaster with wax.

ENCHARAXIS. (From er, and ragarow,

to scarify.) A scarification.

ENCHEIRESIS. (From ev., and yee, the hand.) Encheiria Galen uses this word as part of the title to one of his works, which treats of dissection. The word imports the manual treatment of any subject

ENCHEIRIA. See Encheiresis.

ENGRILOYI. See Enchologia.

Exchonbars. (From er, and yorkers, a cartilage.) A cartilage.

ENCHRISTA. (From excese, to anoint.)

Unguents. Ointments.

ENGHYLOMA. (From er, and zuxos, juice.) An inspissated juice. An elixir, according to Lemery.

ENCHYMAS (From ev, and xew, to infuse.) An infusion. A sanguineous plethora.

ENCHYMATA. (From 2)χυω, to infuse.)

Injections for the eyes and ears.

ENCHYMOMA. (From ev, and xue, to pour in.) In the writings of the ancient physicians, it is a word by which they express that sudden effusion of blood into the cutaneous vessels, which arises from joy, anger, or shame; and in the last instance is what we usually call blushing.

Encurnosis. (εγχυμωτις.) Blushing; also an extravasation of blood, which makes the part appear livid. Thus, but improperly, it is synonymous with Ecchymosis.

ENCHYSIS. See Enchyma.

ENCLYSMA. (From ev, and κλυζω, to cleanse

out.) A clyster.

Excellen. (From e, within, and Roller, the belly.) The abdominal viscera.

Encolpismus. (From εγκολπέω, to insinu-

ate.) An uterine injection.

ENGRANIUM. (From &, within, and agartor, the skull.) The corobrum; the whole contents of the skull.

ENCRASICHOLUS. (From er, in, and zegze, the head; and goan, bile; because it is said to have the gall in its head.) The

Exents, Exect. A cake of meal, oil, and

ENCYMON. (From ev, and xua, to conceive.) Pregnancy.

Exersis. (From e, and xue, to bring forth.) Parturition.

ENCYSTED, A term applied to those tumours which consist of a fluid or other matter, enclosed in sac or cyst.

Everstis. (From er, in, and kusis, a bag.)

A wen. A hard tumour.

(Endemicus; from er, in, ENDEMIC. and Squos, people.) A disease is so termed that is peculiar to a certain class of persons, or country; thus struma is endemial to the inhabitants of Derbyshire and the Alps; scurvy to seafaring people; and the plica polonica is met with in Poland.

Evensis. (From er, and dew, to tie up.)

A ligature. A bandage. Endive. See Endivia.

ENDIVIA. (Quasi eundo viá, quia passim nacitur; named from the quickness of its growth.) Endiva. Endive. This plant, Cichorium endivia; floribus solitariis, pedunrulatis; foliis integris, crenatis, of Linnæus, is an extremely wholesome sallad, possessing bitter and anodyne qualities.

Exposis. (From er and Sideme, to give.)

A remission, particularly of febrile disor-

ENEULAGNENUS. (From standarlo, to interchange.) An epithet applied to the union of the joints of the vertebra.

ENEMA. (From staps, to nject.) Clyster. Injection. Lavement. A clyster. A well-known form of conveying both nourishment and medicine to the system, under certain morbid circumstances. The former takes place where obstruction of the passage to the stomach is so great as to render access to that organ impossible, such as occurs in lock jaw, diseased asopliagus, &c. By this means the body can be supported for a few weeks, till an attempt is made at effecting a cure. It is composed, in such cases, of animal broths, gruels made of farinaceous seeds, mucilages, &c. As a form of medicine, clysters are no less useful; and, according to the intention with which they are prescribed, they are either of an emollient, anodyne, or purgative nature. The following forms are in general use.

ENEMA ANODYNUM. Take of starch jelly, half a pint; tincture of opium, forty to sixty drops. Mix The whole to be injected by means of a pewter clyster-syringe, in cases of dysentery or violent purg-

ing, and pain in the bowels.

ENEMA ANTISPASMODICUM. Take tinct. of asafætida, half an ounce; tincture of opium forty drops, Mix. For spasmodic

affections of the bowels.

ENEMA LAXATIVUM. Take of Epsom salt, two ounces; dissolve in three quarters of a pint of warm gruel, or broth, with an ounce of fresh butter, or sweet oil.

ENEMA NICOTIANE. Take of the leaves of tobacco, two drachms; boiling water, one pound. The tobacco to be infused in the water for the space of ten minutes. Employed in cases of strangulated hernia.

ENEMA NUTRIENS. Take of strong beef tea, twelve ounces; thicken with hartshorn

shavings, or arrow-root.

ENEMA TEREBINTHINE. Take of common turpentine, half an ounce; the yolk of one egg, and half a pound of gruel. The turpentine, being first incorporated with the egg, is to be added to the gruel. This clyster is generally used, and with great good effect, in violent fits of the stone.

ENEREISIS. (From evereuder, to adhere to.)

A compression. A tight ligature

ENERGY. (Energia; from everywee, to ct.) Action. The degree of force exercised by any power: thus, nervous energy, muscular energy, &c.
E NEURESIS. See Enuresis.

ENGALACTUM. (From 27, and 22/24, milk; so called because it is eaten by nurses to increase their milk.) The herb saltwort.

ENGASTRIMYTHUS. (From ev, in, pashe, the belly, and  $\mu\nu\theta\omega\mu\mu\mu$ , to discourse.) A

ventri equist; one who appears to speak from his belly.

Engisona. (From 221/20, o approach.) Camarosis. An instrument for making the parts of the broken clavicle meet. Also a fracture of the cranium.

Linglish mercury. See Mercurialis.

Englorro-Gaston. (From &, yherh, the tongue, and yasag, the belly. A ventriloquist.

Engonemosis. (From ε, and γομφος, a not.) That species of articulation which resembles a mail, driven into wood, as a tooth in its socket.

Engonios. (From et, and paceta, an angle) The flexure, or angle made by the Lending of a joint.

ENXUM PURACELSI. The caput mortuum of the spirit of nitre, joined with vitriolic acid.

ENNEAPHARMACUM. (From eyeza, nine, and фадмаков, a medicine. A medicine composed of nine simple ingredients.

ENNEAPHYLLUM. (From εννεχ, nine, and φυλλεν. leaf; because its flower consists of nine leaves.) A name for helleboraster, or hear's foot.

ENUTTIMUS. (From e, priv. and guθμος, number.) An irregular pulse

Exs nature. A name antiently given to the oxyde of iron, which arises in sublimation, with twice its quantity of sal-ammoniac. Medical practice does not at present place this practical preparation in a higher rank of estimation than other oxydes of iron.

ENS PRINUM SOLARR. Antimony.

ENS VENERIS. The ens veneris is in many dispensitories called by this name.

ENSIFORM. (Ensiformis, see cartilago; fram ensis, a sword, and forma, resemblance.) Sword-like A term applied to a cartilage. See Cartilago ensiformis.

Ensurer (From er, and salo, to instit) A liquid medicine, which is applied stillation, or drop by drop.

ENTATICA. (From efferte, to strain.) Provocatives: medicines which excite venereal inclination.

ENTERA. (From erlos, within. The bowels. Hippocrates calls by this name the bags in which were formerly enclosed medicines for fomentations.

ENTERADENES. (From evileger, an intestine, and adma, gland.)
ENTERENCHYTA. (From evileger, the bow-

ENTERENCHITA. (From effega, the bowels, and αγχυω, to infuse into.) An instrument for administering clysters. A clyster-pipe.

INTERITIS. (Establis: from establis, an intestine.) Inflammation of the intestines. It is a genus of disease in the class pyrexic, and order phlegmasic of Cullen, and is known by the presence of pyrexia, fixed pain in the abdomen, costiveness, and vomiting. The causes of enteritis are much

the same as those of gastritis, being occasioned by acrid substances, indurated faces, long continued and obstinate costiveness, spasmodic cholic, and a strangulation of any part of the intestinal canal; but another very general cause is the application of cold to the lower extremities, or to the belly itself. It is a disease which is most apt to occur at an advanced period of life, and is very hable to a relapse.

It comes on with an acute pain, extending in general over the whole of the abdomen; but more especially round the navel, accompanied with eructations, sickness at the stomach, a vomiting of bilious matter, obstinate costiveness, thirst, heat, great anxiety, and a quick and hard small pulse. After a short time, the pain becomes more severe, the bowels seem drawn together by a kind of spasin, the whole region of the abdomen is nightly painful to the touch, and seems drawn together in lumpy contractions; invincible costiveness prevails, and the urine is voided with great difficulty and pain.

The inflammation continuing to proceed with violence, terminates at last in gangrene; or abating gradually, it goes off by resolution.

Enteritis is always attended with considerable danger, as it often terminates in gangrene in the space of a few hours from its commencement; which event is marked by the sudden remission of pain, sinking of the pulse, shrinking of the features, and distention of the belty; and it frequently proves fatal likewise, during the inflammatory stage. If the pains abate gradually, if natural stools be passed, if an universal sweat, attended with a firm equal pulse, comes on, or if a copious discharge of loaded urine, with the same kind of pulse, takes place, a resolution and favourable termination may be expected.

Dissections of this disease shew that the inflammation pervades the intestinal tube to a very considerable extent; that adhesions of the diseased portion to contiguous parts are formed; and that, in some cases, the intestines are in a gangrenous state, or that ulcerations have formed. They likewise shew that, besides obstinate obstructions, intususception, constrictions, and twistings, are often to be met with; and that, in most cases, the peritoneum is more or less affected, and is perceived, at times, to be covered with a layer of coagulable lymph.

ENTEROCELE. (From offer, an intestine, and wath, a tumour.) Hernia intestinalis. Every hernia may be so called that is produced by the protusion of an intestine, whether it is in the groin, navel, or elsewhere.

ENTERO-EPIPLOCELE. (From enegov, an intestine, 27472000, the epiploon, and милл.

RANAN, a tumour.) A rupture formed by the protusion of part of an intestine, with a por-

tion of the epiploon.

ENTERO-HYDROCELE. (From spregor, an intestine, wdwg, water, and mndm, a tumour.) This must mean a common scrotal hernia, with a good deal of water in the hernial sac; or else a hernia congenta, (in which the bowels descend into the tunica vaginalis testis.) attended with a collection of fluid in the cavity of this membrane.

ENTEROMPHALUS. (From εντέξον, an intestine, and ομφαλ@, the navel.) An umbilical hernia, produced by the protusion

of a portion of intestine.

ENTEROPHYTUM. (From evlegov, an intestine, and polov, a plant.) The sea-chitterling; a plant which grows in the form of

a gut.

ENTERORAPHIA. (From εντεξον, an intestine, and gaφη, a suture.) A suture of the intestines, or the sewing together the divided edges of an intestine.

ENTEROSCHEOCELE. (From είλεςον, an intestine, and οσχεον, the scrotum, and κηλη, a rupture.) Hernia scrotalis, or rupture of the intestines into the scrotum.

ENTHEMATA. (From evilonmi, to put in.)

Anti-inflammatory styptics.

ENTHLASIS. A contusion, with the impression of the instrument by which it happened.

ENTROPIUM. (From ε, and τεετω, to turn.) A disease of the eyelids, occasioned by the eyelashes and eyelid being inverted towards the bulb of the eye.

Entryposis. (From ενθυποω, to make an impression) The acetabulum, or concave

bone of the shoulder.

ENULA CAMPANA. (A corruption of henula, or Helenium, from Helene, the island where it grew.) Helenium. Common inula, or elecampane. Inula helenium of Linnæns :- foliis amplexicaulibus ovatis rugosis subtus tomentosis, calycum squamis ovatis. This plant, though a native of Britain, is seldom met with in its wild state, but mostly cultivated. The root, which is the part employed medicinally, in its recent state. has a weaker and less grateful smell than when thoroughly dried; and kept for a length of time, by which it is greatly improved, its odour then approaching to that of Florentine orris. It was formerly in high estimation in dyspepsia, pulmonary affections, and uterine obstructions, but is now fallen into disuse.

ENULON. (From ey, and 8000, the gums.) The internal flesh of the gums, or that part of them which is within the mouth.

ENURESIS. (From eregeo, to make water.) An incontinency or involuntary flow of urine. This disease usually proceeds either from relaxation or a paralytic affection of the sphincter of the bladder,

induced by various debilitating causes, as too free a use of spirituous liquors, manustrupation, and excess in venery; or it arises from compression on the bladder, from a diseased state of the organ, or from some irritating substance contained in its cavity. It is arranged in the class locales, and order apocenoses of Cullen, and contains two species:—1. Enuresis atonica, the sphincter of the bladder having lost its tone from some previous disease: 2. Enuresis ab irratione, vel compressione vesica, from an irritation or compression of the bladder.

EPACMASTICUS. (From επι, and ακμαζω, to incsease.) It is applied to fever which is still increasing in malignity.

EPACME. (From επαμμαζ, to increase.) The increase, or exacerbation of a disease

EPAGOGIUM. (From επαγω, to draw over.)
The præpuce, that part of the penis which is drawn over the glans, according to Dioscorides.

EPANADIDOUTES. (From επαναδίδωμι, to increase.) A term applied to fevers which continue to increase in their degree of heat.

EPANADIPLOSIS. (From επαναδιτλοω, 'o reduplicate.) The reduplication of a fit of a semitertian fever; that is, the return of the cold fit before the hot fit is ended.

EPANASTASIS. (From em, and ausmui, to excite.) A tubercle, or small pustule upon

the skin.

EPANCYLOTUS. (From επι, and αρκυλος, crooked. A sort of crooked bandage in Oribasius.

EPARMA. (From επαιμα, to elevate.) Eparsis. Any kind of tumour, but frequently applied to the parotis.

EPARSIS. See Eparma.

EPASMASTICA FEBRIS. A fever is so called by Bellini, and others, while it is in its increase.

EPENCRANIS. (From επι, εν, in, and κζανιον, the skull.) The name of the cerebellum.

EPHEBEUM. (From en, and Mn, the groin.) The hair upon the pubes.

EPHEDRA. (From εφεζομα, to sit upon.) Ephedrana. The buttocks. Also a species of horse-tail.

EPHEDRANA. See Ephedra.

EPHELCIS. (From emi, upon, and excess, an ulcer.) The crust of an ulcer; hardened purulent expectoration.

EPHELIS. (From ετι, and πλιος, the sun.) A broad, solitary, or aggregated spot, attacking most commonly the face, back of the hand, and breast, from exposure to the sun.

EPHEMERA. (From ent, upon, and nuega. a day.) A fever which hegins, is perfectly formed, and runs through its course, in the space of twelve hours.

EPHEMERIDES. (From equiples, an almanack; so called because, like the moon's age, they may be foretold by the almanack.) Diseases which return at particular times of the moon.

Ephialtes. (From εφαλλομαι, to leap upon; so called because it was thought a damon leaped upon the breast.) Incubus,

or night-mare.

EPHIALTIA. (From ephialtes, the nightmare; so called because it was said to cure the night mare.) The herb pxony.

El'HIDROSIS. (From spulgew, to perspire.) Sudatio. Mador. A violent and morbid perspiration. A genus of disease in the class locales, and order apocenoses of

EPHIPPIUM. (A saddle, which it is

thought to resemble.) See Sella turcica. Ernonos. (From en, and ofos, a way.) In Hippocrates it hath three significations: 1. The ducts, or passages, by which the excrements of the body are evacuated. The periodical attack of a fever, from the common use of it to express the attack of thieves. 3. The access of similar or dissimilar things, which may be useful or hurtful to the body.

EPIALTES. See Ephialtes.

EPIALUS. (From 11710), gently, and αλεαζω, to heat.) Epialos. An ardent fever, in which both heat and cold are felt in the same part at the same time. Galen defines it to be a fever in which the patient labours under a preternatural heat and a coldness at the same time. The ancient Latins call it Quercera.

EPIBOLE. (From επβαλλω, to press upon.)

The night mare, or spinaltes.

EPICANTHIS. (From em, and navbos, the angle of the eye.) The angle of the eye. ΕΓΙCAUPIUM. (From επι, upon, and κας-

πος, the wrist.) A topical medicine applied to the wrist.

EPICAUMA. (From em, and maur, to Encauma. Epicausis. A burn, or burn.)

Ericausis. See Epicauma.

EPICERAS. (From er, and Regat, a horn; so called because its pods are shaped like

a horn.) The herb fænngreek.

EVICERASTICA. (From ent, and REGAVYUMI, to mix.) Medicines which, by mixing with acrimonious juices, temper them and render them less troublesome. Emolli-

Epicherresis. (From eri, and xug, the hand.) A manual operation.

EPICHOLUS. (From eti, and youn, the bile ) Bilious.

EPICHORDIS. (From et, upon, and xogdh, a gut.) The mesentery

Erichorios. (From eri, upon, and xoge, a region.) The same as ep dermis.

EFICULE. (From 171, upon, and ROLLS, the eyelid.) The upper eyelid, Ericolic. (Epicolica; from 171, upon,

and and or the colon.) Upon the colon. That

part of the abdomen which lies over the head of the cocum and sygmoid flexure of the colon, called the epicolic region.

(From emi, and numpos, EPICOPHOSIS.

deaf.) A total deafness.

EHICRANIUM. (From ett, and ngavior, the cranium.) The common integuments, aponeurosis, and muscular expansion which lie upon the cranium.

Epicranius. See Occipito-frontalis. Epicrasis. (From επι, and κεζαννυμι, to temper.) A critical evacuation of bad humours, an attemperation of bad ones. When a cure is performed in the alterative way, it is called per Epicrasin.

EPICRISIS. (From em ngive, to judge from.) A judgment of the termination of

a disease from present symptoms.

EPICTENIUM. (From em, about, and alue, e pubes.) The parts above and about the pubes.) the pubes.

EPICYEMA. (From επι, upon, and κυω, to conceive.) Episyesis. Superfætation. Superimpregnation.

Epicyesis See Epicyema.

EPIDEMIC. (Epidemicus; from emi, upon, and SnuG, the people.) A contagious disease is so termed, that attacks many people at the same season, and in the same place; thus putrid fever, plague, dysentery, &c. are often epidemic.

EPIDENDRUM. (From em, upon, Ser-Seov. a tree; because all this genus of plants grow parasitically on the trunk or branches of other trees.) The name of a genus of plants in the Linnaan system. Class, Gynandria. Order, Monandria.

EPIDENDRUM VANILLA. The systematic name of the vanelloe plant. See Vanilla.

Epineris. (From ent, and Segae, the skin.)

The clitoris.

EPIDERMIS. (From ett, upon, and deg. μα, the true skin.) The scarf-skin.

Epinesis. (From eti, upon, and dew, to bind.) A bandage to stop a discharge of

EPIDESMUS. (From ext, upon, and See, to bind.) A bandage by which splints,

bolsters, &c. are secured.

EPIDIDYMIS. (From er, upon, and Sidupos, a testicle.) A hard, vascular, oblong substance, that lies upon the testicle, formed of a convolution of the vas deferens. It has a thick end, which is convex, and situated posteriorly; and a thin end, which is rather flat, and situated inferiorly. The epididymis adheres to the testicle by its two extremities only, for its middle part is free, forming a bag, to which the tunica vaginalis of the testicle is attached.

EPIDO-IS. (From Eridifaui, to grow upon.) A preternatural enlargement of any part.

EPIDROME. (From επιβερμα, to run upon.)
An afflux of humours.

EPIGASTRIC. (Epigastricus, entraereins: from eri, upon, or above, and vasue.

the stomach.) That part of the abdomen that lies over the stomach, is called the epigastric region; it reaches from the pit of the stomach to an imaginary line above the navel, supposed to be drawn from one extremity of the last of the false ribs to the other. Its sides are called hypochondria, and are covered by the false ribs, between which ties the epigastrium.

EPIGASTRIUM. (From em, upon, or above, and yasne, the belly.) The region or part immediately over the stomach.

EPIGENNEMA (From entrywound, to generate upon.) Epigennesis. The fur on the tongue. An accessory symptom.

EPIGENNESIS. See Epigennema

EPIGINOMENA. (From etc), no may, to succeed or supervene.) Galen says, they are those symptoms which naturally succeed, or may be expected in the progress of a disease; but Fæsius says, they are accessions of some other affection to diseases, which never happen but in stubborn and malignant diseases.

Englossum. (From επι, upon, and γλωσσα, the tongue; so called because a lesser leaf grows above the larger in the shape of a tongue.) The Alexandrian

laurel

(From er, upon, and EPIGLOTTIS. YAWTTE, the tongue.) The cartilage at the root of the tongue that falls upon the glottis or superior opening of the larynx. Its figure is nearly oval; it is concave posteriorly, and convex anteriorly. Its apex or superior extremity is loose, and is always elevated upwards by its own elasticity. While the back of the tongue is drawn backwards in swallowing, the epiglottis is put over the aperture of the larynx, hence it shuts up the passage from the mouth into the larynx. The base of the epiglottis is fixed to the thyroid cartilage, the os hyoides, and the base of the tongue, by a strong ligament.

EFIGLOTTUM. (From way harder, the epiglottis, which it resembles in shape.) An instrument mentioned by Paracelsus for

elevating the eyelids.

EFIGLOUTIS. (From επι, upon, and γλουθος, the buttocks.) The uperior parts of the buttocks.

Epigonatis. (From eti, upon, and you, the knee.) The patella o knee pan.

EPIGONIDES. (From eri, and your, the knee.) The muscles inserted into the knees.

EPIGONUM. (From extrywould, to proceed

upon.) A superfectation.

EPILEMPSIS. See Epilepsia.

EPILENTIA. Corrupte from epilepsia.

EPILEPSY (From ετλαμβανα, to seize upon; so called, from the suddenness of its at ack) I is also called falling sickness, from the patient suddenly falling to the ground on an attack of this disease. By the ancients it was termed, from its affect-

ing the mind, the most noble part of the rational creature, the sacred disease. It consists of convulsions with steep, and usually froth issuing from the mouth. It is a genus of disease in the class neuroses, and order spasmi of Cullen, and contains nine species: 1. Epilepsia traumatica, arising from an injury of the head: 2. Epilepsia à dolore, from pain: 3. Epilepsia verminosa, from the irritation of worms: 4. Epilepsia à veneno, from poisons: 5. Epilepsia exanthematica, from the repulsion of cutaneous eruptions: 6. Epilepsia à cruditate ventriculi, from crudities of the stomach: 7. Epilepsia ab inanitione, from debility: 8. Epilepsia uterina, from hysterical affections: 9. Epilehsia ex onanismo, from onanism.

Epilepsy attacks by fits, and after a certain duration goes off, leaving the person most commonly in his usual state; but sometimes a considerable degree of supportant and weakness remain behind, particularly where the disease has frequent recurrences. It is oftener met with among children that grown persons, and boys seem more subject to its attacks than girls. Its returns are periodical, and its paroxysms commence more frequently in the night than in the day, being somewhat connected with sleep. It is a disease sometimes counterfeited, in order to extort charity or excite compas

sion.

Epilepsy is properly distinguished into sympathic and idiopathic, being considered as sympathic, when produced by an affection in some other part of the body, such as acidities in the stomach, worms, teething, &c. an idiopathic when it is a primary disease, neither dependent on, nor proceed-

ing from any other.

The causes which give rise to epilepsy, are blows, wounds, fractures, and other injuries done to the head by external violence, together with lodgments of water in the brain, tumours, concretions and polypi. Violent affections of the nervous system, sudden frights, fits of passion, great emotions of the mind, acute pains in any part, worms in the stomach or intestines, teething, the suppression of long accustomed evacuations, too great emptiness or repletion, and poisons received into the body, are causes which likewise produce epilepsy. Sometimes it is hereditary, and at others it depends on a predisposition arising from a mobility of the sensorium, which is occasioned either by plethora, or a state of debility.

An attack of epilepsy is now and then preceded by a heavy pain in the head, dimness of sight, noise in the ears, paintations, flatulency in the stomach and intestines, wearings, and a small degree of supor, and in some cases, there prevails sense of something like a cold vapour or aura arising up to the head; but it more generally happens that the patient falls

down suddenly without much previous notice; his eyes are distorted or inverted, so as that only the whites of them can be seen; his fingers are closely clenched, and the trunk of his body, particularly on one side, is much agitated; he foams at the mouth, and thrusts out his tongue, which often suffers great injury, from the muscles of the lower jaw being affected; he loses all sense of feeling, and not unfrequently voids both urine and faces involuntarily.

The spasms abating he recovers gradually; but on coming to himself, feels very languid and exhausted, and retains not the smallest recollection of what has passed

during the fit.

When the disease arises from an hereditary disposition, or comes on after the age of puberty, or where the fits recur frequently, and are of long duration, it will be very difficult to effect a cure; but when its attacks are at an early age, and is occasioned by worms, or any accidental cause, it may in general be removed with ease. some cases, it has been entirely carried off by the occurrence of a fever, or by the appearance of a cutaneous eruption. It has been known to terminate in apoplexy, and in some instances to produce a loss of the powers of the mind, and to bring on idiotism.

The appearances usually to be observed on dissection are, serous and sanguineous effusion, a turgid tense state of the vessels of the brain without any effusion, a dilatation of some particular part of the brain, excrescences, polypi, and hydatides adhering to it, and obstructing its functions, and likewise ulcerations.

EPILOBIUM. (From erri holes 100, a violet or beautiful flower, growing on a pod.) The name of a genus of plants in the Lin-Class Octandria. næan system. Order,

Monogynia.

EPILOBIUM ANGUSTIFOLIUM. Rose-baywillow herb. The young tender shoots cut in the spring, and dressed as asparagus, are little inferior.

EPIMEDIUM. The plant barren-wort. EPIMORIUS. (From ett, and mesow, to divide.) A term applied to an unequal pulse

(From ent, and punn, the EPIMYLIS. knee.) The patella or knee bone.

EPINENEUCUS. (From extreum, to nod or

incline.) An unequal pulse. EPINOTIUM. (From ETI, upon, and valles,

the back.) The shoulder blade.

EPINYETIS. (From er, and rug, night.) A pustule, which rises in the night, forming an angry tumour on the skin of the arms, hands, and thighs, of the size of a lupine, of a dusky red, and sometimes of a livid and pale colour, with great inflammation and pain. In a few days breaks, and sloughs away.

EPIPACTIS. (From ereraxlow, to coagulate.) A plant mentioned by Dioscorides; and so named because its juice was said to coagulate milk.

EPIPAROXYSMUS. (From em, upon, and παροξυσμος, a paroxysm.) An unusual fre-

quency of febrile exacerbation.

EPIPASTUM. (From ere, upon, and nowσω, to sprinkle.) Any powdered drug sprinkled on the body.

EPIPECHYS. (From en, above, and πεχυς, the cubit.) That part of the arm

above the cubit.

Epiphlogisma. (From επι, upon, and φλορίζω, to inflame.) Violent inflammation, or burning heat in any part, attended with pain, tumour, and redness: also a name given by Hippocrates to the shingles.

EPIPHORA, (From eribegue, to carry forcibly.) The watery eye. An involuntary flow of tears. A superabundant flowing of a serous or aqueous humour from the eyes. A genus of disease in the class locales, and order apocenoses, of Cullen. humour which flows very copiously from the eye in epiphora appears to be furnished, not only by the lachrymal gland, but from the whole surface of the conjunctive membrane, Meibomius's glands, and the caruncula lachrymalis; which increased and morbid secretion may be induced from any stimulus seated between the globe of the eye and lids, as sand, acrid fumes, and the like; or it may arise from the stimulus of active inflammation; or from the acrimony of scrophula, measles, small-pox; or from general relaxation. The disease may also arise from a more copious secretion of tears than the puncta lachrymalia can absorb, or, as it is most common , from an ob . struction in the lachrymal canal, in consequence of which the tears are prevented from passing freely from the eye into the nose.

(From em, upon, and EPIPHYSIS. Any portion of bone growφυω, to grow.) ing upon another, but separated from it by

a cartilage.

(From em, upon, EPIPLASMA. and πλασσω, to spread.) A poultice; also a name for an application of wheat meal, boiled in hydelæum, to wounds.

EPIPLOCELE. (From erithou, the omentum, and wake, a tumour.) An omental hernia. A rupture produced by the protusion of a portion of the omentum. See Hernia.

EPIPLOCOMISTES. (From enunhous, the omentum, and κομιζω, to carry.) has the omentum morbidly large.

EPIPLOIC APPENDAGES. See Appendi

culæ epiploicæ.

EPIPLOITIS. (From entracov. omentum ) An inflammation of the process of the peritoneum, that forms the epiploon or omentum. See Peritonitis.

EPIPLOOMPHALON. (From emithous, the

omentum, and ompanos, the navel.) omental hernia protruding at the navel.

EPIPLOON. (From επιπλοω, to sail over, because it is mostly found floating, as it were, upon the intestines.) See Omen-

EPIPLOSCHEOCELE. (From emitthoov, the omentum, or xeov, the scrotum, and knew, a tumour or heroia.) A rupture of the omentum into the scrotum, or a scrotal hernia containing omentum.

EPIPOLASIS. (From επιπολαζω, to swim on the top.) A fluctuation of humours.

A species of chymical sublimation.

EPIPOMA. (From επι, upon, and πωμα, a lid.) An instrument to cover the shoulder in a luxation.

Epiponoma, (From επιπωρεω, to harden.) An indurated tumour in the joints; a callous concretion, a tophus, a tophaceous callus molesting the joints

Eripryxis. (From επιπθυσσω, to close up.) A spasmodic closing of the lips.

EPIPYREXIS. (From ent, and nuperla, to be feverish.) A rapid exacerbation in a fever.

EPIRIGESIS. (From ent, and pigew, to become cold.) An unusual degree of cold, or repitition of rigors.

(From er, upon, and pew, EPIRRHOE. to flow.) An influx or afflux of humours

to any part. EPISARCIDIUM. (From em, upon, and

σαρέ, the flesh.) An anasarca, or dropsy spread between the skin and flesh.

EPISCHESES. (From εστισχεω, to restrain.) A suppression of excretions. It is an order in the class locales of Cullen's nosology.

(From επι, upon, and ισχιον, The os pubis. Epischium.

the hip-bone.)

Episcopalis. (From episcopus, a bishop, or mitred dignitary.) Resembling a bishop's mitre. It is applied to a valve at the orifice between the left auricle and ventricle of the heart, called the mitral valve.

Erispasmus. (From επισπαω, to draw together.) A quick inspiration of the

breath.

EPISPASTICS. (Epispastica, sc. medicamenta; from επισπαω, to draw together.) Those substances which are capable, when applied to the surface of the body, of producing a serous or puriform discharge, by exciting a previous state of inflammation. The term, though comprehending likewise issues and setons, is more commonly restricted to blisters-those applications which, exciting inflammation on the skin, occasion a thin serous fluid to be poured from the exhalants, raise the cuticle, and form the appearance of a vesicle. effect arises from their strong stimulating power, and to this stimulant operation and the pain they excite, ar to be ascribed the advantages derived from them in the

treatment of disease. The evacuation they occasion is too inconsiderable to have any

It is a principle sufficiently established with regard to the living system, that where a morbid action exists, it may often be removed by inducing an action of a differ-ent kind in the same or neighbouring part. On this principle is explained the utility of blisters in local inflammation and spasmodic action, and it regulates their application in pneumonia, gastritis, hepatitis, phrenitis, angina, rheumatism, colic, and spasmodic affections of the stomach; diseases in which they are employed with the most marked advantage.

A similar principle exists with respect to pain; exciting one pain often relieves another. Hence blisters often give relief in tooth-ach, and some other painful affec-

tions.

Lastly, blisters, by their operation, communicate a stimulus to the whole system, and raise the vigour of the circulation. Hence, in part, their utility in fevers of the typhoid kind, though in such cases they are used with still more advantage to ohviate or remove local inflammation.

EPISPHERIA. (From en, and opaspa, a sphere; so called from the splizucal shape of the brain.) The windings of the exterior surface of the brain; or the winding vessels upon it.

Epistagmus. (From en, and sazw, to

trickle down.) A catarrh.

EPISTAPHILINUS. (From ent, and sa. φυλινό, a parsnip, from their resemblance to a carrot.) See Uvula.

EPISTAXIS. (From erisaço, to distil from.) Bleeding at the nose, with pain, or fulness of the head. A genus of disease arranged by Cullen in the class pyrexia,

and order hamorrhagia.

Persons of a sanguine and plethoric habit and not yet advanced to manhood, are very liable to be attacked with this complaint: females being much less subject to it than males, particularly after menstrua-

Epistaxis comes on at times without any previous warning; but at others, it is preceded by a pain and heaviness in the head, flushing in the face, heat and itching in the nostrils, a throbbing of the temporal arteries and a quickness of the pulse. In some instances a coldness of the feet, and shivering over the whole body, together with a costive belly, are observed to precede an attack of this hæmorrhage.

This complaint is to be considered as of little consequence; when occurring in young persons, being never attended with any danger; but when it arises in those who are advanced in life, flows profusely and returns frequently, it indicates too great fulness of the vessels of the head, and not

unfrequently precedes apoplexy, palsy, &c. and therefore, in such cases, is to be regarded as a dangerous disease. When this hæmorrhage arises in any putrid disorder, it is to be considered as a fatal symytom.

EPISTHOTONOS. (From exister, for wards, and ruva, to extend.) A spasmodic affection of mu-cles drawing the body for-

wards. See Tetanus.

EPISTOMION. Epistomion. (From επι, upon, and τωμα, a mouth) A stopper for a bottle. Also a vent-hole of a furnace, called the re-

gister.

EPISTROPHALUS. (From er, upon, and τρεφω, to turn about.) It is applied to the first vertebra of the neck, because it turns about upon the second as upon an axis, which therefore was so called by the ancients. Some, though improperly, called the second thus. It is also written Epistrophea and Epistrophis.

EPISTROPHE. (From erispepa, to invert.) An inversion of any part, as when the neck is turned round. Also a return of a disor-

der which has ceased

EPISTROPHEUS. (From επισχοφαιώ, to turn round, because the head is turned upon it.) Epistrophæus The second cervical vertebra. See Dentatus.

EPISTROPHIS. See Epistrophe.

EPITASIS. (From επι, and τεινω, to extend.) The beginning and increase of a paroxysm or disease.

EPITHELIUM. The cuticle on the red

part of the tips.

EPITHEMA. (From επι, upon, and τιθημι, to apply.) A term sometimes applied to a lotion, fomentation, or some external application.

EPITHEMATIUM. The same. A plaster. EPITHESIS. (From επι, and τιθημι, to cover or lay upon.) The rectification of crooked limbs by means of instruments.

EPITHYMUM. (From 171, upon, and θυμος, the herb thyme.) Cuscuta. Dodder of thyme. A parasitical plant, possessing a strong disagreeable smell, and a pungent taste, very durable in the mouth. Two kinds are recommended in melancholia, as cathartics, viz. Cuscuta epirhymum of Linnæus :- foliis sessilibus, quinquifidis, bracteis obvallatis, and cuscuta europea; floribus sessilibus.

EPODE. (From ers, over, and adn, a song.) Epodos. The method of curing

distempers by incantation.

EPOMIS. (From ett, upon, and wuoc, the The acromion, or upper part shoulder.) of the shoulder.

(From er, upon, and EPOMPHALIUM. ομφαλος, the navel.) An application to the

EPSOM SALT. A purging salt, formerly obtained by boiling down the mineral water, found in the vicinity of Epsom in Surrey. It is at present prepared from sea water, which, after being boiled down, deposits an unchrystallized brine, that consists chiefly of muriated magnesia, and is sold in the shops under the name of sal. catharticus amarus, or bitter purging salt.

See Sulphas Magnesiæ.

EPSOM WATER. Aqua Epsomensis. This water evaporated to dryness leaves a residuum, the quantity of which has been estimated from an ounce and a half in the gallon to five drachms and one scruple. Of the total residuum, by far the greater part, about four or five sixths, is sulphate of magnesia mixed with a very few mirrats, such as that of lime, and probably magnesia, which render it very deliquescent, and increase the bitterness of taste, till purified by repeated chrystallizations. There is nothing sulphureous or metallic ever found in this spring. The diseases in which it is employed are similar to those of Sedlitz water. There are many other of the simple saline spring, that might be enumerated, all of which agree with that of Epsom, in containing a notable proportion of some purging salt. This, for the most part, is either Epsom or Glauber's salt, or often a mixture of both, such as Acton, Kilburne, Bagnigge Wells, Dog and Duck, St. George's Fields, &c.

EPULIS. (From επι, and ελα, the gums.) A small tubercle on the gums. It is said

sometimes to become cancerous.

EPULOTICS. (Epulotica, sc. medicamenta; from 6782000, to cicatrize.) A term given by surgeons to those applications which promote the formation of skin.

EQUISETUM. (From equus, a horse, and seta, a bristle; so named from its re-

semblance to a horse's tail.)

1. The name of a genus of plants in the Linnæan system. Class, Cryptogamia. Or-

der, Filices.
2. The pharmacopæial name of the Canda equina. Horse-tail, mare's-tail. The plant directed for medicinal purposes under this name is the Hippuris vulgaris of Linnæus. It possesses astringent qualities, and is frequently used by the common people as rea in diarrhoas and hamorrhages. The same virtues are also attributed to the Equiscium arvense, fluviatile, limosum, and other species, which are directed indiscriminately by the term Equisetum.

Equiserum ARVENSE. See Equisetum. Equus asinus. The systematic name of

the animal called an ass; the female affords a light and nutritious milk.

ERANTHEMUS. (From pp, the spring, and ανθεμος, a flower; so called because it Howers in the spring )
EREBINTRUS. (Epsarbos ) The vetch.

ERECTOR CLITORIDIS. First muscle of the chtoris of Doughs. Ischiocavernosus of Winslow, and Ischio-clitoridien of Dumas. A muscle of the clitoris

that draws it downwards and backwards, and serves to make the body of the clitoris more tense, by squeezing the blood into it from its crus. It arises from the tuberosity of the ischium, and is inserted into the cli-

ERECTOR PENIS. Ischio-cavernosus of Winslow, and Ischio-caverneux of Dumas. A muscle of the penis that drives the urine or semen forwards, and, by grasping the bulb of the urethra, pushes the blood towards the corpus cavernosum and the glans, and thus distends them. It arises from the tuberosity of the ischium, and is inserted into the sides of the cavernous substance of the penis.

ERETHISMUS. (From ερεθιζω, to excite or irritate.) Increased sensibility and irritability. It is variously applied by mo-

dern writers.

Mr. Pearson has described a state of the constitution produced by mercury acting on it as a poison. He calls it the mercurial erethismus, and mentions that it is characterized, by great depression of strength, anxiety about the præcordia, irregular action of the heart, frequent sighing, trembling, a small, quick, sometimes intermitting pulse, occasional vomiting, a pale contracted countenance, a sense of coldness; but the tongue is seldom furred, nor are the vital and natural functions much disturbed. In this state any sudden exertion will sometimes prove fatal.

ERGASTERIUM. (From eppor, work.) A labaratory: that part of the furnace in which is contained the matter to be acted

(From epeina, to break; so ERICA. named from its fragility, or because it is broken into rods to make besoms of.) The name of a genus of plants in the Linnæan system. Class, Octandria. Order, Monogynia. Heath.

ERICERUM. (From speaks, heath.) A me-

dicine in which heath is an ingredient.

ERIGERUM. (From no, the spring, and yepay, old, so called, because in the spring it has a white blossom like the hair of an Groundsei old man.) Erigeron. very common plant, Senecio vulgaris of Linnæus, is frequently applied bruised to inflammations and ulcers, as a refrigerent and antiscorbutic.

EROSION. (From erodo, to guaw off.) This word is very often used in the same sense as ulceration, viz. the formation of a breach or chasm in the substance of parts, by the action of the absor-

bents.

(From space, love, and EROTOMANIA. mana, madness.) That melancholy, or mad-

ness, which is the effect of love.

Enres. (From ερπω, to creep; so named from their gradually increasing in size.) The shingles, or herpes.

ERRATIC. (Erraticus, from erro, to wander.) Wandering, Irregular. A term occasionally applied to pains, or any disease which is not fixed, but moves from one part to another, as gout, rheumatism,

ERRHINE. (Errhina, sc. medicamenta: sppera, from sv, in, and per, the nose.) By errhines are to be understood those medicines, which, when topically applied to the internal membrane of the nose, excite sneezing, and increase the secretion, independent of any mechanical irritation. The articles belonging to this class may be referred to two orders.

1. Sternutatary errhines, as nicotiana, helleborus, euphorbium, which are selected for the torpid, the vigorous, but not plethoric; and those to whom any degree of evacuation would not be hurtful.

2. Evacuating errhines, as asarum, &c. which is calculated for the phlegmatic and

ERROR LOCI. Boerhaave is said to have introduced this term, from the opinion that the vessels were of different sizes, for the circulation of blood, lymph, and serum; and that when the larger sized globules were forced into the lesser vessels by an error of place, they were obstructed. this opinion does not appear to be well grounded.

ERUCA. (From erugo, to make smooth, so named from the smoothness of its leaves; or from uro, to burn, because of its biting quality.) Garden rocket. Roman rocket. Rocket gentle. The seeds of this plant, Brassica eruca; foliis lyartis, caule hirsuto siliquis glabris, of Linnaus, and of the wild rocket, have an acrid taste, and are eaten by the Italians in their pickles, &c. They are said to be good aperients and antiscorbutics, but are esteemed by the above-mentioned people for their supposed aphrodisiac qualities.

The wild rocket, ERUCA SYLVESTRIS. Brassica erucastrum of Linnæus.

ERUTHEMA. (From epeu 9 a, to make red. A fiery red tumour, or pustules on the skin.

ERVUM. (Quasi arvum, a field, because it grows wild in the fields: or from eruo, to pluck out, because it is diligently plucked from corn.)

1. The name of a genus of plants in the Linnæan system. Class, Diadelphia. Or-

der, Decandria.

2. The pharmacopæial name of tare.

Orobus. The plant ordered by this name is the Ervum ervilia; germinibus undatoplicatis, foliis imparipinnatis, of Linnæus. In times of searcity the seeds have been made into bread, which is not the most salubrious. The meal was formerly amongst the resolvent remedies by way of poultice.

ERVUM ERVILLA. The systematic name of the Orobos. See Ervum

Envum LENS. The systematic name of the lentil. See Lens.

ERYNGIUM. (From egvyyava, to eruc-

tate.)

1. The name of a genus of plants in the Pentandria. Order, Linnaan system. Class, Pentandria. Order,

Digynia. 2. The pharmacopæial name of the sea eryngo, or holly. Eryngium maritimum; foliis radicalibus subrotundis plicatis spinosis, capituas pedunculatis, paleis tricuspidatis, of Lunaus. The root of this plant is directed for medicinal use. It has no par-

ticular smell, but to the taste it manifests a grateful sweetness; and, on being chewed for some time, it discovers a light aromatic warmth or pungency. It was formerly celebrated for its supposed aphrodisiac powers, but it is now very rarely em-

ployed.

EHYNGIUM CAMPESTRE. The root of this plant, Eryngium campestre; foliis radicalibus, amplexicaulibus, pinnato-lanceolatis, of Linnæus, is used in many places for that of the sea eryngo. See Eryngium.

Erynge. See Eryngium. Eryngo, sea. See Eryngium.

Eryngo leaved lichen. See Lichen islandi-

ERYSIMUM. From equa, to draw, so called from its power of drawing and producing blisters; others derive it and TE eguway, because the leaves are much cut; others from egitimov, precious.)

1. The name of a genus of plants in the Linnæan system. Class, Tetradynamia. Or-

der, Siliquosa.

8. The pharmacopoial name of the hedge mustard. This plant, Erpsimum officinule; siliquis spica adpressis, foliis runcinatis, of Linnaus, was formerly much used for its expectorant and dinretic qualities, which are now forgotten. The seeds are warm and pungent, and very similar to those of mustard in their sensible effects.

ERISIMUM ALLIARIA. The systematic

name of Jack in the hedge. See Alliaria. ERISMUM BARBANEA. The systematic name of the barbarea of the shops. See

Envsimum officinale. The systematic name of the hedge mustard. See Erysi-

ERYSIPELAS. (From egue, to draw, and wealer, adjoining; named from the neighbouring parts being affected by the eruption) Ignis sacer. The rose, or St. Anthony's fire. A genus of disease in the class pyrexic, and order exanthemata of Cutien. It is known by synocha of two or three days continuance, with drowsiness, and sometimes with delirium; pulse commonly full and hard; then erythema of the face, or some other part, with continuance

of synochia, tending either to abscess or gangrene. There are two species of this disease, according to Cullen: 1. Erysipelas resiculosum, with large blisters; 2. Erysipelas phyctanodes, the shingles, or an erysipelas with phlyctenæ, or small blisters.

This disease is an inflammatory affection, principally of the skin, when it makes its appearance externally, and of the mucous membrane, when it is seated internally; and is more liable to attack women and children, and those of an irritable habit, than those of a plethoric and robust constitution.

It is remarkable that erysepalas sometimes returns periodically, attacking the patient once or twice in the year, or even once every month, and then by its repeated attacks it often gradually exhausts the strength, especially if he be old and of a bad habit.

When the inflammation is principally confined to the skin, and is unattended by any affection of the system, it is then called erythema; but when the system is affected it is named erysipelas.

Every part of the body is equally liable to it, but it more frequently appears on the face, legs, and feet, than any where else, when seated externally; and it occurs oftener in warm climates than phlegmonous inflammation.

It is brought on by all the causes that are apt to excite inflammation, such as injuries of all kinds, the external application of stimulants, exposure to cold, and obstructed perspiration; and it may likewise be occasioned by a certain matter generated within the body, and thrown out on its surface. A particular state of the atmosphere seems sometimes to render it epidemical, as we often find the scarlatina anginosa, which is a species of internal erysipelas, prevail as such.

In slight cases, where it attacks the extremities, it makes its appearance with a roughness, heat, pain, and redness of the skin, which becomes pale when the finger is pressed upon it, and again returns to its former colour, when it is removed. There prevails likewise a small febrile disposition, and the patient is rather hot and thirsty. If the attack is mild, these symptoms will continue only for a few days, the surface of the part affected will become yellow, the cuticle or scarf-skin will fall off in scales, and no further inconvenience will perhaps be experienced; but if the attack has been severe, and the inflammatory symptoms have run high, then there will ensue pains in the head and back, great heat, thirst, and restlessness; the part affected will slightly swell: the pulse will become small and frequent; and about the fourth day, a number of little vesicles, containing a limpid, and, in some cases, a yellowish fluid, will arise. In some instances, the fluid is viscid, and instead of running out, as generally happens when the blister is broken, it adheres to and dries upon the skin.

ERY

In unfavourable cases, these blisters sometimes degenerate into obstinate ulcers, which now and then become gangrenous. This, however, does not happen frequently; for although it is not uncommou for the surface of the skin, and the blistered places to appear livid or even blackish, yet this usually disappears with the other symptoms of the complaint.

The period at which the vesicles shew themselves is very uncertain. The same may be said of the duration of the eruption. In mild cases it often disappears gradually, or is carried off by spontaneous sweating. In some cases it continues without shewing any disposition to decline for twelve or four-

teen days, or longer.

The trunk of the body is sometimes attacked with crysipelatous inflammation, but less frequently so than the extremities. It is not uncommon, however, for infants to be attacked in this manner a few days after birth; and in these it makes its appearance about the genitals. The inflamed skin is hard, and apparently very painful to the touch. The belly often becomes uniformly tense, and sphacelated spots sometimes are to be observed. From dissections made by Dr. Underwood, it appears, that in this form of the disease, the inflammation frequently spreads to the abdominal viscora.

Another species of erysipelatous inflammation, which most usually attacks the trunk of the body, is that vulgarly known by the name of shingles, being a corruption of the French word ceingle, which implies a belt. Instead of appearing an uniform inflamed surface, it consists of a number of little pustules, extending round the body a little above the umbilicus, which have vesicles formed on them in a short time. Little or no danger ever attends this species of

erysipelas.

When erysipelas attacks the face, it comes on with chilliness, succeeded by heat, restlessness, thirst, and other febrile symptoms, with a drowsiness or tendency to coma or delirium, and the pulse is very frequent and At the end of two or three days, a fiery redness appears on some part of the face, and this extends at length to the scalp, and then gradually down the neck, leaving a tumefaction in every part the redness has occupied. The whole face at length becomes turgid, and the eyelids are so much swelled as to deprive the patient of sight. When the redness and swelling have continued for some time, blisters of different sizes, containing a thin colourless

acrid liquor, arise on different parts of the face, and the skin puts on a livid appearance in the blistered places: but in those not affected with blisters, the cuticle, towards the close of the disease, falls off in scales.

No remission of the fever takes place on

No remission of the fever takes place on the appearance of the inflammation on the face; but, on the contrary, it is encreased as the latter extends, and both will continue probably for the space of eight or ten days. In the course of the inflammation, the disposition to coma and delinimate sometimes so increased as to destroy the patient between the seventh and eleventh days of the disease. When the complaint is mild, and not marked by a fatal event, the inflammation and fever generally cease gradually, without any evigence of the contract of the cont

dent crisis. If the disease arises in a bad habit of body, occupies a part possessed of great sensibility, is accompanied with much inflammation, fever, and delirium, and these take place at an early period, we may suppose the patient exposed to imminent danger. Where translations of the morbid matter take place, and the inflammation falls on either the b ain, lungs, or abdomiral viscera, we may entertain the same unfavourable opinion. Erysipelas never terminates in suppuration, unless combined with a considerable degree of phlegmonous inflammation, which is, however, sometimes the case; but in a bad habit, it is ant to terminate in gangrene, in which case there will be also great danger. When the febrile symptoms are mild, and unaccompanied by delirium or coma, and the inflammation does not run high, we need not be apprehensive of danger.

Where the disease has occupied the face, and proves fatal, inflammation of the brain, and its consequences, are to be met with on

discection.

ERYTHEMA. (From spudges, red.) A morbid redness of the skin, as is observed upon the cheeks of heetic patients after eating, and the skin covering bubb, phlegnon, &c. Eryspelas is so called when the is flammation is principally confined to the skin.

Environmental (From egulges, red, so called from the colour of its justice.) See

Rubia.

Entitrofines. (From ερυθρος, red, and εωθος, a likeness, so called from its colour.)

A name given to the tunica vaginalis tests.

ERYTHRONIUM. (From spulpos, red, so called from the red colour of its juice.) A species of satyrion.

ERYTHROXYLUM. (From ερυθέςες, red, and ξυλον, wood, so named from its colour.) Logwood.

ERYTHRUS. (From epubgos, red, so named from the red colour of its juice.) The herb sumach.

Esaphe. (From stapaw, to feel.) The touch; or feeling the mouth of the womb, to know its state.

ESCHAR. (Εσχάξα, from εσχάξοω, to scab over.) Eschara. The portion of flesh that is destroyed by the application

of a caustic.

ESCHAROTICS. (Escharotica, sc. medicamenta, εσχαρωίκα, from εσχαρωίκα, sc. medicamenta, εσχαρωίκα, from εσχαρωίκο. A term given by surgeons to those substances which possess a power of destroying the texture of the various solid parts of the animal body to which they are directly applied. The articles of this class of substances may be arranged under two orders.

1. Eroding escharotics, as blue vitriol,

alumen ustum, &c.

2. Caustic escharotics, as lapis infernalis, argentum nitratum, oleum vitrioli, acidum nitrosum, &c.

ESCULENT. An appellation given to such plants, or any part of them, that may

be eaten for food.

ENOX LUCIUS. The systematic name of fish of the class pisces, and order abdominales, from whose liver an oil spontaneously is separated, which is termed in some pharmacopæias oleum lucii piscis. It is used in some countries by surgeons, to destroy spots of the transparent cornea.

ESSENCE. Several of the volatile or essential oils are so called by the perfumers.

ESSENTIAL OIL. See Oil.

ESSERA. (Arab. A humour.) A species of cutaneous eruption, distinguished by broad, shining, smooth, red spots, mostly without fever, and differing from the nettle rash in not being clevated. It generally attacks the face and hands.

ESULA. (From esus, eating, because

it is eaten by some as a medicine.) Spurge. ESULA MAJOR. The officinal plant ordered by this name in some pharmacopæias is the Euphorbia palustris of Linuaus:—umbella multifida, bifida, involucellis ovatis, folis lanceolatis, ramis sterilibus. The juice is exhibited in Russia as a common purge; and the plant is given, in some places, in the cure of intermittents.

ESULA MINOR. Tithymalis cyparissius. Cypress spurge. This, like most of the spurges, is very acrimonious, inflaming the eyes and esophagus after touching them. It is now fallen into disuse, whatever were its virtues formerly, which, no doubt, amongst some others, was that of opening the bowels, for, amongst rustics, it was

called poor man's rhubarb.

ETHER. See Æther.

ETHER, ACETIC. Acetic naphtha. An etherial fluid, drawn over from an equal admixture of alkohol and acetic acid, distilled with a gentle heat from a glass retort in a sand-bath. It has a grateful

smell, is extremely light, volatile, and inflammable.

ETHER, NUBLATIC. Marine ether. Marine ether is obtained by mixing and distilling alcohol with extremely concentrated muriat of tin. It is stimulant, antiseptic, and diuretic.

ETHER, NITROUS. Nitric naphtha. This is only a stronger preparation than the spiritus atheris nitrosi of the London Pharmacopæia; it is produced by the distillation of two parts of alcohol to one part and an half of fuming nitric acid.

ETHER, SULPHURIC. See Æther sulphu-

ricus.

ETHER, VITRIOLIC. See Æther sulphuricus.

ETHERIAL OIL. Any highly rectified essential oil may be so termed.

Ethiops antimonial. See Sulphuretum hy-

drargyri stibiatum nigrum.

Ethiops mineral. See Hydrargyrus cum sulphure.

Ethiops per se. See Oxydum hydrargyri nigrum

ETHMOIDES. See Ethmoid bone.

ETHMOID BONE. (Os ethmoides; from εθμος, a sieve, and ειδος, form; be-cause it is perforated like a sieve.) Os ethmoideum. Os æthmoides. Cribriform bone. A bone of the head. This is, perhaps, one of the most curious bones of the human body. It appears almost a cube, not of solid bone, but exceedingly light, spongy, and consisting of many convoluted plates, which form a net-work, like honey-comb. It is curiously enclosed in the os frontis, betwixt the orbitary processes of that bone. One horizontal plate receives the olfactory nerves, which perforate that plate with such a number of small holes, that it resembles a seive; whence the bone is named cribriform, or ethmoid bone. Other plates dropping perpendicularly from this one, receive the divided nerves, and gives them an opportunity of expanding into the organ of smelling; and these bones, upon which the olfactory nerves are spread out, are so much convoluted as to extend the surface of this sense very greatly, and are named spongy bones. Another flat plate lies in the orbit of the eye; and being very smooth, by the rolling of the eye, it is named the os planum, or smooth bone. So that the ethmoid bone supports the forepart of the brain, receives the olfactory nerves, forms the organ of smelling, and makes a chief part of the orbit of the eye; and the spongy bones, and the os planum, are neither of them distinct bodies, but parts of this athmoid bone.

The cribriform plate is exceedingly delicate and thin; lies horizontally over the root of the nose; and fills up neatly the space betwirt the two orbitary plates of the frontal bone. The olfactory nerves, like two small flat lobes, lie out upon this plate, and, adhering to it, shoot down like many roots through this bone, so as to perforate it with numerous small holes, as if it had been dotted with the point of a pin, or like a nutmeg-grater. This plate is horizontal; but its processes are perpendicu-

lar, one above, and three below.

1. The first perpendicular process is what is called crista galli; a small perpendicular projection, somewhat like a cock's comb, but exceedingly small, standing directly upwards from the middle of the cribriform plate, and dividing that plate into two; so that one olfactory nerve lies upon each side of the crista galli; and the root of the falx, or septum, betwixt the two hemispheres of the brain, begins from this process. The foramen cacum, or blind hole of the frontal bone, is formed partly by the root of the crista galli, which is very smooth, and sometimes, it is said,

hollow, or cellular. 2. Exactly opposite this, and in the same direction with it, i. e. perpendicular to the athmoid plate, stands out the nasal plate of the athmoid bone. It is sometimes called azygous, or single process of the æthmoid, and forms the beginning of that septum, or partition, which divides the two nostrils. This process is thin but firm, and composed of solid bone; it is commonly inclined a little to one side, so as to make the nostrils of unequal size. azygous process is united with the vomer, which forms the chief part of the partition; so that the septum, or partition of the nose, consists of the azygous process of the æthmoid bone above, of the vomer, below, and of the cartilage in the fore or projecting part of the nose; but the cartilage rots away, so that whatever is seen of this septum in the skull, must be either of the æthmoid bone or vomer.

3. Upon either side of the septum, there hangs down a spongy bone, one hanging in each nostril. They are each rolled up like a scroll of parchment; they are very spongy; are covered with a delicate and sensible membrane; and when the olfactory nerves depart from the cribriform plate of the athmoid bone, they attach themselves to the septum, and to these upper spongy bones, and expend upon them, so that the convolutions of these bones are of material use in expanding the organ of smelling, and detaining the odorous effluvia till the impression be perfect. Their convolutions are more numerous in the lower animals, in proportion as they need a more acute They are named spongy or turbinated bones, from their convolutions resembling the many folds of a turban.

The spongy bones have a great many honeycomb-like cells connected with

them, which belong also to the organ of smell, and which are useful perhaps by detaining the effluvia of odorous bodies, and also by reverberating the voice. Thus, in a common cold, while the voice is hurt by an affection of these cells, the sense of smelling is almost lost.

4. The orbitary plate of the athmoid bone, is a large surface, consisting of a very firm plate of bone, of a regular square form; exceedingly smooth and polished; it forms a great part of the socket for the eye, lying on its inner side. When we see it in the detached bone, we know it to be just the flat side of the athmoid bone; but while it is incased in the socket of the eye, we should believe it to be a small square bone; and from this, and from its smoothness, it has got the distinct name of osplanum.

The cells of the æthmoid bone, which form so important a share of the organ of smell, are arranged in great numbers along the spongy bone. They are small neat cells, much like a honey-comb, and regularly arranged in two rows, parted from each other by a thin partition; so that the os planum seems to have one set of cells attached to it, while another regular set of cells belongs in like manner to the spongy bones. There are thus twelve in number, opening into each other, and into the nose.

These cells are frequently the seat of venereal ulcers; and the spongy bones are the surface where polypi often sprout up. And from the general connections and forms of the bone, we can easily understand how the venereal ulcer, when deep in the nose, having got to these cells, cannot be cured, but undermines all the face; how the venereal disease, having affected the nose, soon spreads to the eye, and how even the brain itself is not safe. We see the danger of a blow upon the nose, which, by a force upon the septum, or middle partition, may depress the delicate cribriform plate, so as to oppress the brain with all the effects of a fractured skull, and without any operation which can give relief. And we also see the danger of pulling away polypi, which are firmly attached to the upper spongy bone.

ETRON. (From &a, to eat, as containing the receptacles of the food.) The hypo-

gastrium.

EUANTHEMUM. (From ευ well, and ανθεμος, a flower; so named from the beauty of its flowers.) The chamomile.

EUAPHIUM. (From ευ, well, and αφη, the touch; so called because its touch was supposed to give ease.) A medicine for the piles.

EUGENIA. The name of a genus of plants in the Linnæan system. Class, Icosandria. Order, Monogynia.

EUDIOMETER. An instrument by

which the quantity of oxygen and nitrogen is formed; the figure of the vessel, and in atmospherical air can be ascertained, many other circumstances are capable of They are all founded upon the principle of occasioning considerable differences in the decomposing common air by means of a body which has a greater affinity with the oxygen. See Eucliometry.

EUDIOMETRY. The method of ascertaining the purity of atmospheric air.

No sooner was the composition of the atmosphere known, than it became an inquiry of importance to find out a method of ascertaining, with facility and precision, the relative quantity of oxygen gas contained in a given bulk of atmospheric air.

The instruments in which the oxygen gas of a determined quantity of air was ascertained, received the name of Eucliometers, because they were considered as measurers of the purity of air. They are, however, more properly called Oximeters.

The cudimeters proposed by different chymists, are the following:

1. Priestley's Endiometer.

The first endiometer was made in consequence of Dr. Priestley's discovery, that when nitrous gas is mixed with atmospheric air over water, the hulk of the mixture diminishes rapidly, in consequence of the combination of the gas with the oxygen of the air, and the absorption of the nitric acid thus formed by the water.

When nitrous gas is mixed with nitrogen gas, no diminution takes place : but when it is mixed with oxygen gas in proper proportions, the absorption is complete. Hence it is evident, that in all cases of a mixture of these two gases, the diminution will be proportional to the quantity of the oxygen. Of course it will indicate the proportion of oxygen in air; and by mixing it with different portions of air, it will indicate the different quantities of oxygen which they contain, provided the component parts of air be susceptible of variation.

Dr. Priestley's method was to mix together equal bulks of air and nitrous gas in a low jar, and then transfer the mixture into a narrow graduated glass tube about three feet long, in order to measure the diminution of bulk. He expressed this diminution by the number of hundredth parts remaining. Thus, suppose he had mixed together equal parts of nitrous gas and air, and that the sum total was 200 (or 2.00:) suppose the residuum when measured in the graduated tube to amount to 104 (or 1.04,) and of course that 96 parts of the whole had disappeared, he denoted the

This method of analyzing air by means of nitrous gas is liable to many errors. For the water over which the experiment is made may contain more or less carbonic acid, atmospheric air, or other heterogeneous substance. The nitrons gas is not always of the same composition, and is partly absorbed by the nitrous acid which

purity of the air thus tried by 104.

results.

Fontana, Cavendish, Ladriani, Magellan, Von Humbolt, and Dr. Falconer, have made series of laborious experiments to bring the test of nitrous gas to a state of complete accuracy; but, notwithstanding the exercions of these philosophers, the methods of analyzing air by means of nitrous gas are hable to so many anomalies, that it is unnecessary to give a particular description of the different instruments invented by them.

2. Scheele's Eucliometer.

This is merely a graduated glass cylinder, containing a given quantity of air, exposed to a mixture of iron filings and sulphur, formed into a paste with water. The substances may be made use of in the following manner:

Make a quantity of sulphur in powder, and iron filings, into a paste with water, and place the mixture in a saucer, or plate, over water, on a stand raised above the fluid; then invert over it a graduated bellglass, and allow this to stand for a day or two. The air contained in the bell-glass will gradually dominish, as will appear from the ascent of the water.

When no further diminution takes place, the vessel containing the sulphuret must be removed, and the remaining air will be found to be nitrogen gas, which was contained in that quantity of atmospheric

In this process the moistened sulphuret of iron has a great affinity to oxygen, it attracts and separates it from the atmospheric air, and the nitrogen gas is left behind; the sulphur, during the experiment, is converted into sulphuric acid, which unites to the

alkali and forms sulphate of potash.

The air which is exposed to moistened iron and sulphur, gradually becomes di-minished, on account of its oxygen combining with a portion of the sulphur which becomes converted into sulphuric acid, and its nitrogen remains behind. The quantity of oxygen contained in the air examined becomes thus obvious, by the diminution of bulk, which the volume of air submitted to examination, has undergone.

The only error to which this method is hable is, that the sulphuric acid which is formed acts on the iron and produces hydrogen gas, which joins to the nitrogen remaining after the absorption, and oc-casions an incorrect result; and hence it is that the absorption amounts in general to 0.27 parts, although the true quantity of oxygen is no more than from 0.21 to 0.22.

3. De Marti's Eudiometer.

De Marti obviated the errors to which the method of Scheele was liable. He

RR\*

availed himself for that purpose, of a hydrogenated sulphuret, formed by boiling sulphur and liquid potash, or lime-water, together. These substances, when newly prenared, have the property of absorbing a minute portion of nitrogen gas; but they lose this property when saturated with that gas, which is easily effected by agitating them for a few minutes in contact with a small portion of a mospheric air.

The apparatus is merely a glass tube, ten inches long, and rather less than half an inch in diameter, open at one end, and hermetically sealed at the other. The close end is divided into one hundred equal parts, having an interval of one line between each division. The use of this tube is to measure the portion of air to be employed in the experiment. The tube is filled with water; and by allowing the water to run out gradually, while the tube is inverted, and the open end kept shut with the finger, the graduated part is exactly filled with air. These hundred parts of air are introduced into a glsss bottle, filled with liquid sulphuret of lime previously saturated with nitrogen gas, and capable of holding from two to four times the bulk of the air introduced. The bottle is then to be closed with a ground glass stopper, and agitated for five minutes. After this, the stopper is to be withdrawn, while the mouth of the phial is under water; and for the greater accur v t may be closed and agitated again. Lastly, the air is to be again transfered to the graduated glass tube, in order to ascertain the diminution

4. Humbolt's Eucliometer.

Consists in decomposing a definite quantity of atmospheric air, by means of the combustion of phosphorus, after which, the portion of gas which remains must be measured.

Take a glass cylinder, closed at the top, and whose capacity must be measured into sufficiently small portions by a graduated scale fixed on it. If the instrument be destined solely for examining atmospheric air, it will be sufficient to apply the scale from the orifice of the cylinder down to about half its length, or to sketch that scale on a slip of paper pasted on the outside of the tube, and to varnish it over with a transparent varnish.

'This half of the eudiometrical tube is divided into fifty equidistant parts, which in this case indicate hundredth parts of the whole capacity of the instrument.

Into this vessel, full of atmospheric air, put a piece of dry phosphorus, (one grain to every twelve cubic inches,) close it airtight, and heat it gradually, first the sides near the bottom, and afterwards the bottom itself. The phosphorus will take fire and burn rapidly. After every thing is cold, invert the mouth of the eudiometer

tube into a basin of water, or mercury, and withdraw the cork. The water will ascend in proportion to the loss of oxygen gas the air has sustained, and thus its quantity may be ascertained.

Analogous to this is

5. Seguin's Eudiometer,

Which consists of a glass tube, of about one inch in diameter, and eight or ten inches high, closed at the upper extremity. It is filled with mercury, and kept inverted in this fluid in the mercurial trough. A small bit of phosphorus is introduced into it, which on account of its specific gravity being less than that of mercury, will rise up in it to the top. The phosphorus is then melted by means of a red-hot poker, or burning coal applied to the outside of the tube. When the phosphorus is liquified, small portions of air destined to be examined, and which have been previously measured in a vessel graduated to the cubic inch, or into grains, are introduced into the tube. As soon as the air which is sent up reaches the phosphorus, a combustion will take place and the mercury will rise again. The combustion continues till the end of the operation; but, for the greater exactness, Mr. Seguin directs the residuum to be heated strongly. When cold it is introduced into a small vessel, whose capacity has been ascertained at the same time as that of the preceding. The difference of the two volumes gives the quantity of the oxygen gas contained in the air subjected to examination.

6. Bertholet's Eudiometer.

Instead of the rapid combustion of phosphorus, Bertholet has substituted its spontaneous combustion, which absorbs the oxygen of atmospheric air completely; and, when the quantity of air operated on is small, the process is accomplished in a short time.

Bertholet's apparatus consists of a narrow graduated glass tube, containing the air to be examined, into which is introduced a cylinder, or stick of phosphorus, supported upon a glass rod, while the tube stands inverted in water. The phosphorus should be nearly as long as the tube. Immediately after the introduction of the phosphorus, white vapours are formed which fill the tube; these vapours gradually descend, and become absorbed by the water. When no more white vapours appear, the process is at an end, for all the oxygen gas which was present in the confined quantity of air, has united with the phosphorus: the residuum is the quantity of nitrogen of the air submitted to examination.

This eudiometer, though excellent of the kind, is nevertheless not absolutely to be depended upon; for, as soon as the absorption of oxygen is completed, the nitrogen gas exercises an action upon the phosphorus, and thus its bulk becomes increased. It has been ascertained, that the volume of nitrogen gas is increased to 1.40th part; consequently the bulk of the residuum, dimmished by 1.40, gives us the bulk of the nitrogen gass of the air exanuned; which bulk, subtracted from the original mass of air, gives us the proportion of oxygen gas contained in it. The same allowance must be made in the eudiometer of Segum.

7. Davy's Eudiometer.

Until very lately, the preceding processes were the methods of determining the relative proportions of the two gases which

compose our atmosphere.

Some of these methods though very ingenious, are so extremely slow in their action, that it is difficult to ascertain the precise time at which the operation ceases. Others have frequently involved inaccuracies, not easily removed.

The eudiometer of Mr. Davy is not only free from these objections, but the result it offers is always constant; it requires little address, and is very expeditious; the apparatus is portable, simple and conveni-

Take a small glass tube, graduated into one hundred equi-distant parts; fill this tube with the air to be examined, and plunge it into a bottle, or any other convenient vessel, containing a concentrated solution of green muriate or sulphate of iron, strongly impregnated with nitrous gas. All that is necessary to be done is, to move the tube in the solution a little backwards and forwards; under these circumstances, the oxygen gas contained in the air will be rapidly absorbed, and condensed by the nitrous gas in the solution, in the form of nitrons acid.

N. B. The state of the greatest absorption must be marked, as the mixture afterwards emits a little gas which would alter

the result.

ment.

This circumstance depends upon the slow decomposition of the nitrous acid (formed during the experiment,) by the green oxyd of iron, and the consequent production of a small quantity of aëritorm fluid (chiefly nitrous gas); which, having no affinity with the red muriate, or sulphate of iron, produced by the combination of oxygen, is gradually evolved and mingled with the resi-

dual nitrogen gas. The impregnated solution with green muriate, is more rapid in its operation than the solution with green sulphate. In cases when these salts cannot be obtained in a state of absolute purity, the common sulphate of iron of commerce may be employed. One cubic inch of moderately strong impregnated solution, is capable of absorbing five or six cubic inches of oxygen, in common processes; but the same quantity must never be employed for more than one experi-

In all these different methods of analyzing air, it is necessary to operate on air of a determinate density, and to take care that the residuum be neither more condensed nor dilated than the air was when first operated on. If these things are not attended to, no dependance whatever can be placed upon the result of the experiments, how carefully soever they may have been performed. It is, therefore, necessary to place the air before and after the examination, into water of the same temperature. If this, and several other little circumstances have been attended to, for instance, a change in the height of the barometer, &c. we find that air is composed of 022 of oxygen gas, and 0.78 of nitrogen gas by bulk. But as the weight of these two gases is not exactly the same, the proportion of the component parts by weight will differ a little; for as the specific gravity of oxygen gas is to that of nitrogen gas as 135: 115, it follows that 100 parts of air are composed by weight of about 74 nitrogen gas, and 26 oxygen gas.

The air of this metropolis, examined by means of Davy's endiometer, was found, in all the different seasons of the year to contain 0.21 of oxygen; and the same was the case with air taken at Islington and Highgate; in the solitary cells in Cold-bathfields prison, and on the river Thames. But the quantity of water contained in a given bulk of air from these places, differed con-

siderably.

EUGENIA. (So named by Micheli, in compliment to Prince Eugene of Savoy, who sent him from Germany almost all the plants described by Clusius.) The name of a genus of plants in the Lannaan system. Class,

Icosardria. Order, Monogynia.
Eugenia Jambos The systematic name of the Malabar plum-tree. See Malabar

EUGRUS. (From ev, well, and yv, the earth; so called, because of its fertility.) The uterus.

Eule. (From Eula 20, to putrefy.) A worm

bred in foul and putrid ulcers.

EUNUCHIUM. (From eurs 20s, an eunnich; so called because it was formerly said to render those who eat it impotent, like an eunuch ) The lettuce.

EUPATORIOPHALAURON. (From suralugion, agrimony, and φαλακρος, bald.) A species of

agrimony with baked heads. EUPATORIUM. (Fron (From Eupator, its inventor; or quasi hepatorium, from erag, the liver; because it was said to be useful in diseases of the liver.) 1. The name of a genus of plants in the Linnæan system. Class, Syngenesia. Order, Polygamia aqua.

2. The pharmacopeial name of Eupatorium Arabicum. Hemp agrimony. This very bitter and strong-smelling plant, is the Eupatorium cannabinam; fotis digitatis, of Linnans. Its juice proves violently emetic and purgative, if taken in sufficient quantity, and promotes the secretions generally. It is recommended in dropsies, jaundices, agues, &c. and is in common use in Holland, amongst the lower orders, as a purifier of the blood in old ulcers, scurvy, and ana-

EUPATORIUM ARABICUM. Eupato- , sia.

ขวามก.

EUPATORIUM CANNABINUM. The systematic name of the hemp agrimony. See Eupatorium.

EUPATORIUM MESUES. See Ageratum. EUPEPSIA. (From w, well, and memle, to -

concoct.) A good digestion.

EUPEPTIC. (Eupeptica; from w. good, and merlu, to digest.) Substances are so called that are easy to digest.

EUPHORBIA ANTIQUORUM. The Linnæan name of a plant supposed to produce the Euphorbium.

EUPHORBIA CANARIENSIS. In the Canary islands this species of spurge affords the guin euphorbium.

EUPHORBIA CYPARISSIAS. The systematic name of the cypress spurge. See Eusula minor.

EUPHRORBIA LATHYRIS. The systematic name of the plant, which affords the lesser cataputia se. ds. See Cataputia minor.

EUPHORBIA OFFICINARUM. The systematic name of the plant which affords the euphorbium in the greatest abundance. See Euphorbium

EUPHORBIA PALUSTRIS. The systematic name of the greater spurge. See Esular

EUPRORBIA PARALIAS. See Tithumalus

EUPHORBIA. The name of a genus of plants in the Linnæan system. Class, Dode-

candria. Order, Trigynia. EUPHORBICM. (Fr (From Euphorbus, the physician of king Juba, in honour of whom it was named.) An inodorous gumresin, in yellow tears, which have the appearance of being worm-eaten; said to be obtained from several species of Euphorbia, but principally from the Euphorbia officinarum; aculeata nuda multangularis, aculeis germinatis, of Linnæus; it is imported from Ethiopia, Libya, and Mauritania. contains an active resin, and is very seldown employed internally, but, as an ingredient, it enters into many resolvent and discutient plasters.

EUPHRASIA. (Corrupted from Euphrosyne, superouve, from sugpar, joyful; so called because it exhibarates the spirits.) 1. The name of a genus of plants in the Linnaan system. Class, Didynamia. Order,

Angiospermia.

2. The pharmacopæial name of eyebright. This beautiful little plant, Euphrasia officinalis; foliis ovatis, lineatis, urgute dentatis, of Linnæus, has been greatly es-

teemed by the common people, as a remedy for all diseases of the eyes; yet, notwith-standing this, and the encomiums of some medical writers, is now wholly fallen into disuse. It is an ingredient in the British herb-tobacco.

OFFICINALIS. The syste-EUPHRASIA matic name of the eye-bright. See Euphra-

EUSTACHIAN TUBE. Tuba Eustachia-The tube so called was discovered by the great Eustachius. It begins, one in each ear, from the anterior extremity of the tympanum, and runs forwards and inwards in a bony canal, which terminates with the petrous portion of the temporal bone. It then goes on, partly cartilaginous, and partly membranous, gradually becoming larger, and at length ends behind the soft palate. Through this tube the air passes to the tympanuni.

Eustachian valve. See Valvula Eustachii. EUTHYPORIA. (From ευθυς, straight, and

ποριζω, to pass into.) Euthyporos. An extension made in a straight line, to put in

place a fracture, or dislocation.

EVAPORATION. The volatilization of a fluid, by means of heat, with access of air, in order to diminish its fluidity, to obtain any fixed salts it may hold in solution, or to diminish the quantity of a residuum. In this manner sea water is evaporated, and the salt obtained, and decoctions made into extracts.

EVERRICULUM. (From everro, to sweep away.) A sort of spoon, used to clear the bladder from gravel.

EXACERBATION. (From exacerbesco, to become violent.) An increase of febrile symptoms.

Examesis. (From ¿aieso, to remove.) One of the divisions of surgery, adopted by the old surgeons; the term implies the removal of parts.

EXALMA. (From ¿zanamai, to leap out.) Hippocrates applies it to the starting of the

vertebræ out of their places.

Exambloma. (From εξαμέλισκω, to miscarry.) An abortion.

EXAMBLOSIS. An abortion.

Exanastomosis. (From Exanastomom, to relax or open.) The opening of the mouths of vessels, to discharge their contents; also the meeting of the extremities of the veins and arteries.

EXANTHEMA. (From εξανθω, to spring forth, to bud.) Exanthisma. An eruption of the skin. Cullen makes exanthemata an order in the class pyrexie. It ircludes diseases, beginning with fever, and followed by an eruption on the skin.

EXANTHEMATA (The plural of exanthema.) The name of an order of diseases in Cullen's Nosology, which embraces erup-

tive fevers.

EXAN HISMA. See Exanthema.

EXANTHROPIA. (From & without, and

autewnos, a man, i. e. having lost the faculties of a man.) A species of melancholy, where the patient fancies himself some kind

Exanacina. (From ¿zazarlo, to break.) A fr cture.

Example. (From eguige, to lift up.) A

tumour, a swelling. Exarrena. (From ¿aglaw, to suspend.)

An amulet, or charm, hung bound the neck. out of junt.) Exarthroma. Exarthrosis.

A dislocation, or luxation.

EXARTHROMA. See Exarthrema. Exagendosis. See Exarthrema.

EXARTICULATIO. (Fr. m ex, out of, and articulus, a joint.) A luxation. The dislocation of a bone from its socket.

Excipulty. (From excipio, to receive.)

A chymical receiver.

EXCITABILITY. See Excitement. EXCITEMENT. A term introduced into medicine by Dr. Browne. Animals, differ from themselves in their dead state, or from any other inanimate matter, in this property alone; they can be affected by external agents, as well as by certain functions peculiar to themselves in such a manner, that the phenomena peculiar to the ing state can be produced. This proposition extends to every thing that is vital in nature, and therefore applies to vegetables.

The external agents are reducible to heat, diet, and other substances taken into the stomach, blood, the fluids secreted

from the body and air.

The functions of the system itself, producing the same effect, are muscular contraction, sense, or perception, and the energy of the brain in thinking, and in ex-citing passion and emotion. These affect the system in the same manner as the other agents; and they arise both from the other and from themselves.

If the property which distinguishes living from dead matter, or the operation of cither of the two sets of powers be withdrawn, lile ceases. Nothing else than the

presence of these is necessary to life.

The property on which both sets of powers act Dr. Browne names Excitability, and the powers themselves exciting powers. The word body, means both the body simply so called, and also as endued with an intellectual part, a part appropriated to passion and emotion, or a soul: the usual appellation in medical writings is system.

The effects common to all the exciting powers, are sense, motion, mental exer-tion, and passion. Their effects being the same, it must be granted, that the operation

of all their powers is the same.

The effects of the exciting powers acting upon the excitability, Dr. Browne, denominates excitement.

EXCITING CAUSE. Occasional cause.

Procatarctic cause. Remote cause. That which when applied to the body, excites a disease. The exciting, or remote causes of diseases, are either external or internal.

EXCORIATION. (From excorio, to take off the skin.) Exceriatio. An abrasion of the skin.

EXCREMENT. (From excerno, to se-

parate from ) The alvine faces.

EXCRESCENCE. (From excresco, to Εχαιστικώνα (From εξαρθέοω, to put grow from.) Excrescentia. Any protesnatural formation of flesh, on any part of the body, as wens, warts, &c.

EXCRETION. (From excerno, to se-parate from.) Excretio. This term is applied to the separation or secretion of those fluids from the blood of an animal, that are supposed to be useless, as the urine, perspiration, and alvine fæx.

EXFOLIATION (From exfolio, to cast the leat.) Exfoliatio The separation of a dead piece of bone from the living.

EXPOLIATIVUM (From exfolio, to shed the leaf.) A raspatory or instrument for scraping exfoliating portions of bone.

Exischios. (From 3, out of, and 10x107, the ischium.) A luxation of the thigh-bone. (From exes, to come from.) EXITURA.

A running abscess.

Exitus. (From exeo, to come out.) prolapsus, or falling down of the wonib or

EXOCHAS. (From & without, and exa, to have.) Exoche. A tubercle on the outside of the anus.

Exocur. See Exochas.

EXOCYSTE. See Exocystis.

Exocustis. (From efa, without, and xuois, the bladder.) Exocyste. A prolapsus of the inner membrane of the bladder.

EXOMPHALUS. (From εξ, out, and εμφαλος, the navel.) Exomphalos. An umbilical hernia. See Hernia.

Exonchoma. (From et, and oygos, a tumour.) A large prominent tumour.

EXOPHTHALMIA. (From εξ, out, and οφθαλμος, the eye.) A swelling or protrusion of the bulb of the eye, to such a degree that the eyelids cannot cover it. It may be caused by inflammation, when it is termed exophthalmia inflammatoria; from a collection of pus in the globe of the eye, when it is termed the exophthalmia purulenta; or from a congestion of blood within the globe of the eye, exophthalmia sanguinea.

EXOSTOSIS. (From &, and offsor, a bone.) Hyperostosis. A morbid enlarge-ment, or hard tumour of a bone. A genus of disease arranged by Collen in the class locales, and order tumores. The bones most frequently affected with exostosis, are those of the cranium, the lower jaw, sternum, humerus, radius, ulno, bones of the carpus, the femur, and tibia. There is, however, no bone of the body which may

not become the seat of this disease. It is not uncommon to find the bones of the cranium affected with exostosis, in their whole extent. The ossa parietalla sometimes become an inch thick.

The exostosis, however, mostly rises from the surface of the bone, in the form of a hard round tumour, and venerial exostoses, or nodes, are observed to arise chiefly on compact bones; such of these as are only superficially covered with soft parts, as, for instance, the bones of the cranium, and the front surface of the tibia.

EXPECTORANTS. (Expectorantia, sc. medicamenta, from expectoro, to discharge from the breast.) Those medicines which increase the discharge of mucus from the lungs. The different articles referred to this class may be divided into the following orders: 1. Nauseating expectorants, as squills ammoniacum, and garlic, which are to be preferred for the aged and phlegmatic. Stimulating expectorants, as marrubium, which is adapted to the young and irritable, and those easily affected by expectorants. 3. Antispasmodic expectorants, as vesicatories, pediluvium, and watery vapours; these are best calculated for the plethoric and irritable, and those liable to spasmodic affections. 4. Irritating expectorants, as fumes of tobacco and acid vapours. The constitutions to which these are chiefly adapted, are those past the period of youth, and those in whom there are evident marks of torpor, either in the system generally, or in the lungs in particular.

EXPIRATION. (From expire, to breathe.) Expiratio. That part of respiration in which the air is thrust out from

the lungs. Sec Respiration.

EXPRESSED OILS. Such oils as are obtained by pressing the substance containing them, as olives, which give out olive oil, almonds, &c.

EXSUCCATIO. (From ex, out of, and succus, humour.) An ecchymosis, or extravasation of humours, under the integra-

ments.

extensor. (From extendo, to stretch out.) A term given to those muscles whose office it is to extend any part; the

term is in opposition to flexor.

EXTENSOR BREVIS DIGITORUM PEDIS. Extensor brevis of Douglas, Calcano phalangiaien commune of Dumas. A muscle of the toes situated on the foot. It arises fleshy and tendinous from the fore and upper part of the os calcis, and soon forms a fleshy belly, divisible into four portions, which send off an equal number of tendons that pass over the upper part of the foot under the tendons of the extensor longus digitorum pedis, to be inserted into its tendinous expansion. Its office is to extend the toes.

EXTENSOR CARPI RADIALIS BRE-

VIOR. Radialis externus brewer of Aminus. Radialis secundus of Winslow. An extensor muscle of the wrist, situated on the fore-arm. It arises tendinous from the external condyle of the humerus, and from the hyament that connects the radius to it, and ruus along the outside of the radius. It is inserted by a long tendon into the upper and back part of the metacarpal bone of the middle finger. It assists in extending and bringing the hand backward.

EXTENSOR CARPI RADIALIS LON-GIOR. Radialis externus longior of Albinus. Radialis externus primus of Winslow. An extensor muscle of the carpus, situated on the fore-arm, that acts in conjunction with the former. It arises thin, broad, and fleshy, from the lower part of the external ridge of the os humeri, above its external condyle, and is inserted by a round tendon into the posterior and upper part of the metacarpal bone that sustains the fore-fingers.

EXTENSOR CARPI ULNARIS. Ulnaris externus of Albinus and Winslow. It arises from the outer condyle of the os humeri, and then receives an origin from the edge of the ulna: its tendon passes in a groove between the styloid process of the ulna factor worted into the inside of the basis of the metacarpal bone of the

little finger.

EXTENSOR DIGITORUM COMMUNIS. Cum extensore proprio auvicularis of Albinus. Extensor digitorum communis manus of Douglas and Winslow. Extensor digitorum communis, seu digitorum tensor of Cowper, and Epichondylo-eusphalangettien commune of Dunas. A muscle situated on the fore-arm, that extends all the joints of the fingers. It arises from the external protuberance of the humerus: and at the wrist it divides into three flat tendous, which pass under the annular ligament, to be inserted into all the bones of the fore, middle, and ring fingers.

EXTENSOR DIGITORUM LONGUS.

See Extensor longus digitorum pedis.

Extensor indicis. See Indicator.

EXTENSOR LONGUS DIGITORUM PEDIS. Extensor longus peroneo tibisus phalangittien commune of Dumas. A nuscle situated on the leg, that extends all the joints of the four small toes. It arises from the upper part of the tibia and fibula, and the interosseous ligament; its tendon passes under the annular ligament, and then divides into five, four of which are inserted into the second and third phalanges of the toes, and the fifth goes to the basis of the metatarsal bone. This last Winslow reckons a distinct muscle, and calls it Peronaus brevis.

EXTENSOR LONGUS POLLICIS PEDIS. See

Extensor proprius pollicis pedis.

EXTENSOR MAGNUS. See Gastroenemius internus.

EXTENSOR MAJOR POLLICIS MANUS. See Extensor secundi internodii.

EXTENSOR MINOR POLLICIS MANUS.

Extensor primi internodii.

EXTENSOR OSSIS METACARPI POL-LICIS MANUS. Abductor longus pollicis manus of Albinus. Extensor primi unternochi of Douglas. Extensor primus pollicis of Winslow. Extensor primi internodii pollicis of Cowper. Cubito-radisus metacarpien du pouce of Dumas. It arises fle by from the middle and posterior part of the ulna, from the posterior part of the middle of the radius, and from the interosseous ligament, and is inserted into the os trapezium, and upper part of the metacarpal bone of the thumb.

EXTENSOR POLLICIS PRIMUS. See Exten-

sor primi internodii.

EXTENSOR POLLICIS SECUNDUS. See Ex-

tensor secundi internodii.

EXTENSOR PRIMI INTERNODII. Extensor minor pollicis manus of Albanus. This muscle, and the Extensor ossis metacarpi pollicis manus, are called Extensor pollicis primus by Winslow. Extensor secundi internodii by Douglas. Extensor secundi internodii ossis pollicis of Cowper. Cubitosusphalungien du pouce of Dumas. A muscle of the thumb, situated on the hand, that extends the first bone of the thamb obliquely outwards. It arises fleshy from the posterior part of the ulnar, and from the interosseous ligament, and is inserted tendinous into the posterior part of the first bone of the thumb.

EXTENSOR PROPRIUS POLLICIS PEDIS. Extensor longus of Douglas. Extensor pollicis longus of Winslow and Cowper. Peroneo susphalangien du pouce of Dumas. An exterior muscle of the great toe, struum. It also includes those substances situated on the foot. It arises by an acute, tendinous and fleshy beginning, some way below the head and anterior part of the fibula, along which it runs to near its lower extremity, connected to it by a number of fleshy fibres, which descend obliquely, and form a tendon, which is inserted into the

the great toe.

EXTENSOR SECUNDI INTERNODH, Extensor majus pollicis manus of Albinus. Extensor pollicis secundus of Winslow. Extensor tertii internodii of Douglas. Extensor internodii ossis pollicis of Cowper. Cubito-susphalangettien du ponce of Dumas. A muscle of the thumb, situated on the hand, that extends the last joint of the thumb obliquely backwards. It arises tendinous and fleshy from the middle part of the ulna, and the interosseous ligament; it then forms a tendon, which runs through a small groove at the inner and back part of the radius, to be inserted into the last bone of combination with oxygen from the armosthe thumb. Its use is to extend the last phere. It is soluble in alkohol, but insoplealanx of the thumb obliquely back- luble in ether. It unites with alumine, and wards.

EXTENSOR SECUNDI INTERNODII INDICIS PROPULUS Set Indicator.

EXTENSOR TARSI MINOR. See Planta-

EXTENSOR TARSI SURALIS. See Gastroc. nemius internus.

EXTENSOR TERTII INTERNODII MI DIGITI See Abductor minimi mannes.

EXTENSOR TERTH INTERNODII INDICIS. See Prior indicis.

EXTERNUS MALLEI. See Laxator tym-

EXTIRPATION. (From extirpo, to eradicate.) Extirpatio. The complete removal or destruction of any part, either by cutting instruments, or the action of

EXTRACTION. (From extraho, to draw out.) Extractio. The taking extraneous substances out of the body. Thus bullets and splinters are said to be extracted from wounds; stones from the urethra, or bladder.

Surgeons also sometimes apply the term extraction to the removal of tumours out of cavities, as, for instance, to the taking of cartilaginous tumours out of the joints. They seldom speak of extracting any diseased original part of the body; though they do so in one example, viz. the cata-

EXTRACT. (Extractum; from extraho, to draw out.) The generic term extract is used pharmaceutically, in an extensive sense, and includes all those preparations from vegetables which are separable by the agency of various liquids, and afterwards obtained from such solutions, in a solid state, by evaporation of the menwhich are held in solution by the natural juices of fresh plants, as well as those to which some menstruum is added at the time of preparation. Now, such soluble mutters are various, and mostly complicated; so that chymical accuracy is not to be looked for in the application of the posterior part of the first and last joint of term. Chymists, however, have affixed this name to one peculiar modification of vegetable matter, which has been called extractive, or extract, or extractive principle; and, as this forms one constituent part of common extracts, and possesses certain characters, it will be proper to mention such of them as may influence its pharmaceutical relations. The extractive principle has a strong taste, differing in different plants: it is soluble in water, and its solution speedily runs into a state of putrefaction, by which it is destroyed. Repeated evaporations and solutions render it at last insoluble, in consequence of its rif boiled with neutral salts thereof, precipitates them. It precipitates with strong acids, and with the oxyds from solutions of most metallic salts, especially muriate of tim. It readily unites with alkalies, and forms compounds with them, which are soluble in water. No part, however, of this subject has been hitherto sufficiently examined.

In the preparation of all the extracts, the London Pharmacopæis requires that the water be evaporated as speedily as possible, in a broad, shallow dish, by means of a water-bath, until they have acquired a consistence proper for making pills; and, towards the end of the inspissation, that they should be constantly stirred with a wooden rod. These general ruies require minute and accurate attention, more particularly in the immediate evaporation of the solution, whether prcpared by expression or decoction, in the manner as well as the degree of heat by which it is performed, and the promotion of it by changing the surface by constant stirring, when the liquor begins to thicken, and even by directing a strong current of air over its surface, if it can conveniently be done. It is impossible to regulate the temperature over a naked fire, or if it be used, to prevent the extract from burning; the use of a water-bath is, therefore, absolutely necessary, and not to be di-pensed with, and the beauty and precision of extracts so prepared, will demonstrate their superiority.

EXTRACTIVE. See Extract.

EXTRACTUM ACONTIL Extract of aconite. "Take of aconite leaves, fresh, a pound; bruise them in a stone mortar, sprinkling on a little water; then press out the juice, and, without any separation of the sediment, evaporate it to a proper consistence." The dose is from one grain to five grains. For its virtues, see Aconitum.

EXTRACTUM ALOES. Extract of aloes. "Take of extract of spike aloe, powdered, half a pound; boiling water, four pinis." Macerate for three days in a gentle heat, then strain the solution, and set it by, that the dregs may subside. Pour off the clear solution, and evaporate it to a proper consistence. The dose, from v to xv grs. See Aloes.

EXTRACTUM ANTHEMEDIS. Extract of chamomile, formerly called extractum chamoenel. "Take of chamomile flowers, dried, a pound. Water, a gallon." Boil down to four pints, and strain the solution while it is not, then evaporate it to a proper consistence. The dose is x grs. to a scruple. For its virtues, see Chama melum.

EXTRACTUM BELLADONNE. Extract of belladonna. "Trke of deadly night-shade leaves, fresh, a pound." Bruise them in a stone mortar, sprinkling on a little water: then press out the juice, and without any previous separation of the sediment, evapo-

rate it to a proper consistence. The dose is from one to tive grains. For its virtues, see Bella tonna.

EXTRACTUM CINCHONE RESINOSUM. Resinous extract of bark. "Take of lance-leaved cinchona bark, a pound; rectification pints." Macerate for four days, and strain. Distil the tincture in the heat of a water-bath, until the extract has acquired a proper consistence. This is considered by many as much more grateful to the stomach, and, at the same time, producing all the effects of bark in substance, and, by the distillation of it, is intended that the spirit which passes over shall be collected and pre-served. The dose is from ten grains to half a drachin. See Cinchona.

EXTRACTUM COLOCYNTHEDIS. Extract of colocynth. "Take of colocynth pulp, a pound; water, a gallon." Boil down to four pints, and strain the solution while it is hot, and evaporate it to a proper consistence. The dose is from five to thirty grains. For

its virtues, see Colocynthis.

EXTRACTUM COLOCNTHIBUS COMPOSITUM.
Compound extract of colocynth. "Take of colocynth pulp, sliced, six drachms; extract of spike aloe, powdered, an ounce and haif; scammony gum-resin powdered, half an ounce; cardamom-seeds powdered, half an ounce; cardamom-seeds powdered, a drachm; hard soap, three drachms; boiling water, two pints." Macerate the colocynth pulp in the water, for four days, in a gentle heat; strain the solution, and add to it the aloc, scammony, and soap; then, by means of a water-bath, evaporate it to a proper consistence, constantly stirring, and about the end of the inspissation, mix in the cardamom-seeds. The dose, from five to thirty grains.

EXTRACTUM CONTI. Extract of hemlock, formerly called succus cicutæ spissatus. "Take of fresh hemlock, a pound." Bruisc it in a stone mortar, sprinkling on a little water; then press out the juice, and, without any separation of the sediment, evaporate it to a proper consistence. The dose

from five grains to a scruple.

EXTRACTUM ELATERII. Extract of elaterium. "Cut the ripe, wild cucumbers into slices, and pass the juice, very gently expressed, through a very fine hair sieve, into a glass vessel; then set it by for some hours, until the thicker part has subsided. Pour off, and throw away the thinner part, which swims at the top. Dry the thicker part which remains in a gentle heat." The dose from half a grain to three grains. For its virtues, see Cucumis agrestis.

EXTRACTUM GENTIANE, Extract of gentian. "Take of gentian root, sliced, a pound; boiling water, a gallon." Macerate for twenty-four hours, then boil down to four pints: strain the hot liquor, and evaporate it to a propir consistence. Dose, from ten to thirty grains. See Gentiana.

EXTRACTUM GLYCYRRHIZE. Extract of

liquorice. "Take of liquorice-root, sliced, a pound; water, boiling, a gallon." Macerate for twenty-four hours, then boil down to four pints; strain the hot liquor, and evaporate it to a proper consistence. Dose, from one drachm to half an ounce. See Glycyrrhiza.

EXTRACTUM HEMATOXYLI. Extract of logwood, formerly called extractum ligni campechensis. "Take of logwood, powdered, a pound; water, boiling, a gallon." Macerate for twenty-four hours, then boil down to four pints; strain the hot liquor, and evaporate it to a proper consistence. Dose, from ten grains to half a drachm. For its virtues, see Lignum campechense.

EXTRACTUM RUMULI. Extract of hops. "Take of hops, half a pound; water, boiling, a gallon." Boil down to four pints; strain the hot liquor, and evaporate it to a proper consistence. This extract is said to produce a tonic and sedative power combined. The dose is from five grains to one

scruple. See Lupulus.

EXTRACTUM WYOSCYAMI. Extract of henbane. "Take of tresh henbane leaves, a pound." Bruise them in a stone mortar, sprinkling on a little water; then press out the juice, and, without separating the fæculencies, evaporate it to a proper consistence. Dose, from five to thirty grains. For its virtues, see Hyosciamus.

Extract of ja-EXTRACTUM JALAPÆ. lap. "Take of jalap-root, powdered, a pound; rectified spirit, four pints; water, ten pints." Macerate the jalap-root in the spirit for four days, and pour off the tincture; boil the remaining powder in water, until it be reduced to two pints; then strain the tincture and decoction separately, and let the former be distilled and the latter evaporated, until each begins to grow thick. Lastly, mix the extract with the resin, and reduce it to a proper consistence. Let this extract be kept in a soft state, fit for forming pills, and in a hard one, so that it may be reduced to powder. The dose, from ten to twenty grains. For its virtues, see Jalapium

EXTRACTEM OPIL. Extract of opium, formerly called extractum thebaicum. Opium colatum. "Take of opium, sliced, half a pound; water, three pints." Pour a small quantity of the water upon the opium, and maccrate it for twelve hours, that it nmy become soft; then, adding the remaining water gradually, rob them together until the mixture be complete. Set it by, that the fieculencies may subside; then strain the liquor, and evaporate it to a proper consistence. Dose, from half a grain to five grains.

Extract of PAPAVERIS. EXTRACTUM white poppy. " Take of white poppy capsules, bruised, a pound; water, boiling, a gallon" Macerate for twenty-four hours, rating the light above.

then beil down to four pints; strain the hot liquor, and evaporate it to a proper consistence. Six grains are about equivalent to one of opium. Dose, from half a grain to five grains. For its virtues, see Papaver album.

EXTRACTUM RHEI. Extract of rhubarb. "Take of rhubarb root, powdered, a pound; proof spirit, a pint; water, seven pints.' Macerate for four days in a gentle heat, then strain, and set it by, that the fæculencies may subside. Pour off the clear liquor, and evaporate to a proper consistence. This extract possesses the purgative properties of the root, and the fibrous and earthy parts are separated; it is, therefore a useful basis for pills, as well as given separately. Dose, from ten to thirty grains. See Rhabarbarum.

EXTRACTUM SARSAPARILLE. Extract of sarsaparilla. "Take of sarsaparilla-root, sliced, a pound; water, boiling, a gallon." Macerate for twenty-four hours, then boil down to four pints; strain the hot liquor, and evaporate it to a proper consistence. In practice this is much used, to render the common decoction of the same root stronger and more efficacious. Dose, from ten grains to a drachm. For its virtues, see Sarsaparilla.

EXTRACTUM SATURNI. See Liquor accetatis plumbi.

EXTRACTUM TARAXACI. Take of dandelion root, tresh and bruised, a pound; water, boiling, a gallon. Macerate for twenty-four hours; boil down to four pints, and strain the hot liquor through a woollen cloth; then evaporate it to a proper consistence. Dose, from ten grams to a drachm. For its virtues, see Taraxacum.

EXTRAVASATION. (From extra, without, and vas, a vessel ) Extravasatio. A term applied by surgeons to fluids, which are out of their proper vessels or receptacles. Thus, when blood is effused on the surface, or in the ventricles of the brain, it is said that there is an extravasation. When blood is poured from the vessels into the cavity of the perstoneum, in wounds of the abdomen, surgeons call this accident extravasation. The urine is also said to be extravasated, when, in consequence of a wound, or of sloughing, or ulceration, it makes its way into the cellular substance, or among the abdominal viscera. When the bile spreads among the convolutions of the bowels, in wounds of the gall bladder, it is also a species of extravasation.

EYE. Ocubes. The parts which constitute the eye are divided into external and internal. The external parts are-1. The eyebrows, or supercilia, which form arches of hair above the orbit, at the lower part of the forehead. Their use is to prevent the sweat falling into the eves, and for mode-

EYE 314

2. The eyelashes, or cilia, are the short hairs that grow on the margin of the eyelids; they keep external bodies out of the

eyes, and moderate the influx of light.
3. The eyelids, or palpebræ, of which, one is superior or upper, and the other inferior or under; where they join outwardly, it is called the external canthus; inwardly, towards the nose, the internal canthus; they cover and defend the eyes.

The margin of the eyelids, which is car-

tilaginous, is called tarsus.

In the tarsus, and internal surface of the evelids, small glands are situated, called glandulæ Meibomianæ, because Meibomius discovered them; they secrete the oily mucilaginous fluid, which prevents the attrition of the eyes and eyelids, and facilitates their motions.

4. The lachrymal glands, or glandulæ lachrymales, which are placed in the external canthus, or corner of the eyes, in a little

fovea of the os frontis.

From these glands six or more canals issue, which are called lachrymal ducts, or ductus lachrymales, and they open in the internal superficies of the upper eyelids.

5. The lachrymal caruncie, or caruncula lachrymalis, which is situated in the internal

angle, or canthus of the eyelids.

6. Puncta lachrymalia, are two callous orifices or openings, which open in the internal angle of the tarsus of the eyelids; the one in the superior, the other in the infemor eyelid.

7. The lachrymal ducts, or canales lachrymales, are two small canals, which proceed from the lachrymal points into the

lachrymal sac.

8. The lachrymal sac, or saccus lachrymalis, is a membranous sac, which is situated

in the internal canthus of the eye.

9. The nasal duct, or ductus nasalis, is a membranous canal, which goes from the inferior part of the lachrymal sac through the bony canal below, and a little behind, into the cavity of the nose, and opens under the inferior spongy bone into the nostrils.

10. The conjunctive membrane, or membrana conjunctiva, which, from its white colour, is called albuginea, or white of the eye, is a membrane which lines the internal superficies of the eyelids, and covers the whole fore-part of the globe of the eye; it is very vascular, as may be seen in inflam-· mations.

The bulb or globe of the eye is composed of eight membranes, or coverings, chambers, or camera, and three humours,

improperly so called.

The membranes of the globe of the eye are, four in the hinder or posterior part of the bulb, or globe, viz. sclerotica, choroidea, retina, and hyaloidea, or arachnoidea; four in the fore or anterior part of the bulb, viz.

cornea transparens, iris, uvea, and capsule of

the crystalline lens.

The membrana sclerotica, or the sclerotic or horny membrane, which is the outermost, begins from the optic nerve, forms the spherical or globular cavity, and terminates in the circular margin of the transparent cornea.

The membrana choroidea, or choroides, is the middle tunic of the bulb, of a black colour, beginning from the optic nerve, and covering the internal superficies of the sclerotica, to the margin of the transparent cornea. In this place it secedes from the tornea, and deflects transversely and inwardly, and in the middle forms a round perforated foramen. This circular membrane of the choroidea in the anterior surface is called iris, in the posterior superficies, uvea.

The round opening in the centre is called the pupil, or pupilla. This foramen, or round opening, can be dilated, or contracted, by the moving powers of almost invisi-

ble muscular fibres.

The membrana retina, is the innermost tunic, of a white colour, and similar to mucus, being an expansion of the optic nerve, chiefly composed of its medullary part. It covers the inward superficies of the choroides, to the margin of the chrystalline lens, and there terminates,

The chambers, or cameræ, of the eyes

1. Camera anterior, or fore-chamber: is an open space, which is formed anteriorly, by the hollow superficies of the cornea transpirens, and posteriorly, by the superficies

2. Camera posterior, is that small space which remains anteriorly from the tunica uvea, and prpilla, or pupil; posteriorly from the anterior superficies of the chrystalline lens.

Both these chambers are filled with aqueous humour. The humours of the eye, as they are called, are in number three:

1. The aqueous humour, which fills both

chambers.

2. The chrystalline lens, or humour, is a pellucid body, about the size of a lentil, which is included in an exceeding fine membrane, or capsula, and lodged in a concave fovea of the vitreous humour.

3. The vitreous humour is a pellucid, beautifully transparent substance, which fills the whole bulb of the eye behind, the chrystalline lens. Its external superficies is surrounded with a most peilucid membrane, which is called membrana hyaloidea, or arachnoidea. In the anterior part is a fovea, or bed, for the chrystalline lens, in which the lens is seated.

The connection of the bulb is made anteriorly, by means of the conjunctive membrane, with the inner surface of the eyelids, or palpebræ; posteriorly, by the

315

adhesion of six muscles of the bulb and op-

tic nerve, with the orbit.

The optic nerve, or nervus opticus, perforates the sclerotica and choroides, and then consitutes the retina, by spreading itself on the whole posterior superficies of

the internal globe of the eye.

The muscles by which the eye is moved in the orbit, are six; much adeps surrounds them, and fills up the cavities in which the eyes are scated. The arteries are the internal orbital, the central, and the ciliary arteries. The veins emp'y themselves into the external jugulars. The nerves are the optic, and branches from the third, fourth, fifth, and sixth pair.

The use of the eye is to form the organ

of vision.

Externally, the globe of the eye and the transparent cornea, are moistened with a most limpid fluid, called lachrymie, or tears; the same pellucid sub-ile fluid exactly fills all the pores of the transparent cornea; for, deprived of this fluid, and being exposed to the air, that coat of the eye becomes dry, shrivelled, and cloudy, impeding the rays of light.

Eye bright. See Euphrasia. Eye brow. Supercilium A laver of short hair, which lies thick upon the low part of the frontal bone, or the superior prominent part of the orbit.

EYE-1.10. Palpebra. The semi-lunar moveable production of the skin which covers the eye when shut. It is distinguished

into upper and under eye-lid.

## F.

F. or ft. In a prescription these letters are abbreviations of fiat, or fiant, let it or them be made; thus f. bolus, let the substance or substances prescribed be made into a bolus.

FABA. See Bean. FABA CRASSA. Telephinm. Fabaria crassula. Anacampseros. The plant which bears these names in various pharmacopæias, is the orphine, Sedum telephium of Linnaus: -foliis planiusculis serraiis, corymbo foliose, caule erecto. It was formerly ranked as an antiphlogistic, but now forgotten.

FABA ÆGYPTIACA. Cyamos Ægyptiacus. Nymphaa Indica. The pontic, or Egyptian bean. The fruit of the nym-phea nelumbo of Linnans, which grows on marshy grounds in Egypt, and some of the neighbouring countries. It is eaten either raw or boiled, and is a tonic and astrin-

gent

FARA FEBRIFUGA. See Faba Indica.

FABA INDICA. Faba sancti iguatii. ba febrifuga. The seeds of a gourd-like fruit, the produce of the Ignatia amara of Linuxus. They are of a roundish figure, very irregular and inneven, about the size of a middling nutmeg, semi-transparent, and of a hard, horny texture. They have a very bitter taste, and no considerable smell. They are said to be used in the Philippine islands in all diseases, acting as a vomit and purgative. Infusions are given in the cure of intermittents, &c.

FABA MAJON. The Turkey or garden

bean. See Bean.

FARA MINOR. Equina frasa. The horsebean. It differs no otherwise from the garden bean than in being less.

FARA PECHIRIM. Faba pichurim. Faba pechuris. An oblong oval, brown, and ponderous seed supposed to be the produce of a Laurus, brought from the Brazils. Their smell is like that of musk, between it and the scent of sassafras. They are exhibited as carminatives in flatulent colics, diarrhœas, and dysenteries.

FANA PURGATRIX. See Ricinus.

FABA SANCTI IGNATII. See Faba indica. FABA SUILIA. See Hyosciamus.

FABARIA. (From faba, a bean, which it sembles.) Orphine. See Faba crassa. resembles.) Orphine. See Fuba crassa. FACE. The lower and anterior part of

the cranium, or skull.

FACIAL. Belonging to the face; as

facial nerve, &c.

Nervus facialis. FACIAL NERVE. Portio dura of the auditory nerve. These nerves are two in number, and are properly the eighth pair: but are commonly called the seventh, being reckoned with the auditory, which is the portio mollis of the seventh pair. They arise from the fourth ventricle of the brain, pass through the petrous portion of the temporal bone to the face, where they form the pes anserious, which supplies the integuments of the face and forehead.

FACIES HIPPOCRATICA. That partic dar disposition of the features which immediately precedes the stroke of death is so called, because it has been so admirably described by Hippocrates.

FACIES RUBRA. See Gutta resacea. FACTITIOUS. A term applied to any thing which is made by art, in opposition to that which is native, or found already made in nature.

Fincultas. The power or FACULTY. ability by which any action is performed.

FÆCES. The plural of fiex. The alvine excretions.

FÆCULA. (Diminutive of fæx.) A substance obtained by brinsing or grinding certain vegetables in water. It is that part which, after a little, falls to the bottom. The fæcula of plants appears to be only a slight alteration of micriage, for it differs from mucilage in no other respect than being insoluble in cold water, in which it falls with wonderful quickness. There are few plants which do not contain fæcula; but the seeds of gramineous and leguminous vegetables, and all tuberose roots contain it most plentifully.

FAX. The alvine excretions are called

1 a ce

FAGARA. The name of a genus of plants in the Linnzen system. Class,

Tetrandria. Order, Monogynia.

FAGARA MAJOR. (From fagns, the beech, which it resembles) Castana Luzonis. Cubebis. Fagara plevota of Linnaus. A plant found in the Philippine islands. The berries are aromatic, and, according to Avicenna, heating, drying, good for cold, weak stomachs, and astringent to the bowels.

FAGARA OCTANDRA. The systematic

ca. See Tacamahaca.

FAGORYRUM. (From payes, the beech, and ruges, wheat; because its seeds Were supposed to resemble the mast, i. e. fruit of beech.) See Polygonum fagopyrum.

FAGOTRITICUM. See Polygonum fagopy-

rum.

FAGUS. (From φαγω, to eat; its nut being one of the first fruits used by man.)

1. The name of a genus of plants in the Linnæan system. Class, Monæcia. Order,

Polyandric.

2. The pharmacopécial name of what is also called Oxya, Balanda, Valanida. The beech-tree. The fruit and interior bark of this tree, Fagus sylvatica; foliis ovatis, obsolete serratis, of Linnaus, are occasionally used medicinally, the former in ob-tinate head-achs, and the latter in the cure of hectic lever. The oil expressed from beechnats is supposed to destroy worms; a child may take two drachms of it right and morning; an adult, an onnee. The poor people in Silesia use this oil instead of butter.

FAGUS CASTANEA. The systematic name of the chesnut-tree. See Castanea,

FAGUS SYLVATICA. The systematic name of the beech-tree. See Fagus.

Fainting. See Syncope.

FAIRBURN WATER. A sulphureous water in the county of Ross, in the north of England.

FALCIFORM PROCESS. (Falciformis; from falx, a scythe, and forma, resemblance.) The falx. A process of the dura mater, that arises from the grista galli, separates the hemispheres of the brain, and

terminates in the tentorium.

FALUELLA. Contorted lint, used for compresses.

Falling sickness. See Epilepsia. Fallopian tube. See Tuba Fallopiana. Fallopian ligament. See Poupart's liga-

FALX. See Falciform process. FAMES CANINA. See Bulimia.

Famigeratissimum emplastrum. (From famigeratus, renowned; from fama, tane, and gero, to bear; so named from its excellence.) A plaster used in intermittent fevers, made of aromatic, irritating substances, and applied to the wrists.

FARFARA. (From farfarus, the white poplar; so called because its leaves resemble those of the white poplar.) See Tussi-

lago.

FARINA. (From far, corn, of which it is made.) Meal, or flour. A term given to the pulverulent and glutinous part of wheat, and other seeds, which is obtained by grinding and sifting. It is highly nutritious, and consists of gluten, starch, and mucilage. See Wheat.

FARINACEA. (From furina, flour.) This term includes all those substances employed as aliment, called cerealia, legu-

mina, and nuces oleosæ.

FARINACEOUS. A term given to all articles of food which contain farina. See Furina.

FARINARIUM. See Alica.

FARREUS. (From far, corn.) Scurfy. An epithet of urine, where it deposits a

branny sediment.

FASCIA. (From fascis, a bundle; because, by means of a band, materials are collected into a bundle.) Ligatio. Ligativa. Alligatura. A bandage, fillet, or roller.

2. The aponeurotic expansions of muscles, which bind parts together, are termed

fascia.

FASCIA LATA. A thick and strong tendinous expansion, sent off from the back, and from the tendons of the glutei and adjacent muscles, to surround the muscles of the thigh. It is the thickest on the outside of the thigh and leg, but towards the inside of both becomes gradually thinner. A little below the trochanter major, it is firmly fixed to the linea aspera; and, farther down, to that part of the head of the tibia that is next the fibula, where it sends off the tendinous expansion along the outside of the leg. It serves to strengthen the action of the muscles, by keeping them firm in their proper places when in action, particularly the tendons that pass over the joints where this membrane is thickest.

FASCIALIS. (Fascialis, sc. musculus.)

See Tensor vaginæ femoris.

Fasciatio. (From fascia, a fillet.) The binding up any diseased or wounded park with bandages.

FASCICULUS. (From fuscis, a bundle.)
A handful.

FAT. Adeps. A concrete oily matter contained in the cellular membrane of animals, of a white or yellowish colour, with little or no smell, nor taste. It differs in all animals in solidity, colour taste, &c. and likewise in the same animal at different ages. In infancy it is white, insipid, and not very solid; in the adult it is firm and yellowish, and in animals of an advanced age, its colour is deeper, its consistence various, and its taste in general stronger. Fat meat is nourishing to those that have strong digestive powers. It is used externally, as a softening remedy, and enters into the composition of ointments and plasters.

FATUITAS. (From fatuus, silly.) Fool-

ishness. A synonim of Amentia.

FAUCES. (Faux, pl. fauces.) Isthmion. Amphibranchia. A cavity behind the tongue, palatine arch, uvula, and tonsils: from which the pharynx and larynx proceed.

FAUFEL. Terra japonica, or catechu.

FAVAGO AUSTRALIS. (From favus, a honey-comb, from its resemblance to a honey-comb.) A species of bastard sponge.

FAVUS. A honey-comb. A species of

achor, or foul ulcer.

FEBRES. An order in the class pyraxie of Cullen, characterized by the presence of pyrexia, without primary or local affection.

FEBRICULA. (Dim. of febris, a fever.)
A term employed to express a slight degree

of symptomatic fever.

FEBRIFUGA. (From febrem fugure, to drive away a fever.) The plant fever-few;

lesser centaury.

FEBRIFUGE. (Febrifuga, from febris, a fever, and fugo, to drive away.) A medicine that possesses the property of abating the violence of any fever.

FEBRIFUGUM CRÆNII. Regulus of anti-

mony.

FERRIFUGUM OLEUM. Febribuge oil. The flowers of antimony, made with salammoniac and antimony sublimed together, and exposed to the air, when they de-

liquesce.

FERRIFUGUS PULVIS. Febrifuge powders. The Germans give this name to the pulvis stypticus Helvetii. In England, a mixture of oculi cancrorum and emetic tartar, in the proportions of half a drachm and two grains, has obtained the same name; in fevers it is given in doses of gr. iii. to iv.

FERRIFUGUS SAL. Regenerated marine salt.

FERRIFUGUS SPIRITUS DOMINI CLUTTON. Mr. Clutton's febrifuge spirit. An imperfect ether, which is sometimes given dituted in water, as a common drink in fevers.

FEBRIS. A fever. A disease characterised by an increase of heat, an accelerated pulse, a foul tongue and an impaired state of the functions of the body.

FEBRIS ALBA. See Chlorosis.

FEBRIS AMPHIMERINA. A quotidian, or remittent fever.

FEBRIS ANGINOSA. The scarlatina angi-

FEBRIS ARBENS. An apthose fever. FEBRIS ARDENS. A burning inflammatory fever.

Februs assones. A tertian fever, with extreme restlessness.

FEBRIS AUTUMNALIS. An antunmal or bilious tever.

FEBRIS BULLOSA. The pemphigus, or vesicular tever,

FEBRIS CACATORIA. An intermittent, with diarrhea.

FEBRIS CATARRHALIS. The catarrhal fe-

ver. FEBRIS CHOLERICA. A fever with diar-

rhœa. FEBRIS CONTINUA. A continued fever. A division of the order febres, in the class pyrexiæ of Cullen. Continued fevers have no intermission, but exacerbations come on twice in one day. The genera of continued fever are: 1. Synocha, or inflammatory fever, known by increased heat; pulse frequent, strong, and hard; urine high coloured; senses not much impaired. See Synocha. 2. Typhus, or putrid-tending fever, which is contagious, and is characterized by moderate heat: quick, weak, and small pulse; senses much impaired, and great prostration of strength. Typhus has four varieties, viz. 1. Typhus petechialis, typhus with petechiæ: 2. Typhus mitior, the nervous fever: 2. Typhus gravior, the putrid fever: 4. Typhus icterodes, the yellow fever. See Tuphus.

FEBRIS ELODES. A fever with continual

and profuse sweating.

FEBRIS EPIALA. A fever with a continual sense of cold.

FEBRIS ENYSIPELATOSA. See Erysipe-las.

FEBRIS EXANTHEMATICA. Fever with cruptions.

FEBRIS FLAVA. The yellow fever.

FEBRIS HECTICA. A genus of disease in the class hyrexia and order febres of Cullen. It is known by exacerbations at noon, but chiefly in the evening, with slight remissions in the morning, after nocturnal sweats; the urine depositing a surfuraceolateritions sediment; appenite good; thirst moderate. Hectic fever is symptomatic of chlorosis, scrophula, phthisis, diseased viscera, &c.

FEBRIS HUNGARICA. A species of ter-

FEBRIS HYDRODES. A fever with profuse sweats. FEBRIS CASTRENSIS. A camp fever, gene-

nerally typhus.

FEBRIS INTERMITTENS. An intermittent fever, or ague. A division of the order febres of Cullen, in the class pyrexie. Intermittent fevers are known by cold, hot, and sweating stages, in succession, attending each paroxysm, and followed by an intermission or remission. There are three genera of intermitting fevers, and several varieties.

- Intermittens quotidiana. A quotidian ague. The paroxysms return in the morning, at an interval of about twenty-four hours.
- 2. Intermittens tertiana. A tertian ague. The paroxysms commonly come on at midday, at an interval of about forty-eight hours.
- 3. Intermittens quartona. A quartan ague. The paroxysms come on in the afternoon, with an interval of about seventy-two hours. The tertian ague is most apt to prevail in the spring, and the quartan in antumn.

Of the quotidian, tertian, and quartan intermittents, there are several varieties and forms; as the double tertian, having a paroxysm every day, with the alternate paroxysms, similar to one another. double tertian, with two paroxysms every other day. The triple tertian, with two paroxysms on one day, and another on the next. The double quartan, with two paroxysms on the first day, none on the secould and third, and two again on the fourth day. The double quartan, with a paroxysm on the first day, another on the second, but none on the third. The triple quartan, with three paroxysms every fourth day. The triple quartan, with a paroxysm every day, every fourth paroxysm being similar.

When these fevers arise in the spring of the year, they are called vernal; and when in the autumn, they are known by the name of autumnal. Intermittents often prove obstinate, and are of long duration, in warm climates: and they not unfrequently resist every mode of cure, so as to become very distressing to the patient; and by the extreme debility which they thereby induce, often give rise to other chronic

complaints.

It seems to be pretty generally acknowledged, that marsh miasma, or the effluvia arising from stagmant water, or marsh ground, when acted upon by heat, is the most frequent exciting cause of this fever. In marshes, the putrefaction of both vegetable and animal matter is always going forward, it is to be presumed; and hence it has been generally conjectured, that vegetable and animal putrefaction imparted a peculiar quality to the watery particles of the effluvia arising from thence.

We are not yet acquainted with all the circumstances, which are requisite to render marsh miasma productive of intermittents; but it may be presumed that a moist atmosphere has a considerable influence in promoting its action. A watery poor diet, great fatigue, long watching, grief, much anxiety, exposure to cold, lying in damp rooms or beds, wearing damp linen, the suppression of some long-accustomed evacuation, or the recession of eruptions, have been ranked among the exciting causes of intermittents; but it is more reasonable to suppose that these circumstances act only by inducing that state of the body, which predisposes to these complaints. By some, it has been imagined that an intermittent fever may be communicated by contagion; but this supposition is by no means consistent with general observa-

One peculiarity of this fever is, its great susceptibility of a renewal from very slight causes, as from the prevalence of an easterly wind, or from the repetition of the original exciting cause. It would appear likewise, that a predisposition is left in the habit, which favours the recurrence of the complaint. In this circumstance, intermittents differ from most other fevers, as it is well known that, after a continued fever has once occurred, and been removed, the person affected is by no means so liable to a fresh attack of the disorder, as one in whom it had never taken place.

We have not yet attained a certain knowledge of the proximate cause of an intermittent fever, but a deranged state of the stomach and prime viæ is that which is

most generally ascribed.

Each paroxysm of an intermittent fever is divided into three different stages, which are called the *cold*, the *hot*, and the *sweating* 

stages or fits.

The cold stage commonces with languor, a sense of debility and sluggishness in motion, frequent yawning and stretching, and an aversion to food. The face and extremities become pale, the features shrink, the bulk of erery external part is diminish. ed, and the skin over the whole body appears constricted, as if cold had been applied to it. At length the patient feels very cold, and universal rigours come on, with pains in the head, back, loins and joints, nausea, and vomiting of bilious matter; the respiration is small, frequent and anxious; the urine is almost colourless; sensibility is greatly impaired; the thoughts are somewhat confused; and the pulse is small, frequent, and often irregular. few instances, drowsiness and stupor have prevailed in so high degree as to resemble coma or apoplexy; but this is by no means

These symptoms abating after a short time, the second stage commences with

319

an increase of heat over the whole body, redness of the face, dryness of the skin, thirst, pain in the head, throbbing in the temples, anxiety and restlessness; the respiration is fuller and more free, but still frequent; the tongue is furred, and the pulse has become regular, hard and full. If the attack has been very severe, then perhaps defirium will arise.

When these symptoms have continued for some time, a moisture breaks out on the forehead, and by degrees becomes a sweat, and this, at length, extends over the whole body. As this sweat continues to flow, the heat of the body abates, the thirst ceases, and most of the functions are restored to their ordinary state. This con-

stitutes the third stage.

It must, however, be observed, that in different cases these phenomena, and their mode of succession, may prevail in different degrees, that the series of them may be more or less complete, and that the several stages, in the time they occupy, may be in different proportions to one another.

Such a depression of strength has been known to take place on the attack of an intermittent, as to cut off the patient at once; but an occurrence of this kind is

very incommon.

l'atients are seldom destroyed in intermittents from general inflammation, or from a fulness of the vessels either of the brain or of the thoracic viscera, as happens sometimes in a continued fever; but when they continue for any length of time, they pox fever. are apt to induce other complaints, such as a loss of appetite, flatulency, scirrlus of rash, the liver, dropsical swellings, and general FE debility, which in the end now and then prove fatal. In warm climates, particularly, intermittents are very apt to terminate in this manner, if not speedily removed; and, in some cases, they degenerate into continued fevers. When the paroxysms are of short duration, and leave the intervals quite free, we may expect a speedy recovery; but when they are long, violent, and attended with much anxiety and delirium, the event may be doubtful. Relapses are very common to this fever at the distance even of five or six months, or even a year; autumnal intermittents are more difficult to remove than vernal ones, and quartans more so than the other

Dissections of those who have died of an intermittent, shew a morbid state of many of the viscera of the thorax and abdomen; but the liver, and organs concerned in the formation of bile, as likewise the mysentery, are those which are usually most af-

fected.

FEBRIS LACTEA. Milk fever. FEBRIS LENTA. A slow fever.

FEBRIS LENTICULARIS. A species of petechial fever.

FEBRIS MALIGNA. The malignant fever. FEBRIS MILIARIS. The miliary fever.

FEM

FEBRIS NERVOSA. The measles. FEBRIS NERVOSA. Febris lenta nervosa. The nervous fever. A variety of typhus mittor of Cullen, but by many considered as a distinct disease. It mostly begins with loss of appetite, increased heat and vertigo; to which succeed nausea, vomiting, great languor, and pain in the head, which is variously described, by some like cold water pouring over the top, by others a sense of weight. The pulse, before little increased, now becomes quick, feeble, and tremulous; the tongue is covered with a white crust, and there is great anxiety about the pracordia. Towards the seventh or eighth day, the vertigo is increased, and tinnitus arium, cophosis, delirium, and a dry and tremulous tongue, take place. The disease mostly terminates about the fourteenth or twentieth

FEBRIS NOSOCOMICORUM. The fever of

hospitals.

FEBRIS PALUSTRIS. The marsh fever. FEBRIS PESTILENS. The plague.

FEBRIS PETECHIALIS. Fever with purple spots.

FEBRIS PUTRIDA. See Typhus gravior. FEBRIS SUBATORIA. Scarlet fever. FEBRIS SUBATORIA. Sweating fever.

FEBRIS STNOCHA. See Synocha.

FEBRIS TYPHODES. See Typhus.

Fenris VarioLosa. A variolous or small-

FENRIS URTICARIA. Fever with nettle-

FEBRIS VESICULOSA. See Erysipelas.

FECULA. See Facula. FEL. See Bite.

FEL NATURE. See Aloes.

Fel-wort. So called from its bitter taste like bile. See Gentiana.

FELLICULUS. The gall-bladder.

FELLIFLUA PASSIO. A name given to cholera morbus.

Felon. See Paronychia.

FEMEN. (Quasi ferimen; from fero, to bear; so called because it is the chief support of the body.) The thigh.

FEMORALIS AUTERIA. A continuation of the external iliac along the thigh, from Poupart's ligament to the ham.

FEMORIS OS. See Femur.

FEMUR. Os femoris. The thigh-bone. A long cylindrical bone, situated between the pelvis and tibia. Its upper extremity affords three considerable processes; these are, the head, the trochanter major, and trochanter minor. The head, which forms about two thirds of a sphere, is turned inwards, and is received into the acetabulum of the os innominatum, with which it is articulated by enarthrosis. It is covered by a cartilage, which is thick in its middle part, and thin at its edges, but which is wanting in its lower internal part, where a round spongy fossa is observable, to which the strong ligament, usually, though improperly, called the round one, is attached. This ligament is about an inch in length, flattish, and of a triangular shape, having its narrow extremity attached to the fossa just described, while its broader end is fixed obliquely to the rough surface near the inner and anterior edge of the acetabulum of the os innominatum, so that it appears shorter internally and anteriorly than it does externally and posteriorly.

The head of the os femoris is supported obliquely, with respect to the rest of the bone, by a smaller part, called the cervex, or neck, which, in the generality of subjects, is about an inch in length. At its basis we observe two oblique ridges, which extend from the trochanter major to the trochanter minor. Of these ridges, the posterior one is the most prominent. Around this neck is attached the capsular ligament of the joint, which likewise adheres to the edge of the cotyloid cavity, and is strengthened anteriorly by many strong ligamentous fibres, which begin from the lower and anterior part of the ilium, and, spreading broader as they descend, adhere to the capsular ligament, and are attached to the anterior oblique ridge at the bottom of the neck of the femur. Posteriorly and externally, from the basis of the neck of the bone, a large unequal protuberance stands out, which is the trochanter major. The upper edge of this process is sharp and pointed posteriorly, but is more obtuse anteriorly. A part of it is rough and un-· equal, for the insertion of the muscles; the rest is smooth, and covered with a thm cartilaginous crust, between which and the tendon of the glutæus maximus that slides over it, a large bursa mucosa is interposed. Anteriorly, at the root of this process, and immediately below the bottom of the neck, is a small process called trochanter minor. Its basis is nearly triangular, having its two upper angles turned towards the head of the femur and the great trochanter, while its lower angle is placed towards the body of the bone. Its summit is rough and rounded. These two processes have gotten the name of trochunters, from the muscles that are inserted into them being the principal instruments of the rotatory motion of the thigh. Immediately below these two processes the body of the bone may be said to begin. It is smooth and convex before, but is made hollow behind by the action of the muscles. In the middle of this posterior concave surface is observed a rough ridge, called linea aspera, which seems to originate from the trochanters, and extending downwards, divides at length into two branches, which terminate in the tuberosities near the condyles. At the upper part of it, blood-vessels pass to the internal substance of the bone, by a hole that runs obliquely upwards.

The lower extremity of the os femoris is larger than the upper one, and somewhat flattened, so as to form two surfaces, of which the anterior one is broad and convex, and the postcrior one narrower and slightly concave. This end of the bone terminates in two large protuberances. called condules, which are united before, so as to form a pulley, but are separated behind by a considerable cavity, in which the crural vessels and nerves are placed secure from the compression to which they would be otherwise exposed in the action of bending the leg. Of these two condyles, the external one is the largest; and when the bone is separated from the rest of the skeleton, and placed perpendicularly, the internal condyle projects less forwards, and descends a arly three-tenths of an inch lower than the external one: but in its natural situation, the bone is placed obliquely, so that both condyles are then nearly on a level with each other. At the side of each condyle, externally, there is a tuberosity, the situation of which is similar to that of the condyles of the os humeri. The two branches of the linea aspera terminate in these tuberosities, which are rough, and serve for attachment of ligaments and muscles.

Fennel. See Faniculum.

Fennel, hog's. See Peucedanum. FENESTRA OVALIS. An oblong or eliptical foramen, between the cavity of the tympanum and the vestibulum of the ear. It is shut by the stapes.

FENESTRA ROTUNDA. A round foramen, leading from the tympanim to the cochlea of the ear. It is covered by a mem-

brane in the fresh subject.

Fenugreek. See Fanugrecum.

FERINE. (Ferinus, sc. morbus, savage or brutal.) A term occasionally applied to any

malignant or noxious disease.

FERMENTATION. Fermentatio. spontaneous commotion in a vegetable substance, by which its properties are totally changed. There are several circumstances required in order that fermentation may proceed: such are, 1 A certain degree of fluidity: thus, dry substances do not ferment at all. 2. A certain degree of heat. 3. The contract of air. Chymists, after Boerhuave, have distinguished three kinds of fermentation: the spirituous, which affords ardent spirit; the acetous, which affords vinegar, or acid; and the putrid fermentation, or putrefaction, which produces volatile alkali. The conditions necessary for spirituous fermentation are, 1. A saccharine mucilage. 2. A degree of fluidity slightly viscid. 3. A degree of heat between 55 and 65 of Fahrenheit. 4. A large mass, in which a rapid commotion may be excited. When these four conditions are united, the spirituous fermentation takes place, and is known by the following characteristic phenomena: 1. An intestine motion takes place. The bulk of the mixture then becomes augmented. 3. The transparency of the fluid is diminished by opake filaments. 4. Heat is generated. 5. The solid parts mixed with the liquor rise and float in consequence of the disengagement of elastic fluid. 6. A large quantity of carbonic acid gas is disengaged by bubbles. All these phenomena gradually cease in pro-portion as the liquor loses its sweet and mild taste, and it becomes brisk, penetrating, and capable of producing intoxication. In this manner wine, beer, cider, &c. are made. All bodies which have undergone the spirituous fermentation are capable of passing on to the acid fermentation; but although it is probable that the acid fermentation never takes place before the body has gone through the spiritous fermentation, yet the duration of the first is frequently so short and imperceptible, that it cannot be ascertained. Besides the bodies which are proper for spirituous fermentation, this class includes all sorts of fecula boiled in water. 'The conditions required for the acid fermentation are, 1. A licat from 20 to 25 degrees of Fahrenheit. 2. A certain degree of liquidity. 3. The presence of atmospheric air. 4. A moderate quantity of fermentable matter. The phenomena which accompany this fermentation, are an intestine motion, and a considerable absorption of air. The transparent liquor becomes turbid, but regains its fimpidity when fermentation is over. fermented liquor now consists, in a great measure, of a peculiar acid, called the acetons acid, or vinegar. Not a vestige of spirit remains, it being entirely decomposed; but the greater the quantity of spirit in the liquor, previous to the fermentation, the greater will be the quantity of true vinegar obtained. See also Putre-

FERMENTUM. (Quasi fervimentum from ferree to work) vest.

Fern, male. See Filix. Fern, female. See Filix femina.

PERRAMENTUM. An instrument made of

FERRIT CARBONAS. Carbonate of iron; formerly called chalybis rubigo preparata and ferri rubigo. " Take of sulphate of iron, eight ounces; subcarbonate of soda, ten ounces; boiling water, a gallon." Dissolve the sulphate of iron and subcarbonate of soda separately, each in four pints of water; then mix the solutions toge her and set it by, that the precipitated powder may subside; then, having poured off the

supernatant liquor, wash the carbonate of iron with hot water, and dry it upon bibulous paper in a gentle heat. It possesses corroborant and stimulating properties, and is exhibited with success in leucorrhaa, ataxia, asthenia, chlorosis, dyspepsia, rachites, &c. &c. Dose from two to ten grains.

FERRI LIMATURA PURIFICATA. Purified steel filings. The-e possess tonic, astringent, and deobstruent virtues, and are calculated to relieve chlorosis and other diseases in which steel is indicated, where crudity in the primæ viæ abounds.

FERRI RUBIGO. See Ferri carbonas.

FERRI SUBCARBONAS. See Ferri carbonas. FERRI SULPHAS. Sulphate of iron; formerly called sal martis, vitriolum martis, vitriolum ferri, and lately ferrum vitriolatum. Green vitriol. "Take of iron, sulphuric acid, of each by weight, eight ounces; water, four pints." Mix together the sulphuric acid and water in a glass vessel, and add thereto the iron; then after the effervescence has ceased, filter the solution through paper, and evaporate it until chrystals form as it cools. Having poured away the water, dry these upon bibulous paper. This is an excellent preparation of iron, and is exhibited, in many diseases, as a styptic, tonic, astringent and anthelmintic. Dose from one grain to five grains.

FERRUM AMMONIATUM. Ammoniated iron; formerly known by the name of flores martiales; flores salis ammoniaci martiales; ens martis; ens veneris Boylei: sal martis muriaticum sublimatum, and lately by the title of ferrum ammoniacale. "Take of carbonate of iron, muriate of ammonia, of each a pound." Mix them intimately, and sublime by immediate exposure to a strong fire: lastly, reduce the sublimed aminoniacal iron to powder. This preparation is astringent and deobstruent, in doses from 3 to 15 grs. or more in the form of bolus or pills, prepared with some gum. It is exhibited in most cases of debility, in chlorosis, asthenia menorrhagia, intermittent fevers, &c. This or some other strong preparation of iron, as the Tinct. ferri muriatis, Mr Cline is wont to recommend in scirrhous affections of the breast.

Tartarized FERRUM TARTARIZATUM. iron. A tartrate of potash and iron; formerly called tartarus chalybeatus; mars solubilis; ferrum potabile. "Take of iron, a pound; supertartrate of potash, powdered, two pounds; water, a pint." Rub them together, and expose them to the air in a broad glass vessel for eight days, then dry the residue in a sand bath, and reduce it to a very fine powder. Add to this powder a pint more water, and expose it for eight days longer, then dry it, and reduce it to a very fine powder. Its virtues are astringent and tonic, and it forms in solution an excellent tonic fomentation to con-

T T \*

tusions, lacerations, distortions, &c. Dose from ten grains to half a drachm.

The measles. FERSÆ.

FERULA. The name of a genus of plants in the Linuxun system. Class, Pentandria. Order, Digynia.

FERULA AFRICANA GALBANIFERA.

galbanum plant.

FERULA ASSAFETIDA. The systematic name of the assafætida plant. See Assafætida.

FERULA MINOR. Allheal of Esculapius; this plant is said to be detergent.

FERULACCA. The ferula galbanifera.

Fever. See Febris.

See Matricaria. Feverfew

FIBER. (From fiber, extreme, because it resides in the extremities of lakes and rivers.) The beaver. The female beaver. Castor fiber of Linnxus, it has two excretory forncles near the anns, filled with an unctuous substance called castor. Castoreum.

Fibra. An anatomical term FIBRE. for a very simple filament composed of earthy particles, connected together by an intermediate gluten. It is owing to the different arrangements of the fibres that the cellular structure, membranes, muscles, vessels, nerves, and, in short, every part of the body, except the fluids, are fornied.

Fibre muscular. See Muscular fibre. FIBRINE. The coagulable lymph is so

termed by the French.

FIBULA. (Quasi figilala; from figo, to fasten; so named because it joins together the tibia and the muscles.) A long bone of the leg, situated on the outer side of the tibia, and which forms, at its lower end, the outer ankle. Its upper extremity is formed into an irregular head, on the inside of which is a slightly concave articulating surface, which, in the recent subjects, is covered with cartilage, and receives the circular flat surface under the edge of the external cavity of the ubia. This articulation is surrounded by a capsular ligament, which is farther strengthened by other strong ligamentous fibres, so as to allow only a small motion backwards and forwards.-Externally, the head of the fibula is rough and protuberant, serving for the attachment of ligaments, and for the insertion of the biceps cruris muscle.-Immediately below it, on its inner side, is a the fig-tree. See Carica, turbercle, from which a part of the gastroc-. nemius internus has its origin. Immediately below this head the body of the bone See Immbricalis. begins. It is of a triangular shape, and appears as if it were slightly twisted at each end, in a different direction. It is likewise a little curved inwards and forwards. This curvature is in part owing to the action of muscles: and in part perhaps to the care-lessness of nurses.—Of the three angles of the bone, that which is turned towards the tibia is the most prominent, and serves for

the attachment of the interosseous ligament, which, in its structure and uses, resembles that of the fore-arm, and, like that, is a little interrupted above and below. The three surfaces of the bone are variously impressed by different muscles. About the middle of the posterior surface is observed a passage for the medullary vessels, slanting downwards. The lower end of the fibula is formed into a spongy, oblong head, externally rough and convex, internally smooth, and covered with a thin cartilage, where it is received by the external triangular depression at the lower end of the tibia. This articulation, which resembles that of its upper extremity, is furnished with a capsular ligament, and farther strengthened by ligamentous fibres, which are stronger and more considerable than those before described. They extend from the tibia to the fibula, in an oblique direction, and are more easily discernible before than behind. Below this the fibula is lengthened out, so as to form a considerable process, called malleolus externus, or the outer ankle. It is smooth, and covered with cartilage on the inside, where it is contiguous to the astragalus, or first bone of the foot. At the lower and inner part of this process there is a spongy cavity, filled with fat; and a little beyond this, posteriorly, is a cartilaginous groove, for the tendons of the peroneus longus and peroneus brevis, which are here bound down by the ligamentous fibres that are extended over them.

The principal uses of this bone seem to be, to afford origin and insertion to muscles, and to contribute to the articulation

of the leg with the foot.

FIGARIA. (From ficus, a fig., so called The herb figwort, or from its likeness.) pile-wort, the ranunculus ficaria of Linnæus.

FIGATIO. (From ficus, a fig.) Tubercles near the anus and pudenda.

FICOIDEA. Ficoides. Resembling fig. A name of the houseleek, which is emollient.

1. A fleshy excrescence about FICUS. the anus, in figure resembling a fig.

2. The name of a genus of plants in the Linnæan system. Class, Polygamia. Order, Dioecia. The fig-tree.

FIGUS CARICA. The systematic name of

Ficus Indica. See Lacca.

FIDICINALES. (Fidicinalis, sc. musculus.)

Figs. See Carica.

Figwort. See Ficaria.

FILAGO. Cud or cotton-weed; an astringent.

FILAMENT. (Filamentum; from filum, a thread.) A term applied in anatomy to a small thread-like portion adhering to any part, and trequently synonymous with fibre. See Fibre.

FILELLUM. (From filum, a thread, because it resembles a string.) The frænum of the penis.

FILETUM. (From filum, a thread; named from its string-like appearance.) The fræ-

num of the tongue.

FILICULA. (Dim. of filix, fern; a small sort of fern; also from filum, a thread, which it resembles.) Common maiden-hair.

See . Idianthum capillus Veneris.

FILIPENDULA. (From filum, a thread, and pendeo, to hang; so named because the numerous bulbs of its roots hang, as it were, by small threads.) Saxifraga rubra. Drop wort. The root of this plant, Spir.ca filipendula; foliis pennatis, foliolis uniformibus serratis, caule herbaceo, floribus corymbosis of Linnæns, possesses adstringent, and it is said lithon riptic virtues. It is seldom used in the practice of the present day.

FILIPENDULA AQUATICA. Water-drop-

FILIUS ANTE PATREM. Any plant whose flower comes out before the leaf, as eolts-

FILIX. (From filum, a thread; so called from its being cut, as it were, in slender portions, like threads.) Pteris. Male po-Blancnon Orrbasii. Lonchitis. lypody, or fern. Polypodium filix mas of Linnæus. The root of this plant has lately been greatly eelebrated for its effects upon the tania osculis superficialibus, or broad tape-worm. Madame Noufer acquired great cclebrity by employing it as a specific. This secret was thought of such importance by some of the principal physicians at Paris, who were deputed to make a complete trial of its efficacy, that it was purchased by the French king, and afterwards pub-lished by his order. The method of cure is the following:-after the patient has been prepared by an emollient glyster, and a supper of panada, with butter and salt, he is directed to take in the morning, while in bed, a dose of two or three draehms of the powdered root of the male fern. The powder must be washed down with a draught of water, and, two hours after, a strong cathartic, composed of calomel and seammony, is to be given, proportioned to the strength of the patient. If this does not operate in due time, it is to be followed by a dose of purging salts, and if the worm be not expelled in a few hours, this process is to be repeated at proper intervals. Of the success of this, or a similar mode of treatment, in cases of tania, there can be no doubt, as many proofs in this country afford sufficient testimony; but whether the fernroot or the strong eathartie is the principal agent in the destruction of the worm, may admit of a question; and the latter opinion, Dr. Woodvile believes, is the more generally adopted by physicians. It appears, however, from some experiments made in respecting fire, but no one as yet is gene-

Germany, that the tænia has, in several instances, been expelled by the repeated exhibition of the root, without the assistance of any purgative.

FILIX ACULEATA. Spear-pointed fern. The

Polypodium aculeatum of Linnaus.

FILIX FÆMINA. The female fern. The plant which is thus called, in the pliarmacopæias, is not the Polypodium filix fæmina, but the Pteris aquilina; frondbins supradecompositis, foliolis pinnatis, pinnis lanceolatis, infimis pinnatifidis, superioribus minoribus of Linnæus. The root is esteemed as an anthefmentic, and is supposed to be as efficacious in the destroying the tapeworm as the root of the male fern.

FILIX FLORIDA. The Osmunda regalis of Linuxus. The flowering fern. Emmena-

gogue.

FILIX MAS. See Filix.

FILTRATION. (Filtratio: from filtrum, a strainer.) A method of rendering fluids clear, by passing them through a porons solid, as the filtering stone, compact elose linen, woollen eloths, or porous paper, which is generally used for this purpose, as a lining to a funnel, or other such vessel. .Filtration is also performed on a principle somewhat different, as by immersing one end of a porous subs ance, as a piece of list, skain of cotton, or slip of thick paper, or other such substance, moistened in its whole length in the fluid, and allowing the other end of it to hang down, over the outside of the vessel. The fluid in this depending part drains out by its own gravity, and is supplied by eapillary attraction from the portion next within the vessel, which is supplied in the same manner from the surface of the fluid, till the whole passes over, unless too deep, the list, &e. appearing to act as syphons.

FILTRUM. A filter, straining or filtring

instrument.

FILUM ARSENICALE. Corrosive sublimate.

FIMBRIÆ. (Quasi finibria; from finis, the extremity.) The extre Fallopian tubes. See Uterus. The extremities of the

Finckle. See Fleniculum

Fine leaved water hemlock. See Faniculum aquaticum.

Finochio. The Italian name of the sweet azorian fennel.

Fir-tree. See Abies.

Fir, balsam of Gilead. See Balsamea.

Fir, Canada. See Balsamum Canadense.

Fir, Norway spruce. See Pinus abies.

Fir, Scotch See Pinus sylvestris.

Fir, silver See Pinus picea.

FIRE. Ignis. A very simple and active element, the principal agent in nature to balance the power and natural effect of attraction. The most useful acceptation of the word fire comprehends heat and light. There have been several theories proposed

rally received. It is therefore, at present, only known by its effects, namely, light, heat, rarefaction. See Caloric and Light.

FIRMISIUM MINERALIUM. Antimony.

Fish-glue. See Ichthyocolla.

FISSURA MAGNA SYLVII The anteterior and middle lobes of the cerebrum on each side are parted by a deep narrow sulcus, which ascends obliquely backwards from the temporal ala of the os sphenoides, to near the middle of the os parietale, and this sulcus is thus called.

FISSURE. Fissura. That species of fracture in which the bone is slit, but not com-

pletely divided.

Fistic nut. See Pistachio nut.

FISTULA. (Quasi fusula; from fundo, to pour out; or from its similarity to a pipe, or reed.) Eligii morbus. A term in surgery, applied to a long and sinuous ulcer that has a narrow opening, and which sometimes leads to a larger cavity; and has no disposition to heal. No technical term has been more misapplied; and no mis-interterpretation of a word has had worse influence in practice than this. Many simple healthy abscesses, with small openings, have too often been called fistulous; and, the treatment pursued has in reality at last rendered them so, and been the only reason of their not having healed.

FISTULARIA. (From fistula, a pipe; so called because its stalk is hollow.) A name

for stavesacre.

Five-leaved grass. See Fentaphyllum.

Fixed air. See Carbonic acid.

FIXED BODIES. Chymists give this name to those substances, which cannot be caused to pass by a strong rarefaction from the liquid state to that of an elastic fluid.

Flag, sweet See Calamus aromaticus. Flag, yellow water. See Iris palustris.

FLAMMULA. (Dim. of flamma, a fire, named from the burning pungency of its taste.) Surrecta alba. Small water crowfoot, or spear-wort. The roots and leaves of this common plant, Ranunculus flammula; foliis ovatis lanceolatis, petiolatis, caule declinate of Linnaus; taste very acrid and hot, and, when taken in a small quantity, produce vomiting, spasms of the stomach, and delirium. Applied externally, they vesicate the skin. The best antidote, after clearing the stomach, is cold water acidulated with lemon-juice, and then mucilaginous drinks.

FLAMMULA JOVIS. Flammula jovis, so called from the burning pungency of its taste.) Upright virgin's bower. Clematis recta; foliis pinnatis, foliolis ovato lunceola. tis integerrimis, caule erecto, floribus pentapetalis tetrapetalisque of Linnæus. praises have been bestowed upon the virtue which the leaves of this plant are said to possess, when exhibited internally, as an antivenereal, by foreign physicians, than its trials in this country can justify. The

powdered leaves are sometimes applied ex" ternally to ulcers, as an escharotic.

FLATULENT. Windy.

Flax-leaved daphne. See Thymclea. Flax, purging. See Linun Catharticum. Flax, spurge. See Thymetea.

Flea wort. See Psyllium.
FLEMEN. (From flecto, to incline downwards.) Flegmen. A tumour about the ancles.

FLEXOR. The name of several muscles. whose office it is to bend parts into which they are inserted.

Flexor accessorius digitorum fiedis. See

Flexor longus digitorum pedts.

FLEXOR BREVIS DIGITORUM PE-DIS, PERFORATUS, SUBLIMIS. Flexor brevis digitorum pedis perforatus of Albinus. Flexor brevis of Douglas. Flexor digitorum brevis, sive perforatus pedis of Winslow. Perforatus seu flexor secundi internodii digitorum pedis of Cowper, and calcano sus phalangettien commun. of Dumas. A flexor muscle of the toes, situated on the foot. It arises by a narrow, tendinous, and fleshy beginning, from the inferior pro-tuberance of the os calcis. It likewise derives many of its fleshy fibres from the adjacent aponeurosis, and soon forms a thick belly, which divides into four portions. Each of these portions terminates in a flat tendon, the fibres of which decussate, to afford a passage to a tendon of the long flexor, and afterwards re-aniting, are inserted into the second phalanx of each of the four lesser toes. This muscle serves to bend the second joint of the toes.

FLEXOR BREVIS MINIMI DIGITI PEDIS. Parathenar minor of Winslow. This little muscle is situated along the inferior surface and outer edge of the metatarsal bone of the little toe. It arises tendinous from the basis of that bone, and from the ligaments that connect it to the os cuboides. It soon becomes fleshy, and adheres almost the whole length of the metatarsal bone, at the anterior extremity of which it forms a small tendon, that is inserted into the root of the first joint of the little toe. Its use is to bend the little toe.

FLEXOR BREVIS POLLICIS MANUS. Flexor secundi internodii of Douglas. Thenar of Winslow. Flexor primi et secundi ossis pollicis of Cowper, and Carpophalungi-uin du pouce of Dumas. This muscle is divided into two portions by the tendon of the flexor longus pollicis. The outermost portion arises tendinous from the anterior part of the os trapezoides and internal annular ligament. The second, or innermost, and thickest portion, arises from the same bone, and likewise from the os magnum, and os cuneiforme. Both these portions are inserted tendinous into the sesamoid bones of the thumb. The use of this muscle is to bend the second joint of the thumb.

FLEXOR BREVIS POLLICIS

DIS. Flexor brevis of Douglas. Flexor brevis pollicis of Cowper, and Tarso phalangien du pouce of Dumas. A muscle of the great toe, that bends the first joint of the great toe. It is situated upon the metatarsal bone of the great toe, arises tendinous from the under and anterior part of the os calcis, and from the under part of the os cuneiforme externum. It soon becomes fleshy, and divisible into two portions, which do not separate from each other till they have reached the anterior extremity of the metatarsal bone of the great toe, where they become tendinous, and then the innermost portion unites with the tendon of the abductor, and the outermost with that of the abductor pollicis. They adhere to the external os sesamoideum, and are finally inserted into the root of the first joint of the great toe. These two portions, by their separation, form a groove, in which passes the tendon of the flexor longus pollicis.

FLEXOR CARPI RADIALIS. Radiahis internus of Albinus and Winslow, and Epitrochlo-metacarpien of Dumas. This is a long thin muscle, situated obliquely at the inner and anterior part of the fore-arm, between the palmaris longus and the prona-It arises tendinous from the intor teres. ner condyle of the os humeri, and, by many fleshy fibres, from the adjacent tendinous fascia. It descends along the inferior edge of the pronator teres, and terminates in a long, flat, and thin tendon, which afterwards becomes narrower and thicker, and, after passing under the internal annular ligament, in a groove distinct from the other tendons of the wrist, it spreads wider again, and is inserted into the fore and upper part of the metacarpal bone that sustains the fore-finger. It serves to bend the hand, and its oblique direction may likewise enable it to assist in its pronation.

FLEXOR CARPI ULNARIS. ris internus of Winslow and Albinus. trochli cubito-carpien of Dumas. A muscle situated on the cubit or fore-arm, that assists the former in bending the arm. It arises tendinous from the inner condyle of the as humeri, and, by a small fleshy origin, from the anterior edge of the olecranon. Between these two portions, we find the ulnar nerve passing to the fore-arm. Some of its fibres arise likewise from the tendinous fascia that covers the muscles of the fore-arm. In its descent, it soon becomes tendinous, but its fleshy fibres do not entirely disappear till it has reached the lower extremity of the ulna, where i's tendon spreads a little, and, after sending off a few fibres to the external and internal and annular ligaments, is inserted into the os pisiforme.

Flexor digitorum longus, sive perforans pedis, and perforans sen flexor tertii internodii digitorum pedis of Cowper, and Tibio phalangettien of Dumas. A flexer muscle of the toes, situated along the posterior part and muer side of the leg. It arises fleshy from the back part of the tibia, and, after running down to the internal ankle, its tendon passes under a kind of annular ligament, and then through a smuosity at the inside of the os calcis. Soon after this it receives a small tendou from the flexor longus pollicis pedis, and about the middle of the foot it divides into four tendons, which pass through the shits of the flexor brevis digitorum pedis, and are inserted into the upper p rt of the last bone of all the lesser toes. About the middle of the foot, this muscle unites with a fleshy portion, which, from the name of its first describer, has been usually called massa carnea Jacobi Sylvii: it is also termed Flexor accessorius digitorum pedis. This appendage arises by a thin fleshy origin, from most part of the sinuosity of the es calcis, and likewise by a thin tendinous beginning from the anterior part of the external tubercle of that bone; it soon becomes all fleshy, and unites to the long flexor just before it divides into its four tendons. The use of this muscle is to bend the last joint of the toes.

FLEXOR LONGUS POLLICIS MANUS. Flexor longus politicis of Albinus, Flexor tertui internodii of Douglas. Flexor tertii internodii sive longissimus pollicis of Cowper, and radio-phalangettien du pouce of Dumas. This muscle is praced at the side of the flexor longus digitorum pedis, profundus, perforans, and is covered by the extensores carpi radiales. It arises fleshy from the anterior surface of the radius, immediately below the insertion of the biceps, and is continued down along the oblique ridge, which serves for the insertion of the supinator brevis, as far as the pronator quadratus. Some of its fibres spring likewise from the neighbouring edge of the interosseous ligament. Its tendon passes under the internal annular ligament of the wrist, and after running along the inner surface of the first bone of the thumb, between the two portions of the flexor brevis pollicis, goes to be inserted into the last joint of the thumb, being bound down in its way by the ligamentous expansion that is spread over the second bone. In some subjects we find a tendinous portion arising from the inner condyle of the os humeri, and forming a fleshy slip that commonly terminates near the upper part of the ori-gin of this muscle from the radius. The use of this muscle is to bend the last joint of the thumb.

FLEXOR LONGES POLLICIS PEDIS. FLEXOR LONGUS DIGITORUM PE- This muscle is situated along the pos-DIS, PROFUNDUS, PERFORANS Per- terior part of the leg. It arises tendi-Perforans seu flexor profundus of Douglas, nous and fleshy a little below the head of the fibula, and its fibres continue to adhere to that bone almost to its extremity. little above the heel it terminates in a round tendon, which, af er passing is a groove formed at the posterior edge of the astragalus, a d internal and lateral part of the os calcis, n which it is secured by an annular ligament, goes to be inserted into the last bone of the great toe, which it serves to bend.

FLEXOR OSSIS METACARPI POL-LICIS: Seu opponens pollicis of Innes. Opponens pollicis manus of Albinus. Flexor primi internodii of Douglas. Antithenar sive semi-interesseus pollicis of Winslow, and carpo-phalangien du pouce of Dumas. This muscle is situated under the abductor brevis pollicis, which it resembles in its shape. It arises tendmous and fleshy from the os scaphoides, and from the anterior and inner part of the internal annular ligament. is inserted tendinous and fleshy into the under and anterior part of the first bone of the thumb. It serves to turn the first bone of the thumb upon its axis, and at the same time to bring it inwards, opposite to the other fingers.

FLEXOR PARVUS MINIMI DIGITI. Abductor minimi digiti, Hypothenar Riolant of Douglas. Hypothenar minimi digiti of Winslow. and second-carpo phalangien du petit doigt of Dumas. situation of this muscle is along the inner surface of the metacarpal bone of the little finger. It arises tendinous and fleshy from the hook-like process of the unciform bone, and likewise from the anterior surface of the adjacent part of the annular ligament. It terminates in a flat tendon, which is connected with that of the abductor minimi digiti, and inserted into the inner and anterior part of the upper end of the first bone of the little finger. It serves to bend the little finger, and likewise to assist the abductor.

FLEXOR **PROFUNDUS** PERFO. RANS. Profundus of Albinus. rans of Douglas. Perforans vulgo profundus of Winslow. Flexor tertii internochii digitorum manus, vel perforatus manus of Cowper, and cubito-phalangettien commun. of Dumas. This muscle is situated on the fore-arm, immediately under the perforatus, which it greatly resembles in its shape. It arises fleshy from the external side, and upper part of the ulna, for some way downwards, and from a large portion of the interosseous ligament. It splits into four tendons a little before it passes under the annular ligament of the wrist, and these pass through the slits in the tendons of the flexor sublimis, to be inserted into the fore and upper part of the third or last bone of all the four fingers, the joint of which they bend.

FLEXOR SUBLIMIS PERFORATUS. This muscle, which is the perforatus of fluat of alumin, fluat of ammonia, &c.

Cowper, Douglas, and Winslow, is by Albinus and others named sublimis. has gotten the name of perforatus from its tendons being perforated by those of another flexor muscle of the finger, called the They who give it the appellation of sublimis, consider its situation with respect to the latter, and which, instead of perforans, they name perfundus. It is a long muscle, situated most commonly at the anterior and inner part of the forearm, between the palmaris longus and the flexor carpi ulnaris; but, in some subjects, we find it placed under the former of these muscles, between the flexor carpi ulnaris and the flexor carpi radialis. It arises. tendinous and fleshy, from the inner condyle of the os humeri, from the inner edge of the coronoid process of the ulna, and from the upper and fore part of the radius. down to near the insertion of the pronator teres. A little below the middle of the fore-arm, its fleshy belly divides into four portions, which degenerate into as many round tendons, that pass all together under the internal annular ligament of the wrist, after which they separate from each other. become thinner and flatter, and running along the palm of the hand, under the aponeurosis palmaris, are inserted into the upper part of the second bone of each finger. Previous to this insertion, however, the fibres of each tendon decussate near the extremity of the first bone, so as to afford a passage to a tendon of the perforans. Of these four tendons, that of the middle finger is the largest, that of the fore-finger the next in size, and that of the little-finger the smallest. The use of this muscle is to bend the second joint of the fingers.

Flexor tertii internodii. See flexor lon-

gus pollicis manus.

FLORES BENZOES. See Benzoic acid. FLORES MARTIALES. See Ferrum ammoniatum.

FLORES SALIS AMMONIACI. See Carbonas ammoniæ.

FLORES SULPHURIS. See Sulphur.

FLORES SULPHURIS LOTI. limed sulphur is boiled and washed in water, it forms the flores sulphuris loti of the pharmacopæias. Analogous to this preparation is the sulphur pracipitatum; they possess eccoprotic, diaphoretic, and antipsorical virtues, and are administered in obstipation, where there are piles, colica pictonum, worm cases, to diminish salivations,

FLOWERS. A term formerly employed by chymists to the fine parts which are sublimated from certain bodies, as the flowers of benjamin, sulphur, zinc, &c.

Flower-de-luce. See Iris nostras Flowers of Benjamin. See Benzoic acid. FLUAT. A all formed by the fluoric acid, combined with different bases: thus,

FLUCTUATION. A term used by surgeons, to express the undulations of a fluid; thus, when pus is formed in an abscess, or when water accumulates in the abdomen, if the abscess or abdomen be lightly pressed with the fingers, the motion of fluctuation may be distinctly felt.

Fluellin. See Elatine.

FLUID. A fluid is that, the constituent principles of which so little attract cach other, that, when poured out, it drops guttatin, and adapts itself, in every respect, to the form of the vessel contain-

FLUIDS OF THE BODY. This term is often applied to the blood, and other humours of which the body is composed. The drying of any part of the human body demonstratest that by far the greater part consists of fluid. The quantity of fluid in a man of one hundred and sixty pounds weight, is estimated at one hundred and thirty-five pounds. The fluids of the human body are divided into, 1. Crude, or those which have not yet entirely put on the animal nature, as the cliyme and chyle. 2. Sanguineous; to this is referred the blood, or the cruor of the blood. 3. Lymphatic, which are those of the lymphatic vessels, and the nutritious jelly. 4. Secreted; to this head are referred all those separated from the blood, which are very numerous. 5. Excrementitious, which are climinated from the body, as the alvine fæces, urine, cutaneous and pulmonary perspirable matter.

The secreted humours are divided into, 1. Lacteal, which are white; as the milk, juice of the prostate and thymus glands 2. Aqueous, as the aqueous humour of the eye. 3. Mucous, as the mucus of the nostrils and primæ viæ. 4. Albuminous, as the serum of the blood. 5. Oleous, as the oil of the adipose membrane. 6. Bilious, as the bile and wax of the ears.

The fluids of the human body are also divided from their motion into, 1. Circulating, which continually circulate in the vessels. 2. Commorant, which circulate with a slow motion, as the oil of the adipose membrane and male semen. 3. Stagnant, which remain for a certain time in any receptacle, as cystic bile, urine, and the alvine faces.

FLUOR ALBUS. The Leucorrhaa.

FLUOR SPAR. Vitreous spar. Sparry flour. Derbyshire spar A species of salt which abounds in nature, formed by the combination of the fluoric acid with lime. It is called spar, because it has the sparry form and fracture; fluor, because it nelts very readily; and vitreous, because it has the appearance of glass, and may be fused into glass of no contemptible appearance.

FLUORIC ACID. The acidifiable base of fluoric acid is unknown; for no experi-

ments have yet been made by which it can be exhibited. It is merely from general inference, that we may conjecture it to consist of a simple acidifiable basis united to

xygen.

This acid is to be obtained by putting one part of finely pulverized fluate of lime into a leaden or tin retort, and pouring upon it two parts and a half of sulphure acid. Lute the retort to a receiver of the same metal, containing one part of water, and apply a gentle heat. The fluoric acid gas, disengaged, will be absorbed by the water, and form liquid fluoric acid, which must be kept in well closed leaden or tin bottles, or phials, coated within with wax or varnish.

The distinguishing property of fluoric acid is, its power of dissolving and volatilizing silex. Its odour resembles muriatic acid. On being exposed to a moist atmospheric air, it emits white fumes. Its action upon all the inflammable substances is very teeble; it does not afford oxygen to them. It has no action upon most of the metals, but it dissolves many of their oxyds.

Fluoric acid, united to different bases, forms saline compounds called FLUATS.

FLUORIC ACID GAS. The most remarkable property of this gas is, its power of dissolving silex, and keeping it suspended in the gazeous state; it therefore dissolves glass, crystals, and various precious stones. It is heavier than atmospheric air. It does not maintain combustion, nor can animals breathe it. It is absorbed by water, and forms with it liquid fluoric acid. It has a penetrating odour, approaching nearly to that of muriatic acid gas. It corrodes animal and vegetable matters. Light has no effect upon it. It emits white fumes, in contact with moist atmospheric air. It is very sour, and therefore reddens blue vegetable colours. It precipitates lime-water. With ammonia it unites and forms a concrete body. It has no action upon platina, gold, silver mercury, tin, lead, antimony, cobalt, nickel, and bismuth; but it attacks iron, arsenic, and manganese.

Method of obtaining Fluoric Acid Gas.

1. Fluoric acid gas may be obtained by decomposing fluate of lime (Derbyshire spar) by means of sulphuric acid.

For that purpose, put one part of powdered fluate of lime into a leaden or tin retort, and pour over it two or three parts of concentrated sulphuric acid. A violent action takes place instantly, and fluoric acid gas is extricated, which must be colected over mercury, either in a leaden or tin vessel, or in a glass receiver, covered within with a thick coat of varnish and wax. When no more gas is produced spontaneously, the action of the acid must be assisted by a gentle heat.

Fluate of lime consists of fluoric acid, united to lime; on adding suphuric acid, in the above process a decomposition takes place. The sulphuric acid having a greater attraction for the lime than the fluoric acid, unites to it and forms sulphate of lime, disengaging at the same time the fluoric acid, which takes the gazeous state at the instant of its extrication, and appears under the form of fluoric acid gas.

2. Fluoric acid gas may likewise he obtained from liquid fluoric acid, by heat-

Flux. This word is mostly employed

for dusenteria sauguinea.

FLUXION. A term mostly applied by chymists, to signify the change of metals, or other bodies, from the solid into the fluid state, by the application of heat. See *Fusion*.

Fly, Spanish. See Cantharis.

FOCILE MAJUS. The ulna and the radius are occasionally denominated by the barbarous appellations of focile majus and minus; the tibia and fibula in the leg are also so called.

Focus. A lobe of the liver.

FODINA. (From fodho, to dig.) A quarry. The labyrinth of the ear.

FENICULATUM LIGNUM. A name for

sassafras.

FCENICULUM. (Quasi fanum oculorum, the hay or herb good for the sight; so called because it is thought good for the eyes.) Fennel.

Faniculum aquaticum. Water fennel. Fine-leaved water hemlock. The plant which bears this name in the pharmacoposias is the *Phellandrium aquaticum*; foliorum ramificationibus divaricatis of Linnaus. It possesses vertiginous and poisonous qualities, which are best counteracted by acids, after clearing the primavia. The seeds are recommended by some, in conjunction with Peruvian bark, in the cure of pulmonary phthisis.

FENICULUM ALPINUM. The herb spig-

nel.

FENICULUM ANNUUM. Royal cummin. FEENICULUM DULCE. Common fennel. Anethum faniculum, fructibus ovatis of Linnaus. The seeds and roots of this indigenous plant are directed by the colleges of London and Edinburgh. The seeds have an aromatic smell, and a warm sweetish taste, and contain a large proportion of essential oil. They are stomachic and carminative. The root has a sweet taste, but very little aromatic warmth, and is said to be pectoral and diuretic

FENICULUM MARINUM. Samphire.
FENICULUM ORIENTALE. Cuminum.
FENICULUM PORCINUM. See Peuceda-

num.

FENICULUM SINENSE, Aniseed. FENICULUM SYLVESTRE, Bastard spigFENICULIM TORTUOSUM. French hart-

FENICULUM VULGARE, Faniculum germanicum. Marathrum. Common fennel, or fenckel. A veriety of the Anethum faniculum. See Faniculum dulce.

FINUM CAMELORUM. See Juncus odo-

atus.

FENUM GRACUM. (Fanum, hay, and græcus, belonging to Grecce; because, in Greece, it grew in the meadows, like hay.) Buceras. Egoceras. Fenugreek. Trigonella fenum gracum of Linnæus, leguminbus sessilibus strictis erectiusculis subfulcatis acuminatis, caude erecto. A native of Montpelier. The seeds are brought to us from the southern parts of France and Germany; they have a strong disagreeable smell, and an unctuous farmaceous taste, accompanied with a slight bitterness. They are esteemed as assisting the formation of pus, in inflammatory tumours; and the meal, with that intention, is made into a poultice with milk.

FIGHTLE STATES. Wild fenugreek, FIGHTLE LINE. (From fates, to become putrid.) An encysted abscess, or foul ul-

cer.

FŒTUS. (From feo, to bring forth, according to Vossius.) Epicyema. Epigonion. The child enclosed in the uterus of its mother, is called a foctus from the fifth month after pregnancy until the time of its birth. The internal parts peculiar to the fœtus, are the thymus gland, canalis venosus, canalis arteriosus, foramen ovale, and the membrana pupillaris. Besides these pe-culiarities, there are other circumstances in which the fœtus differs from the adult. The lungs are black and collapsed, and sink in water; the liver is very large; all the glands, especially the thymus and suprarenal, and the verm form process of the cæcum, are also considerably larger in proportion. The teeth of the fætus are hid within their sockets; the great intestines contain a substance called meconium; the membrana tympani is covered with a kind of mucous membrane, and the bones in many places are cartilaginous.

FOLIATA TERRA. (From its resemblance to folium, a leaf.) Sulphur, also the acetas

potassæ.

FOLIUM ORIENTALE. See Senna.

FOLLICLE. Folliculus; dim. of folis,

a bag.) See Folliculose gland.

FÖLLICULOSE GLAND. Follicle. One of the most simple species of gland, consisting merely of a hollow vascular membrane or follicle, and an excretory duct; such are the muciparous glands, the sebaceous, &c.

FOLLICULUS FELLIS. The gall-blad-

der.

FOMENTATION. Fomentatio. A sort of partial bathing, by applying hot flannels to any part, dipped in medicated

decoctions, whereby steams are communicated to the diseased parts, their vessels are relaxed, and their morbid action sometimes removed.

FOMES VENTRICULI. Hypochondriacism.

FOMITES. A term mostly applied as synonymous with contagion

FONS PULSATILIS. See Fontanella.

FONTANELLA. (Dim. of fons, a foun-Fons pulsatilis. The parietal bones and the frontal bones do not eoalesce until the third year after birth, so that, before this period, there is an obvious interstice, commonly ealled mould, and scientifically the fontanel, or fons pulsatilis. There is also a lesser space, occasionally, between the occipital and parietal bones, termed the posterior fontancl. These spaces between the bones are filled up by the dura mater and the external integuments, so that during birth, the size of the head may be lessened: for, at that time, the bones of the head, upon the superior part, are not only pressed nearer to each other, but they frequently lap over one another, in order to diminish the size during the passage of the head through the pelvis.

FONTANELLA ANTERIOR. Sce Fonta-

nella.

FINTANELLA POSTERIOR. See Fonta-

FONTICULUS. (Dim. of fons, an issuc.) An artificial ulcer formed in any part, and kept discharging by introducing daily a pea, covered with any digestive ointment

FORAMEN. (From foro, to pierce.) A

little opening.

FORAMEN CÆCUM. A single opeuing in the basis of the cranium between the ethmord and the frontal bone, that gives exit to a small vein.

LACERUM FORAMEN IN BASII

See Foramina lacera.

LACERUM FORAMEN ORBITALE SUPERIUS. A large opening between the greater and lesser wing of the parietal bone through which the third, fourth, first branch of the fifth and the sixth pair of nerves, and the opthalmia artery pass.

FORAMEN OPTICUM. The hole trans-

mitting the optic nerve

FORTMEN OVALE. The opening between the two aurieles of the heart of the feetus. See also Innominatum os.

FORTMEN OF WINSLOW. An opening in

the omentum. See Omentum.

LACERA. FORAMINA A pair of foramina in the basis of the cranium, through which the internal jugular veins and the eighth pair of accessory nerves

FORAMINULUM OS. The ehmoid bone.

FORCEPS. (Quasi ferriceps, as being iron with which we seize any thing ligt, from f rrum, iron, and capio, to take.)

Pincers. A surgical instrument with which extraneous bodies or other substances are extracted. Also an instrument occasionally used by men midwives to bring the head of the fœtus through the pelvis.

Foreskin. See Prapuce.

FORMIAT. Formias. A salt produced by the union of the formie acid with different bases; thus, formiat of alumin, for-

miat of ammonia, &c.

FORMICA. (Quod ferat micas, because of his diligence in collecting small partieles of provision together.) 1. The ant, or pismire. This industrious little insect, Formica rufa of Linnæus, contains an acid juice and gross oil, which were supposed to possess aphrodisiae virtues. The erysalides of this animal are said to be diuretic and earminative, and by some recommended in the cure of dropsy

2. The name of a black wart with a broad base, and eleft superficies, because the pain attending it resembles the biting

of an ant.

3. A varieose tumour on the anus and glans penis.

FORMICA MILIARIS. Any herpetic erup-

FORMIC Acidum formicum. ACID. The acid of ants was known to Tragus, Bauhin, Fisher, Etmuller, Hoffman, and many others. It is obtained chiefly from the red ant, Formica rufu of Linnaus, by distilling them in a retort, and by washing them in boiling water. When rectified, and rather concentrated, it has a penetrating smell, and is corrosive; and its taste is so agreeable, when greatly diluted with water, that it has been proposed to be used instead of vinegar,

The herpes exedens. FORMIX.

(Dim. of forma, a form.) FORMULA. A little form of prescription, such as physicians direct in extemporaneous practice, in distinction from the greater forms in pharmaeopæias, &e.

FORNAX. Furnus. A furnace.

mieal instrument. See Furnace.

FORNIX. (Fornix, an areb or vault.) A part of the corpus callosum in the brain is so ealled, because, if viewed in a particular direction, it has some resemblance to the arch of an ancient vault. It is the medullary body, composed of two anterior and two posterior eritra, situated at the bottom and inside of the lateral ventriele, over the third ventricle, and below the septum lucidum.

A weak nitrous acid. FORTIS AQUA.

FOSSA. (From fodio, to dig.) A little depression or sinus. The pudendum muliebre.

Fossa AMYNTE. A double-headed roller for the face.

Fossa MAGNA. The great groove of the ear, the pudendum muliebre.

Fossa Navicularis. The cavity at the Uv.

U U -

U U -

entrance of the pudendum muliebre: also

the great groove of the ear.

Fossa ovalis. The depression in the right auricle of the human heart, which in the feetus opened into the other auricie, forming the foramen ovale.

The fossa of the FOSSA PITUITARIA. sella turcica of the sphanoid bone.

FOSSIL. (Fossilis, from fodio, to dig.) Any thing dug out of the earth,
Fossilus. The bone of the leg.

FOSTITS. The bone of the R.S. FOVEA. (From fodio, to dig.) A liver procession. The pudendum muliebre, A little depression. partial sweating-bath.

Fox-glove. See Digitalis.

The seeds of FOX-GLOVE, EASTERN. this plant, Sesamum orientale of Linuxus, are in much esteem in South Carolina, where they are called oily grain, they are made into soups and puddings after the manner of rice. Toasted over the fire, they are mixed with other ingredients, and stewed into a delicious food. The fresh seed affords a considerable quantity of a warm pungent oil, otherwise not unpalatable. In a year or two the pungency leaves it, when the oil is used for sallad, &c. The seed of the Sesamum indicum arc used in the same manner

FRACTURE. (Fractura; from frango, break ) Categma. Cassis. Agme. A Fracture is a solution of a bone into two or more fragments. A simple fracture is when the bone only is div ded. A compound fracture is a division of the bone, with a laceration of the integuments, the bone mostly protruding. A fracture is also termed transverse, oblique, &c. accord-

ing to its direction.

FRENULUM. (Dim. of frenum, a bridle.) The cutaneous fold, under the apex of the tongue, that connects the tongue to the infralingual cavity. It is sometimes, in infancy, so short as to prevent the child from sucking, when it is necessary to cut it, in order to give more from for the motion of the tongue.

FRÆNUM. The membranous fold which connects the præpuce to the inferior part

of the glans penis.

FRAGA. (From fragro, to smell sweet. The strav berry. See Fragaria.

FRAGARIA. (From fragro, to smell

sweet.) The strawberry.

1. The name of a genus of plants in the Linnaan system. Class, Icosandria. Order,

2. The pharmacopæial name of the strawberry. Fraga. The mature fruit of the Fragaria vesca, fragellis reptantibus of Linnzus, was formerly recommended in gouty and calculous affections, in consequence, it would appear, of its efficacy in removing tartar from the teeth, which it is said to do very effectually.

FRAGARIA STERILIS. Barren strawberry.

Astringent.

The systematic name FRAGARIA VESCA. of the strawberry. See Fragaria.

FILAGILITAS OSSIUM. Friabilitas ossium. Brittleness of the bones.

FRAGMEN. Fragmentum. A splinter of a bone.

FRAMBŒSIA. (From framboise, Fr. for a raspberry.) The yaws. A genus of disease arranged by Cullen in the class cachexia, and order impetigines. somewhat similar in its nature to the lues venerea, and is endemial to the Antilla islands. It appears with excrescences, like mulberries, growing out of the skin in various parts of the body, which discharge

an ichorous fluid.

FRANGULA. (From frango, to break, so called because of the brittleness of its branches.) Black alder. This officinal tree is the Rhamnus frangula of Linnaus: -inermis floribus monogynis hermaphroditis, foliis integerrimis. The berries and bark are used medicinally as strong purgatives. The former are often substituted for those of the buckthorn; the latter, which is the internal bark, and of a yellow colour, is mostly employed by the common people in dropsical and other disorders.

Frankincense. See Thus.

FRAXINELLA. (From fraxinus, the ash, so called because its leaves resemble those of the ash.) See Dictamnus albus.

Fraxinella, white. See Dictamnus albus. FRAXINUS. (A fragore, from the noise its seeds make when shaken by the wind; or from φεαξισ, a hedge, because of its use

in forming hedges.) The ash.

1. The name of a genus of plants in the Linnman system. Class, Polygamia. Or-

der, Dioecia. The ash.

2. The pharmacopæial name of the ashtree, called also brumeli and bumelia. The bark of this tree, Fraxinus excelsior of Linnæus :- folis serratis floribus apetalis, when fresh, has a moderately strong bitterish taste. It possesses resolvent and diuretic qualities, and has been successfully exhibited in the cure of intermittents. The seeds are occasionally exhibited medicinally as diuretics, in the dose of a drachim. warm climates, a species of manna exudes from this species of fraxinus.

FRAXINUS EXCELSION The systematic

name of the ash-tree. See Fraxinus.
Fraxinus ornus. The systematic name of the tree from which manna flows. Manna.

FRAXINUS ROTUNDIFOLIA. . The systematic name of a tree which affords manna. See Manna.

FRENA. The sockets of the teeth.

(From frigidus, cold.) The cold bath.

A putrid fever. FRIGIDARIUM.

The part between the eyebrows and the hairy scalp.

Frontal bone. See Os frontis. Frontal sinus. See Os frontis.
FRONTALIS. See Occipitio frontalis.
FRONTALIS VERUS. See Corrugator su-

percilli.

FRONTIS OS. See Os frontis. FRUCTUS ROREI. Sec Fruits, summer.

FRUITS, SUMMER. Fructus horei. Under this term physicians comprehend strawberries, cherries, currants, mulberries, raspberries, and the like. They possess a sweet sub-acid taste, and are exhibited as dietetic auxilliaries, as refrigerants, anti-septies, attenuants, and aperients. For-merly they were exhibited medicinally in the cure of putrid affections, and to promote the alvine and urinary exerctions. Considering them as an article of diet, they afford little nourishment, and are liable to produce flatulencies. To persons of a bilious constitution and rigid fibres, and where the habit is disposed naturally, or from extrinsic causes, to an inflammatory or putrescent state, their moderate, and even plentiful, use is salubrious; by those of a cold inactive disposition, where the vessels are lax, the circulation languid, and the digestion weak, they should be used very sparingly. The juices extracted from these fruits, by expression, contain their active qualities, freed from their grosser indigestable matter. On standing, the juice ferments and changes to a vinous or acetous state. By proper addition of sugar, and by boiling, their fermentive power is suppressed, and their medicinal qualities preserved. The juices of these fruits, when purified from their feculencies by settling and straining, may be made into syrups, with a due proportion of sugar, in the usual way.

FRUMENTACEOUS. A term applied to all such plants as have a conformity with wheat, either with respect to their

fruit, leaves, or ears.
FUCUS. The name of a genus of plants in the Lunnaan system. Class, Cryptogamia.

Order, Alga.

FUCUS DIGITATUS. This fucus grows upon stones and rocks in the sea near the shore. It has several plain, long leaves or sinuses springing from a round stalk, in the manner of fingers when extended. It affords soda.

Fueus esculentus. Edible fucus. Mr. Hudson has made this a distinct species, but Linnaus included it under his saecharinus. It grows plentifully in the sea, near the shores of Scotland, and also those of Cumberland. It has a broad, plain, simple, sword-shaped leaf, springing from a pinnated stalk.

FUCUS HELMINTOCHORTON. See Corrul-

ina corsicuna

FICUS PALMATUS. Handed fucus. This grows in the sea, and consists of a thin lobed leaf like a hand.

Fecus SACCHARINUS. Sea-belts; so called from the supposed resemblance of its leaves to a belt or girdle. It grows upon rocks and stones by the sea shore The leaves are very sweet, and when washed and hanged up to dry will exude a substance like that of sugar, from whence it was named.

The systematic Fucus vesiculosus. name of the sea oak. See Quercus marina. FULIGO (Quasi fumiligo from fumus,

wood soot, fultgo ligm, or the condensed smoke from burning wood, has a pungent, bitter, and nauseous taste, and is resolved by chymical analysis into a volatile alkaline salt, and empyreumatic oil, a fixed alkali, and an insipid earth. The tincture prepared from this substance, tinctura fuliginis, is recommended as a powerful antispasmodie in hysterical affections.

FULMINATION. A quick and lively explosion of bodies, such as takes place with fulminating gold, fulminating powder, and in the combustion of inflammable gas

and vital air.

FUMARIA: (From fumus, smoke, from its juice, when dropped into the eye, producing the same sensations as smoke.)

1. The name of a genus of plants in the Linnzan system. Class, Diadelphia. Order, Decandria. Fumitory.

2. The pharmacopæial name of the common fumitory. Fumis terræ. Capnos. Herba melancholifuga. The leaves of this indigenous plant, Fumaria officinalis of Linnæus:-pericarpiis monospermis racemosis, caule diffuso, are directed for medicinal use by the Edinburgh college; they are extremely succulent, and have no remarkable smell, but a bitter, somewhat saline taste. The infusion of the dried leaves, or the expressed juice of the fresh plant, is esteemed for its property of clearing the skin of many disorders of the leprous kind.

FUMARIA BULBOSA. See Aristolochia

fabacea.

FUMARIA OFFICINALIS. The systematic

name of the fumitory. See Fumaria. FUMIGATION. The application of filmes, either from metallic or other preparations, to particular parts of the body, as those of the mercurial kind to venereal sores, &c.

Fumitory. See Fumaria.

Funus albus. Merenry.

FUMUS CITTINUS. Sulphur.
FUMUS DUPLEX. Sulphur and mercury.
FUMUS RUBENS. Orpiment.

FUNCTION. See Action. FUNGUS. 1. Proud flesh. A term in surgery to express any luxuriant formation of flesh.

2. The name of an order of plants in the Linnzan system, belonging to the Cruptogamia class.

Fungus igniarius. See Agaricus.

FUNGUS LARICIS. See Agaricus albus. FUNGUS MELITENSIS. This is impro-

perly called a fungus, it being the Cinomorium coccineum of Linnæus, a small plant which grows only on a little rock adjoining Malta. A drachm of the powder is given for a dose in dysenteries and hæmorrhages, and with remarkable success.

FUNGUS ROSACEUS. See Bedeguar.
FUNGUS SALICIS. The willow fungus. The species of fungus ordered in some pharmacopæias by this name is the Boletus suavolens; acaulis superne lavis, salicibus, of Linnæus, and the Boletus albus of Hudson. When fresh, it has a suburinous smell, and at first an acid taste, followed by a It is seldom used at present, but was formerly given in plithisical complaints.

FUNGUS SAMBUCINUS. Sec Auricula Tude.

FUNGUS VINOSUS. The dark cobweblike fungus, which vegetates in dry cellars, where wine, ale, and the like, are kept.

FUNICULUS UMBILICALIS. (Funiculus; dim. of funis, a cord.) See Umbilical

cord.

FUNIS. A rope or cord.

FUNIS UMBILICALIS. See Umbilical

FURCALA. The clavicle or collar-bone. FURCELLA INFERIOR. The ensiform cartilage

FURFUR. Bran. A disease of the skin, in which the cuticle keeps falling off

in small scales like bran.

FURFURACEOUS. (Furfuraceus, from furfur, bran.) A term applied to the sediment deposited in the urine of persons afflicted with fever, of a reddish or whitish matter, which generally appears within an hour or two after the urine is passed, and

only falls in part to the bottom, the urine remaining turbid.

FURNACE. Furnus. The furnaces employed in chemical operations are of three kinds: 1. The evaporatory furnace, which has received its name from its use; it is employed to reduce substances into vapour by means of heat, in order to separate the more fixed principles from those which are more ponderous, and were mixed, suspended, compounded, or dissolved in the fluid. 2. The reverberatory furnace, which name it has received from its construction, being appropriated to distillation. 3. The forge furnace, in which the current of air is determined by bellows.

FUROR UTERINUS. (From furo, to be mad, and uterus, the womb.) Acrai. Brachuna. Estromania. Arascon. Arsatum.

See Nymphomania.

FURUNCULUS. (From furo, to rage; so named from its heat and inflammation before it suppurates.) Dothein of Para-Chiadus. Chioli. A boil. inflammation of a subcutaneous gland, known by an inflammatory tumour that does not exceed the size of a pigeon's

FUSION. (Fusio; from fundo, to pour out.) A chymical process, by which bodies are made to pass from the solid to the fluid state, in consequence of the application of heat. The chief objects susceptible of this operation are salts, sulphur, and metals. Salts are liable to two kinds of fusion: the one, which is peculiar to saline matters, is owing to water, and is called aqueous fusion; the other, which arises from the application of fire, is known by the name of igneous fusion.

TABIANUM OLEUM. See Petroleum rubrum.

GABIREA. A fatty kind of myrrli, men-

tioned by Dioscorides.

GALACTIA. (From yaxa, milk.) Galactirrhaa, An excess or overflowing of the milk.

GALACTINA. (From yaxa, milk) Ali-

men | ep red of milk.

(From yana, GA .ACLIRAHŒA. milk, and pour a flow.) See Galactia.

GALACTODES. (From 2xxx, milk) Hippocrates it signifies both milk warm, and a n.i.ky colour

(From GALACTOPHORA MEDICAMENTA. γαλα, mitk, and φερε, to carry.) Medicines which increase the mark.

GALACTOPHOROUS DUCTS. (Ga-

lactophorus; from zana, milk, and que, to carry, because they bring the milk to the nipple.) The excretory ducts of the glands of the breasts of women, which terminate in the papilla, or nipple, are so called.

GALACTOPOETICA. (From yana, milk, and movew, to make.) Milk-making, an epithet applied to the faculty of making

milk.

GALACTOPOSIA. (From γαλα milk, and πινω, to drink.) The method of curing dis-

eases by a milk diet.

GALANGA. (Perhaps its Indian name) Galangal. The roots of this plant are used medicinally; two kinds are mentioned in the pharmacopæias; the greater galangal Kemferi galanga of Linnaus, and the mailer galangal, the root of the Maranta galanga;

caulino simplici foliis lanceolatis subsessilibus, of Lin auis. The dried root is blought from China, in pieces from an inch to two in length, scarce half so thick, branched, full of knots and joints, with several circular rings of a reddish brown colour on the outside, and brownish within. It has an aromatic smell, not very grateful, and an unpleasant, bitterish, hot, biting taste. It was formerly much used as a warm stomachic bitter, and generally ordered in bitter infusions. It is now, however, seldom employed.

GALANGA MAJOH. See Galanga.
GALANGA MINOR See Galanga,
Galangal. See Galanga.
Galangal, English. See Cyperus.

GALBANUM (From chalbanah, Heb.) Albetud, Chalbane. Gesor. The plant is also named Ferula Africana; Oreoselinum Africanum: Anisum fruticosum galbaniferum; Anisum Africanum fruticescens; and Ayhorzat. Galbanum is the gumini-resinous juice, obtained partly by its spontaneous exudation from the joints of the stem of the Lovage-leaved button, Button galbanum of Linnæus :- foliis rhombeis dentatis striatis glabris umbellis paucis; but more generally, and in greater abundance, by making an incision in the stalk, a tew inches above the root, from which it immediately issues, and soon becomes sufficiently concrete to be gathered. It is imported into England from Turkey and the East Indies, in large, softish, ductile, pale-coloured masses, which, by age, acquire a brownish yellow appearance: these are intermixed with distinct whitish tears, that are the most pure part of the mass. Galbanum has a strong unpleasant smell, and a warm, bitterish, acrid taste; "like the other gummy resins it unites with water, by trituration into a milky liquor, but does not perfectly dissolve, as some have reported, in water, vinegar or wine. Rectified spirit takes up much more than either of these menstrua, but not the whole: the tincture is of a bright golden colour. A mixture, of two parts of rectified spirit, and one of water, dissolves all but the impurities, which are commonly in considerable quantity. In distillation with water, the oil separates and rises to the surface, in colour yellowish, in quantity one twentieth of the weight of the galbanum. Galbanum, medicinally considered, may be said to hold a middle rank between assafœtida and ammoniacum; but its fætidness is very inconsiderable, especially when compared with the former; it is therefore accounted less antispasmodic, nor are its expectorant qualities equal to those of the latter; it, however, is esteemed more efficacious than either in hysterical disorders. Externally it is often applied, by surgeons, to expedite the suppuration of inflammatory and indolent tumours, and,

by physicians, as a warm stimulating plaster. It is an ingredient in the pilulæ galbani compositæ, the emplastrum galbani compositum of the London Pharmacopær, and in the emplastrum ad clavos pedum of the Edinburgh.

Galbeit. Galbeum. A sort of ornamental and medical bracelets worn by the

Romans.

GALBULUS. (From galbus, yellow.) When the skin of the body is naturally yellow.

Galda Gummi. This is a gum-resin, mentioned by old writers, but totally forgot in the present day, and not to be obtained. Externally, it is of a brown colour, but white within, of a hard lamellated structure, and smells and tastes somewhat like clemi. When burnt it gives out an agreeable odour. It was formerly used as a warm, stimulating medicine, and applied in plasters as a strengthener.

GALEA. (From yahn, a cat, of the skin of which it was formerly made.) A helmet. In anatomy, the amnios is so called, because it surrounds the fectus like a helmet. In surgery, it is a bandage for the head. A species of head-ach is so called, when it surrounds the head like a helmet.

GALEANTHROPIA. (This term seems to be from γαλη, a cat, and ανόξαπος, a man.) It is a species of madness, in which a person imagines himself to be a cat, and imitates its manners.

GALEGA (From yaza, milk; so named because it increases the milk of animals which eat it.) The name of a genus of plants in the Linnaan system. Class, Diadelphia. Order, Decandria.

2. The pharmacopæral name of the Ruta praria. Goats rue. From the little smell and taste of this plant, Galega officinalis of Linnaus: leguminibus strictis, erectis; foliolis lanceolatis, striatis, nudis, it may be supposed to possess little virtues. In Italy the leaves are eaten amongst salads.

GALEGA OFFICINALIS. The systematic name of the goats rue. See Galega.

GALEGE. A species of senna. The cassia tora of Linnaus.

GALENA. (From γαλων, to shine.) The name of an ore formed by the combination of lead with sulphur.

GALENIC MEDICINE. That practice of medicine which conforms to the rules of Galen, and runs much upon multiplying herbs and roots in the same composition, though seldom torturing them any otherwise than by decoction. It is opposed to chymical medicine, which by the force of fire, and a great deal of art, fetches out the virtues of bodies, chiefly mineral, into a small compass.

GALENIUM. (From Janua, galena.) A cataplasm, in the composition of which was the galena. In Paulus Ægineta it is considered as anodyne.

GALFOBBULON. See Lamium alium.

GALEOPSIS. (Flom Maxor, good, and ohis, vision; so called because it was thought good for the sight; or from yann, a cat, and our, aspect; the flowers gaping like the open mouth of that animal.) mium rubrum. Urtica iners magna fætidissima. Stachys fatida. Hedge nettle. See Lamium album.

GALERICULUM APONEUROTICUM. The tendinous expansion which lies over the

pericranium.

GALIUM. (From vala, milk: some species having the property of coagulating milk.) 1. The name of a genus of plants in the Linnxan system. Class, Tetrandria.

Order, Monogynia.

2. The pharmacopæial name of the herb cheese rennet, or ladies bedstraw tops of this plant, Galium verum; foliis octonis, linearibus, sulcatis; ramis floriteris, brevibus, of Linnaus, were long used as an efficacious medicine in the curc of epilepsv, but, in the practice of the present day, they are abandoned. Indeed, from the sensible qualities of the plant, little can be expected. The leaves and flowers possess the property of curdling milk; it is on that account styled cheese rennet.

3. A name for madder.

GALIUM ALBUM. The greater ladies This herb, Galium mollugofoliis octonis, ovato-linearibus, subserratis, patentissimis, mucronatis; caule flaccido, ramis patentibus, of Linnæus, with its flowers, are used medicinally. Five ounces, or more, of the expressed juice, taken every evening upon an empty stomach, is said to cure epilepsy.

GALIUM APARINE. The systematic name

of the goose-grass. See Aparine.

GALIUM MULLUGO. The systematic name of the greater ladies bedstraw. See Galium

GALIUM VERUM. The systematic name of the true ladies bedstraw. See Galium.

Gall. See Bile.

GALL SICKNESS. A popular name for the remitting fever occasioned by marsh miasmata, in the Netherlands, and which proved so fatal to thousands of the English soldiers after the capture of Walcheren in the year 1809. Dr. Lind informs us, that at Middleburg, the capital of Walcheren, a sickness generally reigns wards the latter end of August, or the beginning of September, which is always most violent after hot summers. It commences after the rains which fall in the end of July; the sooner it begins the longer it continues, and it is only checked by the coldness of the weather. Towards the end of August and the beginning of September, it is a continual burning fever, attended with a vomiting of bile, which is the gall sickness. This fever, after continuing three or four days, intermits, and asumes the form of a double tertian; leaving the patient in a fortnight, or perhaps sooner. Strangers, that have been accustomed to breathe a dry, pure air, do Foreigners, in not recover so quickly. indigent circumstances, such as the Scots and German soldiers, who were garrisoned in the adjacent places, were apt, after those fevers, to have a swelling in the legs, and a dropsy; of which many died.

These diseases are the same with the double tertians common within the tropics. Such as are seized with the gall sickness, have at first some flushes of heat over the body, a loss of appetite, a white, foul tongue, a yellow tinge in the eyes, and a pale colour of the lips. Such as live well, drink wine, and have warm clothes, and a good lodging, do not suffer so much during the sickly season as the poor people; however, these diseases are not infectious, and seldom prove mortal to the natives.

Sir John Pringle observes, that the prevailing epidemic of autumn, in all marshy countries, is a fever of an intermitting nature, commonly of a tertian form, but of a bad kind; which, in the dampest places and worst seasons, appears as a double tertian, a remitting, or even an ardent fever. But, however these may yary in their appearance, according to the constitution of the patient, and other circumstances, they are all of a similar nature. For though, in the beginning of the epidemic, when the heat, or rather the putrefaction in the air, is the greatest, they assume a continued or a remitting form; yet, by the end of autumn, they usually terminate in regular intermittents.

But although, in the gall-sickness, there is both a redundance and a depravation of the bile, still the disease cannot, with justice, be said to originate wholly from that cause. It is certain, however, that the disease may be continued, and the symptoms aggravated, by an increased secretion and putrefaction of the bile, occasioned by the fever. In proportion to the coolness of the season, or the height and dryness of the ground, this disease is milder, remits and intermits more freely, and removes further from the nature of a continued fever. higher ranks of people in general are the least hable to the diseases of the marshes; for such countries require dry houses, apartments raised above the ground, moderate exercise, without labour, in the sun, or evening damps; a just quantity of fer-mented liquors, plenty of vegetables, and fresh meats. Without such helps, not only strangers, but the natives themselves, are sickly, especially after hot and close summers. The hardiest constitutions are very little excepted more than others; and hence the British in the Netherlands have always been subject to fevers.

By this disease the British troops were harassed throughout the war, from 1743 to 1747. It appeared in the month of August, 1743: the paroxysms came on in the evening, with great heat, thirst, a violent head-ache, and often a delimim. These symptoms lasted mo t of the night, but abated in the morning, with an imperfect sweat; sometimes with an hæmorrhage of the nose, or looseness. The stomach, from the beginning, was disordered, with a nausea and sense of oppression; frequently with a bilious and offensive vomiting. If evacuations were either neglected, or too sparingly used, the patient fell into a continued fever, and sometimes grew yellow, as in jaundice. When the season was further advanced, this fever was attended with a cough, rheumatic pains, and sizy blood. The officers, being better accommodated than the common men, and the cavalry, who had clooks to keep them warm, were not so subject to it; and others who belonged to the army, but lay in quarters, were least of all effected; and the less in proportion to their being exposed to heats, night damps, and the other fatigues of the service. In this manner did the remitting fever infest the army for the remaining years of the war; and that exactly in proportion to their distance from the marshy places, of which we have several notable instances in Pringle's observations.

GALLA. (From Gallus, a river in Bythenia.) Nux galla. Galla maxima orbiculata. The gall-nut. The production of the quercus cervis of Lunnaus. By this name is usually denoted any protuberance, tuberele, or tumour, produced by the puncture of insects on plants and trees of different kinds. These galls are of various forms and sizes, and no less different with regard to their internal structure. Some have only one cavity, and others a number of small cells, communicating with each other. Some of them are as hard as the wood of the tree they grow on, whilst others are soft and spongy; the first being termed gall-nuts, and the latter berry-galls,

or apple galls. The gall is thus produced :- 'he cynips querci folii, an insect of the fly kind, deposites its eggs in the leaves and other tender parts of the tree. Around each puncture an excrescence is presently formed, within which the egg is hatched, and the insect passes through all the stages of its metaniorphosis, until it becomes a perfect insect, when it eats its way out of its prison. The best oak galls are heavy, knotted, and of a blue celour, and are obtained from Aleppo. They are nearly entirely soluble in water, with the assistance of heat. This soluble active matter consists of tannin, in combination with gallic acid; nine-tenths of the former, with one-tenth of the latter.

Oak galls are supposed to be the strongest astringent in the vegetable kingdom. Both water and spirit take up nearly all their virtue, though the spirituous extract is the strongest preparation. The powder is, however, the best form; and the dose is from a few grains to half a drachm.

They are not much used in medicine. though they are said to be beneficial in intermittents. Dr. Cullen has cured agues. by giving half a drachm of the powder of galls every two or three hours during the intermission; and by it alone, or joined with camomile flowers, has prevented the return of the paroxysms. But the doctor states the amount of his results only to be this: that, "in many cases, the galls cured the intermit ents; but that it failed also in many cases, in which the Peruvian bark afterwards proved successful." A fomentation, made by macerating half an onnce of bruised galls in a quart of boiling water for an hour, has been found useful for the piles, the projapsus ani, and the fluor albus, applied cold. An injection, simply astringent, is made by diluting this fomentation, and used in gleets and leucorrhea. camphorated ointment of galls has been found also serviceable in piles, after the use of leeches; and is made by incorporating half a drachm of camphor with one ounce of hog's lard, and adding two drachms of galls in very fine powder. In fact, galls may be employed for the same purposes as oak bark, and are used under the same forms.

GALLA TURETEA. See Quercus.

GALL BLADDER. Vesicula fellis. An oblong membranous receptacle, situated under the liver, to which it is attached in the right hypochondrium. It is composed of three membranes: a common, fibrous, and villous. Its use is to retain the ble which regurgitates from the hepatic duct, there to become thicker, more acrid, and bitter, and to send it through the cystic duct, which proceeds from its neck into the ductus communis choledochus, to be sent on to the duodenum.

GALL-STONES. Biliary concretions. Hard concrete bodies, of which there are great varieties, formed in the gall-bladder of animal bodies. Gall-stones often lie quiet; so that, until dissection after death, some are never known to exist; but when they are prevented from passing through the gall duets, they obstruct the passage of the bile into the intestines, and produce also many inconvenient symptoms, particularly the jaundice.

The diagnostics of this disorder are generally very obscure and uncer in; for other caus is produce the same kind of symptoms as those which occur in this disease. The usual symptoms are, a ross of appetite, a sense of fulness in the stomach,

sickness and vomiting, langour, inactivity, sleepiness; and if the obstruction continues for a time, there is wasting of the flesh; yellowness of the eyes, skin, and urine; whitish stools; a pain in the pit of the stomach; whilst the pulse remains in its natural state. The pain excited by an obstruction of the gall ducts, in consequence of gall-stones passing through them, and this not affecting the pulse, is considered as the leading pathognomonic symptom. This pain, in some, is extremely acute, in others there is only a slight uncasmess felt about the region of the liver; but its particular seat is the gall duct, just where it enters the duodenum. In some patients there is no vellowness of the skin; in others it exists for several months. There is no disease more painful than this, in some instances; it is as frequent as any other affection of the liver; it admits of much relief from medicine, and is not immediately dangerous to the patient.

GALLIC ACID. A peculiar acid which is extracted from the nut-gall that grows on the oak. This acid is also found, in a greater or less quantity, in all sour or as-

tringent vegetable substances.

GALLICTRICHIS. Corrupted from callitrichis, or callitricum.

Gallicus morbus. The French disease, See Lues venerea.

GALLINAGO. (Diminutive of gallus, a

cock.) 1. The woodcock.

2. An eminence within the prostate gland is called caput gallinagins, from its fancied resemblance to a woodcock's head.

GALLIUM. See Galium.

GALVANISM. A professor of anatomy, in the university of Bologna, was one day making experiments on electricity, in his elaboratory; near the machine were some frogs that had been flayed; the limbs of which became convulsed every time a spark was drawn from the apparatus. Galvani, surprised at this phenomenon, made it a subject of investigation, and discovered that metals, applied to the nerves and muscles of these animals, occasioned powerful and sudden contractions, when disposed in a certain manner. gave the name of animal electricity to this order of new phenomena, from the analogy that he considered existing between these effects and those produced by

The name animal electricity has been superseded, notwithstanding the great analogy that exists between the effects of electricity and of Galvanism, in favour of the latter term; which is not only applicable to the generality of the phenomena, but likewise serves to perpetuate the memory

of the discoverer.

In order to give rise to Galvanic effects, it is necessary to establish a communication

between two points of one series of nervous and muscular organs. In this manner a circle is formed, one arch of which consists of the animal parts, rendered the subject of experiment, while the other arch is composed of excitatory instruments, which generally consist of several pieces, some placed under the animal parts called supporters, others destined to establish a communication between the latter are called conductors. To form a complete Galvanic circle, take the thigh of a frog, deprived of its skin; detach the crural nerve, as far as the knee; put it on a piece o zinc; put the muscles of the leg on a piece of silver; then finish the excitatory arch, and complete the Galvanic circle by establishing a commu ication by means of the two supporters, by means of iron or copper wire, pewter, or lead. The instant that the communicators touch the two supporters, a part of the animal arch formed by the two supporters will be convulsed. Aithough this disposition of the animal parts, and of Galvinic instruments, be most favourable to the developement of the phenomena, yet the composition of the animal and excitatory arch may be much varied. Thus contractions are obtained, by placing the two supporters under the nerve, and leaving the muscle out of the circle, which proves that nerves essentially constitute the animal arch.

It is not necessary for nerves to be entire, in order to produce contractions. They take place whether the organs be tied or cut through, provided there exists a simple contiguity between the divided ends. This proves that we cannot strictly conclude from what happens in muscular action, from that which takes place in Gaivanic phenomena; since, if a nerve be tied or divided, the muscles on which the power is distributed lose the power of action.

The curcle is an obstacle to Galvanic effects; they are always feebly manifested in parts of vered by it. When it is moist, fine, and delicate, the effect is not entirely interrupted. Humboldt, after having detached the curicle from the posterior part of the neck and back, by means of two blisters, applied plates of metal to the bare cutis, and at the moment of establishing a communication, he experienced sharp prickings, accompanied with a serosanguinous discharge.

If a plate of zinc be placed under the tongue, and a flat piece of silver on its superior surface, on making them touch each other, an accept taste will be perceived, accompanied with a slight rembling.

The excitatory arch may be constructed with three, two, or even one metal only, with alloys, a calgams, or other metanic or mineral combinations, carbonated substances, &c. It is observed that metal-

which are in general the most powerful excitors, induce contractions so much the more as they have an extent of surface. Metals are all more or less excitants; and it is observed that zinc, gold, silver, pewter, are of the highest rank; then copper,

lead, nickel, antimony, &c.

Galvanic susceptibility, like muscular irrilability, is exhausted by too long continurd exercise, and is recruited by repose. Immersion of nerves and muscles in alkoh l and opiate solutions diminishes and even destroys this susceptibility, in the same manner, doubtless, as the immoderate use of these substances in the living man blunts, and induces paralysis in muscular action. Immersion in oxygenated muriatic acid revests the fatigued parts, in being acted on by the stimulus. Animals killed by the repeated discharge of an electric battery, acquire an increase of Galvanic susceptibility; and this property sub-sists unchanged in animals destroyed by submersion in mercury, pure hydrogen gas, azot, and ammoniac; and finally, it is totally annihilated in animals sufficated by the vapour of charcoal.

Galvanic susceptibility is extinct in the muscles of animals of warm blood, in proportion as vital heat is dissipated; sometimes even when life is terminated in convulsions, contractility cannot be put into action, although warmth be not completely gone, as though the vital property were consumed by the convulsion, amidst which the animals had expired. In those of cold blood, on the contrary, it is more durable. The thighs of frogs, long after being separated from every thing, and even to the instant of incipient purrefaction, are influenced by Galvanic stimuli, doubtless, because irritability, in these animals, is less intimately connected with respiration, and life more divided among the different organs, which have less occasion to act on each other for the execution of its phenomena. The Galvanic chain does not produce sensible actions (that is contractions) until the moment it is completed, by esta-blishing a communication with the parts constituting it. During the time it is com-plete, that is, through the whole space of time that the communication remains established, every thing remains tranquil; nevertheless, Galvanic influence is not suspended: in fact excitability is evidently increased, or diminished, in muscles that have been long continued in the Galvanic chain, according to the difference of the reciprocal situation of the connecting metals.

If silver has been applied to nerves, and zinc to muscles, the irritability of the latter increases in proportion to the time they have remained in the chain. By this method, the thighs of frogs have been revivified in some degree, and alterwards be-

came sensible to stimuli, that before had ceased to act on them. By distributing the metals in an inverse manner, applying zinc to nerves and silver to muscles, an effect absolutely contrary is observed; and the muscles that possessed the most lively irritability when placed in the chain, seem to be rendered entirely paralytic if they remain long in this situation.

This difference evidently depends on the direction of the Galvanic fluid, determined towards the muscles or nerves, according to the manner in which these metals are disposed, and this is of some importance to be known for the application of Galvanic

means to the cure of diseases.

Galvanic Pile.

M. Volta's apparatus is as follows :---

Raise a p.le, by placing a plate of zine, a flat piece of wet card, and a plate of silver, successively; then a second piece of zine, &c. until the elevation is several feet high; for the effects are greater in proportion to its height; then touch both extremities of the pile, at the same instant, with one piece of iron wire; at the moment of contact, a spark is excited from the extremities of the pile, and luminous points are often perceived at different heights, where the zine and silver come into mutual contact. The zine end of this pile appears to be negatively electrified; that formed by the silver, on the contrary, indicates marks of positive electricity.

If we touch both extremities of the

If we touch both extremities of the pile, after having dipped our hands into water, or, what is better, a saline solution, a commodon, followed by a disagreeable pricking in the fingers and clow, is felt.

If we place in a tube filled with water, and hermetically closed by two corks, the extremities of two wires of the same metal which are in contact at the other extremity, one with the summit, the other with the base of the pile; these end-, even when separated only by the space of a few lines, experience evident changes at the instant the extremities of the pile are touched; the wire in contact with that part of the pile composed of zinc becomes covered with bullæ of hydrogen gas; that which touches the extremity formed by silver, becomes oxydated. Fourcroy attributes this phenomenon to the decomposition of water, by the Galvanic fluid, which abandons the oxygen to the iron that touches the positive extremity of the pile; then conducts the other gas invisibly to the end of the other wire, there to be disengaged.

From the numerous experiments of Mr. Davy, many new and important facts have been established, and Galvanism has been found one of the most powerful agents in chymistry; by its influence, platina wire has been melted; gold, silver, copper, and most of the nietals, have easily been burnt; the fixed alkalis, and many of the earths.

have been made to appear as consisting of a metallic base, and oxygen compound substances, which were before extremely difficult to decompose, are now, by the aid of Galvanism, easily resolved into their

GAMANDRA. See Gambogia. GAMBIENSE GUMMI. See Kino. Gamboge. Sce Gambogia.

GAMBOGIA. (From the province of Cambaya, in the East Indies; called also Cambodja and Cambogia; hence it has obtained its name of Cambadium. Cambagium. Gambogia. Gambogium.) Gamboge. its supposed virtues, it is called gummi ad podagram; gammi gutta; and, by corruption, gotta, gutta gamba, gamon, germandra catagemu, gamboidea, &c.; and, from its gold colour, chrysopus; and from its purgative quality, succus laxativus, succus Indicus purgans; and scammonium orientale.

A concrete vegetable juice, the produce of two trees, both called, by the Indians, Caracapulli, and by Linnæus, Gambogra gutta. It is partly of a gummy and partly of a resinous nature. It is brought to us chiefly from Gambaja, in the East Indies, either in form of orbicular masses, or of cylindrical rolls of various sizes; and is of a dense, compact, and firm texture, and of

a' beautiful yellow colour.

In medicine, it is chiefly used as a drastic purge; it operates powerfully both upwards and downwards. Some condemn it as acting with too great violence, while others are of a contrary opinion. The dose is from two to four grains, as a cathartic; from four to eight grains it proves emetic and purgative. The roughness of its operation is said to be diminished, by giving it in a liquid form, sufficiently diluted. Rubbed with almonds, from its want of taste, it is a convenient laxative for children.

It has been given in dropsy, with cream of tartar, to correct its operation. It has also been recommended by some, to the extent of fifteen grains, joined with an equal quantity of vegetable askali, to destroy the tape-worm. This dose is ordered in the morning, and if the worm is not expelied in two or three hours, it is repeated even to the third time, with safety and efficacy. It is asserted that it has been given to this extent even in delicate habits. This is said to be the remedy alluded to by Van Swieten, which was employed by Dr. Herenchwand, and with him proved so successful in the removal of the tæma lata. It is an ingredient, and probably the active one, in most of the nostrums for expelling teniæ.

Dr. Cullen says, that, on account of the quick passage of gamboge through the intestines, he was induced to give it in small and frequently repeated doses, as three or four grains, rubbed with a little sugar, every three hours; and thus found it ope-

rate without griping, or sickness, and, in three or four exhibitions, evacuate a great quantity of water, both by stool and urine.

GAMBOGIUM. See Gambogia. GAMBOIDEA. See Gambogia.

GAMMA. (Fron the letter I, gamma, which it resembles.) A surgical instrument for cauterising a hernia.

GAMPHELE. (From zajitos, crooked.)

The cheek. The jaw.

GANGAMON. (From yaylaun, a fishingnet, which it was said to resemble.) name of the omentum. Some call the contexture of nerves about the navel by this

GANGLION. (γαγγλιον, a knot.) knot.

1. In anatomy it is applied to a natural knot-like enlargement, in the course of a nerve.

2. In surgery it is an encysted tumour, formed in the sheath of a tendon, and containing a fluid like the white of an egg. It most frequently occurs on the back of the

hand or foot.

Gangrena. An incinio GANGRENE. fication, so named from its eating away the flesh. Authors have generally distinguished mortification into two stages; the first, or incipient one, they name gangrene, which is attended with a sudden diminution of pain in the place affected; a livid discoloration of the part, which, from being yellowish, becomes of a greenish liue; a detachment of the cuticle, under which a turbid fluid is effused; lastly, the swelling, tension, and hardness, of the previous inflammation subside, and, on touching the part, a crepitus is perceptible, owing to the generation of air in the gangrenous parts.

Such is the state to which the term gangrene is applied. When the part has become quite cold, black, fibrous, incapable of moving, and destitute of all feeling. circulation, and life; this is the second stage of mortification, termed, sphacelus. Gangrene, however, is frequently used syneny nonsly with the word mortification.

See Mortification.

GARABA. An Arabic name for the dis-

order called Ægilops.

GARCINIA MANGOSTANA. (Named honour of Dr. Garcin, who accurately described it.) The systematic name of the mangosteen tree. See Mangosteen.

GARGALE. (yagyann.) Gargalus. galismos. Irritation, or stimulation.

GARGAREON. (Hebrew.) The uvula, or glandulous body, which hangs down into the throat.

GARGARISM. Gargarismus. A wash for the mouth and throat. GARGARISMA.

(From zaelaeila, to

gargle.) A gargle. GARGARISMUM. A gargle or wash

for the throat.

CARGATHOM. A bed on which lunatics, Sc. were formerly confined.

Garale See Gargarisma.

Garlie. See Allium. Garon bark. See Thymalea.

Genov (γαζον.) A kind of pickle prepared of fish; at first it was made from a fish which the Greeks call *Garos*; but the best was made from mackarels. Among the moderns, garon signifies the liquor in which fish is pickled.

GARROTILLO. (From garottar, to bind closely. Span.) A name of the cynanche maligna, from its sense of strangulation, as if the throat were bound with a cord.

GAROPHYLLUS. See Caryophyllus.

GAS. (From gascht, a German word which means an eruption of wind.) See Gax.

GASTRIC ARTERY. Arteria gastrica. The right, or greater gastric artery, is a branch of the hepatic; the left or lesser, a

branch of the splenic.

GASTRIC JUICE. Succus gastricus. A fluid separated by the capillary exhaling arteries of the stomach, which open upon its internal surface. The œsophagus also affords a small quantity, especially in the inferior part. Modern philosophers have paid great attention to this fluid, and from their several experiments it is known to possess the following properties. It is the principal agent of digestion, and changes the aliments into a kind of uniform soft paste: it acts on the stomach after the death of the animal. Its effects shew that it is a solvent, but of that peculiar nature that it dissolves animal and vegetable substances, uniformly, and without exhibiting a stronger affinity for the one than for the other. Although it is the most powerful agent of digestion in the stomach, its dissolvent power has need of assistance from the action of several secondary causes, as liest, which seems to augment and concentrate itself in the epigastric region. long as the exertion of the stomach contimes, there is a sort of intestme fermentation, which should not, in its full's use, be compared to the motion by which fermentative and putrescent substances are decomposed; there is also a moderate and peristaltic motion of the muscular fibres of the stomach, which press the aliment on all sides, and perform a slight trituration, while the gastric moisture softens and macerates the food before it is dissolved. many it has been considered merely as a ferment, but this cannot be the case.

It is one of the most powerful antiseptics with which we are acquainted; and, from the experiments of Spallanzani, Scopoli, Carminati, and others, its nature appears to be essentially different in the several classes of animals, as they have proved by analysis. The gastric juice of the human subject,

when healthy, is inodorous, of a saltish taste, and limpid, like water, unless it be a little tinged with the yellow colour of some bile, that has regurgitated into the stemach. In quantity it is very considerable, as must be evident from the extent of the surface of the stomach, and its continual secretion; but it is most copious when solicited by the stimulus of food. Besides the properties of this fluid before mentioned, it has others, which have induced physicians and surgeons to exhibit it medicinally. It cures dyspepsia and intermittent lever. Applied externally, in farm of fomentation or poultice, it cures putrid and scrofulous ulcere in a wonderful manner; and it is to be regretted that its utility is not more generally known.

GASTRITIS. (From passes, the stomach.) Inflammation of the stomach. A genus of disease in the class pyrexia, and order phlegmasia, of Culien. It is known by pyrexia, anxiety, heat, and pain in the epigastrium, increased when any thing is taken in 5 the stomach, vomiting, heccup, pulse small and hard, and prostration of strength. There are two species: I. Gastritis phlegmonoidea, with an inflammatory tumour. Gastritis erysipelatosa, when the inflammation is of a creeping or erysipelatous nature.

Gastris is produced by aerid substances of various kinds, such as arsenic, corrosive sublimate, &c. taken into the stomach, as likewise by food of an improper nature; by taking large draughts of any cold liquor when the body is much heated by exercise, or dancing; and repelled exanthemata and gout. Besides these, it may arise from an inflammation of some of the neighbouring parts being communicated to the stomach.

The erysipelatous gastritis arises chiefly towards the close of other diseases, marking the certain approach to dissolution, and being unaccompanied with any marks of general inflammation, or by any burning pain in the stomach.

The symptoms of phlegmonous gastritis, as observed above, are, a violent burning pain in the stomach, with great soreness, distention, and flatulency; a severe vomiting, especially after any thing is swallowed, whether it be liquid or solid; most distressing thirst; restlessness, anxiety, and a continual tossing of the body, with great debility, constant watching, and a frequent, hard and contracted pulse. In some cases, a severe purging attends,

If the disease increases in violence, symptoms of irritation then ensue; there is a great loss of strength, with faintings; a short and interrupted respiration; cold, clammy sweats, hiccups, coldness of the extremities, an intermittent pulse, and the patient is soon cut off.

The event of gastritis is seldom favour-

able as the person is usually either suddenly destroyed by the violence of the inflammation, or else it terminates in suppuration,

ulceration or gangrene.

If the symptoms are very mild, and proper remedies have been employed at an early period of the disease, it may, however, terminate in resolution, and that in the course of the first, or, at farthest, the second week.

Its termination in suppuration may be known by the symptoms, although moderate, exceeding the continuance of this period, and a remission of pain occurring, whilst a sense of weight and anxiety still remain; and, on the formation of an abscess, cold shiverings ensue, with marked exacerbations in the evening, which are iollowed by night sweats, and other symptoms of hectic fever; and these at length prove fatal, unless the pus is thrown up by vomiting, and the ulcer heals.

its tendency to gangrene may be dreaded, from the violence of its symptoms not yielding to proper remedies early in the disease; and when begun, it may be known by the sudden cessation of the pain; by the pulse continuing its frequency, but becoming weaker, and by delirium, with other marks of increasing debility ensuing.

Fatal cases of this disease shew, on dissection, a considerable redness of the inner coat of the stomach, having a layer of coagulable lymph lining its surface. They likewise shew a partial thickening of the substance of the organ, at the inflamed part, the inflammation seldom extending over the whole of it. Where ulceration has taken place, the ulcers sometimes are found to penetrate through all its coats, and sometimes only through one or two of

GASTROCELE. ) From yasne, the stomach, and RHAH, a tumour.) A hernia of the stomach, occasioned by a protusion of that viscus through the abdominal parietes.

GASTROCNEMIUS. (From 2250g, the stomach, and empin, the leg.) The muscles of the foot, which form the calf or belly of

the eg.

GASTROCNEMIUS EXTERNUS. Gemelius. This muscle, which is situated immediately under the integuments at the back part of the leg, is sometimes called gemellus; this latter name is adopted by Atbinus. Winslow describes it as two muscles, which he calls gentrocnemii; and Dourles considers this and the following as a quadriceps, or muscle with four heads, to which he gives the name of extensor tarsi suralis. It is called bi femoro calcanien by Dumas. The gastrocnemus externus arises by two distinct heads. The first, which is the thickest and longest of the two, springs by a strong thick tendon from the upper and back part of the inner condyle of the os femoris, adhering strongly to the capsular ligament of the joint, between which and the tendon is a considerable bursa mucosu. The second head arises by a thinner and shorter tendon from the back part of the onter conclyle of the os femoris. A little below the joint, their fleshy bellies unite in a middle tendon, and below the middle of the tibia they cease to be fleshy, and terminate in a broad tendon, which, a little above the lower extremity of the tibia, unites with that of the gastrocnemius internus, to form one great round tendon, sometimes called chorda magna, but more commonly, tendo Achillis.

GASTROCNEMIUS INTERNUS Tibio peronei calcanien of Dumas. This, which is situated immediately under the last described muscle, is sometimes named soleus, on account of its shape, which resembles that of the sole-fish. It arises by two heads. The first springs by tendinous and fleshy fibres from the posterior part of the head of the fibula, and for some way below it. The second arises from an oblique ridge at the upper and posterior part of the tibia, which affords origin to the inferior edge of the popliceus, continuing to receive fleshy fibres from the inner edge of the tibia for some way down. This muscle, which is narrow at its origin, spreads wider as it descends, as far as its muldle; after which it becomes narrower again, and begins to grow tendinous, but its fleshy fibres do not entirely disappear till it has almost reached the extremity of the tibia, a little above which it unites with the last described muscle, to form the tendo . Ichillis. This thick round chord is inserted into the lower and posterior part of the os calcis, after sliding over a cartilaginous surface on that bone, to which it is connected by a tendinous sheath that is furnished with a large bursa mucosa.

Both the gastrocnemii have the same use, viz. that of extending the foot, by drawing it backwards and downwards.

GASTROCOLICUS. (From yasne, the stomach, and xoxov, the colon.) A term applien to a vem which preceds from the sto-mach to the co-GASTROLAMA. (From 225mg, the stomach, and odom, pain.) Pain in the

stomach

GASTRO-EPIPLOIC ARTERY. ria gastrico epiploica. The branch of the greater gastric artery that runs to the epi-

GASTRORAPHY. (Gastroraphe; from pasng, the stomach, and gapn, a suture.) The sewing of wounds of the abdomen.

GASTROTOMIA. (From yasve, the belly, and τεμνω, to cut.) The operation of cutting open the belly and uterus, as in the Casarian operation.

GAULE. See Myrtus Brabantica.

GAZ (From Gascht, German, an eruption of wind.) Gas. Elastic fluid.

GAZ. 341

Acriform fluid. Elastic vapour. By the word gaz, we distinguish a permanently elastic air form fluid, or sub-tance which has the appearance of air; that is to say, it is transparent, elastic, ponderable, invisible, (oxygenated muriano acid gas, and natrons acid gas, are the only exceptions to this rule,) and not condensible into a liquid or solid state by any degree of cold hitherto known.

Some of the gases exist in nature, without the aid of art, and may therefore be collected; others, on the contrary, are only pro-

ducible by artificial me ins.

All gases are combinations of certain substances, reduced to the gazeous form by the addition of caloric and light. It is, therefore, necessary to distinguish, in every gas, the matter of heat which acted the part of a solvent, and the substance which forms the busis of the gas.

Gases are not contained in those substances from which we obtain them in the state of gas, but owe their formation to the

expansive property of caloric.

The bases of some gases are known to us, and may be exhibited in an uncombined state; others again are not producible by art.

Formation of Gases.

The different forms under which bodies appear depend upon a certain quantity of calone, chymically combined with them. The very formation of gases corroborates this truth. Their production totally depends upon-the combination of the particular substances with calorie; and those we call permanently elastic are only so, because we cannot so far reduce their temperature, as to dispose them to part with it; otherwise they would undoubtedly become fluid or solid.

Water, for instance, is a solid substance in all degrees below 32° of Ethrenheit's scale; above this temperature it combines with caloric, and becomes a fluid. It retains its fluidity under the ordinary pressure of the atmosphere, till its temperature is augmented to 212°. It then combines with a larger portion of caloric, and is converted, apparently, into gas, or at least into elastic vapour; in which state it would continue, it the temperature of our atmosphere was above 212°. Gases are therefore solid substances, between the particles of which a repulsion is established by the quantity of caloric.

But as in the gazeous water, or steam, the caloric is retained with but little force, on account of its quitting the water when the vapour is merely exposed to a lower temperature, we do not admit steam amongst the class of gases, or permanent acriform clastic fluids—In gases, caloric is united by a very forcible affinity, and no diminution of temperature, or pressure.

that has ever yet been effected, can separace it from them. Thus the air of our atmosphere, in the most intense cold, still remains in the aëriform state, and hence is derived the essential characters of gases, namely; that they shall remain aëriform, under all variations of pressure and temperatures.

In the modern nomenclature, the name of every substance existing in the acriform state is derived from its solid base; and the term gas is used to denote its existence in this state.

In order to illustrate the formation of gases, or to shew in what manner caloric is combined with them, the following experiment may serve. Put into a retort, capable of holding half a pint of water, two ounces of muriate of soda, (common salt;) pour on it half its weight of sulphuric acid, and apply the heat of a lamp; a great quantity of gas is produced, which might be collected and retained over mercury. to serve the purpose of this experiment, let it pass through a glass receiver, having two openings, into one of which the neck of the retort passes, whilst, from the other, a bent tube proceeds, which ends in a vessel of water. Before closing the apparatus, let a thermometer be included in the receiver, to shew the temperature of the gas. It will be found that the mercury in the thermometer will rise only a few degrees; whereas the water in the vessel which receives the bent tube will soon become boiling hot.

Explanation.—Common salt consists of muriatic acid, united to soda; on presenting sulphuric acid to this union, a decomposition takes place. The sulphuric acid unites by virtue of its greater affinity to the soda, and forms sulphate of soda, or Glauber's salt; the muriatic acid becomes therefore disengaged, and takes the gazeous form, in which it is capable of existing in our temperature. To trace the caloric during this experiment, as was our object, we must remark that it first flows from the lamp to the disengaged muriatic acid, and converts it into gas, but the heat thus expended is chymically united, and therefore not appreciable by the thermometer. The caloric, however, is again evolved, when the muratic acid gas is condensed by the water, with which it forms liquid muriatic acid.

In this experiment we therefore trace caloric in a chymical combination producing gas; and from this union we again trace it in fire, or sensible heat.

Such, in general, is the cause of the formation and fixation of gases. It may be further observed, that each of these fluids loses or suffers the disengagement of different quantities of heat, as it becomes more or less solid in its new combination,

GAZ.

or as that combination is capable of retain-

ing more or less specific heat.

342

The discovery of derivorm gazeous fluids has occasioned the necessity of some peculiar instruments, by m and of which those substances may be conveniently collected, and submitted to examination. The principal ones for that purpose are styled the pneumatic apparatus.

The Pneumatic Reservoir, or Cistern,

Is made either of wood or strong sheetiron, tinned, japanned, or painted. A trough of about two feet long, sixteen inches wide, and fifteen high, has been found to be sufficient for most experiments. Two or three inches below its brim, a horizontal shelf is fastened, in dimension about half, or one-third part, of the width of the trough. In this shelf are several holes: these holes must be made in the centre of a small excavation, shaped like a finnel, which is formed in the lower part of the shelf.

This trough is filled with water sufficient to cover the shelf to the height of an meh.

The use of this shelf is to support reeeivers, jars, or bell-glasses, which, being previously filled with water, are placed invertedly, their open end turned down upon the above-mentioned holes, through which the gases conveyed there, and directed by means of the funnel-shaped excavations, rise in the form of air-bubles into the receiver.

When the gazeous fluids are capable of being absorbed by water, as is the case with some of them, the trough must be filled with mercury. The price and gravity of this fluid make it an object of convenience and economy, that the trough should be smaller than when water is used.

A mercurial trough is best cut in marble, free-stone, or a solid block of wood. A trough about twelve inches long, three inches wide, and four deep, is sufficient for all private experiments.

Method of collecting Gases, and transferring

them from one vessel to another.

If we are desirous of transmitting air from one vessel to another, it is necessary that the vessel destined to receive it be full of water, or some fluid heavier than air. For that purpose take a wide mouthed bell-glass, or receiver; plunge it under the water in the trough, in order to fill it; then raise it, with the mouth downwards, and place it on the shelf of the trough, so as to cover one or more of the holes in it.

It will now be full of water, and continue so as long as the mouth remains below the surface of the fluid in the cistern, for in this case, the water is sustained in the vessel by the pressure of the atmosphere, in the same manner as the mercury is sustained in the barometer. It may without difficulty be imagined, that if common air (or any

other fluid resembling common air in light. ness and elasticity) be suffered to enter the inverted vessel filled with water, it will rise to the upper part, on account of its levity, and the surface of the water will sub ide To exemplify this, take a glass, or any other vessel, in that state which is usually called empty, and plunge it into the water with its mouth downwards; scarce any of it will enter the glass, because its entrance is opposed by the elasticity of the included air; but if the vessel be turned with its mouth upwards, it immediately fills, and the air rises in bubbles to the surface. Suppose this operation be performed under one of the jars, or receivers, which are filled with water, and placed upon the perforated shelf, the air will ascend in bubbles as before, but, instead of escaping, it will be caught in the upper part of the jar, and expel part of the water it contains.

In this manner we see that air may be emptied out of one vessel into another by a kind of inverted pouring, by which means it is made to ascend from the lower to the upper vessel. When the receiving vessel has a narrow neck, the air may be poured in a similar manner through an inverted

funnel, inserted in its mouth.

If the air is to be transferred from a vessel that is stopped like a bottle, the bottle must be unstopped, with its orifice downwards in the water: and then inclined in such a manner that its neck may come under the perforated excavation of the shelf. The gas will escape from the bottle, and, passing into the vessel adapted to receive it, will ascend in it in the form of bubbles.

In whatever manner this operation is performed, the necessity of the excavation in the lower part of the shelf may be readily conceived. It is, as mentioned before, destined to collect the gas which escapes from the vessel, and direct it in its passage towards the vessel adapted to receive it. Without this excavation, the gas, instead of proceeding to the place of its destination, would be dispersed and lost.

The vessels, or receivers, for collecting the disengaged gases, should be glass cylinders, jars, or bell-glasses, of various sizes; some of them should be open at both ends, others should be fitted with necks at the top, ground perfectly level, in order that they may be stopped by ground flat pieces of metal, glass, slate, &c. ofhers should be furrished with ground stoppers. Some should be graduated into cubic inches, and sub-divided into decimal or other equi-distant parts. Besides these, common glass bottles, tumblers, &c. may be used.

Classification of Gases.

All the clastic aëriform fluids with which we are hitherto acquainted are generally divided, by systematic writers, into two

classes; namely, those that are respirable, and capable of maintaining combustion, and those that are not respirable, and incapable of maintaining combustion. This division, indeed, has its advantage; but the term respirable, in its physico-logical application, has been very differently employed by different writers. Sometimes by the respirability of a gas has been meant its power of supporting life, when repeatedly applied to the blood in the lungs. At other times all gases have been considered respirable, which were capable of intro-duction into the lungs by voluntary efforts, without any relation to their vitality. In the last case, the word respirable seems to us most properly employed, and in this sense it is here used.

Non-re-pirable gases are those which, when applied to the external organs of respiration, stimulate the muscles of the epiglottis in such a manner as to keep it perfectly close on the glottis; thus preventing the smallest particle of gas from entering into the bronchia, in spite of voluntary

exertions.

Of respirable gases, or those which are capable of being taken into the lungs by voluntary efforts, according to their conditions, only one has the power of uniformly supporting life, namely, atmospheric air; other gases, when respired, sooner or later impair the health of the human constitution, or perhaps occasion death; but in different modes.

Some gases effect no positive change in the blood; animals immersed in it die of a disease produced by the privation of atmospheric air, analogous to that occasioned

by their submersion in water.

Others again produce some positive change in the blood, as appears from the experiments of Dr. Beddoes and Professor Davy. They seem to render it incapable of supplying the nervous and muscular fibres with principles essential to sensibility and irritability. These gases, therefore, destroy animal life on a different principlc.

It is obvious, therefore, that the above classification does not hold good in all respects, but is capable of misleading the

student.

Gaz, azotic. See Nitrogen.

Gaz, carbonic acid. This may be obtained by pouring any acid upon calcareous earth, which thereby becomes decomposed; the effused acid combines with the lime, and forms a new neutral salt, and the carbonic acid is disengaged and escapes in the form of a colourless gaz, viz. carbonic acid gas. See Carbonic acid.

Gaz-hepatic. Sec Sulphurated hydrogen

Gaz hydrogen. Inflammable air. See Hydrogen.

Gaz, light carbonated hydrogen. Sec Carbonated hydrogen gas, light.

Gaz, heavy carbonated hydrogen.

Carbonated hydrogen gaz heavy.
Gazeous exyd of carbon. See Carbon,

gazeous oxyd of.
GEISOMA. (From yarrow, the eaves of the house.) Geison. The prominent parts of the eye-brows, which hang over the eyes like the eaves of a house.

GEISON. See Geisoma.

Gelasinos. (From γελαω, to laugh.) An epithet for the four inciddle fore-teeth, because they are shewn in laughter.

GELASMUS. (From yeare, to laugh.)

The Sardonic laugh.

GELATINE. Gelly, or jelly. An animal substance soluble in water, but not in alcohol; capable of assuming a well-known elastic or tremulous consistence, by cooling, when the water is not too abundant, and liquifiable again, by increasing its temperature. This last property remarkably distinguishes it from albumen, which becomes consistent by heat. It is precipitated in an insoluble form by tannin, and it is this action of tannin on gelatine that is the foundation of the art of tanning lca-

Jellies are very common in our kitchens; they may be extracted from all the parts of animals, by boiling them in water. Hot water dissolves a large quantity of this substance. Acids likewise dissolve them, as do likewise more particularly the alkalis. Jelly, which has been extracted without long decoction, possesses most of the characters of vegetable mucilage; but it is seldom obtained without a mixture of albu-

Jellies, in a pure state, have scarcely any smell or remarkable taste. By distillation, they afford an insipid and inodorous phlegm, which easily putrefies. A stronger heat causes them to swell up, become black, and emit a fætid odour, accompanied with white acrid fumes. An impure volatile alkali, together with empyreumatic oil, then passes over, leaving a spongy coal, not easily burned, and containing common salt and phosphat of lime.

The jelly of various animal substances is prepared for the use of sea-faring persons under the name of portable soup. The whole art of performing this operation consists in boiling the meat, and taking the scum off, as usual, until the soup possesses the requisite flavour. It is then suffered to cool, in order that the fat may be separated. In the next place, it is mixed with five or six whites of eggs, and slightly boiled. This operation serves to clarify the liquid, by the removal of opake par-ticles, which unite with the white of egg at the time it becomes solid by the heat,

and are consequently removed along with it. The liquor is then to be strained through flannel, and evaporated, on the water-bath, to the consistence of a very thick paste; after which it is spread, rather thin, upon a smooth stone, then cut into cakes, and, lastly, dried in a stove, until it These cakes may be becomes brittle. kept four or five years, if defended from moisture. When intended to be used, nothing more is required to be done, than to dissolve a sufficient quantity in boiling water, which by that means becomes converted into soup.

(From gelo, to freeze.) GELATIO. Freezing; or that rigidity of the body which happens in a catalepsy, as if the

person were frozen.

GEMELLUS. (From geminus double. having a fellow.) See Gastrocuemius and

GEMINI. Gemelli of Winslow. Part of the marsupialis of Cowper. Ischio spini trochanterien of Dumas. This muscle has been a subject of dispute among anatomists since the days of Vesalius. Some describe it as two distinct muscles, and hence the name it has gotten of gemini. Others contend that it ought to be considered as a single muscle. The truth is, that it consists of two portions, which are united together by a tendinous and fleshy membrane, and afford a passage between them to the tendon of the obturator internus, which they inclose as it were in a purse. These two portions are placed under the glutzus maximus, between the ischium and the great trochanter.

The superior portion, which is the shortest and thickest of the two, arises fleshy from the external surface of the spine of the ischium; and the inferior, from the tuberosity of that bone, and likewise from the posterior sacro-iscliatic ligament They are inserted, tendinous and fleshy, into the cavity at the root of the great trochanter. Between the two portions of this muscle, and the termination of the obturator internus, there is a small bursa mucosa, con-nected to both, and to that part of the capsular of the joint which lies under the

This muscle assists in rolling the os femoris outwards, and prevents the tendon of the obturator internus from slipping out of its place while that muscle is in action.

GEMURSA. (From gemo, to groan; so called from the pain it was said to occasion in walking.) The name of an excrescence between the toes.

GENEIAS. (From yevus, the cheek.) The downy hairs which first cover the cheek; also the name of a bandage mentioned by Galen, which covers the cheek, and comes under the chin.

GENERATION. Many ingenious hy-

potheses have been instituted by physiologysts to explain the mystery of generation. but the whole of our knowledge concerning it appears to be built upon the phenomena it affords; and may be seen in the works of Haller, Buffon, Cruickshanks, and Haighton. It is a sexual action, performed in different ways in most animals; many of them have different sexes, and require conjunction: such are the human species, quadrupeds, and others. The females of quadrupeds have a matrix, separated into two cavities, uterus bicornis, and a considerable number of teats; they have no menstrual flux; most of them bear several young at a time, and the period of their gestation is generally short. The genera-tion of birds is very different. The males have a strong genital organ, which is often double. The vulva in females is placed behind the anus; the overies have no matrices, and there is a duct for the purpose of conveying the egg from the ovarium into the intestines; this passage is called the oviduct. The eggs of pullets have exhibited unexpected facts to physiologists, who examined the phenomena of incubation, The most important discoveries are those of the immortal Haller, who found the chicken perfectly formed in eggs which were not fecundated. There is no determinate conjunction between fishes; the female deposits her eggs on the sands, over which the male passes, and emits its seminal fluid, doubtiess for the purpose of fecundating them; these eggs are hatched after a certain time. The males of several oviparous quadrupeds have a double forked organ. Insects exhibit all the varieties which are observed in other animals: there are some, indeed the greater number, which have the sexes in two separate individuals; among others, the reproduction is made either with or without conjunction, as in the vine fretter; one of these in-ects, confined alone beneath a glass, produces a great number of others. The organ of the male, in insects, is usually armed with two hooks, to seize the female: the place of these organs is greatly varied; with some it is at the upper part of the belly, near the chest, as in the female dragonfly; in others it is at the extremity of the antenna, as in the male spider. Most worms are hermaphrodite; each individual has both sexes. Polypi, with respect to generation, are singular animals: they are reproduced by buds, or offsets: a bud is separated from each vigorous polypus, which is fixed to some neighbouring body, and grows: polypi are likewise found on their surface, in the same manner as branches issue from plants. These are the principal modes of generation in animals. In the human species, which engages our attention more particularly, the phenomena

are as follow: the mode of congress of the man with the woman requires no description; but generation does not consist in that alone; there are certain states or conditions requisite for conception to take The ovum must have arrived at a state of maturity. There must be such a determination of blood to the uterus, that, together with the venereal stimulus, shall induce an action in the Fallopian tubes, by which the fimbria grasp the ovum that is to be impregnated. During this state of the parts, the semen virile must be propelled into the uterus, in order that its subtle and vivifying portion shall pass along the tube to the ovum. Fecundation having thus taken place, a motion is induced in the vivified ovum, which ruptures the tender vesicle that contains it; the fimbrize of the Fallopian tube then grasp and convey it into the tube, which, by its peristalic motion, conducts it into the cavity of the uterus, there to be evolved and brought to maturity, and, at the expiration of nine months, to be sent into the world.

GENERATION, FEMALE ORGANS OF. The parts subservient to generation, in a woman, are divided into external and

internal.

The external parts are, the mons veneris, the labia, the perineum, the clitoris, and the nymphæ. To these may be added the meatus urinarius, or orifice of the urethra. The hymen may be esteemed the barrier between the external and internal parts. The internal parts of generation are, the vagina and uterus, and its appendages.

GENERATION, MALE ORGANS OF. The parts which constitute the organs of generation in men are the penis, testicles,

and vesiculæ seminales.

GENIO. (From yeverov, the chin.) Names compounded of this word belong to muscles which are attached to the chin.

GENIO-HYO-GLOSSUS. (Musculus genio hyo-glossus; from yerwor, the chin, and γλοσσα, the tongue, so called from its origin in the chin, and insertion in the tongue.) Genio glossus of some authors. This muscle forms the fourth layer between the lower jaw and os hyoides. It arises from a rough protuberance in the inside of the middle of the lower jaw; its fibres run like a fan, forwards, upwards, and backwards, and are inserted into the top, middle, and root of the tongue, and base of the os hyoides, near its corner. Its use is to draw the tip of the tongue backwards into the mouth, the middle downwards, and to render its back concave. It also draws its root and the os hyoides forwards, and thrusts the tongue out of the mouth.

GENIO HYOIDEUS. (Musculus gemio-hyoideus; from ; evetor, the chin, and origin in the chin, and its insertion in the

os hyoides.) This muscle constitutes the third layer between the lower jaw and os hyoides. It is a long, tlfin, and fleshy muscle, arising tendinous from a rough protuberance at the inside of the chin, and growing somewhat broader and thicker as it descends backward, to be inserted by very short tendinous fibres into both the edges of the base of the os hyoides. It draws the os hyoides forwards to the

GENIOPHARYNGEUS. The constrictor

pliaryngis superior.

GENIEL ALBUM. The plant which bears this name, in the pharmacopoias, is the Artemisia rupestris of Linnæus:-foliis pinnatis, caulibus adscendentibus; floribus globosis, cermuis; receptaculo papposo. It has a grateful smell, and is used in some countries in the cure of intermittents and obstructed catamenia.

GENIPI VERUM. The plant directed for medicinal purposes, under this title, is the Achillea ; foliis pinnatis, pinnis simplicibus, glabris, punctatis, of Haller. It has a very grateful smell, and a very bitter taste, and is exhibited in Switzerland in epilepsy, diarrhœa, and debility of the

stomach.

GENISTA. (From genu, a knee; so called from the inflection and angularity of its twigs.) 1. The name of a genus of plants in the Linnæan system. Class, Dia-

delphia. Order, Decandria.

2. The pharmacopocial name of the common broom. The tops and leaves of this indigenous plant, Spartium scoparium of Linnæus :- joliis ternatis solitariisque, ramis inermibus angulatis, are the parts that are employed medicinally; they have a bitter taste, and are recommended for their purgative and diuretic qualities, in hydropic cases.

GENISTA CANARIENSIS. The systematic name of the tree the wood of which is called rhodium. See Rhodium lignum.

GENITALE. (From gigno, to beget.)

The privy member.

GENITALIUM. (From genitale, the membrum virile.) A disease of the genital parts. GENITURA. (From gigno.) The male

seed. Also the membrum virile.

GENON. (From your, the knee.) A moveable articulation like that of the knee.

Gensing. See Ginseng. GENTIANA. (From Gentius, king of Illyria, who first used it.)

1. The name of a genus of plants in the Linaman system Class, Pentandria. Or-

der, Digynia. Gentian.

2. The pharmacopæial name of what is also called Gentiana rubra. Gentian. Felwort. The gentien that is met with in the shops is the root of the Gentiana lutea of Linnaus : - corollis subquinquefichs rotatis verticillatis, calycibus spathaceis; and is

imported from Switzerland and Germany. plant possesses slightly adstringent vir-It is the only medicinal part of the plant, has little or no smell, but to the taste manifests great bitterness, on which account it is in general use as a tonic, stomachic, anthelmintic, antiseptic, emmenagogue, and febrifuge. The officinal preparations of this root are, the infusum gentiana compositum, and tinctura gentiana composita, of the London Pharmacopæia, and the infusum amarum, vinum amarum, tinctura amara, of the Edinburgh Pharmacopæia; and the extractum gentiana is ordered by

The root of this GENTIANA ALBA. plant, Laserpitium latifolium; foliis cordatis, inciso-serratis, of Linnæus, posseses stomachic, corroborant, and deobstruent virtues. It is seldom used.

GENTIANA CENTAURIUM. Lesser centanry was lately so called in the Linnaan system, but now chironia centaurium. See

Centaurium.

GENTIANA LUTEA. systematic The name of the officinal gentian. See Gen-

GENTIANA RUBRA. See Gentiana.

GENU. The knee.

GENUGIA. (From yove, the knee, and agea, a seizure.) A name in Paracelsus for the gout in the knee.

GEOFFRÆA. (Named in honour of Dr. Geoffrey ) 1. The name of a genus of plants in the Linnaan system. Class, Dia-

delphia. Order, Decundria.

2. The pharmacopoial name of the bark of the Geoffroya inermis foliolis lanceolatis of Swatz. The plant is a native of Jamaica, where it is distinguished by the name of cabbage-bark tree, or worm bark tree. It has a mucilaginous and sweetish taste, and a disagreeable smell. According to Dr. Wright of Jamaica, it is powerfully medicinal as an anthelmintic.

GEOFFROYA JAMAICENSIS. The systematic name of the bastard cabbage-tree.

Cortex Geoffroya Jamaicensis.

GEOFFROYA SURINAMENSIS. The systematic name of the tree, the bark of which

is esteemed as an authelmintic.

GERANIS. (From pseavos, a crane; so called from its supposed resemblance to an extended crane.) A bandage for a fractured clavicle.

GERANIUM. (From preares, a crane; so called because its pistil is long, like the bill of a crane.) Class, Monadelphia. Order, Decandria. The name of a genus of plants in the Linnaan system. Geranium, or cranes-bill.

GERANIUM BATHACHIOIDES. Crowfoot dense. cranes-bill. This is the Geranium pratense Gil of Linuxus; it possesses adstringent virtues, but in a slight degree.

tues.

GEHANIUM MOSCHATUM. The adstringent property of this plant has induced practitioners to exhibit it in cases of debility and profluvias.

GERANIUM PRATENSE. The systematic name of the crowfoot cranes-bill. Geranium batrachioides.

GERANIUM ROBERTIANUM. Stinking cranes-bill. Herb robert. This common plant has been much esteemed as an external application in ervsipelatous inflammations, cancer, mastedynia, and old ulcers. but is now deservedly fallen into disuse.

GERANIUM ROTUNDIFOLIUM. The systematic name of the doves foot. See Ge-

ranium columbinum.

GERANIUM SANGUINARIUM. Bloody cranes Geranium sanguineum of Linuxus. The adstringent virtues ascribed to this plant do not appear to be considerable.

GERANIUM SANGUINEUM. The matic name of the Geranium sanguinarium.

Germander. See Chamadris.

Germander, water. See Scordium.

GEROCOMIA. (From yegav, an aged person, and nomew, to be concerned about) That part of medicine which regards the regimen and treatment of old age.

Genontopogon. (From pegav, an old man, and πωριων, a beard; so called because its downy seed, while enclosed in the calyx, resembles the beard of an aged man.) The herb old man's beard. Purple flowered tragopogon.

GENONTOXON. (From regor, an old person, and τοξον, a dart.) A small ulcer, like the head of a dart, appearing sometimes in the cornea of old persons. The socket of a tooth.

GENOPOGON. See Gerontopogon.

GERYON. Quicksilver.

1. The name of a genus of GEUM. plants in the Linnæan system. Class, Ico.

sandria. Order, Polygynia.

2. The pharmacopæial name of the Geum rivale of Linnaus, the root of which is the part directed for medicinal uses. It is inodorous, and imparts an austere taste. In America it is in high estimation in the cure of intermittents, and is said to be more efficacious than the Peruvian bark. Diarrhoas and hæmorrhages are also stopped by its exhibition.

GEUM UHBANUM. The systematic name of the herb bennet, or avens. See Caryo-

phyllata.

Giddiness. See Vertigo.

Gilead, balsam. See Balsamum Gilea-

Gill-go-by-ground. See Hederacea.

Gilliflower. See Caryophyllus ruber. GIN. Geneva. Hollands. The names GERANIUM COLUMBINUM. Doves foot. of a spirit distilled from malt or rye, which Geranium rotundifolium of Linnaus. This afterwards undergoes the same process, a second time, with juniper berries. This is the original and most wholesome state of the spirit; but it is now prepared without juniper-berries; and is distilled from turpentine, which gives it something of a similar flavour. The consumption of this article, especially in the metropolis, is immense, and the consequences are, as Dr. Willan observes, pernicious to the health of the inhabitants.

Ginger. See Zinziber. GINGIBER. See Zingiber.

GINGIBHACHIUM. (From gingiva, the gums, and brachum, the arm.) A name for the scurvy, because the gums, arms, and legs, are affected with it.

GINGIDIUM. A species of Daucus.

GINGIHIL. See Zingiber.

GINGIPEDIUM. (From gingivæ, the gums, and pes, the foot.) A name for the scurvy, because the arms and legs are af-

GINGIVÆ. (From gigno, to beget, because the teeth are, as it were, born in them.) The gums. See Gums.

GINGLYMUS. (γηγλυμο, a hinge.) The hinge-like joint. A species of diarthrosis or moveable connection of bones, which admits of flexion and extension, as the

knee-joint, &c.

GINSENG. (Ginseng, Indian.) name of the root of the Panax quinquefolium of Linnaus:-foliis ternis quinatis. It is imported into this country scarcely the thickness of the little finger, about three or four inches long, frequently forked, transversely wrinkled, of a horay texture, and both internally and externally of a yellowish white colour. To the taste it discovers a mucilaginous sweetness, approaching to that of liquorice, accompanied with some degree of bitterness, and a slight aromatic warmth. The Chinese ascribe extraordinary virtues to the root of ginseng, and have no confidence in any medicine unless in combination with it. In Europe, however, it is very seldom employed.

Ginseng root. See Ginseng.

Gin. Quick lime.

Ginnin. Tartar.

GIZZARD. The gizzards, or stomach of poultry, with white flesh, have long been considered, in France, as medi-cinal. They have been recommended in obstructions of the urinary passages, complaints of the bladder, and nephritic pains; but particularly as a febrifuge. Bouillon Lagrange considers its principal substance as oxygenated gelatine, with a small quantity of extractive matter.

GLARELLA. (From glaber, smooth; because it is without hair.) The space be-

twixt the eye-brows.

GLADIOLUS. (Dim. of gladius, a sword; so named from the sword-like

shape of its leaf.) The name of a genus of plants in the Linnaun system. Class, Triandria. Order, Monogynia.

GLADIOLUS LUTEUS. See Iris palustris.

GLAMA. ( ) Aama.) The sordes of the eye. GLAND, (Glandula; diminutive of glans, a gtand.) A gland is an organic part of the body, composed of blood-vessels, nerves, and absorbents, and destined for the secretion or alteration of some peculiar fluid. The glands of the human body are divided, by anatomists, into different classes, either according to their structure, or the fluid they contain. According to their fabric, they are distinguished into four classes.

1. Simple glands.

2. Compounds of simple glands.

3. Conglobate glands.

4. Conglomerate glands.

According to their fluid contents, they are more properly divided into, 1. Mucous glands. 2. Sebaceous glands. 5. Limphatic glands. 4. Sal.val glands 5 Lachrymal glands.

Simple glands are small hollow follicles. covered with a peculiar membrane, and having a proper excretory duct, through which they evacuate the liquor contained in their cavity. Such are the mucous glands of the nose, tongue, fauces, trachea, sto-mach, intestines, and urinary bladder, the sebaccous glands about the anus, and those of the ear. These simple glands are either dispersed here and there, or are contiguous to one another, forming a heap, in such a manner that they are not covered by a common membrane, but each hath its own excretory duct, which is never joined to the excretory duct of another gland. The former are termed solitary simple glands, the latter aggregate or congregate simple

The compound glands consist of many simple glands, the excretory ducts of which are joined in one common excretory duct; as the sebaccous glands of the face, lips, palate, and various parts of the skin,

especially about the pubes.

Conglobate, or, as they are also called. lymphatic glands, are those into which lymphatic vessels enter, and from which they go out again: as the mesenteric, lumbar, &c. They are composed of a texture of lymphatic vessels, connected together by cellular membranes-have no excretory duct-they are largest in the focus.

Congiomerate glands are composed of a congeries of many simple glands, the excretory ducts of which open into one common trunk: as the parotid gland, thyroid gland, pancreas, and all the salival glands. Conglomerate glands differ but little from the compound glands, yet they are composed of more simple glands than the compound.

The excretory duct of a gland is the

duct through which the fluid of the gland is excreted. The vessels and nerves of glands always come from the neighbouring parts, and the arteries appear to possess a higher degree of irritability. The use of the glands is to separate a peculiar liquor, or to change it. The use of the conglobate glands is unknown.

GLANDULA LACHRYMALIS. See

Lachrymal gland.

GLANDULE MYRTIFORMES. See Caruncula myrtiformes.

GLANDULÆ PACCHIONIÆ. (Pacchioni, the name of the discoverer.) A number of small, oval, fatty substances, not yet ascertained to be glandular, situated under the dura mater, about the sides of the longitudinal sinus. Their use is not known.

GLANDULOSOCARNEUS. An epithet given by Ruysch to some excrescences which he observed in the bladder.

GLANS. A gland, or nut.

GLANS PENIS. The very vascular body that forms the apex of the penis. The posterior circle is termed the corona glandis. See Corpus spongiosum urethræ.

GLASS. This substance is sometimes

employed by surgeons, when roughly powdered, to destroy opacities of the cornea. Glass of antimony. A vitreous oxyd of antimony.

Glass wort, snail-seeded. See Kali.

GLASTUM. (Quasi callastum; from Callia, who first used it.) The herb woud.
Glauber's salt. See Sulphas sodæ.

GLAUCIUM. (From phaunos, blue, or yellow; so called from its colour.) The

yellow-horned poppy.

GLAUCOMA. (From pravios, blue; because of the eye becoming of a blue or sea-green colour.) Glaucosis. An opacity of the vitreous humour. It is difficult to ascertain, and is only to be known by a very attentive examination of the eye.

GLAUCOSIS. See Glaucoma.

GLELOMA. (From γληχων, the name of a plant in Dioscorides.) Class, Didynamia. Order, Gymnospermia. The name of a genus of plants in the Linnæan system. Ground ivy.

GLECOMA HEDERACEA. The systematic name of the ground ivy. See Hedera ter-

restris.

Glechon. (From γληχαν.) Penny-royal. Glechonites. (From γληχαν, penny-royal.) Wine impregnated with penny-

royal.

GLEET. In consequence of the repeated attacks of gonorrhæa, and the debility of the part occasioned thereby, it not unfrequently happens that a gleet, or constant small discharge, takes place, or remains behind, after all danger of infection is removed. Mr. Hunter remarks, that it differs from gonorrhoa in being uninfectious, and in the discharge consisting of globular bodies, contained in a slimy mucus, instead of serum. It is unattended with pain, scalding in making of water, &c.

GLENE. (YANVI). Strictly signifies the cavity or socket of the eye; but by some anatomists is also used for that cavity of a bone which receives another within it.

GLENOID. (Glenoides; from yann, a cavity, and eidos, resemblance.) The name of some articulate cavities of bones.

GLEUCINUM. (From pheusos, must.) An ointment, in the preparation of which was must.

GLEUXIS. (From γλυκυς, sweet.) A sweet wine.

GLISCERE. To increase gradually, properly as fire does: but, by physical writers is sometimes applied to the natural heat and increase of spirits; and by others to the exacerbation of fevers which return periodically.

GLISCHRASMA. (From γλισχεαινω, to become glutinous.) Lentor. Viscidity.

GLISCHROCHOLOS. (From γλισχεος, viscid, and χολη, the bile.) An epithet for bilious viscid excrements.

GLISOMARGO. White chalk. Globate gland. See Gland.

GLOBULARIA. (From globus, a globe; so called from the shape of its flower.) The French daisy.

GLOBULARIA ALYPHUM. The leaves of this plant are used in some parts of Spain in the cure of the venereal disease. It is said to act also as a powerful but safe cathartic.

GLOBUS HYSTERICUS. The air rising in the assophagus, and prevented by spasm from reaching the mouth, is so called by authors, because it mostly attends hysteria, and gives the sensation of a ball ascending in the throat.

GLOMER. (A clue of thread.) Mostly

applied to glands.

GLOMERATE GLAND. A gland formed of a glomer of sanguineous vessels, having no cavity, but furnished with an excretory duct; as the lachrymal and mammary glands.

GLOSSAGRA. (From γλωσσα, the tongue, and αγεα, a seizure.) A rheumatic pain in

the tongue.

GLOSSO (From γλωσσα, the tongue.) Names compounded with this word belong to muscles, nerves, or vessels, from their being attached, or going to the tongue.

GLOSSO-PHARTNGEAL NERVES. The ninth pair of nerves. They arise from the processes of the cerebellum, which run to the medulla spinalis, and terminate by numerous branches in the muscles of the tongue and pharynx.

GLOSSO-PHARTNGEUS. (Musculus glossopharyngieus; γλωσσοφαρυγίανοι, foin γλωσσα, the tongue, and φαρυγέ, the pharynx:

its insertion in the pharynx.)- See Construc-

tor pharyngeus superior.

GLOSSO-STAPHILINUS. (Musculus glossostaphylinus; from yxosoa, the tengue, and saφυλινος, the staphylinus; so named because it is fixed in the tongue, and terminates in the staphylinus. See Constrictor isthmi faucium.

GLOSSOCATOCHOS. (From yhoora, tongue, and κατιχω, to hold. An instrument in P. Ægineta for depressing the tongue. A spatula lingua. The antient glossocatochus was a sort of forceps, one of the blades of which served to depress the tongue, while the other was applied under the chin-

GLOSSOCELE. (From γλωσσα, the tongue, and κηλη, a tumour.) An extrusion

of the tongue.

GLOSSOCOMA. A retraction of the tongue. GLOSSOCOMION. (From γλωσσα, a tongue, and κομεω, to guard.) By this was formerly meant a case for the tongue, for a hautboy; but the old surgeons, by metaphor, use it to signify an instrument, or case, for containing a fractured limb.

GLOTTA. (γλωτία, the tongue.) The

GLUCINE. For the discovery of this earth we are indebted to Vauquelin, who found it, in 1795, in the Aigue-marine or beryl, a transparent stone, of a green colour, and in the emerald of Peru. It exists combined with silex, argil, lime, and oxyd of iron in the one; and with the same earths, with oxyd of chrome, in the other. It has lately been discovered in the Gadolinite by Mr. Ekeberg.

Its name is taken from the Greek word ( ) which signifies sweet or saccharine, because it gives that taste to the salts it

forms.

Glucine is white, light, and soft to the touch. It is insipid, and adheres to the tongue; and is infusible by itself in the fire. Its specific gravity is 2.967. It is soluble in alcalies and their carbonates, and in all the acids except the carbonic and phosphoric, and forms with them saccharine and slightly astringent salts. It is exceedingly soluble in sulphuric acid used to excess. It is fusible with borax, and forms with it a transparent glass. It absorbs onefourth of its weight of carbonic acid. It decomposes sulphate of alumine. It is not precipitated by the hydro-sulphurets, nor by prussiate of potash, but by all the suc-Its affinity for the acids is intercinates. mediate between magnesia and alumine.

an impalpable powder, fuse it with three times its weight of po ash, and dissolve the mass in muratic acid. Separate the silex chanter there is a considerable bursa muby evaporation and filtration, and decom- cose. This tendon is inserted into the pose the remaining fluid by adding carbo- upper part of the linea aspera, for the

so named from its origin in the tongue, and nate of potash; re-dissolve the deposit when washed in sulphuric acid, and by mingling this solution with sulphate of potash, sulphate of alumine will be obtained, which crystallizes.

> Then mix the fluid with a solution of carbonate of ammonia, which must be used in excess; filter and boil it, and a white powder will gradually fall down, which is

GLOTTIS. (From phorla, the tongue.) The superior opening of the larynx at the bottom of the tongue.

GLUTEAL ARTERY. A branch of the

internal iliac artery.

GLUTEN. (Quasi geluten; from gelo, to congeal.) Glue, Lentor. See Gluten, animal and vegetable.

GLUTEN, ANIMAL. This substance constitutes the basis of the fibres of all the solid parts. It resembles in its properties

the gluten of vegetables.

GLUTEN, VEGETABLE. If wheat flour be made into a paste, and washed in a large quantity of water, it is separated into three distinct substances; a mucilaginous saccharine matter, which is readily dissolved in the liquor, and may be separated from it by evaporation; starch, which is suspended in the fluid, and subsides to the bottom by repose; and gluten, which remains in the hand, and is tenacious, very ductile, somewhat elastic, and of a brown gray colour. This glutinous substance is obtained from several vegetables in great abundance, and, when dried, becomes a horny mass. It is soluble both in water and spirit of wine, and, if boiled with the former, it coagulates like the white of an egg. It burns like horn, and affords the same products by distillation in the dry way. It readily putrefies when kept in a cold and moist place.

GLUTEUS MAXIMUS. (From 2A8-Tos, the buttocks.) Gluteus magnus of Albinus, Glutaus major of Cowper, and Ilio sacro femoral of Dumas. This broad radiated muscle, which is divided into a number of strong fasciculi, is covered by a pretty thick aponenrosis derived from the fascia lata, and is situated immediately under the integuments. It arises fleshy from the outer lip of somewhat more than the posterior half of the spine of the ilium, from the ligaments that cover the two posterior spinous processes; from the posterior sacro-ischiatic ligament; and from the outer sides of the os sacrum and os coccygis. From these origins the fibres of the muscle To obtain this earth, reduce some berylto run towards the great trochanter of the os femoris, where they form a broad and thick tendon, between which and the trospace of two or three inches downwards; and sends off fibres to the fascia lata, and to the upper extremity of the vastus externus. This muscle serves to extend the thigh, by pulling it directly backwards; at the same time it draws it a little outwards, and thus assists in its rotatory motion. Its origin from the coccyx seems to prevent that bone from being forced too far backwards.

GLUTEUS MEDIUS. Ilio trochanterien of Dumas. The posterior half of this muscle is covered by the gluteus maximus, which it greatly resembles in shape; but the anterior and upper part of it is covered only by the integuments, and by a tendinous membrane which belongs to the fascia lata. It arises fleshy from the outer lip of the anterior part of the spine of the ilium, from part of the posterior surface of that bone, and likewise from the fascia that covers it. From these origins its fibres run towards the great trochanter, into the outer and posterior part of which it is in-serted by a broad tendon. Between this tendon and the trochanter there is a small thin bursa mucosa. The uses of this muscle are nearly the same as those of the gluteus maximus; but it is not confined like that muscle, to rolling the os femoris outwards, its anterior portion being capable of turning that bone a little inwards. As it has no origin from the coccyx, it can have no effect on that bone.

GLUTEUS MINIMUS. Glutæus minor of Albinus and Cowper; and Ilio ischii trochanterien of Dumas. This, which is likewise a radiated muscle, is situated under the glutens medius. In adults, and especially in old subjects, its outer surface is usually tendinous. It arises fleshy between the two semicircular ridges we observe on the outer surface of the ilium, and likewise from the edge of its great niche. Its fibres run, in different direc-tions, towards a thick flat tendon, which adheres to a capsular ligament of the joint, and is inserted into the fore and upper part of the great trochanter. A small bursa mucosa may be observed between the tendon of this muscle and the trochanter. This muscle assists the two former in drawing the thigh backwards and outwards, and in rolling it. It may likewise serve to prevent the capsular ligament from being pinched in the motions of the joint.

GLUTIA. (From pastes, the buttocks.)
The two small protuberances in the brain,

called Nates.

GLUTTUPATENS. (From gluttus, the throat, and pateo, to extend.) An epithet for the stomach, which is an extension of the throat.

GLUTUS. (222705, from 220105, filthy.) The buttocks.

GLYCASMA. (From phunus, sweet.) A sweet medicated wine.

GLYCYPICROS. (From γλυκυς, sweet, and πικχος, bitter; so called from its bitterish sweet taste.) The woody nightshade. See Dulcamara.

GLYCYRRHIZA. (From γλυκυς, sweet, and μιζα, a root.) 1. The name of a genus of plants in the Linnæan system. Class, Diadelfthia. Order, Decandria.

2. The pharmacopocial name of liquorice. The sweet root of the Glycyrrhiza glabra of Linnæus:—leguminibus glabris, stipulis nullis, foliolo impari petiolato. A native of the south of Europe, but cultivated in Britain. The root contains a great quantity of sagcharine matter, joined with some proportion of mucilage, and hence it has a viscid sweet taste. It is in common use as a pectoral or emollient, in catarihal defluxions on the breast, coughs, hoarseness, &c. Infusions, or the extrac. made from it, which is called Spanish liquorice, afford likewise very commodious vehicles for the exhibition of other medicines; the liquorice taste concealing that of unpalatable drugs more effectually than syrups or any of the sweets of the saccharine kind.

GLYCYRRHIZA ECHINATA. This species of liquorice is substituted in some places

for the root of the glabra.

GLYCYRRHIZA GLABHA. The systematic name of the officinal liquorice. See Glycyrrhiza.

GLYCYSANCON. (From paukes, sweet, and appear, the elbow; so called from its sweetish taste, and its inflections, or elbows, at the joints.) A species of southernwood.

Glyssons capsule. See Capsule of Glys-

GNAPHALIUM. (From γιαφαλοι, cotton; so named from its soft down, surface.)

1. The name of a genus of plants in the Linnæan system. Class, Syngenesia. Or-

der, Polygamia superflua.

2. The pharmacopæial name of the hero cotton-weed. The flores gnaphalii of the pharmacopæias, called also flores hispidulæ; seu pedes cati are the produce of the Gnaphalium dioicum of Linnæus. They are now quite obsolete, but were formerly used as adstringents, and recommended in the cure of hooping-cough, phthisis, pulmonalis, and hæmoptysis.

GNAPHALIUM ARENARIUM. The flowers of this plant, as well as those of the gnaphalium stocchas, called in the pharmacopoias

flores elichrysi. See Elichrysum.

GNAPHALIUM DIOICUM. The systematic name of the pes cati. See Gnaphalium.

GNAPHALIUM STECHAS. The systematic name of Goldilocks. See Elychrysum.

GNATHUS. (From γναπίω, to bend; so

called from their curvature.) The jaw, or jaw-bones. Also the cheek.

GNIBUS A term applied by Hippocrates, and others since, to some medicinal precepts wrote in the island of Gnidos.

Goat's rue. See Galiga. Gorne. See Brynchocele.

GOLD. Aurum. A metal found in nature only in a metallic state; most commonly in grains, ramifications, leaves, or rhomboidal, octahedral, or pyramidical crystals. Its matrix is generally quartz, sand-stone, siliceous schistus, &c. It is found also in the sands of many rivers, particularly in Africa, Hungary, and France, in minute irregular grains, called gold-dust. Native gold, found in compact masses, is never completely pure; it is alloyed with silver, or copper, and sometimes with iron and tellurium. The largest piece of native gold that has been hitherto discovered in Europe, was found in the county of Wicklow, in Ireland. Its weight was said to be twenty-two ounces, and the quantity of alloy it contained was very small. Several other pieces, exceeding one ounce, have also been discovered at the same place, in sand, covered with turf, and adjacent to a rivulet.

Gold is also met with in a particular sort of argentiferous copper pyrites, called in Hungary Gelf. This ore is found either massive, or crystallized in rhomboids, or other irregular quadrangular or polygonal masses. It exists likewise in the sulphurated ores of Nagaya in Transylvania. These all contain the metal called telluririum. Berthollet, and other French chymists, have obtained gold out of the ashes

of vegetables.

Gold-cup. A vulgar name for many species of Ranunculi,

Golden-rod. See Virga aurea. Goldilocks. See Elychrysum.

GOMPHASIS. (From γομφος, a nail.) Gomphiasmus. A disease of the teeth, when they are loosened from the the sockets, like nails drawn out of the wood.

GOMPHIASMUS. See Gomphiasis.

Gomputer. (From 30,4000, a nail; so called, because they are as nails driven into their sockets.) The dentes molares, or grinding teeth.

GOMPHOMA. See Gomphosis.

GOMPHOSIS. (From γομφοω, to drive in a nail.) Gomphoma. A species of immoveable connection of bones, in which one bone is fixed in another, like a nail in a board, as the teeth in the alveoli of the jaws.

GONAGRA. (From you, the knee, and ayeur, capiu, to take.) The gout in the

Cione. (200m.) The seed. But in Hippocrates it is the uterus.

GONGRONA. (From 2027)ges, a hard knot.)

1. The cramp.

2. A round tubercle in the trunk of a

3. A hard round tumour of the nervous parts; but particularly a bronchecele, or other hard tumour of the neck.

GONGYLION. (From 20250x05, round.) A

pill.

GONOIDES. (From 2000, seed, and selfs, form.) Resembling seed. Hippocrates often uses it as an epithet for the excrements of the belly, and for the contents of the urine, when there is something in them which resembles the seminal matter.

GONORRHŒA. (From you, the semen, and goo, to flow; from a supposition of the action of the contents, that it was a semmal flux.) A genus of disease in the class beales, and order apocenoses, of Dr. Cullen's arrangement, who defines it a preternatural flux of fluid from the urethra in males, without any libidinous desires, and from the vagina in females. He makes four species, viz.

1. Gonorrhaa pura, or benigna; a mucous discharge from the urethra, without

dysuria, or lascivious inclination.

2. Gonorrha a impura, maligna, syphilitica, virulenta; a discharge resembling pus, from the urethra, with heat of urine, &c. after impure coition, to which often succeeds a discharge of micus from the urethra, with little or no dysury, called a gleet. Fluor albus malignus. Blennorrhagia of Swediaur. In English, a clap, from the old French word clapises, which were public shops, kept and inhabited by single prostitutes, and generally confined to a particular quarter of the town, as is even now the case in several of the great towns of Italy. In Germany, the disorder is named tripper, from dripping; and in French, chaudpisse, from the heat and scalding in making water.

No certain rule can be laid down with regard to the time that a clap will take before it makes its appearance, after infection has been conveyed. With some persons it will shew itself in the course of three or four days, whilst, with others, there will not be the least appearance of it before the expiration of some weeks. It most usually is perceptible, however, in the space of from six to fourteen days, and in a male, begins with an uneasiness about the parts of generation, such as an itching in the glans penis, and a soreness and tingling sensation along the whole course of the urethra; soon after which, the person perceives an appearance of whitish matter, at its orifice, and also some degree of pungency upon making water.

In the course of a few days, the discharge of matter will increase considerably; will assume, most probably, a greenish or yellowish hue, and will become thinner, and lose its adhesiveness; the parts will also be occupied with some degree of redness and inflammation, in consequence of which the glans will put on the appearance of a ripe cherry; the stream of urine will be smaller than usual, owing to the canal being made narrower by the inflamed state of its internal membrane, and a considerable degree of pain, and scaiding heat, will be experienced on every attempt to make water.

Where the inflammation prevails in a very high degree, it prevents the extension of the urethra, on the taking place of any erection, so that the penis is, at that time, carried downwards, with great pain, which is much increased, if attempted to be raised towards the belly, and the stimulus occasions it often to be erected, particularly when the patient is warm in bed, and so deprives him of sleep, producing, in some cases, an involuntary emission of semen.

In consequence of the inflammation, it sometimes happens that, at the time of making water, owing to the rupture of some small blood-vessel, a slight hæmorrhage ensues, and a small quantity of blood is voided. In consequence of inflammation, the prepuce likewise becomes often so swelled at the end, that it cannot be drawn back; which symptom is called a phymosis; or that, being drawn behind the glans, it eannot be returned, which is known by the name of paraphymosis. Now and then, from the same cause, little hard swellings arise on the lower surface of the penis, along the course of the urethra, and these perhaps suppurate and form into fistulous sores.

The adjacent parts sympathizing with those already affected, the bladder becomes irritable, and incapable of retaining the urine for any length of time, which gives the patient a frequent inclination to make water, and he feels an uneasiness about the scrotum, perinæum, and fundament. Moreover the glands of the groins grow indurated and enlarged, or perhaps the testicle becomes swelled and inflamed, in consequence of which he experiences excruciating pams, extending from the seat of the complaint up into the small of the back; he gets hot and restless, and a small symptomatic fever arises.

Where the parts are not occupied by much inflammation, few or none of the last-mentioned symptoms will arise, and only a discharge, with a slight heat or scalding in making water, will prevail.

If a gonorrhoa is neither irritated by any irregularity of the patient, nor prolonged by the want of timely and proper assistance, then, in the course of about a fortnight or

three weeks, the discharge, from having been thin and discoloured at first, will become thick, white, and of a ropy consistence; and from having gradually began to diminish in quantity, will at last cease entirely, together with every inflammatory symptom whatever; whereas, on the contrary, if the patient has led a life of intemperance and sensuality, has partaken freely of the bottle and high-seasoned meats, and has, at the same time, neglected to pursue the necessary means, it may then continue for many weeks, or months: and, on going off, may leave a weakness or gleet behind it, besides being accompanied with the risk of giving rise, at some distant period, to a constitutional affection, especially if there has been a neglect of proper cleanliness: for where venereal matter has been suffered to lodge between the prepuce and glans penis for any time, so as to have occasioned either excoriation or ulceration, there will always be danger of its having been

Another risk, arising from the long continuance of a gonorrhea, especially if it has been attended with inflammatory symptoms, or has been of frequent recurrence, is the taking place of one or more strictures in the urethra. These are sure to occasion a considerable degree of difficulty, as well as pain, in making water, and, instead of its being discharged in a free and uninterrupt-stream, it splits into two, or perhaps is voided drop by drop. Such affections become, from neglect, of a most serious and dangerous nature, as they not unfrequently block up the urethra, so as to induce a total suppression of urine.

Where the gonorrhea has been of long standing, warty excrescences are likewise apt to arise about the parts of generation, owing to the matter falling and lodging thereon; and they not unfrequently prove both numerous and troublesome.

Having noticed every symptom which usually attends on gonorrhoa, in the male sex, it will only be necessary to observe, the same heat and soreness in making water, and the same discharge of discoloured mucus, together with a slight pain in walking, and an uneasiness in sitting, take place in females as in the former; but as the parts in women, which are most apt to be affected by the venereal poison, are less complex in their nature, and fewer in number, than in men, so of course the former are not liable to many of the symptoms which the latter are; and from the urinary canal being much shorter, and of a more simple form, in them than in men, they are seldom, if ever, incommoded by the taking place of strictures.

With women, it indeed often happens, that all the symptoms of a gonorrhoa are

so very slight, they experience no other inconvenience than the discharge, except perhaps immediately after menstruation, at which period, it is no uncommon occurrence for them to perceive some degree of aggra-

vation in the symptoms.

Women of a relaxed habit, and such as have had frequent miscarriages, are apt to be afflicted with a disease known by the name of fluor albus, which is often difficult to distinguish from gonorrhæa virulenta, as the matter discharged in both is, in many cases, of the same colour and consistence. The surest way of forming a just conclusion, in instances of this nature, will be to draw it from an accurate investigation, both of the symptoms which are present and those which have preceded the discharge; as likewise, from the concurring circumstances, such as the character and mode of life of the person, and the prboability there may be of her having had venereal infection conveyed to her by any connection in which she may be engaged.

Not long ago, it was generally supposed that gonorrhæa depended always upon ulcers in the urethra, producing a discharge of purulent matter; and such ulcers do, indeed, occur in consequence of a high degree of inflammation and suppuration; but many dissections of persons, who have died whilst labouring under a gonorrhœa, have clearly shewn that the disease may, and often does, exist without any ulceration in the urethra. so that the discharge which appears is usually of a vitiated mucus, thrown out from the mucous follicles of the urethra. On opening this canal, in recent cases, it usually appears red and inflamed; its mucous glands are somewhat enlarged, and its cavity is filled with matter to within a small distance from its extremity. Where the disease has been of long continuance, its surface all along, even to the bladder, is generally found pale and relaxed, without any erosion.

3. Gonorrhea laxorum libidinosa; a pellucid discharge from the urethra, without erection of the penis, but with venereal thoughts while awake.

Gonorche a dormientium, oneirogmos. When, during sleep, but dreaming of venereal engagements, there is an erection of the penis and a seminal discharge

GONORRIGEA BENIGNA. See Gonorrhaa

GONOBRHEEA CHORDATA. A gonorrhœa, accompanied with painful tension of the penis, called chordee.

GONORRIGHT DORMIENTIUM. Involuntary nocturnal emission.

GONORHUGA IMPURA. The venereal gonorrhoa.

LAXORUM. GONOHRHOM Im oluntary emission from debility.

GONORRHO:A LIMIDINOSA. Involuntary emission from lust.

A venereal or GONORRHŒA MALIGNA. malignant gonorrhæs.

GONORRHŒA MUCOSA. A discharge o mucus from the urethra, or gleet.

GONORRHEA ONEIROGMOS. An involuntary nocturnal emission.

GONORRHEEA PURA. A common gleet. GONORRHEEA SPURIA. A species of gonorrhoa affecting the glans.

GONORRHEA SYPHILITICA. The venereal gonorrhæa.

GONORRHEEA BALANI. A species of gonorrhœa affecting the glans penis only.

GONALGIA. (From yoru, the knee, and αλγος, pain.) Gonyalgin. Gout in the knee. Gornius. A species of vermes, peculiar

to hot climates. Goose foot, stinking. See Atriplex fa-

Goose-grass. See Aparine.

GOSSŸPIUM. (From gotne, whence gottipium, Egyptian.) 1. The name of a genus of plants in the Linnaan system. Class, Monadelphia. Order, Polyandria.

2. The pharmacopæial name of the cot-

ton tree. See Bombax.

Gossypium HERBACEUM. The systematic name of the cotton-plant. See Gos-

GOULARD'S EXTRACT. A saturated solution of acetat of lead. See Acetatis liquor phumbi.

Gourd. See Cucurbita. Gourd, bitter. See Colocynthis.

See Arthritis. GRACILIS. (Gracilis, from its smallness.( Rectus interior femoris sive gracilis interior of Winslow. Sous pubio creti tibial of Dumas. This long, straight, and slen-der muscle is situated immediately under the integuments, at the inner part of the thigh. It arises by a broad and thin tendon, from the anterior part of the ischium and pubis, and soon becoming fleshy, descends nearly in a straight direction along the inside of the thigh. A little above the knee, it terminates in a slender and roundish tendon, which afterwards becomes flatter, and is inserted into the middle of the tibia, behind and under the sartorius. Under the tendons of this and the rectus, there is a considerable bursa mucosa, which on one side adheres to them and to the tendon of the semitendinosus, and on the other to the capsular ligament of the knee. muscle assists in bending the thigh and leg inwards.

GRAMEN CANINUM. Gramen dioscoridis. Gramen repens. Loliaceum radice repente. Dog's grass. Couch grass Triticum repens of Linnæus. The roots are agreeably sweet, and possess aperient properties. The expressed juice is recommended to be given largely.

GRAMEN CRUCIS CYPERIOIDIS. Gramen Egyptiacum. Egyptian cock's-foot grass, or grass of the cross. The roots and plants

Z z \*

possess the same virtues as the dog's grass, and are serviceable in the earlier stages of dropsy. They are supposed to correct the bad smell of the breath, and to relieve nephritic disorders, colics, &c. although now neglected.

GRAMIA. The sordes of the eyes.

Gramme. (From yeamm, a line; so called from its linear appearance.) The iris of the eye.

GRANA CRIDIA. See Coccognidia.
GRANA INSECTORIA. Kermes berries.
GRANA KERMES Kermes berries.

GRANA PARADISI. Cardamomum majus. Meleguetta maniguetta. Cardamomum piperatium. Grains of Paradise. The seeds of the Amomum grana Paradisi of Linnans. They are angular reddish brown seeds, smaller than pepper, and resembling very much the seeds of the cardamomum minus. They are extremely hot, and similar in virtue to pepper.

GRANA TIGLIA. See Tiglia grana. GRANA TINCTORIA. See Kermes.

GRANADILLA. (Dim. of granado, a pomegranate, Spanish: so called because at the top of the flower there are points, like the grains of a pomegranate.) The passion-flower, the fruit of which is said to possess refrigerating qualities.

GRANATRISTUM. A boil, or carbuncle.

GRANATUM. (From granum, a grain, because it is full of seed.) The pomegranate. The fruit of the Punica granatum of Linnaus:—foliis lanceolatis, caule arboreo. The rind of the fruit, and the flowers called Balaustine flowers, are the parts directed for medicinal use. In their smell there is nothing remarkable, but to the taste they are very adstringent, and have successfully been employed as such, in diseases both internal and external.

GRANDEBALE. (Quod in grandioribus etate nascantur, because they appear in those who are advanced in years.) The hairs under the arm-pits.

GRANDINES. Small tumours on the eyelids. See Grando.

GRANDINOSUM os. The cuboid bone of the foot.

GRANDO. (Quod similitudinem granorum habeat, because it is in shape and size like a grain of seed.) Hail. A moveable tumour on the margin of the cyclid is so called, from its likeness to a hail stone.

GRANULATION. (Granulatio; from granum, a grain.) The little grain-like fleshy bodies, which form on the surfaces of nlcers and suppurating wounds, and serve both for filling up the cavities, and bringing nearer together and uniting their sides.

Nature, in bringing parts as nearly as possible to their original state, whose disposition, action, and structure, have been altered by accident, or disease; and after having, in her operations for this purpose, formed pus, she immediately sets about forming

a new matter upon surfaces, in which there has been a breach of continuity. This process is called granulating or incarnation; and the substance formed is called granulations. The colour of healthy granulations is a deep floral red. When livid, they are unhealthy, and have only a languid circulation. Healthy granulations, on an exposed or flat surface, rise nearly even with the surface of the surrounding skin, and often a little higher; but when they exceed this, and take on a growing disposition, they are unhealthy, become soft, spongy, and without any disposition to form skin. Healthy granulations are always prone to unite to each other, so as to be the means of uniting parts.

Granum moschi. See Abelmoschus.
Granum negium. The castor-oil seed.

Graphioides. (From 1820ts, a pencil, and 250s, a form.) The processus styliformis of the os temporis and ulna is so called. The musculus biventer vel digastricus was formerly so called, from its supposed origin from the process of the temple-bone, so called.

GBASSA. Borax.

GRATIOLA. (Dim. of gratia, so named from its supposed adm. rable qualities.)

1. The name of a genus of plants in the Liunxan system. Class, Diandria. Order, Monogunia.

The pharmacopæial name of the hedgehyssop, called also digitalis minima, gratia dei, gratiola centaurioides. This exotic plant, the Gratiola officinalis of Linnaus:folis lanceolatis serratis, floribus pedunculatis, is a native of the south of Europe; but is raised in our gardens. The leaves have a nauseous bitter taste, but no remarkable smell: they purge and vomit briskly in the dose of half a drachm of the dry herb, and of a drachm infused in wine or water. plant, in small doses, has been commonly employed as a cathartic and diuretic in hpdropical diseases, and instances of its good effects in ascites and anasarca are recorded by many respectable practitioners. Gesner and Bergius found a coruple of the powder a sufficient dose, as in this quantity it frequently excited nausea or vomiting; others have given it to half a drachm, two scruples, a drachm, and even more.

An extract of the root of this plant is said to be more efficacious than the plant itself, and exhibited in the dose of half a drachm, or a drachm, in dysenteries, produces the best effects. We are also told by Kostrzewski that, in the hospitals at Vienna, three maniacal patients were perfectly recovered by its use; and in the most confirmed cases of lues venerea, it effected a complete cure; it usually acted by increasing the urinary cutaneous, or salivary discharges.

GRATIOLA OFFICINALIS, The syste-

matic name of the hedge-hyssop. See Gratiola.

GHAVEDO. (From gravis, heavy.) catarrh, or cold, with a sense of heaviness in the head.

Gravel. See Calculus.

Green sickness. See Chlorosis.

GRESSUHA. (From gredier, to proceed.) The perinaum which goes from the pudendum to the anus.

GRIELUM. A name formerly applied to

parsley; smallage.

GRIPHOMENOS. (From yeipos, a net, because it surrounds the body as with a net.) Applied to pains which surround the body at the loins.

Gromwell, common. See Lithospermum. GROSSULARIA. (Dim. of grossus, an unripe fig; so named because its fruit resembles an unripe fig.) The gooseberry

or gooseberry-bush.

GHOTTO DEL CANT. A grotto near Naples, in which dogs are suffocated. The carbonic acid air rises about eighteen inches. A man therefore is not affected, but a dog forcibly held in, or who cannot rise above it, is soon killed, unless taken He is recovered by plunging him in an adjoining loke.

Ground liverwort. See Lichen cinereus

terrestris.

GROUND IVY. A common plant used in the form of infusion or tea in pectoral complaints. See Hedera.

Groundpine. See Chamæpitys.

Ground nut. See Pignut.
Groundsel. See Erigerum.
Guurum. Mihum. A hard white tubercle of the skin, resembling in size and appearance a millet-seed.

GRYPHOSIS. (From ppurow, to incurvate.) A disease of the balls, which turn inwards, and irritate the soft parts below.

GUAIACUM. (From the Spanish Guayacan, which is formed from the Indian Hoa.r. acan.) Guaracum Americanum, Lignum vitæ Lignum sanctum. Lignum benedictum. Palus sanctus

1. The name of a genus of plants in the Linnaan system. Class, Decandria. Or-

der, Monogynia.

2. The pharmacopoial name of the officinal gualacum, Guiaincum officinale of Linnams:-folius bijngis obtusis. This tree is a native of the West Indian islands. The wood, gum, bark, fruit, and even the flowers, have been found to possess medicinal qualities. The wood is brought principally from Jamaica, in large pieces of four or five hundred weight each, and from its hardness and beauty is used for various articles of turnery ware. It scarcely discovers any smell, unless heated, or while rasping, in which circumstances it yields a light aromatic one: chewed, it impresses a slight acrimony, biting the palate and fauces. The gum, or rather resin, is ob-

tained by wounding the bark in different parts of the body of the tree, or by what has been called jagging. It exudes copiously from the wounds, though gradually; and when a quantity is found accumulated upon the several wounded trees, hardened by exposure to the sun, it is gathered and packed up in small kegs for exportation; it is of a friable texture, of a deep greenish colour, and sometimes of a reddish hue; it has a pungent sorid taste, but little or no smell, unless heated. The bark contains less resinous matter than the wood, and is consequently a less powerful medicine, though in a recent state it is strongly cathartic. "The fruit," says a late author, " is purgative, and, for medicinal use, far excels the bark. A decoction of it has been known to cure the venereal disease, and even the yaws in its advanced stage, without the use of mercury." The flowers or blossoms, are laxative, and in Jamaica are commonly given to the children in the form of syrup. It is only the wood and resin of guaiacum which are now in general medicinal use in Europe; and as the efficacy of the former is supposed to be derived merely from the quantity of resinous matter which it contains, they may be considered indiscriminately as the same medicine. Guaiacum was first introduced into the materia medica soon after the discovery of America; and previous to the use of mercury in the lues venerea, it was the principal remedy employed in the cure of that disease; its great success brought it into such repute, that it is said to have been sold for seven gold crowns a pound: but notwithstanding the very numerous testimonies in its favour, it often failed in curing the patient, and was at length entirely superseded by mercury; and though it be still occasionally employed in syphilis, it is rather with a view to correct other diseases in the habit, than for its effects as an antivenereal. It is now more generally employed for its virtues in curing gouty and rheumatic pains, and some cutaneous diseases. Dr. Woodville and others frequently conjoined it with mercury and soap, and in some cases with bark or steel, and found it eminently useful as an alterative. In the pharmacopoias it is directed in the form of tincture and elixir: the latter is ordered by the Edinburgh College to be prepared in two ways, viz. with rectified spirit, and the virous spirit of sal ammoniac. Of these compounds, the dose may be from two scruples to two drachms; the gum is generally given from 6 grains to 20 or even more, for a dose, either in pills or in a fluid form, by means of mucilage or the yolk of an egg. The decoctum lignorum (Pharm. Eding.) of which guaiacum is the chief ingredient, is commonly taken in the quantity of a pint a day. As many writers of the sixteenth centure

contended that guaiacum was a true specific for the venereal disease, and the celebrated Boerhaave maintained the same opinion, the following observations are inserted: Mr. Pearson mentions, that when he was first intrusted with the care of the Lock Hospital, in 1781, Mr. Bromfield and Mr. Williams were in the habit of reposing great confidence in the efficacy of a decoction of guaiacum wood. This was ad-ministered to such patients as had already employed the usual quantity of mercury; but who complained of nocturnal pains, or had gummata, nodes, ozæna, and other effects of the venereal virus, connected with secondary symptoms, as did not yield to a course of mercurial frictions. The diet consisted of raisins, and hard biscuit; from 2 to 4 pints of the decoction were taken every day; the hot bath was used twice a week; and a dose of antimonial wine and laudanum, or Dover's powder, was commonly taken every evening. Constant confinement to bed was not deemed necessary; neither was exposure to the vapour of burning spirit, with a view of exciting perspiration, often practised; as only a moist state of the skin was desired. This treatment was sometimes of singular advantage to those whose health had sustained injury from the disease, long confinement, and mercury. The strength increased; bad ulcers healed; exfoliations were completed; and these anomalous symptoms, which would have been exasperated by mercury, soon yielded to guaiacum.

Besides such cases, in which the good effects of guaiacum made it be erroneously regarded as a specific for the lues venerea, the medicine was also formerly given, by some, on the first attack of the venereal The disorder being thus benefited, a radical cure was considered to be accomplished; and though frequent relapses followed, yet, as these partly yielded to the same remedy, its reputation was still kept up. Many diseases also, which got well, were probably not venereal Mr. Pearson seems to allow, that in symphilitic affections, it may indeed operate like a true antidote, suspending, for a time the progress of certain venerear symptoms, and removing other appearances altogether; but he observes, that experience has evinced, that the unsubdued virus yet remains active in the con-

stitution.

Mr. Pearson has found guaiacum of little use in pains of the bones, except when it proved sudorific; but that it was then inferior to antimony or volatile alkali. When the constitution has been impaired by mercury and long confinement, and there is a thickened state of the ligaments, or periosteum, or foul ulcers still remaining, Mr. Pearson says, these effects will often subside during the exhibition of the decoction; and

it will often suspend for a short time the progress of certain secondary symptoms of the lues venerea: for instance, ulcers of the tonsils, venereal cruptions, and even nodes. Mr. Pearson, however, never knew one instance, in which guaiacom eradicated the virus; and he contends, that its being conjoined with mercury neither increases the virtue of this mineral, lessens its bad effects, nor diminishes the necessity of giving a certain quantity of it. Mr. Pearson remarks that he has seen guaiacum produce good effects in many patients, having cutaneous diseases, the ozana, and scrophulous affections of the membranes and ligaments.

Guinea-worm. The Gordius medinensis. GUM. The mucilage of vegetables. is usually transparent, more or less brittle when dry, though difficultly pulverable; of an insipid, or slightly saccharine taste; soluble in, or capable of combining with, water in all proportions, to which it gives a gluey adhesive consistence, in proportion as its quantity is greater. It is separable, or coagulates by the action of weak acids; it is insoluble in alkohol, and in oil; and capable of the acid fermentation, when diluted with water. The destructive action of fire causes it to emit much carbonic acid, and converts it into coal without exhibiting any flame. Distillation affords water, acid a small quantity of oil, a small quantity of

These are the leading properties of gums, rightly so called; but the inaccurate custom of former times applied the term gum to all concrete vegetable juices so that in common we hear of gum copal, gum sandarach, and other gums, which are either pure resins, or mixtures of resins with the vegetable mucilage.

ammonia, and much coal.

The principal gums are, 1. The common gums, obtained from the plum, the reach, the cherry-tree, &c. 2. Gum arabic, which flows naturally from the acacia in Egypt, Arabia, and elsewhere. This forms a clear transparent mucilage with water. 3. Gum Seneca or Senegal. It does not greatly differ from gum arabic: the pieces are larger and clearer; and it seems to communicate a higher degree of the adhesive quality to water. It is much used by calico-printers and others. The first sort of gums are frequently sold by this name, but may be known by their darker colour. 4. Gum adragant or tragacanth. It is obtained from a small plant of the same name, growing in Syria, and other eastern parts. It comes to us in small white contorted pieces resembling worms. It is usually dearer than other gums, and forms a thicker jelly with water.

Mr. Willis has found, that the root of the common blue bell, hyaenthus non scriptus, dried and powder d, affords a mucilage possessing all the qualities of that from gum arabic. The roots of the vernal squill, white lily and orchis, equally yield muchage. Lord Dundonald has extracted a mucilage also from licheus.

Gums treated with nitric acid afford the

acid of sugar.

Gum-boil. See Parulis.
GUMMA. A strumous tumour on the periosteum of a bone.

GUMMI ARABICUM. See Acaciæ gummi.

GUMMI CARANNE. See Carunna. GUMMI CERASORUM. The juices which exude from the back of cherry-trees. is very similar to gum arabic, for which it may be substituted.

GUMMI CHIBOU. A spurious kind of gum

elimi, but little used.

GUMMI COURBARIL. An epithet sometimes applied to the juice of the Hymenaa courbaril. See Anime.

GUMMI EUPHORHII. See Euphorbium.

GUMMI GALDA. See Galda. GUMMI GAMBIENSE. See Kino.

GUMMI GUTTE. See Gambogia.

sinous juice of the Hedera helix of Linnæus, or ivy. It is imported from the East Indies, though it may be collected from trees in this country. It is brought over in hard compact masses, externally of a reddish brown colour, internally of a bright brownish yellow, with reddish specks or veins. It has a strong, resmous, agreeable smell, and an adstringent taste. Though never used in the practice of the present day, it possesses corroborant, adstringent, and antispasmodic virtues.

GUMMI JUNIPERINUM. See Sandarack. GUMMI KIKEKUNEMALO. See Kikekune-

GUMMI KINO. See Kino.

GUMMI LACCA. See Lacca.

GUMMI MYHRHA. See Myrrha.

GUMMI HESINA LUTEA. An astringent gum from New Holland.

GUMMI RUBRUM ASTHINGENS GAMBIENSE. See Kino.

GUMMI SAGAPENUM. See Sagapenum.

GUMMI SENEGALENSE. This is a true guin, brought from the country through which the river Senegal runs, in loose or single drops, much larger than gum arabic. It exudes from the Mimosa Senegal of Linnæus. And is similar in virtue and quality to the gum arabic, and the gum which exndes in this climate from the cherry-trees.

See Traga-GUMMI TRAGACANTHE.

GUM-RESIN. Gum-resina. Gum-resins are the juices of plants that are mixed with resin, and an extractive matter, which has been taken for a gummy substance.

They seldom flow naturally from plants, but are mostly extracted by incision, in the form of white, yellow, or red fluids, which dry more or less quickly. Water, spirit of wine, wine or vinegar, dissolve them only face and nose.

in part, according to the proportion they contain of resin or extract. Gum-resins may also be formed by art, by digesting the parts of vegetables containing the gumresin in diluted alkahol, and then evaporating it. For this reason most tinctures contain gum-resin. The principal gumresins employed medicinally are aloes, ammoniacum, asafœtida, galbanum, gambogia, guaiacum, myrrha, olibanum, opoponax, sag penum, sarcocolla, scammonium, and styrax.

GUMS. Gingiva. The very vascular and elastic substance that covers the alveolar arches of the upper and under jaws, and embraces the necks of the teeth.

GUTTA Alunsel. A drop. Drops are uncertain forms of administering medicines. The shape of the bottle, or of its mouth, from whence the drops fall, as well as the consistence of the fluid, occasions a considerable difference in the quantity administered.

Gutta is also a name of the apoplexy, from a supposition that its cause was a drop of blood falling from the brain upon the heart.

GUTTA GAMBA. See Gambogia,

GUTTA OPACA. A name for the cata-

GUTTA SERENA (So called by the Arabians.) Amaurosis. This is a disease of the eye attended with a diminution or total loss of sight, and arising from a paralytic affection of the retina and optic

The symptoms of gutta serena are noted for being very irregular. In many cases, the pupil is very much dilated, immoveable and of its natural black colour. Sometimes, however, in the most complete and incurable cases, the pupil is of its natural size, and the iris capable of free motion. In some cases, the pupil has a dull, glassy or horny appearance. Sometimes its colour is greenish, occasionally whitish and opake, so as to be liable to be mistaken for an incipient cataract. Richter mentions a degree of strabismus, as the only symptom, except the loss of sight, as invariably attendant on amaurosis.

The blindness produced by the gutta serena, is generally preceded by an ima-ginary appearance of numerous insects, or substances, like cobwebs, interposing themselves between objects and the eye. The origin of a cataract on the other hand, is usually attended with a simple cloudiness of vision.

GUTTE NIGRE. The black drops, occasionally called the Lancashire or the Cheshire drops. A secret preparation of opium, said to be more active than the common tincture and supposed to be less injurious, as seldons followed by headache.

GUTTE ROSACEE. Red spots upon the

GUTTURAL ARTERY. The superior thyroideal artery. The first branch of the ex-

ternal carotid.

GYMNASTICA. (From yupros, naked, performed by naked men in the public games. A method of curing diseases by exercise, or that part of physic which treats of the rules that are to be observed in all sorts of exercises, for the preservation of health. This is said to have been invented by one Herodicus, born at Salymbra, a city of Thrace; or, as some say, at Leutini in Sicily. He was first master of an academy, where young gentlemen came to learn warlike and manly exercises; and observing them to be very healthful on that account, he made exercise become an art in reference to the recovering of men out of diseases, as well as preserving them from them: and called it Gymnastic, which he made a great part of his practice of physic. But Hippocrates, who was his scholar, blames him sometimes for his excesses

with this view. And Plato exclaims against him with some warmth, for enjoining his patients to walk from Ahens to Megara, which is about 25 miles, and to come home on foot as they went, as soon as ever they had but touched the walls of the city.

GYNECIA. (From your, woman.) It signifies the menses, and sometimes the

lochia.

GYNECIUM. (From youn, a woman.) A seraglio; the budendum muliebre; also a name for antimony.

GYNECOMANIA. (From youn, a woman, and uavia, madness.) That species of insa-

nity that arises from love.

GYNECOMASTON. (From youn, a woman, and  $\mu\alpha$ 505, a breast.) An enormous increase of the breasts of women.

GYNECOMYSTAX. (From γυγη, a woman, and μυςταξ, a beard.) The hairs on the female pudenda.

H.

HABENA. A bridle. A bandage for keeping the lips of wounds together, made in the form of a bridle.

HACUB. A species of cardinus. Gundelia tournefortii of Linnaus:—the young shoots of which are eaten by the Indians, but the

roots are en.etic.

Hæmagoga. (From αμα, blood, and αγα, to bring off.) Medicines which promote the menstrual and hæmorrhoidal discharges.

Hæmalopia. (From αμια, blood, and σπομα, to see.) A disease of the eyes, in which all things appear of a red colour. A variety of the pseudoblepsis imaginaria.

Hæmators. (From αιμα, blood, and ωψ, the face.) A red or livid mark in the face

or eye. A blood-shot eye.

Hæmanthus. (From the αμα, blood, and ανθος, a flower, so called from its colour.) The blood-flower.

HÆMATEMESIS (From αμα, blood, and εμεω, to vomit.) Vomitus cruentus.

A vomiting of blood. A vomiting of blood is readily to be distinguished from one which proceeds from the lungs, by its being usually preceded by a sense of weight, pain, or anxiety in the region of the stomach; by its being unaccompanied by any cough; by its being discharged in a very considerable quantity; by its being of a dark colour, and somewhat grumous; and by its being mixed with the other contents of the stomach.

The disease may be occasioned by any thing received into the stomach, which stimulates it violently or wounds it; or may proceed from blows, bruises, or any other cause capable of exciting inflammation in this organ, or of determining too great a flow of blood to it; but it arises more usally as a symptom of some other disease (such as a suppression of the menstrual, hæmorrhoidal flux, or obstructions in the liver, spleen, and other viscera) than as a primary affection.

Hæmatemesis is seldom so profuse as to destroy the patient suddenly, and the principal danger seems to arise, either from the great debility which repeated attacks of the complaint induce, or from the lodgment of blood in the intestines, which by becoming putrid might occasion some other disagreeable disorder.

The appearances to be observed on dissection, where it proves fatal, will depend on the disease of which it has proved symp-

tomatic.

HEMATITES. (From upa, blood, so named from its property of stopping blood, or from its colour.) Lapts hematites. Bit odstone. An elegant from ore caffed bloodstone. Finely levigated, and freed from the grosser parts by frequent washings with water, it has been long recommended in hemorrhages, fluxes, uterine obstructions, &c. in doses of from one scruple to three or four.

HEMATINUS. (From apading, the bloodstone.) An epithet of a collyrium, in

which was the bloodstone.

HÆMATOCELE. (From 21µ2, blood,

and \*\*\*, a tumour.) A swelling of the scrotum, or spermatic chord, proceeding

from or caused by blood.

The distinction of the different kinds of ha natocele, though not usually made, is absolutely necessary towards rightly understanding the disease; the general idea, or conception of which, appears to Mr. Pott to be somewhat erroncous, and to have produced a prognostic which is ill founded and hasty. According to this eminent surgeon, the disease properly called hæmatocele is of four kinds: two of which have their seat within the tunica vaginalis testis; one within the albuginea; and the fourth in the tunica communis, or common cellular membrane, investing the spermatic vessels.

In the passing an instrument, in order to let out the water from an hydrocele of the vagnal coat, a vessel is sometimes wounded, which is of such size, as to tinge the fluid pretty deeply at the time of its running out: the orifice becoming close, when the water is all discharged, and a plaster being applied, the blood ceases to flow from thence, but insimites itself partly into the eavity of the vaginal coat, and partly into the cells of the dartos; making sometimes, in the space of a few hours, a tumour nearly equal in size to the original hydrocele. This is one species.

It sometimes happens in tapping an hydrocele, that although the fluid discharged by that operation be perfectly clear and timpid, yet in a very short space of time (sometimes in a few hours) the scrotum becomes as large as it was before, and palpably as full of a fluid. If a new puncture be now made, the discharge instead of being limpid (as before) is now either pure blood or very bloody. This is another species; but, like the preceding, confined

to the tunica vaginalis.

The whole vascular compages of the testucle is sometimes very much enlarged, and at the same time rendered so lax and loose, that the tumour produced thereby has, to the fingers of an examiner, very much the appearance of a swelling composed of a mere fluid, supposed to be somewhat thick, or viscid. This is in some measure a deception; but not totally so; the greater part of the tumefaction is caused by the loosened texture of the testes; but there is very frequently a quantity of extravasated blood also.

If this be supposed to be an hydrocele, and pierced, the discharge will be mere blood. This is a third kind of hæmatocele; and very different, in all its circumstances, from the two preceding: the fluid is shed from the vessels of the glandular part of the testicles, and contained within the tunica albuginea.

The fourth consists of a rupture of, and an effusion of blood, from a branch of the spermatic vein, in its passage from the groin to the testicle. In which case, the Catravasation is made into the tunica communis, or cellular membrane, investing the spermatic vessels.

Each of these species, Mr. Potts says, he has seen so distinctly, and perfectly, that he has not the smallest doubt concerning their existence, and of their difference from

each other.

HEMATOCHYSIS. (From 2μμ2, blood, and  $\chi_{\omega}$ , to pour out.) A hæmorrhage or flux of blood.

HÆMATODES. (From aua, blood; so called from the red colour of its flowers.)

1. An old name of the bloody cranesbill. See Geranium sunguineum.

2. Now applied to a fungus or fleshy excrescense, which has somewhat the appear-

ance of blood.

HÆMATOLOGY. (From αιμα, blood, and λογος, a discourse.) Hæmotologia. The

doctrine of the blood.

Henatomphalocele. (From αμα, blood, ομφαλ), the navel, and καλη, a tumour, λ a species of ecchymosis. A tumour about the navel from an extrava-ation of blood. It is mostly absorbed, but, if too considerable, a puncture may be made to evacuate the blood, as in ecchymosis. See Ecchymosis.

Hematopenesis. (From αιμα, blood, and σσδαω, to leap.) The leaping of the blood from a wounded artery.

HEMOTOSIS. (From aqua, blood.) An

hamorrhage or flux of blood.

H.EMATONYLON. (From αιρα, blood, and ξολον, wood; so called from the red colour of its wood.) The name of a genus of plants in the Linnæan system. Class, Decandria. Order, Monogynia.

HÆMATOXYLUM. (From αμα, blood, or αμαθικος, bloody, and ξυλόν, wood.) The name in some pharmacopæias for the logwood; which is so called from its red colour. See Lignum campechense.

HEMATOXYLON CAMPECHIANUM. The systematic name of the logwood-tree. See

Lignum campechianum.

HEMATURIA (From eque, blood, and seev, urine.) The voiding of blood with urine. This disease is sometimes occasioned either by falls, blows, bruises, or some violent exertion, such as hard riding and jumping; but it more usually arises from a small stone lodged either in the kidney or ureter, which, by its size or irregularity, wounds the inner surface of the partit comes in contact with; in which case the blood discharged is most usually somewhat coagulated, and deposits a sediment of a dark-brown colour, resembling the grounds of coffee.

A discharge of blood by urinc, when proceeding from the kidney or ureter, is commonly attended with an acute pain in the back, and some difficulty of making water, the urine, which comes away first, being muddy and high coloured, but to-

wards the close of its flowing, becoming transparent and of a natural appearance. When the blood proceeds immediately from the bladder, it is usually accompanied with a sense of heat and pain at the bottom

of the belly.

The voiding of bloody urine is always attended with some danger, particularly when mixed with purulent matter. When it arises in the course of any malignant disease, it shews a highly putrid state of the blood, and always indicates a fatal termination.

\* The appearances to be observed on dissection will accord with those usually met with in the disease which has given rise to

the complaint.

Η ΕΝΟΒΙΑ. (From αιμωδοω, to stupefy.)

A painful stupor of the seeth, caused by

acrid substances touching them.

ΗΕΜΟΡΤΟΕ. (From αιμα, blood, and πλυω, to spit up.) The spitting of blood.

See Hamoptysis.

HÆMOPTYSIS. (From asua, blood, Alua, to spit.) Hamoptoe. A spitting of blood. A genus of disease arranged by Cullen in the class of pyrexie, and order hemorrhagia It is characterized by coughing up florid or trothy blood, preceded usually by heat or pain in the chest, irritation in the larynx, and a saltish taste in the mouth. There are five species of this disease: 1. Hamoptysis plethorica, from fulness of the vessels. 2. Hamoptysis viotenta, from some external violence. 3. Hamoptysis phthisica, from ulcers corroding the small vessels. 4. Hamoptysis calculosa, from calculous matter in the lungs. 5. Hamoptysis vacaria, from the suppression of some customary evacuation.

It is readily to be distinguished from hematemesis, as in this last the blood is usually thrown out in considerable quantities; and is, moreover, of a darker colour, more grumous, and mixed with the other contents of the stomach; whereas blood proceeding from the lungs is usually in small quantity, of a florid colour, and mixed with a little frothy mucus only.

A spitting of blood arises most usually between the ages of 16 and 25, and may be occasioned by any violent exertine either in running, jumping, wrestling, singing loud, or blowing wind-instruments; as likewise by wounds, plethora, weak vessels, hectic fever, coughs, irregular living, excessive drinking, or the suppression of some accustomed discharge, such as the menstrual or hæmorrhoidal. It may likewise be occasioned by breathing air which is too much! rarefied to be able properly to expand the lungs.

Persons in whom there is a faulty proportion either in the vessels of the lungs, or in the capacity of the chest, being distinguished by a narrow thorax and prominent shoulders, or who are of a delicate make and sanguine temperament, seem much predisposed to this hamorrhage; but in these, the complaint is often brought on by the concurrence of the various occasional and exciting causes before mentioned.

A spitting of blood is not, however, always to be considered as a primary disease. It is often only a symptom, and in some disorders, such as pleurisies, peripneumonies, and many fevers, often arises, and is the presage of a favourable termination.

Sometimes it is preceded (as has already been observed) by a sense of weight and oppression at the chest, a dry tickling cough, and some slight difficulty of breathing. Sometimes it is ushered in with shiverings, coldness at the extremities, pains in the back and loins, flatulency, costiveness, and lassitude. The blood which is spit up is sometimes thin, and of a florid red colour; and at other times it is thick, and of a dark or blackish cast; nothing, however, can be inferred from this circumstance, but that the blood has lain a longer or shorter time in the breast, before it was discharged.

An hæmoptooe is not attended with danger, where no symptoms of phthisis pulmonalis have preceded, or accompanied the hæmorrhage, or where it leaves behind no cough, dyspnæa, or other affection of the lungs; nor is it dangerous in a strong healthy person, of a sound constitution; but when it attacks persons of a weak lax fibre, and delicate habit, it may be difficult

to remove it.

It seldom takes place to such a degree as to prove fatal at once; but when it does, the effusion is from some large vessel. The danger, therefore, will be in proportion as the discharge of blood comes from a large vessel, or a small one.

When the disease proves fatal, in consequence of the rupture of some large vessels, there is found, on dissection, a considerable quantity of clotted blood betwixt the lungs and pleura, and there is usually more or less of an inflammatory appearance at the ruptured part. Where the disease terminates in pulmonary consumption, the same morbid appearances are to be met with as described under that particular head.

HÆMORRHAGIA. (From αιμα, blood, and ρηγισμο, to break out.) A hæmorrhage;

or flow of blood.

HEMORRHAGLE. Hamorrhages, or afflixes of blood. An order in the class pyrexia of Cullen's nosology is so called It is characterized by pyrexia with a discharge of blood, without any external injury; the blood on venæsection exhibiting the buffy coat. The order hamorrhagia contains the following genera of diseases, viz. epistaxis, hæmorrhois and menorrhagia.

HEMORRHODAL ARTERIES. Arteria hamorrhoidules. The arteries of the rectum are to called: they are sometimes two, and at other times three, in number

1. The upper hamorrhoidal artery, which is the great branch of the lower mesenteric continued into the pelvis. 2. The middle hamorrhoidal, which sometimes comes off from the hypogastric artery, and very often from the pudical artery. It is sometimes wanting. 3. The lower or external hamorrhoidal is almost always a branch of the pudical artery, or that artery which goes to the penis.

HÆMORRHOIDAL VEINS. Venæ Hæmorrhoidales. These are two. 1. The external, which evacuates itself into the vena iliaca interna. 2. The internal, which conveys its blood into the vena portæ.

HÆMORRHOIS. (From αιμα, blood, and εια, to flow.) Aimorrhois. The piles. A genus of disease in the class pyrexia and order hamorrhagia of Cullen. They are certain exorescences or tumours arising about the verge of the anus, or the inferior part of the intestinum rectum; when they discharge blood, particularly upon the patient's going to stool, the disease is known by the name of bleeding piles: but when there is no discharge, it is called blind piles. The rectum, as well as the colon, is composed of several muscular membranes, connected to each other by an intervening cellular substance; and as the muscular fibres of this intestine always tend, by their contraction, to lessen its cavity, the internal membrane, which is very lax, forms itself into several rugæ or folds. In this construction nature respects the use of the part, which occasionally gives passage to or allows the retention of the excrements, the hardness and bulk of which might produce considerable lacerations, if this intestine were not capable of dilatation. The arteries and veins subscrvient to this part are called hæmorrhoidal, and the blood that returns from hence is carried to the meseraic veins. The intestinum rectum is particularly subject to the hamorrhoids, from its situation, structure, and use; for whilst the course of the blood is assisted in almost all the other veins of the body, by the distension of the adjacent muscies, and the pressure of the neighbouring parts, the blood in the hamorrhoidal veins, which is to ascend against the natural tendency of its own weight, is not only destitute of these assistances, but is impeded in its passage: for, first, the large excrements which lodge in this intestine dilate its sides, and the different resistances which they form there are so many impediments obstructing the return of the blood; not in the large veins, for they are placed along the external surface of the intestine, but in all the capillaries which enter into its composition. Secondly, as often as these large excrements, protruded by others, approach near the anns, their successive pressure upon the internal coats of the intestine, which they

and for so long suspends its course; the necessary consequence of which is, a distension of the veins in proportion to the quantity of blood that fills them. Thirdly, in every effort we make, either in going to stool, or upon any other occasion, the contraction of the abdominal muscles, and the diaphragm pressing the contents of the abdomen downwards, and these pressing upon the parts contained in the pelvis, another obstruction is thereby opposed to the return of the blood, not only in the large veins, but also in the capillaries, which, being of too weak a texture to resist the impulse of the blood that always tends to dilate them, may thereby become varicose.

The dilatation of all these vessels is the primary cause of the hamorrhoids; for the internal coat of the intestine, and the cel-Inlar membrane which connects that to the muscular coat, are enlarged in proportion to the distension of the vessels of which they are composed. This distension, not being equal in every part, produces separate tumours in the gut, or at the verge of the anus, which increases according as the venal blood is obstructed in them, or circulates

there more slowly.

Whatever, then, is capable of retarding the course of the blood in the hæmorrhoidal veins, may occasion this disease. Thus, persons that are generally costive, who are accustomed to sit long at stool, and strain hard; pregnant women, or such as have had difficult labours; and likewise persons who have an obstruction in their liver; are for the most part afflicted with the piles; yet every one has not the hæmorrhoids, the different causes which are mentioned above being not common to all, or at least not having in all the same effects. When the hamorrhoids are once formed, they seldom disappear entirely, and we may judge of those within the rectum by those, which, being at the verge of the anus, are plainly to be seen. A small pile, that has been painful for some days, may cease to be so, and dry up; but the skin does not afterwards retain its former firmness, being more lax and wrinkled, like the empty skin of a grape. If this external pile swells and sinks again several times, we may perceive, after each return, the remains of each pile, though shrivelted and decayed, yet still left larger than before. The case is the same with those that are situated within the rectum; they may happen indeed never to return again, if the cause that produced them is removed; but it is probable that the excrements in passing out occasion a return of the swelling, to which the external ones are less liable: for the internal piles make a sort of knots or tumours in the intestine, which straightening the passage, the excrements, in passing out, occasion irritations there, that are more or less painful in prodilate, drives back the blood into the reins, portion to the efforts which the person

makes in going to stool; and it is thus these tumours become gradually larger. hæmorrhoids are subject to many variations; they may become inflamed from the above irritations to which they are exposed, and this inflammation cannot always be removed by art. In some, the inflammation terminates in an abscess, which arises in the middle of the tumour, and degenerates into a fistula. These piles are very painful till the abscess is formed. In others, the inflammation terminates by induration of the hamorrhoid, which remains in a man-ner schirrous. These never lessen, but must necessarily grow larger. This schirrous sometimes ulcerates, and continually discharges a sanies, which the patient perceives by stains on his shirt, and by its occasioning a very troublesome itching about the verge of the anus. These kinds of hamorrhoids sometimes turn cancerous. There are some hamorrhoids, and those of different sizes, which are covered with so fine a skin as frequently to admit blood to pass through This fine skin is only the internal coat of the rectum, greatly attenuated by the varicose distension of its vessels. The hæmorrhage may proceed from two causes; namely, either from an excoriation produced by the hardness of the excrements, or from the rupture of the tumefied vessels, which break by their too great distension. In some of these, the patient voids blood almost every time he goes to stool; in others not so constantly. We sometimes meet with men who have a periodical bleeding by the piles, not unlike the menses in women; and as this evacuation, if moderate, does not weaken the constitution, we may infer that it supplies some other evacuation. which nature either ceases to carry on, or does not furnish in due quantity; and hence also we may explain why the suppression of this discharge, to which nature had been accustomed, is frequently attended with dangerous diseases. The hæmorrhoids are sometimes distended to that degree as to fill the rectum, so that if the excrements are at all hard they cannot pass. In this case the excrements force the hæmorrhoids out of the anus, to procure a free passage, consequently the internal coat of the rectum, to which they are connected, yields to extension, and upon examining these patients commediately after having been at stool, a part of the internal coat of that gut is perceived forming a sort of ligature or stricture round the hamorrhoids. A difficulty will occur in the return of these, in proportion to their size, and as the verge of the anus is more or less contracted. If the bleeding piles come out in the same manner upon going to stool, it is then they void most blood, because the verge of the anus forms a kind of ligature above them.

HEMOSTASIA. (From αιμα, blood, and 15ημι, to stand.) A stagnation of blood.

ΠΕΜΟSTATICA. (From αιμα, blood, and

HEMOSTATICA. (From aims, 5100d, and 520, 10 stop.) Styptics. Medicines which stop hamorrhages.

Hagiospermum. (From appe, holy, and stepped, seed, so called from its reputed

virtues.) Wormseed.

HAGIOXYLUM. (From αγιος, holy, and ξυλοη, wood, so named because of its medi-

cal virtues.) Guaiacum.

HAIR. Pili. Capilli. The hairs of the human body are thin, elastic, dry filaments, arising from the skin. They consist of the bulb, situated under the skin, which is a vascular and nervous vesicle; and a trunk, which perforates the skin and cuticle, and is covered with a peculiar vagina. The colour of hair varies; its seat, however, is in the medullary juice. The hair, according to its situation, is differently named; thus, on the head it is called capilli; over the eyes, supercilia; cilia, on the margin of the eyelids; vibrissa, in the foramina of the nostrils; pili auriculares, in the external auditory passage; mystax, on the upper lip; and barba, on the lower jaw.

HALATIUM. (From ans, salt.) A clyster

composed chiefly of salt.

HALCHEMIA. (From αλς, salt, and χεω, to pour out.) The art of fusing salts.

HALELEUM. (From αλς, salt, and ελαιον,

oil.) A medicine composed of salt and oil.

HALICABACUM. (From ans, the sea, and manabes, night-shade; so called because it grows upon the banks of the sea.) See

Alkekengi.

HALIMUS. (From ans, the sea, because of its saltish taste.) Sea-purslane, said to be

antispasmodic.

Halinithum. (From ans, the sea, and vilgor, nitre.) Nitre, or rather rock

HALITUS. (From halite, to breathe

out.) A vapour or gaz.

HALLUCINATIO. (From hallucinor, to err.) A deprayed or erroneous imagination.

HALO. (From alog, an area or circle.) The red circle surrounding the nipple, which becomes somewhat brown in old people, and is beset with many sebaceous glands.

Halmyrones. (From applied, salted.) A term applied to the humours; it means acrimonious. It is also applied to fevers which communicate such an itching sensation as is perceived from handling salt substances.

HAMALGAN .. See Amalgam.

HAMPSTEAD WATER. A good chalybeate mineral water in the neighbourhood of London.

HAMULUS. (Dim. of hamus, a hook.) Hamus. A term in anatomy, applied to any hook-like process, as the hamulus of the pterygoid process of the sphanoid latter is employed largely as an internal

HAMUR. See Hamulus.

HAND. Manus. The hand is composed of the carpus or wrist, mctacarpus, and fingers. The arteries of the hand are the palmary arch and the digital arteries. The veins are the digital, the cephalic of the thumb, and the salvatella. The nerves are the cutaneus externus and internus.

HARDESIA. See Lapis Hibernicus. HARE-LIP. Lagocheilus. Labia lepo-A fissure or longitudinal division of one or both lips. Children are frequently born with this kind of malformation, particularly of the upper lip. Sometimes the portions of the lip, which ought to be united, have a considerable space between them; in other instances they are not much apart. The cleft is occasionally double, there being a little lobe, or small portion of the lip, situated between the two fissures. Every species of the deformity has the same appellation of hare-lip, in consequence of the imagined resemblance which the part has to the upper lip of a hare.

The fissure commonly affects only the lip itself. In many cases, however, it extends along the bones of the palate, even as far as the uvula. Sometimes these bones are totally wanting; sometimes they are only di-

vlded by a fissure.

Such a malformation is always peculiarly afflicting. In its least degree, it constantly occasions considerable deformity; and when it is more marked, it frequently hinders infants from sucking, and makes it indispensable to nourish them by other means. When the lower lip alone is affected, which is not most frequently the case, the child can neither retain its saliva, nor learn to speak, except with the greatest impediment. But when the fissure pervades the palate, the patient not only never articulates but very imperfectly, but cannot masticate nor swallow, except with great difficulty, on account of the food readily getting up into the nose.

HARMONIA. (From apo, to sit together.) Harmony. A species of symmetry or immoveable connection of bones, in Harmony. A species of synarthrosis, means of rough margins, not dentiform; in this manner most of the bones of the face

are connected together.

HARROGATE WATER. The villages of High and Low Harrogate are situate in the centre of the county of York, adjoining the town of Knaresborough. The whole of Harrogate, in particular, has long enjoyed considerable reputation, by possessing two kinds of very valuable springs; and, some years ago, the chalybeate was the only one that was used internally, whilst the sulphureous water was confined to external use. At present, however, the

medicine.

The sulphureous springs of Harrogate are four in number, of the same quality, though different in the degree of their powers. This water, when first taken up, appears perfectly clear and transparent, and sends forth a few air bubbles, but not in any quantity. It possesses a very strong sulphureous and fetid smell, precisely like that of a damp rusty gun barrel, or bilge-water. To the taste it is bitter, nauscous, and strongly saline, which is soon borne without any disgust. In a few hours of exposure this water loses its transparency, and becomes somewhat pearly, and rather greenish to the eye; its sulphureous smell abates, and at last the sulphur is deposited in the form of a thin film, on the bottom and sides of the vessel in which it is kept. The volatile productions of this water shew carbonic acid, sulphurated hydrogen, and azotic gas.

The sensible effects which this water excites, are often a head-ach and giddiness on being first drank, followed by a purgative operation, which is speedy and mild, without any attendant gripes; and this is the only apparent effect the exhibition of this

water displays.

The diseases in which this water is used are numerous, particularly of the alimentary canal, and irregularity of the bilious secretion. Under this water the health, appetite, and spirits improve; and, from its opening effects, it cannot fail to be useful in the costive habit of hypochondriasis. But the highest recommendation of this water has been in cutaneous diseases, and for this purpose it is universally employed, both as an internal medicine, and an external application: in this united form, it is of particular service in the most obstinate and complicated forms of cutaneous affections; nor is it less so in states and symptoms supposed connected with worms, especially with the round worm and ascarides, when taken in such a dose as to prove a brisk purgative; and in the latter case also, when used as a elyster, the ascarides being chiefly confined to the rectum, and therefore within the reach of this form of medicine. From the union of the sulphurcous and saline ingredients, the benefit of its use has been long established in hamorrhoidal affections.

A course of Harrogate waters should be conducted so as to produce sensible effects on the bowels; half a pint taken in the morning, and repeated three or four times, will produce it, and its nauseating taste may be corrected by taking a dry biscuit, or a bit of coarse bread, after it. The course must be continued, in obstinate cases, a period of some months, before a cure can be

HARTFELL WATER. This mineral

water is near Moffat, in Scotland. it is a chalvbeate dissolved by the suiphuric acid, and is much celebrated in scrophulous affections, and cutaneous diseases. It is used no less as an external application, than drank internally. The effects of this water, at first, are some degree of drowsiness, vertigo, and pain in the head, which soon go off, and may be liastened by a slight purge. It produces generally a flow of urine, and an increase of appetite. It has acquired much reputation also in old and languid ulcers, where the texture of the diseased part is very lax, and the discharge profuse and ill conditioned.

The dose of this water is more limited than that of most of the mineral springs which are used medicinally. It is of importance in all cases, and especially in delicate and irritable habits, to begin with a very small quantity, for an over dose is apt to be very soon rejected by the stomach, or to occasion griping and disturbance in the intestinal canal; and it is never as a direct purgative that this water is intended to be employed. Few patients will bear more than an English pint in the course of the day; but this quantity may be long continued in. It is often advisable to warm the water, for delicate stomachs, and this may be done without occasioning any material change in its properties.

Hartshorn. See Cornu cervi. Hartshorn shavings. See Cornu cervi. Hart's tongue. See Scolopendrium.

Hart-wort. See Seseli.

Hart wort of Marseilles. See Seseli Marsiliense.

Hay, came's. See guncus odoratus.

HEAD. Caput. The superior part of the body placed upon the neck, containing the cerebrum, cerebellum, and medulla oblongata. It is divided into the face and hairy part. On the latter is observed the vertex, or crown of the head; the sinciput, or fore part ; the occiput, or hinder part. For the former, see Face. For the bones and mus-cles of the head, see Cranium. The common integuments of the head are called the

HEARING. Auditus. This sense is placed, by physiologists, among the animal actions. It is a sensation by which we hear the sound of sonorous bodies. The organ of hearing is the soft portion of the auditory nerve which is distributed on the vestibule, semicircular canals, and coch-

HEART. Cor. A hollow muscular viscus, situated in the cavity of the pericardium for the circulation of the blood. It is divided externally into a base, or its broad part; a superior and an inferior surface, and an anterior and posterior margin. Internally, it is divided into a right and left ventricle. The situation of the heart is oblique, not transverse; its base being

placed on the right of the bodies of the vertebræ, and its apex obliquely to the sixth rib on the left side ; so that the left ventricle is almost posterior, and the right anterior. Its inferior surface lies upon the diaphragm. There are two cavities adhering to the base of the heart, from their resemblance called auricles The right auricle is a muscular sac, in which are four apertures, two of the venæ cavæ, an opening into the right ventricle, and the opening of the coronary vein. The left is a similar sac, in which there are five apertures, viz. those of the four pulmonary veins, and an opening into the left ventricle. The cavities in the base of the heart are called ventricles: these are divided by a fleshy septum, called septum cordis, into a right and left. Each ventricle has two orifices; the one suricular, through which the blood enters, the other arterious, through which the blood passes out. These four orifices are supplied with valves, which are named from their resemblance; those at the arterious orifices are called the semilunar; those at the orifice of the right auricle, mitral; and those at the orifice of the left auricle, tricuspid. The valve of Eustachius is situated at the termination of the vena cava inferior, just within the auricle. The subtance of the heart is muscular, its exterior fibres are longitudinal, its middle transverse, and its anterior oblique. The internal superfices of the ventricles and auricles of the heart are invested with a strong and smooth membrane, which is extremely arritable. The vessels of the heart are divided into common and proper. The common are, 1. The aorta, which arises from the left ventricle. 2. The pulmonary artery, which originates from the right ventricle. 3. The four pulmonary veins, which terminate in the left auricle. 4. The venæ cavæ, which evacuate themselves into the right auricle. The proper vessels are, 1. The coronary arteries, which arise from the aorta, and are distributed on the heart. 2. The coronary veins, which return the blood into the right auricle. The nerves of the heart are branches of the eighth and great intercostal pairs. The heart of the focus differs from that of the adult, in having a foramen ovale, through which the blood passes from the right auricle to the left.

Heart's ease. See Viola tricolor.

Heat. See Caloric. Heat, absolute. This term is applied to the whole quantity of caloric existing in a body in chymical union.

Heat, animal. See Animal heat.

HEAT, FREE. If the heat which exists in in any substance be from any cause forced in some degree to quit that substance, and to combine with those that surround it, then such heat is said to be free, or sensible, until the equilibrium is restored.

HEAT, LATENT. When any body is in

equilibrium with the bodies which surround it with respect to its heat, that quantity which it contains is not perceptible by any external sign or organ of sense, and is termed combined caloric, or latent heat.

Heat, sensible. See Heat, free. Heavy carbinated hydrogen gas.

Carbonated hydrogen gar heavy. H.ctic fever. (From ¿c, nabit.) See

(From hereo, to stick, be-HEDERA. cause it attaches itself to tres and old walls.) The name of a genus of plants in the Linnwan system Class, Pentandria.

Order, Monogyma. The ivy.

HEDERA ARBOURA. The ivy. The leaves of this tree, Hedera helix of Linnwas, have little or no unell, but a very nauseous taste. Haller informs us, that they are recommended in Germany against the atrophy of children. By the common people of this country they are sometimes applied to running sales, and to keep issues The berrics were supposed by the antients to have a purgative and emetic quality; and an extract was made from them by water, called by Quercetanius extractum purgans. Later writers have re-commended them in small doses as alexipharm c and sudorific: it is said, that in the plague at London, the powder of them was given in vinegar, or white wine, with good success. It is from the stalk of this tree that a resinous juice exudes very plentifully in warm climates. See Gummi hederre.

HEDERA RELIX. The systematic name of the ivy-tree. See Hedera arborea.

HEDERA TERRESTRIS. Ground-ivy, or gill. Glecoma hederacea of Linnaus:-foliis reniformibus crenatis. This indigenous plant has a peculiar strong smell, and a bitterish somewhat aromatic taste. It is one of those plants which was formerly much esteemed for possessing virtues that, in the present age, cannot be detected. In obstinate coughs it is a favourite remedy with the poor.

Hedge hyssop. See Gratiola. Hedge mustard. See Erysimum.

Hedge mustard, stinking. See Alliaria. HEDRA. The anus. Excrement. A frac-

HEDVOSMOS. Mint.

HELCOMA, Ulceration. HELCOMA. (From 60x200, an ulcer.) An ulcer in the external or internal superfices of the cornea, known by an excavation and oozing of purulent matter from the cornea.

HELCYDRION. (From same, an ulcer, and Helcydrium. A moist ulcevoag, water.)

rous pustule.

HELCYSTER. (From Axa, to draw.) instrument for extracting the fœtus.

HELENIUM. (From Helene, the island where they grew.) See Enula campana. HELICALIS MAJOR. See Helicis major.

HELICALIS MINOR. See Helicis minor.

HELICIS MAJOR. A proper muscle of the ear, which depresses the part of the cartilage of the ear mito which it is inscrted; t lies upon the upper or sharp point of the helix, or outward ring, arising from the upper and acute part of the helix anteriorly, and passing to be inserted into its cartilage a little above the tragus.

HELICIS MINOR. A proper muscle of the ear, which contracts the fissure of the ear: it is situated below the helicis major, upon part of the helix. It arises from the inferior and anterior part of the helix, and is inserted into the crus of the helix, near the fissure in the cartilage opposite to the

coucha.

HELIOTROPH SUCCUS. See Bezetta cærulea.

HELIX. (Ελίξ, from αλώ, to turn about.) The external circle or border of the outer

ear, that curls inwards.

HELLEBORASTER. (From ENDEGOES, hellebore.) Fetid hellebore, or bear's foot. He'leborus fatidus of Linaæus : caule multifloro folioso; foliis pedatis. The le ves of this indigenous plant are recommended by many as possessing extraordinary anthelmintic powers. The smell of the recent plant is extremely fetid, and the taste is bitter and remarkably acrid, insomuch that, when chewed, it excoriates the mouth and fances. It commonly operates as a cuthartic, sometimes as an emotic, and, in large doses, proves highly deleterious.

Hellebore, black. See Helleborus niger.
Hellebore, white. See Helleborus albus.

HELLEBORUS. (Ελλεδοβος: παρά το τη βορα ελλεν, because it de troys, if caten.)
The name of a genus of plants in the Linnæan system. Class, Polyandria. Order. Polyginia Hellchore.

ALBUS. Form.

ALBUS. White helle-HELLEBORUS album. Elleborum album. bore, or veratrum. Veratrum album of Linnæus:-racemo supradecomposito, corollis erectis. This plant is a native of Italy, Switzerland, Austria, and Russia. Every part of the plant is extremely acrid and poisonous. The dried root has no particular smell, but a durable, nauseous, and bitter taste, burning the mouth and fauces: when powdered, and applied to issues, or ulcers, it produces griping and purging; if snuffed up the nose, it proves a violent sternutatory. Gesner made an infusion of half an ounce of this root with two ounces of water; of this he took two drachms, which produced great heat about the scapulæ and in the face and head, as well as the tongue and throat, followed by singul. tus, which continued till vomiting was exci. ted. Bergius also experienced very distress. ing symptoms, upon tasting this infusion. The root, taken in large doses, discovers such acrimony, and operates by the stomach and rectum with such violence, that blood

is usually discharged; it likewise acts very powerfully upon the nervous system, producing great anxiety, tremors, vertigo, syncope, aphonia, interrupted respiration, sinking of the pulse, convulsions, spasms, Upon opening those who and death. have died of the effects of this poison, the stomach discovered marks of inflammation, with corrosions of its internal coat The ancients exhibited this active medicine in maniacal cases, and it is said with success. The experience of Greding is somewhat similar: out of twenty-eight cases, in which he exhibited the bark of the root collected in the spring, five were cured. In almost every case that he relates, the medicine acted more or less upon all the excretions; vomiting and purging were very generally produced, and the matter thrown off the stomach was constantly mixed with bile; a florid redness frequently appeared on the face, and various cutaneous efflorescences upon the body; and, in some, pleuritic symptoms, with fever, supervened, so as to require bleeding; nor were the more alarming affections of spasms and convulsions unfrequent. Critical evacuations were also very evident; many sweating profusely, in some the urine was considerably increased, in others the saliva and mucous discharges : and uterine obstructions, of long duration, were often removed by its use. Veratrum has likewise been found useful in epilepsy, and other convulsive complaints: but the diseases in which its efficacy seems least equivocal are those of the skin, as itch, and different prurient eruptions, herpes, morbus pediculosus, lepra, scrofula, &c.; and in many of these it has been successfully employed, both internally and externally. As a powerful stimulant and irritating medicine, its use has been resorted to in desperate cases only, and even then it ought first to be exhibited in very small doses, as a grain, and in a di-luted state, and to be gradually increased, according to the effects, which are generally of an alarming nature.

HELLEBORUS FORTIDUS. The systematic name of the footid hellebore. See Hellebo-

raster.

HELLEBORUS NIGER. Melampodium. Black hellebore, or Christmas rose. Helleborus niger of Linnæus: -scapo subbiflore subnudo ; foliis pedatis. The root of this exotic plant is the part employed medicinally: its taste, when fresh, is bitterish, and somewhat acrid: it also emits a nauseous acrid smell; but, being long kept, both its sensible qualities and medicinal activity suffer very considerable diminu-tion. The ancients esteemed it as a powerful remedy in maniacal cases. At present it is exhibited principally as an alterative, or, when given in a large dose, as a purgative. It often proves a very powerful emmenagogue in plethoric habits,

where steel is ineffectual, or improper. It is also recommended in dropsies, and some cutaneous diseases.

Helmet-flower, yellow. See Anthora.

HELMINTHAGOGUES. (Helminthagoga; from expers, a worm, and exper, to drive out.) Medicines which destroy and expel worms. See Anthelmintics.

HELMINTHIASIS. (Ελμινθιασικ, from ελμινθια, which signifies any species of worm.) Λ disease in which worms, or the larvæ of worms, are bred under the skin, or some external part of the body. It is endemial to Martinique, Westphalia, Transylvania, and some other places.

HELMINTHOCHORTON. See Carolina corsicana.

Helodes. (From 3005, a marsh.) A term applied to fevers generated from marsh miasma.

HELOSIS. (From elaw, to turn.) As aversion to turning up of the eyelids.

HELXINE. (From Exam, to draw; so called because it sticks to whatever it touches.) Pellitory of the wall.

HEMALOFIA. Corruptly written for hemerolopia.

HEMATURIA. See Hematuria.

HEMERALOPS. (From nusga, the day, and ay, eye.) One who can see but in the day-time.

HEMEROLOPIA. (From nuega, a day, and on la, to see.) A defect in the sight, which consists in being able to see in the day-time, but not in the evening. following is Scarpa's description of this curious disorder. Hemeralopia, or nocturnal blindness, is properly nothing but a kind of imperfect periodical amaurosis, most commonly sympathetic with the stomach. Its paroxysms come on towards the evening, and disappear in the morning. The disease is endemic in some countries. and epidemic, at certain seasons of the year, in others. At sun-set, objects ap-pear to persons affected with this complaint as if covered with an ash-coloured veil, which gradually changes into a dense cloud, which intervenes between the eyes and surrounding objects. Patients with hemerolopia have the pupil, both in the day and night time, more dilated, and less moveable, than it usually is in healthy eyes. The majority of them, however, have the pupil more or less moveable in the daytime, and always expanded and motionless at night. When brought into a room faintly lighted by a candle, where all the bystanders can see tolerably well, they cannot discern at all, or in a very feeble manner, scarcely any one object; or they only find themselves able to distinguish light from darkness, and at moon light their sight is still worse. At day-break they recover their sight, which continues perfect all the rest of the day till sun-set.

HEMICRANIA. (From nuious, half, and ngavior, the head.) A pain that affects only

one side of the head.

HENICEHAUNIOS. (From nuious, half, and xuew, to cut; so called because it was cut half way down. A bandage for the back and breast.

HEMICRANIA CLAVUS. Pain resembling

the driving a nail into the head.

HEMIOPSIA. (From nuious, half, and wt, an eye.) A defect of vision, in which the person sees the half, but not the whole of an object.

HEMIPAGIA. (From nuious, half, and rayios, fixed.) A fixed pain on one side

of the head.

HEMIPLEGIA. (From ημίσυς, half, and πλισσω, to strike.) A paralytic affection of one side of the body. See Paraly-

Hemlock. See Cicuta.

Hemlock, dropwort. See Ocnanthe.

Hemlock, water. See Cicuta aquatica. · Hemorrhage from the lungs. See Hamop-

Hemorrhage from the nose. See Epistaxis. Hemorrhage from the penis. See Hama-

Hemorrhage from the stomach. See Hamatemesis.

Hemp. See Cannabis.

Hemp-agrimony. See Eupatorium. Hemp, water. See Eupatorium.

Henbaue. See Hyosciamus. HEPAR. (1172g, the liver.) See Liver.

HFPAR SULPHURIS. Liver of sulphur. This is a sulphuret made either with potash or soda. It has a disagreeable foctid smell, but it is in high esteem as a medicine to decompose corrosive sublimate, when taken into the stomach. See Sulphuretum po-

HEPAR UTERINUM. The placenta. HEPATALGIA. (From ηπαρ, the liver, and αλγ , pain.) Pain in the liver.

HEPATIC. Any thing belonging to the liver.

HEPATIC AIR. Hepatic airs consist of inflammable air combined with sulphur, which exists in very different proportions. Where each ingredient is combined merely to saturation, it is called simply sulphurated hydrogen; but where the sulphur is in exeess, it is termed super sulphurated hydro-Sulphurated hydrogen, combined with any base, forms a hydrosulphuret, and may be also called an hepatule, to distinguish it from an hepar, which is the union of sulphur singly with a basis.

HEPATIC ARTERY. Arteria hepa-The artery which nourishes the substance of the liver. It arises from the exliac, where it almost touches the point of the lobulus Spigelii. Its root is covered by the pancreas; it then turns a little forwards, and passes under the pylorus to the porta

of the liver, and runs betwixt the biliary ducts and the vena portæ, where it divides into two large branches, one of which enters the right, and the other the left lobe of the liver. In this place it is enclosed along with all the other vessels in the capsule of Glisson.

HEPATIC DUCT. Ductus hepaticus. The trunk of the biliary pores. It runs from the sinus of the liver towards the duodenom, and is joined by the cystic duct, to form the duetus communis choledochus, See Biliary ducts.

HEPATIC VEINS. See Cave hepatica,

and Vena porte.

HEPATICA. (From wag, the liver; so called because it was thought to be useful in diseases of the liver.) The herb liverwort. See Hepatica terrestris.

HEPATICA NOBILIS. Herba trinitatis. Hepatica, or herb trinity. This plant Ancmone hepatica of Linnaus, possesses mildly adstringent and correborant virtues, with which intentions infusions of it have been drank as tea, or the powder of the dry leaves given, to the quantity of half a spoonful at a time.

HEPATICA TERRESTRIS. Jecoraria. Liverwort. This is the Marchantia polymopha, which is very common in this country. It has a penetrating though mild pungency, and bitter taste, sinking, as it were, into the tongue. It is recommended as an aperient, resolvent, and antiscorbutic, and, though seldom used in this country, appears to be a plant of no inconsiderable virtue.

HEPATIRRHÆA. (From »πας, the liver, and gsα, to flow.) A diarrhæa, in which portions of flesh, like liver, are

voided.

HEPATITIS. (From norag, the liver.) Inflammatio hepatis. An inflammation of the liver. A genus of disease in the class pyrexie, and order phlegmasia, of Cullen, who defines it, "febrile affection, attended with tension and pain of the right hypochondrium, often pungent, like that of a pleurisy, but more frequently dull, or obtuse; a pain at the clavicle and at the top of the shoulder of the right side; much uneasiness in lying down on the left side; difficulty of breathing; a dry cough, vomiting, and hiccough."

Hepatis has generally been considered of two kinds; one the acute, the other

Besides the causes producing other inflammations, such as the application of cold, external injuries from contusions, blows, &c. this disease may be oceasioned by certain passions of the mind, by violent exercise, by intense summer heats, by long continued intermittent and remittent fevers, and by various solid concretions in the substance of the liver. In warm climates,

this viscus is more apt to be affected with inflammation than perhaps any other part of the body, probably from the increased secretion of bile which takes place when the blood is thrown on the internal parts, by an exposure to cold; or from the bile becoming acrid, and thereby exciting an irri-

tation in the part.

The acute species of hepatitis comes on with a pain in the right hypochondrium, extending up the clavicle and shoulder; which is much increased by pressing upon the part, and is accompanied with a cough, oppression of breathing, and difficulty of laying on the side affected; together with nausea and sickness, and often with a vomiting of bilious matter. The urine is of a deep saffron colour, and small in quantity; there is loss of appetite, great thirst, and costiveness, with a strong, hard, and frequent pulse; and when the disease has continued for some days, the skin and eyes become tinged of deep yellow.

The chronic species is usually accompanied with a morbid complexion, loss of appetite and flesh, costiveness, indigestion, flatulency, pains in the stomach, a yellow tinge of the skin and cyes, clay-coloured stools, high-coloured urine, depositing a red sediment and ropy mucus; an obtuse pain in the region of the liver, extending to the shoulder, and not unfrequently with a

considerable degree of asthma.

These symptoms are, however, often so mild and insignificant as to pass almost unnoticed; as large abscesses have been found in the liver, upon dissection, which in the person's life-time had created little or no inconvenience, and which we may presume to have been occasioned by some previous inflammation.

Hepatitis, like other inflammations, may end in resolution, suppuration, gangrene, or scirrhus; but its termination in gangrene

is a rare occurrence.

The disease is seldom attended with fatal consequences of an immediate nature, and is often carried off by hæmorrhage from the nose, or hæmorrhodal vessels, and likewise by sweating, by a diarrhea, or by an evacuation of urine, depositing a copious sediment. In a few instances, it has been observed to cease on the appearance of

When suppuration takes place, as it generally does before this forms an adhesion with some neighbouring part, it is usually discharged by the different outlets with which this part is connected, as by coughing, voniting, or by an abscess breaking outwardly; but in some instances,

erysipelas in some external part.

of the abdomen, where no such adhesion has been formed.

On dissection, the liver is often found much enlarged, and hard to the touch; its

the pus has been discharged into the cavity

colour is more of a deep purple than what is natural, and its membranes are more or less affected by inflammation. Dissections likewise show that adhesions to the neighbouring parts often take place, and that large abscesses, containing a considerable quantity of pus, are often found in its substance.

HEPATITIS CYSTICA. Inflammation of the gall-bladder.

HEPATITIS PARENCHEMATOSA. Inflammation in the inner substance of the liver.

HEPATITIS PERITONEALIS. Inflammation in the peritoneum covering the liver.

HEPATOCELE. (From ηπας, the liver, and κηλη, a tumour.) An hernia, in which a portion of the liver protrudes through the abdominal parietes.

HEPATORIUM. The same as Eupato-

rium.

Hepatule. See Sulphurated hydrogen gas.

Hephestias (From Hoasse, Vulcan, or

fire.) A drying plaster of burnt tiles.

HEPIALUS. (From \$7105, gentle.) A mild quotidian fever.

Heftapharmacum. (From ετ/α, seven, and φαςμαακονα, medicine) A medicine composed of seven ingredients, the principal of which were ceruss, litharge, wax, &c.

Heptaphyllum. (From επ/a, seven, and φυλλον, a leaf; so named because it consists of seven leaves.) See Tormentilla.

HEPTAPLURUM. (From επ/α, seven, and πλευςα, a rib: so named from its having seven ribs upon the leaf.) The herb plantain.

HERBA BRITANNICA. See Hydrolapa-

thum.

HEREA SACRA See Verbena.

Merb-bennet. See Caryophyliata.

Herb-mustich. See Marum vulgare.

Herb-trinity. See Hepatica nobilis.

Hercules's allheal. See Panax.

HERCULES BOVII. Gold and mercury dissolved in a distillation of copperas, nitre, and sea-salt. Violently cathartic.

HEREDITARY DISEASE. (From heres, an heir.) A disease which is continued from

parents to their children.

HERMAPHRODITE. (From Eguns, Mercury, and Apgodil, Venus, i. e. partaking of both sexes.) The true hermaphrodite of the ancients was, the man with male organs of generation, and the female stature of body, that is, narrow chest and large pelvis; or the woman with female organs of generation, and the male stature of body, that is, broad chest and narrow pelvis. The term is now, however, used to express any lusus natura, wherein the

of both sexes.

(From Equis, Mercury.) HERMETIC. In the language of the antient chymists, Hermes was the father of chymistry, and the Hermetic seal was the closing the end of a glass vessel while in a state of fusion, according to the usage of chymists.

Hermodactyl. See Hermodactylus.

HERMODACTYLUS. (Egmodanlunos. Etymologists have always derived this word from Eguns, Mercury, and Sanlunes, a finger. It is probably named from Hermus, a river in Asia, upon whose banks it grows, and fannolog, a date, which it is like.) The root of a species of colchicum, not yet ascertained, but supposed to be the Colchicum illyricum of Linnaus, of the shape of a heart, flattened on one side, with a furrow on the other, of a white colour, compact and solid, yet easy to cut or powder. This root, which has a viscous, sweetish, farinaceous taste, and no remarkable smell, is imported from Turkey. Its use is totally laid aside in the practice of the present day. Formerly, the roots were esteemed as cathartics, which power is wanting in those that reach this country.

HERNIA. (From egros, a branch; from its protruding forward.) A rupture. Surgeons understand, by the term hernia, a tumour formed by the protusion of some of the viscera of the abdomen out of that cavity into a kind of sac, composed of the portion of peritoneum, which is pushed before them. However, there are certainly some cases which will not be comprehended in this definition; either because the parts are not protruded at all, or have no hermal sac, as the readers will learn in the course

of this article.

The places in which these swellings most frequently make their appearance, are the groin, the navel, the labia pudendi, and the upper and fore-part of the thigh; they do also occur at every point of the anterior part of the abdomen; and there are several less common instances, in which hernial tumours present themselves at the foramen ovale, in the perinentn, in the vagina, at the ischiatic notch, &c.

The parts which, by being thrust forth from the cavity, in which they ought naturally to remain, mostly produce hernix, are either a portion of the omentum, or a part of the intestinal, canal, or both together. But the stomach, the liver, the spleen, uterus, ovaries, bladder, &c. have been known to form the contents of some

hernial tumours.

From these two circumstances of situation and contents, are derived all the different appellations by which herniæ are distinguished. If a portion of intestine only forms the contents of the tumour, it is called entergele; if a piece of omentum

parts of generation appear to be a mixture only, epiplocele; and if both intestine and omentum contribute mutually to the formation of a tumour, it is called entero epiplocele. When the contents of a hernia are protruded at the abdominal ring, but only pass as low as the groin, or labium pudendi, the case receives the name of bubonocele, or inguinal hernia; when the parts descend into the scrotum, it is called an oscheocele, or scrotul hernia. The crural and femoral hernia, is the name given to that which takes place below Poupart's ligament. When the bowels protrude at the navel, the case is named an exomphalos, or umbilical hernia; and ventral is the epithet given to the swelling, when it occurs at any other promiscuous part of the front of the abdomen. The congenital rupture, is a very particular case, in which the protruded viscera are not covered with a common hernial sac of peritoneum, but are lodged in the cavity of the tunica vaginalis, in contact with the testicle; and, as must be obvious, it is not named, like herniæ in general, from its situation, or contents but from the circumstances of its existing from the time of birth.

HER

When the hernial contents lie quietly in the sac, and admit of being readily put back into the abdomen, it is termed a reducible hernia; and when they suffer no constriction, yet cannot be put back, owing to adhesions, or their large size in relation to the aperture, through which they have to pass, the hernia is termed irreducible. incarcorated; or strangulated herma, signifies one which not only cannot be reduced. but suffers constriction: so that, if a piece of intestine be protruded, the pressure to which it is subjected stops the passage of its conten's onward towards the anus, makes the bowel inflame, and brings on a train of most alarming and often fatal consequences.

The general symptoms of a hernia, which is reducible and free from strangulation, are-an indolent tumour at some point of the parietes of the abdomen; most frequently descending out of the abdomi-nal ring, or from just below Poupart's ligament, or else out of the navel; but occasionally from various other situations.

The swelling mostly originates suddenly, except in the circumstances above related; and it is subject to a change of size, being smaller when the patient lies down upon his back, and larger when he stands up, or holds his breath. The tumour frequently diminishes when pressed, and grows large again when the pressure is removed. size and tension often increase after a meal. or when the patient is flatulent. Patients with hernia, are apt to be troubled with cholic, constipation, and vomiting, in consequence of the unnatural situation of the bowels Very often, however, the functions. of the viscera seem to suffer little or no interruption.

If the case be an enteroccle, and the portion of the intestine be small, the tumour is small in proportion; but though small, yet, if the gut be distended with wind, inflamed, or have any degree of stricture made on it, it will be tense, resist the impression of the finger, and give pain upon being handled. On the contrary, if there be no stricture, and the intestine suffers no degree of inflammation, let the prolapsed piece be of what length it may, and the tumour of whatever size, yet the tension will be little, and no pain will attend the handling it; upon the patient's coughing, it will feel as if it was blown into; and, in general, it will be found very easily returnable. A guggling noise is often made when the bowel is ascending.

If the hernia be an epiplocele, or one of the omental kind, the tumour has a more flabby and a more unequal feel; it is in general perfectly indolent, is more compressible, and (if in the scrotum) is more obiong and less round than the swelling occasioned in the same situation by an intestinal hernia; and, if the quantity be large, and the patient an adult, it is, in some measure, distinguishable by its greater

weight.

If the case be an entero-epiplocele, that is, one consisting of both intestine and omentum, the characteristic marks will be less clear in either of the simple cases; but the disease may easily be distinguished from every other one, by any body in the habit of making the examination.

HERNIA CEREBRI. Fungus cerebri. This name is given to a tumour which every now and then rises from the brain, through an ulcerated opening in the dura matter, and protrudes through a perforation in the cranium, made by the previous application

of the trephine.

HERNIA CONGENITA. (So called because it is, as it were, born with the person.) This species of hernia consists in the adhesion of a protruded portion of intestine or omentum to the testicle, after its descent into the scrotum. This adhesion takes place while the testicle is yet in the abdomen. Upon its leaving the abdomen it draws the adhering intestine, or omentum, along with it into the scrotum, where it forms the hernia congenita.

From the term congenital, we might suppose that this herna always existed at the time of birth. The protrusion, however, seldom occurs till after this period, on the operation of the usual exciting causes of hernia in general. The congenital hernia does not usually happen till some months after birth; in some instances not till a late period. Mr. Hey relates a case, in which a hernia congenita was first formed in a young man, aged sixteen, whose right testis had, a little while before the attack of the disease, descended into the scrotum.

It seems probable that, in cases of herma congenita, which actually take place when the testicle descends into the scrotum before birth, the event may commonly be referred, as observed above, to the testicle having contracted an adhesion to a piece of intestine, or of the omentum, in its passage to the ring. Whrisberg found one testicle, which had not passed the ring, adhering, by means of a few slender filaments, to the omentum, just above this aperture, in an infant that died a few days after birth.

Excepting the impossibility of feeling the testicle in hernia congenita, as we can in most cases of bubonocele, (which criterion Mr. Samuel Cooper, in his Surgical Dictionary, observes Mr. Pott should have mentioned,) the following account is very excellent. "The appearance of a hernia, in very early infancy, will always make it probable that it is of this kind; but in an adult, there is no reason for supposing his rupture to be of this sort, but his having been afflicted with it from his infancy; there is no external mark, or character, whereby it can be certainly distinguished from the one contained in a common hernial sac; neither would it be of any material use in practice, if there was.

HERNIA CRURALIS. Femoral her-The parts composing this kind of hernia nia are always protruded under Poupart's ligament, and the swelling is situted towards the inner part of the bend of the thigh. The rupture descends on the side of the femoral artery and vein, between these vessels and the os pubis. Females are particularly subject to this kind of rupture, in consequence of the great breadth of their pelvis, while in them the inguinal herma is rare. It has been computed, that nineteen out of twenty married women, afflicted with hernia, have this kind; but that not one out of an hundred unmarried females, or out of the same number of men, have this form of the disease. situation of the tumour makes it liable to be mistaken for an enlarged inguinal gland; and many fatal events are recorded to have happened from the surgeon's ignorance of the existence of the disease. A gland can only become enlarged by the gradual effects of inflammation; the swelling of a crural hernia comes on in a momentary and sudden manner; and, when strangulated, occasions the train of symptoms described in the account of the inguinal hernia, which symptoms an enlarged gland could never Such circumstances seem to be sufficiently discriminative; though the feel of the two kinds of swelling is often not in itself enough to make the surgeon decided in his opinion. A femoral hernia may be mistaken for a bubonocele, when the expanded part of the swelling li s over Poupart's ligament As the taxis and operation for the first case ought to be done

differently from those for the latter, the error may lead to very bad consequences. The femoral hernia, however, may always be discriminated, by the neck of the tumour having Poupart's ligament above it. In the bubonocele, the angle of the pubes is behind and below this part of the sac; but in the femoral hernia, it is on the same horizontal level, a little on the inside of it.

Until very lately, the stricture, in cases of fenioral hernia, was always supposed to be produced by the lower border of the external oblique muscle, or, as it is termed, Poupart's ligament. A total change of surgical opinion on this subject has, however, latterly taken place, in consequence of the accurate observations first made in 1768, by Gimbernat, surgeon to the king of Spain. In the crural hernia, (says he,) the aperture through which the parts issue is not formed by two bands, (as in the inguinal hernia,) but it is a foramen, almost round, proceeding from the internal margin of the crural arch, (P upart's ligament,) near its insertion into the branch of the os pubis, between the bone and the iliac vein; so that, in this hernia, the branch of the os pubis is situated more internally than the intestine, and a little behind; the vein externally, and behind; and the internal border of the arch before. Now it is this border which always forms the strangulation.

HERNIA FLATULENTA. A swelling of the side, caused by air that has escaped through the plenra.

HERNIA HUMORALIS.

HERNIA GUTTURIS. Bronchocele, or tumour of the bronchial glands.

Orchitis, Swelled testicle. A very common symptom attending a gonorrhæa, is a swelling of the testicle, which is only sympathetic, and not venereal, because the same symptoms follow every kind of irritation on the urethra, whether produced by strictures, injections, or bougies. Such symptoms are not similar to the actions arising from the application of venereal matter, for suppuration seldom occurs, and, when it does, the matter is not venereal. The swelling and inflammation appear suddenly, and as suddenly disappear, or go from one testicle to the other. The epidydimis remains swelled,

The first appearance of swelling is generally a soft pulpy fulness of the body of the testicle, which is tender to the touch; this increases to a hard swelling, accompanied with considerable pain. The epidydimis, towards the lower end of the testicle, is generally the hardest part. The hardness and swelling, however, often pervade the whole of the epidydimis. The spermatic cord, and especially the vas differens, are often thickened, and sore to the touch.

however, even for a considerable time af-

terwards.

The spermatic veins sometimes become varicose. A pain in the loins, and sense of weakness there, and in the pelvis, are other casual symptoms. Cholicy pains; uneasiness in the stomach and bowels; flatulency; sickness; and even vomiting; are not unfrequent. The whole testicle is swelled, and not merely the epidydimis, as has been asserted.

The inflammation of the part most probably arises from its sympathizing with the urethra. The swelling of the testicle coming on, either removes the pain in making water, and suspends the discharge, which do not return till such swelling begins to subside, or else the irritation in the urethra, first ceasing, produces a swelling of the testicle, which continues till the pain and discharge return; thus rendering it doubtful which is the cause and which the effect. Occasionally, however, the discharge has become more violent, though the testicle has swelled; and such swelling has even been known to occur after the discharge has ceased; yet the latter has returned with violence, and remained as long as the hernia humoralis.

Hernia humoralis, with stoppage of the discharge, is apt to be attended with strangury. A very singular thing is, that the inflammation more frequently comes on when the irritation in the urethra is going off, than when at its height.

The enlargements of the testiole, from cancer and scrophula, are generally slow in their progress: that of an hernia humoralis

Inflamma-

very quick.
HERNIA INCARCERATA. rated hernia. Strangulated hernia, or a hernia with stricture. The symptoms are a swelling in the groin, or scrotum, resisting the impression of the fingers. If the hernia be of the intestinal kind, it is generally painful to the touch, and the pain is increased by coughing, sneezing, or standing upright. These are the very first symptoms; and, if they are not relieved, are soon followed by others, viz. a sickness at the stomach, a frequent reaching, or inclination to vomit, a stoppage of all discharge per anum, attended with frequent hard pulse, and some degree of fever. These are the first symptoms; and if they are not appeased by the return of the intestine, that is, if the attempts made for this purpose do not succeed, the sickness becomes more troublesome, the vomiting more frequent, the pain more intense, the tension of the belly greater, the fever high-er, and a general restlessness comes on, which is very terrible to bear. When this is the state of the patient, no time is to be lost; a very little delay is now of the ut-most consequence; and if the one single remedy which the disease is now capable of be not administered immediately, it will generally baffle every other attempt.

This remedy is the operation whereby the parts eng ged in the stricture may be set free. If this be not now performed, the vomiting is soon exchanged for a convulsive hiccough, and a frequent gulping up of bilious matter; the tension of the belly, the restles ness, and fever, having been considerably increased for a few hours, the patient suddenly becomes perfectly easy, the belly subsides, the pulse, from having been hard, full, and frequent, becomes low, languid, and generally interrupted; and the kin, especially that of the limbs, cold and moist; the eyes have now a languor and a glassiness, a lack lustre, not easy to be described; the tumour of the part disappears, and the skin covering it sometimes changes its natural colour for a livid hue; but whether it keeps or loses its colour, it has an emphysematous feel, a crepitus to the touch, which will easily be conceived by all who have attended to it, but is not so easy to convey an idea of by words. This crepitus is the too sure indicator of gangrenous mischief within. In this state, the gut either goes up spontaneously, or is returned with the smallest degree of pressure; a discharge is made by stool, and the patient is generally much pleased at the ease he finds; but this pleasure is of short duration, for the hiccough and the cold sweats continuing and increa ing, with the addition of spasmodic rigors and subsultus tendinum, the tragedy soon finishes.

HERNIA INGUINALIS. Bubonocele. Inguinal hernia. The hernia inguinalis is so called, because it appears i. both sexes at the groin. It is one of the divisions of hernia, and includes all those herniz in which the parts displaced pass out of the abdomen through the ring, that is, the arch formed by the aponeurosis of the musculus obliquus externus in the groin, for the passage of the spermatic vessels in men, and the round ligament in women. The parts displaced that form the hernia, the part into which they fall, the manner of the hernia being produced, and the time it has continued, occasion great differences in this disorder. There are three different parts that may produce a hernia in the groin, viz. one of more of the intestines, the epiploon, and the bladder. That which is formed by one or more of the intestines was called, by the antients, enterocele. The intestine which most frequently produces the herma is the ilium: because, being placed in the iliac region, it is nearer the groin than the rest; but notwithstanding the situation of the other intestines, which seems not to allow of their coming near the gron, we often find the jejunum, and frequently also a portion of the colon and cacha, included in the hemia. It must be remembered, that the mesentery and mesocolon are membranous substances,

capable of extension, which, by little and little, are sometimes so far stretched by the weight of the intestines, as to escape with the ilium, in this species of hemia. The hernia made by the epiploon is called epiplocele; as that caused by the epiploon and one of the intestines together is called entero-epiplocele The hernia of the bladder is called cystocele. Hernia of the bladder is uncommon, and has seldom been known to happen but in conjunction with some of the viscera. When the parts, having passed through the abdominal rings, descend no lower than the groin, it is called an incomplete hernia; when they fall into the scrotum in men, or into the labia pudendi in women, it is then termed complete.

The marks of discrimination between some other diseases and inguinal herma are

hose :---

The disorders in which a mistake may possibly be made are, the circocele, bubo, hydrocele, and hernia humoralis, or inflamed testicle.

For an account of the manner of distinguishing circocele from a bubonocele, see

Circocele.

The circumscribed incompressible hardness, the situation of the tumour, and its being free from all connection with the spermatic process, will sufficiently point out its being bubo, at least while it is in a recent state; and when it is in any degree suppurated, he must have a very small share of the tactus eruditus, who cannot feel the difference between matter, and either a piece of intestine or omentum.

The perfect equality of the whole tumour, the freedom and smallness of the spermatic process above it, the power of feeling the spermatic vessels, and the vas deferens in that process; its being void of pain upon being handled, the fluctuation of the water, the gradual formation of the swelling, its having begun below and proceeded upwards, its not being affected by any posture or action of the patient, nor increased by his coughing or sneezing, together with the absolute impossibility of feeling the testicle at the bottom of the scrotum, will always, to an intelligent person, prove the disease to be hydrocele.

Mr. Pott, however, allows that there are some exceptions, in which the testicle cannot be felt at the bottom of the scrotum, in cases of hernia. In recent bubonoceles, while the hernial sac is thin, has not been long or very much distended, and the scrotum still preserves a regularity of figure, the testicle may almost always be easily felt at the inferior and posterior part of the tumour. But in old ruptures, which have been long down, in which the quantity of contents is large, the sac considerably thickened, and the scrotum of an irregular

figure, the testicle frequently cannot be felt; neither is it in general easily felt in the congenital hernia, for obvious reasons.

the hermia humoralis, the pain in the testicle, its enlargement, the hardened state of the epidydmiis, and the exemption of the spermatic cord from all innatural fulness, are such marks as cannot easily be mistaken; not to nemion the generally preceding genory heat. But if any doubt still remains of the true nature of the disease, the progress of it from above downwards, its different state and size in different postures, particularly lying and standing, together with its descent and ascent, will, it duly attended to, put it out of all doubt that the tumour is a true hermia.

When an inguinal hernia does not descend through the abdominal ring, but only into the canal for the spermatic chord, it is covered by the aponeurosis of the external oblique muscle, and the swelling is

small and undefined.

Now and then, the testicle does not descend into the scrotum till a late period. The first appearance of this body a the ring, in order to get into its natural situation, might be mistaken for that of a herma, were the surgeon not to pay attention to the absence of the testicle from the scrotum, and the peculiar sensation occasioned by pressing the swelling.

HERNIA ISCHIATICA. A rupture at the ischiatic notch. This is very rare. A case, however, which was strangulated, and undiscovered till after death, is related in Mr. A. Cooper's second part The disease hapof his work on hernia. pened in a young man aged 27. On opening the abdomen, the ilium was found to have descended on the right side of the rectum into the pelvis; and a fold of it was protruded into a small sac, which passed out of the pelvis at the ischiatic notch. The intestine was adherent to the sac at two points: the strangulated part, and about three inches on each side, were The intestines towards the very black. stomach were very much distended with air, and here and there had a hvid spot on them. A dark spot was even found on the stomach itself, just above the The colon was exceedingly contracted, as far as its sigmoid flexure. A small orifice was found in the side of the pelvis, in front of, but a little above, the sciatic nerve, and on the fore part of the pyriformis muscle sac lay under the glutæus maximus muscle. and its orifice was before the internal iliac arrery, below the obturator artery, but above the vein.

HERNIA INTESTINALIS. See Hernia scrotalis.

Pass through the puncta lachrymalia,

but stagnate in the sacculus lachrym list, the little propriety or precision. It is with equal impropriety called, by Anel, a dropsy of the lachrymal sac.

If the mar a gle of the eye is pressed, and an aqueous humour flows ut, the dis-

ease is the fistula lachrymalis.

HERNIA MESENTERICA. Mesenteric hernia. If one of the layers of the mesentery be torn by a blow, while the other remains in its natural state, the intestines may insinuate themselves into the aperture, and form a kind of hernia. The same consequences may result from a natural deficiency in one of these layers. Mr. A. Coper relates a case, in which all the small intestines, except the duoderum, were thus corcumstanced. The symptoms during life were unknown.

HERNIA MESOCOLICA Mesocolic hernia. So named by Mr. A. Cooper, when the bowels glide between the layers and the mesocolon. Every su geon should be aware that the intestines may be strangulated from the following causes: 1. Apertures in the omentum, mesentery, or mesocolon, through which the intestine protrudes. 2. Adhesions, leaving an aperture, in which a piece of intestine becomes confined. 3. Membranous bands at the mouths of hernial sacs. which becoming elongated by the frequent protrusion and return of the viscera, surround the intestine, so as to strangulate them within the abdomen when returned from the sac.

HERNIA OMENTALIS. Epiplocele. A rupture of the omentum; or a protrusion of the omentum through apertures in the integuments of the belly. Sometimes, according to Mr. Sharpe, so large a quantity of the omentum hath fallen into the scrotum, that its weight, drawing the stomach and bowels downwards, hath excited vomiting, inflammation, and symptoms similar to those of the bubonocele.

HERNIA PERINEALIS. Perineal hernia. In men, the parts protrude between
the bladder and rectum; in women, between the rectum and vagina. The hernia
does not project so as to form an external
tumour; and, in men, its existence can only
be distinguished by examining in the rectum. In women, it may be detected both

from this part and the vagina.

HERNIA PHRENICA. Phrenic hernia. The abdominal viscera are occasio dly protruded through the diaphragm, either through some of the natural apertures in this muscle, or deficiencies, or wounds and lacerations in it. The second kind of case is the most frequent. Morgagni furnishes an instance of the first. Two cases related by Dr. Macandey, and two others published by Mr. A. C. — I are instances of the second sort. And another case has

been lately recorded by the latter gentleman, affording an example of the third kind. Hildanus, Parè, Petit, Schenck, &c. also

mention cases of phrenie hernia.

HERNIA PUDENDALIS. Pudendal hernial. This is the name assigned, by Mr. A. Cooper, to that which descends between the vagina and ramus ischii, and forms an oblong tumour in the labium, traceable, within the pelvis, as far as the os uteri. Mr. C. thinks this case has some times been mistaken for a hernia of the foramen oyale.

HERNIA SCROTALIS. Hernia oschea-Hernia enteroschocele, oschiocele. Paracelsus cails it crepatura. When the omentum, the intestine, or both, descend into the scrotum, it has these appellations; when the omentum only, it is called epiploschiocele. It is styled a perfect rupture, in contradistinction to a bubonocele, which is the same disorder; but the descent is not so great. The hernia scrotalis is distinguished into the true and false; in the former, the omentum or intestine, or both, fail into the scrotum; in the latter, an inflammation, or a fluid, causes a tumour in this part, as in hernia humoralis, or hydrocele. Sometimes sebaceous matter is collected in the scrotum; and this hernia is called steatocele

HERNIA THYROIDEALIS Hernia oraminis svalis. Thyroideal hernia. In the anterior and upper part of the obturator ligament there is an opening, through which the obturator artery, vem, and nerve proceed, and through which occasionally a piece of omentum or intestine is protruded, covered with a part of the peritoneum, which constitutes the hernial sac.

HERNIA UMBILICALIS. Epiploomphation. Omphalosele. Exomphalos. Omphalos, and, when owing to flatulency, Pneumatomphalos. The exomphalos, or umbilical rupture, is so called from its situation, and has (like other hernia) for its general contents, a portion of intestine, or omentum, or both. In old umbilical ruptures, the quantity of omentum is sometimes very great. Mr. Ranby says, that he found two ells and a half of intestine in one of these, with about a third part of the stonnach, all adhering together.

Mr. Gay and Mr. Nourse, found the liver in the sac of an umbilical herma; and Bolinius says that he did also.

But whatever are the contents, they are originally contained in the sac formed by

the protrusion of the peritoneum.

In recent and small ruptures, this sac is very visible; but in old and large ones, it is broken through at the knot of the navel, by the pressure and weight of the contents, and is not always to be distinguished: which is the reason why it has by some been

doubted whether this kind of rupture has a hernial sac or not.

Infants are very subject to this disease, in a small degree from the separation of the funiculus; but in general they either get rid of it as they gather strength, or are easily cured by wearing a proper bandage. It is of still more consequence to get this disorder cured in females, even than in males; that its return, when they are become adult and pregnant, may be prevented as much as possible; for at this time it often happens, from the too great distention of the belly, or from unguarded motion, when

the parts are upon the stretch.

Dr. Hamilton has met with about two cases annually, for the space of seventeen years, of umbilical hernia, which strictly deserve the name of congenital umbilical The funis ends in a sort of bag, containing some of the viscera, which pass out of the abdomen through an aperture in The swelling is the situation of the navel. not covered with skin, so that the contents of the hernia can be seen through the then distended covering of the cord. The disease is owing to a preternatural deficiency in the abdominal muscles, and the hope of cure must be regulated by the size of the malformation and quantity of viscera protruded.

HERNIA UTERI. Hysterocele. Instances have occurred of the uterus being thrust through the rings of the muscles; but this is scarcely to be discovered, unless in a pregnant state, when the strugglings of a child would discover the nature of the disease. In that state, however, it could scarcely ever occur. It is the cerexis of

Hippocrates.

HERNIA VAGINALIS. Elytrocele. Vaginal hernia. A tumour occurs within the os externum of the vagina. It is elastic, but not painful. When compressed, it readily recedes, but is reproduced by coughing, or even without this, when the pressure is removed. The inconveniences produced are an inability to undergo much exercise, or exertion; for every effort of this sort brings on a sense of bearing down. The vaginal hernia protrudes in the space left between the uterus and rectum. This space is bounded below by the peritoneum, which membrane is forced downwards, towards the peringum; but being unable to protrude further in that direction, is pushed towards the back part of the vagina. These cases probably are always intestinal. Some hernix protrude at the anterior part of the vagina.

HERNIA VARICOSA. See Circocele HERNIA VENTOSA. See Pneumatocele.

HERNIA VENTRALIS. Hypogastrocele. The ventral hernia may appear at almost any point of the anterior part of the belly, but is most frequently found between the recti muscles. The portion of intestine, &c. &c. is always contained in a sac made by the protrusion of the peritonaum. Mr. A. Cooper imputes its causes to the dilatation of the natural foramina, for the transmission of vessels, to congenital deficiencies, lacerations, and wounds of the abdominal muscles, or their tendons. small ventral herniæ, a second fascia is found beneath the superficial one; but in large ones the latter is the only one covering the sac.

HERNIA VESICALIS. Hernia cys-Cystocele. The urinary bladder is liable to thrust forth from its proper situation, either through the opening in the ob-lique muscle, like the inguinal hernia, or under Poupart's ligament, in the same man-

ner as the femoral.

This is not a very frequent species of hernia, but does happen, and has as plain and determined a character as any other.

HERNIARIA. (From hernia, a rupture; so called from its supposed efficacy in curing ruptures.) 1. The name of a genus of plants in the Linnaan system. Class, Pen-

tandria. Order, Digynia.

This plant, though 2. Rupturc-wort. formerly esteemed as efficacious in the cure of hernias, appears to be destitute not only of such virtues, but of any other. It is the Herniaria glabra of Linnaus; has no smell, nor taste.

HEUNIAUIA GLABRA. The systematic name of the rupture-wort. See Herniaria. HERNIOTOMY (Herniotomia; from hernia, and τεμνω, to cut.) The operation to remove the strangulated part in cases

of incarcerated herniæ.

(From ερπω, to creep; be-HERPES. cause it creeps and spreads about the skin.) Tetter. A genus of disease in the class locales, and order dialysis, of Cullen, distinguished by an assemblage of numerous little creeping ulcers, in clusters, itching very much, and difficult to heal, but termi-

nating in furfuraceous scales,

Mr. Bell, in his treatise on ulcers, arranges the herpes amongst the cutaneous ulcers, and says, that all the varieties of importance may be comprehended in the four following species: 1 Herpes farinosus, or what may be termed the dry tetter, is the most simple of all the species: it appears indiscriminately in different parts of the body; but most commonly on the face, neck, arms, and wrists, in pretty broad spots and small pimples; these are generally very itchy, though not otherwise troublesome; and, after continuing a certain time, they at last fall off in the form of a white powder, similar to fine bran, leaving the skin helow perfectly sound; and again returning in the form of a red efflorescence, they fall off, and are renewed as before. 2. Herpes pustulosus.

pears in the form of pustules, which originally are separate and distinct, but which afterwards run together in clusters. At first, they seem to contain nothing but a thin watery serum, which afterwards turns yellow, and, exuding over the whole surface of the part affected, it at last dries into a thick crust, or scab; when this falls off, the skin below frequently appears entire, with only a slight degree of redness on its surface; but on some occasions when the matter has probably been more acrid, upon the scab falling off, the skin is found slightly excoriated. Eruptions of this kind appear most frequently on the face, behind the ears, and on other parts of the head; and they occur most commonly in children. 3. Herpes miliaris. The miliary tetter. This breaks out indiscriminately over the whole body: but more frequently about the loins, breast, perinæum, scrotuin, and inguina, than in other parts. It generally appears in clusters, though sometimes in distinct rings, or circles, of very minute pimples, which, from their resemblance to the millet seed, has given rise to the denomination of the species. The pimples are at first, though small, perfectly separate, and contain nothing but a clear lymph, which, in the course of this disease, is excreted upon the surface, and there forms into small distinct scales; these, at last, fall off, and leave a considerable degree of inflamination below, that still continues to exude tresh matter, which likewise forms into cakes, and so falls off as before. The itching, in this species of complaint, is always very troublesome; and the matter discharged from the pimples is so tough and viscid, that every thing applied to the part adheres, so as to occasion much trouble and uneasiness on its being removed. 4. Herpes exedens, the eating and corroding tetter; so called from its destroying or corroding the parts which it attacks, appears commonly, at first, in the form of several small paintul ulcerations, all collected into larger spots, of different sizes and of various figures, with always more or less of an ervsipelatous-like inflammation. These ulcers discharge large quantities of a thin, sharp, serous matter; which sometimes forms into small crusts, that in a short time fall off; but most frequently the discharge is so thin and acrid as to spread along the neighbouring parts, where it soon produces the same kind of sores. Though these ulcers do not, in general, proceed farther than the cutis vera, yet sometimes the discharge is so very penetrating and corrosive as to destroy the skin, cellular substance, and, on some occasions, even the muscles themselves. It is this species that should be termed the depascent, or phagedenic ulcer, from the great destruction of parts which it This species ap- frequently occasions. See Phagedena.

HER

HERPES AMBULATIVA. A species of erysipelas which moves from one part to another.

Tetters about the HERPES COLLARIS. neck.

HERPES DEPASCENS. The same as herpes exedens. See Herpes. HERPES ESTHIOMENOS. Herpes destroy-

ing the skin by ulceration.

HERPES FACIEI. Red piniples common in the faces of adults.

See Herpes. HERPES FARINOSUS.

HERPES FERRUS. Common erysipelas. HERPES INDICA. A fiery, itchy herpes,

pecuiiar to India.

HERPES MILIARIS. See Herpes.

HERPES PERISCELIS. That species of erysipelas known by the name of shingles. See Erysipelas.

HERPES PUSTULOSUS. See Herpes.

HERPES RAPIENS. Venereal ulceration in

HERPES SERPIGO. A name given to the cutaneous affection popularly called a ringworm. See Psoriasis Till the recent observations of Dr. Willan, this disease has not been well discriminated by any author, though it is one with which few practitioners are unacquainted.

HERPES SICCUS. The dry, mealy, tetter

round the knees.

HERPES SYPHILITICUS. Herpes venereus. An herpetic venereal eruption on the skin.

HERPES ZOSTER. Shingles encircling

the body. See Erysipelas.

Herpetic eruptions. See Herpes.

HERPETON. (From εξπω, to creep.) oreeping pustule, or ulcer.

Нехарнанмасим. (From εξ, six, and фадианов, a medicine.) Any medicine, in

the composition of which are six ingredients. HIBERNICUS LAPIS. See Lapis hiberni-

Hibiscus. (From 1/315, a stork, who is said to chew it, and inject it as a clyster) The marsh-mallow.

The systema-HIBISCUS ABELMOSCHUS. tic name of the plant whose seeds are called musk-seed. See Abelmoschus.

Hiccoveн. Hiccup. A spasmodic affection of the diaphragm, generally arising from irritation produced by acidity in the stomach, error of diet, &c.

HIDROA. (From εδρως, sweat.) A pustular disease, produced by sweating in hot wea-

ther.

(From is pos, sweat, and HIDROCRISIS. upwa, to judge.) A judgment formed from the sweat of the patient.

HIDRONOSOS. (From ωρως, sweat, and νοσος, a disease.) The sweating sickness. HIDROPYRETUS. (From 18 pas, sweat, and rupalos, a fever.) The sweating fever, or

sickness. See Sudor Anglicanus. HIDROTICA. (From ideas, sweat.) Medicines which cause perspiration.

HIDROTOPOIETICA. (From ideas, sweat,

and ποιεω, to make.)
and ποιεω, to make.)
Pilvis aloe-HIERA PICRA. (From 1690s, 10ly, and τικρος, bitter) Holy bitter. Pulvis alocticus, formerly hiera logadii, made in the form of an electuary with honey. It is now kept in the form of dry powder, prepared by mixing socotorme alors, one pound, with three ounces of white canella.

HIERABOTANE. (From 1200s, holy, and Bolarn, an herb; so called from its supposed

virtues. A species of verbena.

HIERACANTHA. (From 1890\$, a hawk, and nanbos, a flower; so named because it seizes passengers as a hawk does its prev.)

A sort of thistle.

HIERACIUM. (From ιεχαξ, a hawk; so called because hawks feed upon it, or because it was said that hawks applied the inice of it to cleanse their eyes.) The name of a genus of plants in the Linnaan system. Class, Syngenesia. Order, Polygamia aqualis. Hawk weed.

HEIRACIUM PILOCELLA. The systematic name of the auricula muris.

HIERACULUM. The hieracium, or hawkweed.

HIERANOSOS. (From 1880s, holy, and voros, a disease; so called because it was supposed to be that disorder which our Saviour cured, in those who were said to be possessed of devils.) The epilepsy.

(From 1200s, holy.) HIERATICUM. poultice for the stomach, so named from its

supposed divine virtues.

hangs down like a thong

Highmore'e antrum. See Antrum of Highmore

The calabash tree.

HIGUERO.

said to be febrifuge. HIMANTOSIS. (From 1 µas, a thong of leather.) A relaxation of the uvula, when it

HIMAS. A relaxation of the uvula.

HIN. Hindisch. Hing: Assafætida.
HIPPOCASTANUM (From 1770s, a horse, and ragarov, a chesnut; so called from its size.) Castanea equina, pavina. Common horse-chesnut. Æsculus hippocastanum; foliolis septennis of Linnæus. The fruit, when dried and powdered, is recommended as an errhine. The bark is highly esteemed on the Continent as a febrifuge; and is, by some, considered as being superior in quality to the Peruvian bark. The bark intended for medical use is to be taken from those branches which are neither very young nor very old, and to b exhibited under similar forms and doses as directed with respect to the cortex peruvianus. It rarely disagrees with the stomach; but its astringent effects generally require the occasional administration of a laxative-

During the late scarcity of grain, some attempts were made to obtain starch from the horse-chestnut, and not without success.

HIPPOCRATICUS. See Fucies hippocratica.

HILLIA LAPATHUM. (From 17770s, a horse, and namador, the lapathum: a species of lapatter, so named from its size.) See Rhubarbarum monachorum.

HI POSTARATURUM. (From 1770s, a horse, and pagabor, fermel; so named from its size.)

See Saxifraga vulgaris.

HIPPOSLLINUM. (From varos, a horse, and on wor, purslane; so named because it resembles a large kind of purstane.) Smyrnium. Macerona. Herba Alexandrina Grielum agrioselinum. Common Alexanders. This plant, Smyrmium olusatrum of Linnæus, was formerly cultivated in our gardens, for culinary use, but is now superseded by celery. These seeds are bitter and aromatic, and the roots are more powerfully bitter. They stand recommended as resolvents, dirretics, and emmenagogues, though seldom used in medical prescription.

HIPPS. The ripe fruit of the dog-rose. They are chiefly used as a sweet-meat, or in a preserved state, or to make up medi-

cines. See Confectio Rosa canina.

HIPPURIS. (From 177705, a horse, and 8ga, a tail.) 1. Some herbs are thus named, because they resemble a horse's tail.

2. The name of a genus of plants in the Linnwan system. Class, Monandria. Or-der, Monogynia. Mare's tail.

The systematic HIPPURIS VULGARIS. name of the horse's tail. See Equisetum.

HIPPUS. (From 17770s, a horse; because those who labour under this affection are continually twinkling and trembling, as is usual with those who ride on horse-back.) A repeated dilatation and alternate constriction of the pupil, arising from spasm, or convulsion of the iris.

HIR. (From xug, the hand.) The palm

of the hand.

HIRA. (From hir, the palm of the hand; because it is usually found empty.) The intestinum jejunum.

HIRCUS BEZOAUTICUS. (Quasi hirtus; from his shaggy hair.) The goat which af-

fords the oriental bezoar.

Hinguus. (From egnos, a hedge; because it is hedged in by the eye-lash.) The angle of the eye.

HIRUDO. (Quasi haurudo; from haurio, to draw out; so named from its greedi-

ness to suck blood.) The leech.

HIRCNDINARIA. (From hirundo, swallow; so called from the resemblance of its pods to a swallow.) Swallow-wort, or asclepias. Sec Nummularia and Vincetoxicum.

HIRUNDO. (Ab herendo: from its sticking its nest to the eaves of houses.) The swallow. The cavity in the bend of the arm.

HISTINGLA. (From hispidus, rough; so named from the rough, woolly surface of its stalks.) See Gnaphalium.

Hog's fennel. See Peucedanum.

HOLCIMOS. (From ELKO, to draw.) It sometimes means a tumour of the liver.

HOLCUS. 1. The Indian millet-seed, which is said to be nutritive.

2. The name of a genus of plants in the Linnæan system. Class, Polygamia. Order, Monoecia.

Holly-knee. See Ruscus. Holly, sea. See Eryngium.

HOLMISCU. (Dim. of oxuos, a mortar.) A small mortar. Also the cavity of the large teeth, because they pound the food as in a mortar.

HOLOPBLYCTIDES. (From oxos, whole, and φλυκζις, a pustule.) Little pimples all over

the body.

HOLOSTES. See Holosteus.

Holosteus. (From oxog, whole, and oser, a bone.) Holostes. Holosteum. Gluebone, or osteocolla.

Holosteum. See Holosteus.

HOLOTONICUS. (From olos, whole, and πεινω, to stretch.) Applied to diseases accompanied with universal convulsion, or rigour.

Holy thistle. See Carduus benedictus.

HOLYWELL WATER. A mineral water, arranged under the class of simple cold waters, remarkable for its purity. It possesses similar virtues to that of Matvern. See Malvern water.

Homa An anasarcous swelling.

Homberg's sedative sult. See Boracic acid.

HOMOGENEOUS. (Homogeneus; from omos, like, and gevos, a kind.) Uniform, of a like kind, or species. A term used in contr. distinction to heterogeneous, when the parts of the body are of d fferent qualities.

HOMOPLATE OS. (Ωμοπλαλα: from aμος, the shoulder, and mala, the blade.) See

Scapula

HONEY. Mel. A substance collected by bees from the nectary of flowers, resembling sugar in its elementary properties. It has a white or yellowish colour, a soft and grained consistence, and a saccharine and aromatic smell. Honey is an excellent food, and a softening and slightly aperient remedy: mixed with venegar, it forms oxymel, and is exhibited in various torms, in medicine and pharmacy. Ia is particularly recommended to the asthmatic, and those subject to gravel complaints, from its detergent nature. Founded upon the popular opinion of honey, as a pectoral remedy, Dr. Hill's balsam of honey, a quack medicine, was once in demand; but this, besides honey, contained balsam of Tolu, or gum Benjamin, in solution.

Honey-suckle. See Lonicera pericleminum.

Hooping-cough. See Pertussis.

Hoplochi ISMA. (From other, a weapon, and xpioua, a slave.) A slave, which was ridiculously said to cure wounds by consent; that is, by anointing the instrument with which the wound was made.

Hops. See Lupulus.

Hor Tors The young sprouts of the lion-plant are so called, plucked when only a foot above the ground, and boiled, they are eaten with butter as a delicacy,

and are very wholesome

HORDEOLUM. (Diminutive of Lordeum, barley.) A little tumour on the eyelids, resembling a barley corn. A stye. Scarpa remarks, the stye is strictly only a little boil, which projects from the edge of the eye lids, mostly near the great angle of the eye. This little tumour, like the furuncul s, is of a dark red colour, much inflamed, and a great deal more painful than might be expected, considering its small size. The latter circumstance is partly owing to the vehemence of the inflammation producing the stye, and partly to the exquisite sensibility and tension of the skin which covers the edge of the eyelids. On this account, the hordeolum very often excites fever and restlessness, in delicate irmable constitutions; it suppurates slowly and impersectly; and, when suppurated, has no tendency to burst.

The stve, like other furunculous inflammations, forms an exception to the general rule, that the best mode in which inflammatory swellings can end is, resolution; for, whenever a forunculous inflammation extends so deeply as to destroy any of the cellular substance, the little tumour can never be resolved, or only imperfectly so. This event, indeed, would rather be burtful, since there would still remain behind a greater or smaller portion of dead cellular membrane; which, sooner or later, might bring on a renewal of the stye, in the same place as before, or else become converted into a hard indolent body, deforming the

edge of the eye-lid.

HORDEUM. (Ab horrore arista; from the unpleasantness of its beard to the touch ) 1 The name of a genus of plants in the Lim wan system. Class, Triandria.

Order, Digynia. Barley.
2. The pharmacopæial name of the common bariey. The seed called barley is obtained from several species of hordeum, but principally from the vulgare, or common or Scotch barley, and distiction, or hordeum gallicum vel mundatum, or French barley, of Linnæus. It is ex-remely nutritious and mucilaginous, and in common use as a drink, when boiled, in all inflammatery diseases and affections of the chest, especially when there is cough or irritation about the fances. A decoction of barley, with gum, is considered a useful diluent and demulcent in dysury and strangury; the gun maxing with the urms, sheaths the urinary canal from the acrim ny of the urine. Amongst the ancients, decoctions of barley, Keibn, were

the principal medicine, as well as aliment, in acute diseases. Barley is freed from its shells in mills, and in this state called Scotch and French barley. In Holland, they rub barley into small round grains, somewhat like pearls, which is therefore called pearl barley, or hordeum perlatum. See Ptisan.

HOBDEUM CAUSTICUM. See Cevadilla. HORDEUM DISTICHON.

This plant affords the barley in common use. See Hor-

Hordeum Perlatum. See Hordeum.

HORDEUM VULGARE. The systematic name of one of the plants which afford the barley See Hordeum

Horehound. See Manubium.

(From oguaw, to incite; HORMINUM. named from its supposed qualities of pro-Garden clary. The voking to venery. Sulvia sclara of Linnaus.

Horn, harts. See Cornu.

HORRIPILATIO. A sense of creeping in different parts of the body. A symptom of the approach of fever

Horse-chesnut. See Hippocastanum. See Raphanus rustica-Horse-radish.

Horse-tail. See Equisetum.

HORTUS. (From orior, to rise, as being the place where vegetables grow up.) 1. A garden.

2. The genitals or womb of a woman, which is the repository of the human se-

Hound's tongue. See Cynoglossum. House leek. See Sedum majus.

Human body. See Man.

HUMBETANTIA. (From humecto, to make moist.) Medicines which soften and make

moist the solids of the body.

HUMERAL ARTERY. Arteria humeralis. Brachial artery. The axillary artery, having passed the tendon of the great pectoral muscle, changes its name to the brachial or humeral artery, which name it retains in its course down the arm to the bend, where it divides into the radial and nlnar artery. In this course it gives off several muscular branches, three of which only deserve attention: 1 The arteria profunda superior, which goes round the back of the arm to the exterior muscle, and is often named the upper muscular artery. 2. Another, like it, called arteria profunda inferior, or the lower muscular artery. 3. Ramus anastomoticus major, which anastomoses round the elbow with the branches of the ulnar artery,

HUMERALIS MUSCULUS. See Deltoides. HUMERALIS NERVUS. The cervical

HUMERI OS. (Humerus; from apos,

the shoulder.) Os humeri. Os brachii. long cylindrical bone, situated between the scapula and fore arm. Its upper extremity is formed somewhat laterally and internally, into a large, round, and smooth head, which is admitted into the g'enoid cavity of the scapula. Around the basis of this head is observed a circular to sa, deepest anteriorly and externally, which forms what is called the neck of the bone, and from the edge of which arises the capsular ligament, which is farther strengthened by a strong membrinous expansion, extending to the upper edge of the glenoid cavity, and to the coracoid process of the scanula; and likewise by the tendmous expansions of the muscles, inserted into the head of the humerus. This capsular hg ment is sometimes torn in luxation, and becomes an obstacle to the easy reduction of the bone. The articulating surf ce of the head is covered by a cartilage, which is thick in its middle part, and thin towards its edges; by which means it is more convex in the recent subject than in the skeleton. upper extremity, besides the round smooth head, affords two other smaller protuberances. One of these, which is the largest of the two, is of an irregular oblong shape, and is placed at the back of the head of the bone, from which it is separated by a kind of groove, that makes a part of the neck. This tuberosity is divided, at its upper part, into three surfaces; the first of these, which is the smallest and uppermost, serves for the insertion of the supraspinatus muscle; the second, or middlemost, for the insertion of the infraspinatus; and the third, which is the lowest and hindmost, for the insertion of the teres minor. The other smaller tuberosity is situated anteriorly, between the larger one and the head of the humerus, and serves for the insertion of the subscapularis mu-cle. Between these two tuberosities there is a deep groove, for lodging the tendinous head of the biceps brachii; the capsular ligament of the joint affording here a prolongation, thinner than the capsule itself, which covers and accompanies this muscle to its fleshy portion, where it gradually disappears in the adjacent cellular membrane. Immediately below its neck, the os humeri begins to assume a cylindrical shape, so that here the body of the bone may be said to commence. At its upper part is observed a continuation of the groove for the biceps, which extends downwards, about the fourth part of the length of the bone, in an oblique direction The edges of this groove are continuations of the greater and lesser tuberosities, and serve for the attachment of the pectoralis, latissimus dorsi, and teres major muscles. The groove itself is lined with a glistening substance like cartilage, but which seems to be nothing more than the remains of tendinous fibres. A little lower down, towards the external and anterior side of the middle

of the bone, it is seen rising into a rough ridge, for the insertion of the deltoid muscle. On each side of his ridge the bone is smooth and flat, for the lodgment of the brachialis internus mu-cle; and behind the middle part of the outermose side of the ridge is a channel, for the transmission of vessels into the sub-like of the bone. A little lower down, and near the inner side of the ridge, there is sometimes seen such another channel, which is intended for the same nurpose. The os homeri, at its lower extremey, becomes gradually broader and flatter, so as to have this end nearly of a triangular shape. The bone, thus expanded, affords two surfaces, of which the ane terior one is the broadest, and somewhat convex; and the poster or one narrower and smoother. The bone terminates in four large processes, the two autermost of which are called condyles, though not designed for the articulation of the bone. These condyles, which are placed at some distance from each other, on each side of the bone, are rough and irregular protuberances, formed for the insertion of muscles and ligaments, and differ from each other in size and shape. The external condyle, when the arm is in the most natural position, is found to be placed somewhat forwarder than the other. The internal condyle is longer; and more protuberant, than the external. From each of these processes, a ridge is continued upwards, at the sides of the bone. In the interval between the two condyles are placed the two articulating processes, contiguous to each other, and covered with cartilage. One of these, which is the smallest, is formed into a small, obtuse, smooth head, on which the rad us plays. This little head is placed near the external condyle, as a part of which it has been sometimes described. The other, and larger, process is composed of two lateral protuberances and a middle cavity, all of which are smooth, and covered with cartilage From the manner in which the ulnar moves upon this process, it has gotten the name of trochlea, or pulley. The sides of this pulley are unequal; that which is towards the little head, is the highest of the two; the other, which is contiguous to the external condule, is more slaning, being situated obliquely from within outwards, so that when the forearm is full extended it does not form a straight line with the os humeri, and, for the same reason, when we bend the elbow, the hand comes not to the shoulder, as it might be expected to do, but to the forepart of the breast. There is a cavity at the root of these processes, on each of the two surfaces of the bone. The cavity on the anterior surface is divided, by a ridge into two, the external of which receives the end of the radius, and the internal one lodges the coronoid process of the ulnar in the flexions of the fore-arm. The cavity on the posterior surface, at the basis of the pulley, is much larger, and lodges the olecranon when the arm is extended. The internal structure of the os humeri is similar to that of other long bones. In new-born infants, both the ends of the bone are cartilaginous, and the large head, with the two tubercles above, and condyles, with the two articulating processes below, become epiphyses before they are entirely united to the rest of the bone.

HUMERUS. (From a µos.) Adjutorium. The houlder, or joint which connects the rin to the body. In Hippocrates it is

call-d brachium

HUMILIS. (From humi, on the ground; so named because it turns the eye downwards, and is expressive of humility.) See Rectus inferior oculi.

HUMOR (Ab. humo, from the ground; because moisture springs from the earth.) A general name of any fluid of the body

HUMOR VITREUS. The vitreous humour of the eye, which takes its name from the resemblance to melted glass, is less dense than the chrystalline, but more than the aqueous humour: it is very considerable in the human eye, and seems to be formed by the small arteries that are distributed in cells of the hyaloid membrane; it is heavier than common water, slightly albuminous and saline.

Humour, Aqueous. See Aqueous humour

of the eye.

Humour, Vitreous. See Humor vitreus.

HUMOURS OF THE EYE. They are three in number: the aqueous humour, chrystalline lens, and vitreous humour. See Eye.

HUMULUS. (From humilis, the ground; so named, because without facticious support it creeps along the ground.) The name of a genus of plants in the Linnzan Class, Dioecia. Order, Pentansystem. dria. The hop.

Humulus lupulus. The systematic name

of the hop-plant. See Lupulus.

Hurtsicle. The bluebottle, or cyanus, is so called, because it is troublesome to cut down, and sometimes notches the sickle.

(Membrana hyaloides; HYALOIDES. from vanos, glass, and esdos, likeness.) Membrana arachnoidea. Capsule of the vitreous humour. The transparent membrane enclosing the vitreous humour of the eye.

HYD ARTRUS. (From udwg, water, and agbeor, a joint.) Hydaithron. Hydarthros. Spina ventosa of the Arabian writers, Rhazes and Avicenna. White swelling. The white swelling, in this country, is a peculiarly common and exceedingly terrible disease. The varieties of white swelling are very numerous, and might usefully receive particular appellations. Systematic writers have generally been content with a

distinction into two kinds, viz. rheumatic and scrophulous. The last species of the disease they also distinguish into such tumours as primarily affect the bones, and then the ligaments and soft parts; and into other cases, in which the ligaments and soft parts become deceased, before there is any morbid affection of the bones.

These divisions, Mr. Samuel Cooper, in his treatise on the diseases of the joints, proves to be not sufficiently comprehensive; and the propriety of using the term rheumatic he thinks to be very questionable.

The knee, ankle, wrist, and elbow, are the joints most subject to white swellings. As the name of the disease implies, the skin is not at all altered in colour. In some instances, the swelling yields, in a certain degree, to pressure; but it never pits, and is almost always sufficiently firm to make an uninformed examiner believe that the bones contribute to the tumour. is sometimes vehement from the very first; in other instances, there is hardly the least pain in the beginning of the disease. In the majority of scrophulous whi e swellings, let the pain be trivial or violent, it is particularly situated in one part of the joint, viz. either the centre of the articulation, or the head of the tibia. Sometimes the pain continues without interruption; sometimes there are intermissions; and in other instances the pain recurs at regular times, so as to have been called, by some writers, periodical. Almost all authors describe the patient as suffering more uneasiness in the diseased part when he is warm, and particularly when he is in this condition in

At the commencement of the disease, in the majority of instances, the swelling is very inconsiderable, or there is even no visible enlargement whatever. little depressions, naturally situated on each side of the patella, a fulness first shews itself, and gradually spreads all over the af-

fected joint.

The patient, unable to bear the weight of his body on the disordered joint, in consequence of the great increase of pain thus created, gets into the habit of only touching the ground with his toes; and the knee, being generally kept a little bent in this manner, soon loses the capacity of becoming extended again. When white swellings have lasted awhile, the knee, is almost always found in a permanent state of flexion. In scropliulous cases of this kind, pain constantly precedes any appearance of swelling; but the interval between the two symptoms differs very much in different subjects.

The morbid joint, in the course of time, acquires a vast magnitude. Still the integuments retain their natural colour, and remain unaffected. The enlargement of the

381

articulation, however, always seems greater than it really is, in consequence of the emacration of the limb both above and below the disease.

An appearance of blue distended veins, and a shining smoothness, are the only alterations to be noticed in the skin covering the enlarged joint. The shining smoothness seems attributable to the distension, which obliterates the natural forrows and wrinkles of the cutis. When the joint is thus swollen, the integuments cannot be pinched up into a fold, as they could in the state of health, and even in the beginning of the disease.

As the distemper of the articulation advances, collections of matter form about the part, and at length burst. The ulcerated openings sometimes heal up; but such abscesses are generally followed by other collections, which pursue the same course. In some cases, these abscesses form a few months after the first affection of the joint; on other occasions, several years elapse, and no suppuration of this

kind makes its appearance.

Such terrible local mischief must necessarily produce constitutional disturbance. The patient's health becomes gradually impaired; he loses both his appetite and natural rest and sleep; his pulse is small and frequent; and obstinate debilitating diarrhea and profuse nocturnal sweats ensue. Such complaints are sooner or later followed by dissolution, unless the constitution be relieved in time, either by the amendment or removal of the diseased part. In different patients, however, the course of the disease, and its effects upon the system, vary very much in relation to the rapidity with which they occur.

Rheumatic white swellings are very distinct diseases from the scropbulous distemper of large joints. In the first, the pain is said never to occur without being distended with swelling. Scrophulous white swellings, on the other hand, are always preceded by a pain, which is particularly confined to one point of the articulation. In rheumatic cases, the pain is more general,

and diffused over the whole joint.

With respect to the particular causes of all such white swellings as come within the class of rheumatic ones, little is known. External irritation, either by exposure to damp or cold, or by the application of violence, is often concerned in bringing on the disease; but very frequently no cause of this kind can be assigned for the complant. As for scrophulous white swellings, there can be no doubt that they are under the influence of a particular kind of constitution, termed a scrophulous or strumous liabit. In this sort of temperament, every cause capable of exciting inflammation, or any morbid and irritable state of a large joint, may bring such disorder as may end

HYD in the severe disease of which we are now speaking.

In a man of a sound constitution, an irritation of the kind alluded to might only induce common healthy inflammation of the

affected joint.

In scrophulous habits, it also seems probable that the irritation of a joint is much more easily produced than in the other constitutions; and no one can doubt that, when once excited in scrophulous habits, it is much more dangerous and difficult of

removal than in other patients.

HYDATID. (Hydatis; from vdwg, water.) A very singular animal, formed like a bladder, and distended with an aqueous fluid. These animals are sometimes formed in the natural cavities of the body, as the abdomen and ventricles of the brain, but more frequently in the liver, kidney, and lungs, where they produce diseased actions of those viscera. Cullen arranges these affections in the class locales, and order tumores. If the vires naturæ medicatrices are not sufficient to effect a cure, the patient mostly falls a sacrifice to their ravages. Dr. Baillie gives the following interesting account of the hydatids, as they are sometimes found in the liver :- There is no gland in the human body in which hydatids are so frequently found as the liver, except the kidneys, where they are still more common. Hydatids of the liver are usually found in the cyst, which is frequently of considerable size, and is formed of very firm materials. so as to give to the touch almost the feeling of cartilage. This cyst, when cut into, is obviously laminated, and is much thicker in one liver than another. In some livers it is not thicker than a shilling, and in others it is near a quarter of an inch in thickness. The laminæ which compose it are formed of a white matter, and on the inside there is a lining of a pulpy substance, like the coagulable lymph. The cavity of the cyst I have seen, in one instance, subdivided by a partition of this pulpy substance. In a cyst may be found one hydatid, or a greater number of them. They lie loose in the cavity, swimming in a fluid; or some of them are attached to the side of the cyst. They consist of a round bag, which is composed of a white, semi-opaque, pul-py matter, and contain a fluid capable of coagulation. Although the common colour of hydatids be white, yet I have occasionally seen some of a light amber colour-The bag of the hydatid consists of two laminæ, and possesses a good deal of contractile power. In one hydatid this coat, or bag, is much thicker and more opaque than in another; and even in the same hydatid, different parts of it will often differ in its thickness. On the inside of an hydatid, smaller ones are sometimes found, which are commonly not larger than the heads of pins, but sometimes they are even

larger in their size than a gooseberry. These are attached to the larger hydatid. either at scattered irregular distances, or so as to form small clusters; and they are also found floating loose in the liquor of the larger hydatids. Hydatids of the liver are often found unconnected with each other; but sometimes they have been said to enclose each other in a series, like pillboxes. The most common situation of hydatids of the liver is in its substance, and enclosed in a cyst: but they are occasionally attached to the outer surface of the liver, hanging from it, and occupying more or less of the general cavity of the abdomen. The origin and real nature of these hydatids are not fully ascertained: it is extremely probable, however, that they are a sort of imperfect animalcules. There is no doubt at all, that the hydatids in the livers of sheep are animalcules; they have been often seen to move, when taken out of the liver and put into warm water; and they retain this power of motion for a good many hours af er a slieep has been killed. The analogy is great between hydatids in the liver of a sheep, and those of the human subject. In both, they are contained in strong cysts, and in both they consist of the same white pulpy matter. There is undoubtedly some difference between them in simplicity of organization: the hydatid in the human liver being a simple uniform bag, and the hydatid in that of a sheep having a neck and mouth appending to the bag. This difference need be no considerable objection to the opinion above stated. Life may be conceived to be attached to the most simple form of organization. In proof of this, hydatids have been found in the brains of sheep, resembling almost exactly those in the human liver, and which have been seen to move, and therefore are certainly known to be animalcules. The hydatids of the human liver, indeed, have not, as far as I know, been found to move, when taken out of the body and put into warm water; were this to have happened, no uncertainty would remain. It is not difficult to see a good reason why there will hardly occur any proper opportunity of making this experiment. Hydatids are not very often found in the liver, because it is not a very frequent disease there; and the body is allowed to remain for so long a time after death before it is examined, that the hydatids must have lost their living principle, even if they were animalcules, however, it is very strong: and it appears even more difficult to account for their production, according to the common theory of generation, than for that of intestinal worms. We do not get rid of the difficulty by asserting, that hydatids in the hu- and constitutions, as an anthelmintic and man liver are not living animals, because in sheep they are certainly such, where the

difficulty of accounting for their production is precisely the same.

HYDRAGOGUES. (Medicamenta hydrogoga; from voog, water, and axa, to drive ont.) Medicines are so termed, which possess the property of increasing the secretions or excretions of the body, so as to cause the removal of water from any of its cavities, such as tonics, diuretics, cathartics, &c.

HYDRARGYRI NITRICO-OXYDUM

Submurias hydrargyri.

HYDRARGYRI SULPHURETUM RU-See Sulphuretum hydrargyri rubrum.

HVDRARGYRUS. useapyugos: from usug, water, and agruess, silver; so named from its having the resemblance to fluid silver.)

See Mercury

HYDRARGYRUS ACETATUS. Mercurius acetatus Pilulæ Keyseri. By this preparation of mercury, the celebrated Keyser acquired an immense fortune in curing the venereal disease. It is an acetite of quicksilver, and therefore termed acetis hydrargyri in the new chemical nomenclature. The dose is from three to five grains. Notwithstanding the encomium given to it by some, it does not appear to be so efficacious as some other

preparations of mercury. HYDRARGYRUS CUM CRETA. Mer-

cury with chalk, Mercurius alkalizatus. "Take of purified mercury, by weight, three ounces; prepared chalk, five ounces." Rub them together, until the metallic globules disappear. This prepiration is milder than any other mercurial, and does not so easily act upon the bowels; it is, therefore, used largely by many practitioners, and possesses alterative properties in cutaneous and venereal complaints, in obstructions of the viscera, or of the prostate gland, given in the dose of Ass to

3ss, two or three times a day.

HYDRARGYRUS CUM SULPHURE. Æthiops mineral. This is a black salphuret of mercury, and therefore called sulphuretum hydrargyri nigrum in the new chemical nomenclature. The mercury and sulphur are triturated together; the blended mass thus obtained consists of sulphur and an imperfect oxyd of mercury. The mercury, by this admixture of the sulphur, is deprived of its salivating power, and may be administered with safety to all ages alterative.

HYDRARGYRUS PRECIPITATUS ALBUS. White precipitated mercury. Calx hydrargyri alba. " Take of oxymu- flavus. riate of mercury, muriate of ammonia, of each half a pound; solution of subcarbonate of potash, half a pint; distilled water, four pints." First dissolve the muriate of ammonia, then the oxymuriate of niercury, in the distilled water, and add thereto the solution of subcarbonate of potash. Wash the precipitated powder until it becomes tasteless; then dry it. It is only used externally, in the form of ointment, as an application in some cutaneous affections.

HYDRARGYRUS PRECIPITATUS CINEREUS. This preparation, ordered in the Edinburgh pharmacopæia, is an oxyd of mercury, and nearly the same with the hydrary yri oxydum cinereum of the London pharmacopæia; it is used s an alterative in cases of pains arising from an admixture of rheumatism with syphilis, may be substituted for the hydrargyrus sulphuratus ruber, in fumigating ozena, and venereal ulcerated sore throat, on account of its not yielding any vapour offensive to the patient

HYDRARGYRUS PURIFICATUS. Purified inercury. Argentum vivum purificatum. "Take of mercury, by weight, six pounds; iron filings, a pound." Rub them together, and distil the mercury from an iron retort, by the application of heat to it. Purified quicksilver is sometimes administered in its metallic state, in doses of an ounce or more, in constipation

of the bowels.

HYDRARGYRUS PHOSPHORATUS, This remedy has been observed to heal inveterate venereal ulcers in a very short time, nay, in the course of a very few days, particularly those about the pudenda. In venereal inflammations of the eyes, chancres, rheumatisms, and chronic eruptions, it has proved of emment service. . Upon the whole, if used with necessary precaution, and in the hards of a judicious practitioner, it is a medicine mild and gentle in its operation. The cases in which it deserves the preference over other mercurial preparatio s ar these: in an inveterate stage of syphylis, particularly in persons of torpid insensible fibr.s; in cases of exostosis, as well as obstructions in the lymphatic system; in chronic complaints of the skin.

The following is the formula Be Hydrargyri phosphorati, gr iv. Corticis connamomi in pulverem triti, gr xiv. Sac-chai purif. 388. Misee. The whole to be divided into eight equal parts, one of which is to be taken every morning and evening, unless salivation takes place, when it ought to be discontinued. Some patients, however, will bear from one to two grains of the phosphat of quicksilver, without in a painful degree of distention in a few convenience

HYDRARGYRUS

Turpethum minerale. Mercurius emeticus Sulphas hydrargyri. Formerly this medicine was in more general use than in the present day. It is a very powerful and active alterative when given in small doses. Two grains act on the stomach so as to produce violent vomitings. It is recommended as an errhine in cases of amaurosis. In combination with antimony, it acis powerfull, on the skin.

HYDRELEUM. (From voug, water, and Exauor, oil.) A mixture of oil and water.

HYDRENTEROCELE. (From vdag, water, evilegov, an intestine, and known, a tumour.) A dropsy of the scrotum, attended with rupture.

HYDROA. (From usag, water.) A wa-

tery pustule.

HYDROGARDIA. (From udag, water, and nagona, the heart.) Hydrocordis. H, drops pericardii. Dropsy of the heart. Dropsy of the pericardium. A confection of fluid in the pericardium, which may be either coagulable lymph, serum, or a puriform fluid. It produces symptom similar to those of hydrothorax, with violent palpitation of the heart, and mostly an intermit ent pulse. It is incurable.

EARLY, a tumour.) The term below if used in a tumour. if used in a literal sense, means any tumour produced by water; but surgeons have always confined it to those which possess either the membranes of the scrotum, or the coats of the testicle and its vessels. The first of these, viz. that which has its seat in the membranes of the scrotum, anasarca integumentorum, is common to the whole bag, and to all the cellular substance which loosely envelopes both the testes. It is, strictly speaking, only a symptom of a disease, in which the whole habit is most frequently more or less concerned, and very seldom affects the part only. The latter, or those which occupy the coats immediately investing the testicle and its v. ssels, hydrocele tunicæ vaginalis, are absorutely local, very seldom affect the common membrane of the scrotum, generally attack one side only, and are frequently found in persons who are perfectly tree from all other complaints.

The anasarca integumentorum retains the impression of the finger. The vaginal

hydrocele is elastic.

The hydrocele of the tunica vaginalis testi is a morbid accumulation of the water separated on the internal surface of the tunica v ginalis, to moisten or lubricate the testicle.

From its first appearance, it seldom disappears, or diminishes, but generally continues to increase, sometimes rapidly, at others more slowly. In some, it grows to mosths; in others, it continues many years VITRIOLATUS .- with little disturbance. As it enlarges, it

becomes more tense, and is sometimes transparent; so that if a candle is held on the opposite a degree of light is perceived through the whole tumour; but the only certain distinction is the fluctuation, which is not found when the disease is an hernia of the omentum, or intestines, or an inflammatory or a schirrhous tumour of the testicle.

HYDROCELE CYSTATA. Encysted hydrocele of the spermatic cord resembles the common hydrocele; but the tumour does not extend to the testicle, which may be felt below or behind it, while, in the hydroeele of the vaginal coat, when large, the testicle cannot be discovered. In this disease, also, the penis is not buried in the tumour. Sometimes the fluid is contained in two distinct cells; and this is discovered by little contractions in it. It is distinguished from the anasarcous hydrocele by a sensible fluctuation, and the want of the inelastic pitting; from hernia, by its beginning below, from its not receding in an horizontal position, and not enlarging by coughing and sneezing.

Hydrocele funiculi spermatic, or hydrocele of the spermatic cord. Anasarcous hydrocele of the spermatic cord sometimes accompanies ascites, and at other times it is found to be confined to the cellular substance, in or about the spermatic cord. The causes of this disease may be, obstructions in the lymphatics leading from the part, in consequence of schirrous affections of the abdominal viscera, or the pressure of a truss applied for the cure of

hernia,

When the affection is connected with anasarca in other parts, it is then so evident as to require no particular description. When it is local, it is attended with a colourles tumour in the course of the spermatic cord, soft and inelastic to the touch, and unaccompanied with fluctuation. In an erect position of the body, it is of an oblong figure; but when the body is recumbent, it is flatter, and somewhat round. Generally, it is no longer than the part of the cord which lies in the groin; though sometimes it extends as far as the testicle, and even stretches the scrotum to an ancommon size. By pressure, a great part of the swelling can always be made to recede into the abdomen. It instantly, however, returns to its former situation, on the pressure being withdrawn.

HYDROCELE PERITONÆI. Ascites, or

common dropsy of the belly.

HYDROCELE SPINALIS. A watery swell-

ing on the vertebræ.

Hidrocelodes isenting. (From using water, and καλαδης, attended with tumour.) Applied to a suppression of urine, from a rupture of the urethra.

HYDROCEPHALUS. (From υδως, water, and κεφαλη, the head.) Hydrocepha-

lum. Dropsy of the brain. Dropsy of the head. A genus of disease arranged by Culten, in the class cachexia, and order intumescentia. It is distinguished by authors into external and internal: 1. Hydrocephalus externus, is a collection of water between the membranes of the brain. 2. Hydrocephalus internus, is when a fluid is collected in the ventricles of the brain, producing dilatation of the pupils, apoplexy, &c. See Apoplexia. It is sometimes of a chronic nature, when the water has been known to increase to an enormous quantity, effecting a diastasis of the bones of the head, and an absorption of the substance of the brain.

Pain in the head, particularly across the brow, stupor, ddatation of the pupils, nausea, vomiting, preternatural showness of the pulse, and convulsions, are the pathognomic symptoms of this disease, which have been laid down by the generality of

writers.

Hydrocephalus is almost peeuliar to children, being rarely known to extend beyond the age of twelve or fourteen; and it seems more frequently to grise in those of a scrophulous and ricketty habit than in others. It is an affection which has been observed to pervade families, affecting all or the greater part of the children at a certain period of their life; which seems to shew that, in many cases, it depends more on the general habit than on any local affection, or accidental cause.

The disease has generally been supposed to arise in consequence either of ujuries done to the brain itself, by blows, falls, &c. from seirrhous tumours or excrescences within the skull, from original laxity or weakness in the brain, or from general debility and an impoverished state of the

blood.

With respect to its proximate cause, very opposite opinions are still entertained by medical writers, which, in conjunction with the equivocal nature of its symptoms, prove a source of considerable embarrassment to the young practitioner.

Dr. Beddoes says, he believes it to belong to inflammations, and that, at an early period, he should be inclined to bleed as

largely as in pneumonia.

Dr. Withering observes that, in a great many cases, if not in all, congestion, or slight inflammation, are the precursors to

the aqueous aecumulation.

Dr. Rush thinks that, instead of its being considered an idiopathic drops, it should be considered only as an effect of a primary influmnation, or congestion of blood in the brain. It appears (says he) that the disease, in its first stage, is the effect of causes which produce a less degree of that inflammation which constitutes phrenitis; and that its second stage is a less degree of that effusion which produces

serous apoplexy in adults. partakes of the nature of the chronic in. over the eyes, soreness of the integuments flammation of Dr. Cullen, and the asthe-nic inflammation of Dr. Brown. There are others again, who view the subject in a very different light. Dr. Darwin supposes inactivity, or torpor of the absorbent vessels of the brain, to be the cause of hydrocephalus internus; but he confesses, in another part of his work, that the torpor of the absorbent vessels may often exist as a secondary effect.

Dr. Whytt, who has published an ingenious treatise on the disease, observes, the immediate cause of every kind of dropsy is the same, viz. such a state of the parts as makes the exhalent arteries throw out a greater quantity of flaids than the absorbents can take up. From what he afterwards mentions, he evidently considers

this state as consisting in debility.

As many cases are accompanied with an increased or inflammatory action of the vessels of the brain, and others again are observed to prevail along with general anasarca, it seems rational to allow that hydrocephalus is, in some instances, the consequence of congestion, or slight inflammation in the brain; and that, in others, it arises either from general debility or topical laxity. In admitting these as incontrovertible facts, Dr. Thomas is at the same time induced to suppose that the cases of it occurring from mere debility are by no means frequent.

The great analogy subsisting between the symptoms which are characteristic of inflammation, and those which form the first stage of the acute species of hydrocephalus, (for the disease, as already observed, has been divided into the chronic and acute by some writers,) together with the good effects often consequent on bloodletting, and the inflammatory appearance which the blood frequently exhibits, seem to point out strong proof of the disease being, in most instances, an active inflammation, and that it rarely occurs from mere debility, as a primary cause.

The progress of the disorder has, by some, been divided into three stages.

When it is accompanied by an increased or inflammatory action of the brain, as not uncommonly happens, its first stage is marked with many of the symptoms of pyrexia, such as languor, inactivity, loss of appetite, nausea, vomiting, parched tongue, hot, dry skin, flushing of the face, head-ach, throbbing of the temporal arteries, and quickened pulse; which symptoms always suffer an exacerbation in the evening, but towards morning hecome

When it is unaccompanied by any inflammatory action of the brain, many of these appearances are not to be observed. In these cases it is marked by a dejection

The former of countenance, loss of appetite, pains of the cranium to the touch, propensity to the bed, aversion to being moved, nansea, and costiveness. The disease, at length, makes a remarkable transition, which de-notes the commencement of its second stage. The child screams out, without being able to assign any cause; its sleep is much disturbed; there is a considerable dilatation of the pupils of the eyes, without any contraction on their being exposed to light; lethargic torpor, with strabismus, or perhaps double vision, ensues, and the pulse becomes slow and unequal.

In the third stage, the pulse returns again to the febrile state, becoming uncommonly quick and variable; and coma, with convulsions, ensue. When the accumulation of water is very great, and the child young, the sutures recede a considerable way from each other, and the head, towards the end, becomes much enlarged.

When recoveries have actually taken place in hydrocephalus, we ought probably to attribute more to the efforts of nathre than to the interference of art. In every instance it is to be regarded as of difficult cure.

An accumulation of water in the ventricles of the brain is one of the most common appearances to be observed on dissection. In different cases, this is accumulated in greater or less quantities. sometimes amounts only to a few ounces, and occasionally to some pints. When the quantity of water is considerable, the fornix is raised at its anterior extremity, in consequence of its accumulation, and an immediate opening of communication is thereby formed between the lateral ven-The water is of a purer colour, and more limpid than what it is found in the dropsy of the thorax, or abdomen. appears, however, to be generally of the same nature with the water that is accumulated in these cavities. In some instances the water in avdrocephalus contains a very small proportion of coagulable matter, and in others it is entirely free

When the water is accumulated to a very large quantity in the ventricles, the substance of the brain appears to be a sort of pulpy bag, containing a fluid. skull, upon such occasions, is very much enlarged in size, and altered in its shape; and it appears exceedingly large in proportion to the face. On removing the scalp, the bones are found to be very thin, and there are frequently broad spots of membrane in the bone. These appearances are, however, only to be observed where the disease has been of some years continuance.

In some cases, where the quantity of water coll cted is not great, the substance

of the brain has appeared to be indurated, and in others softened. At times, the organ has been found gorged with blood; collections also of a viscid tenacious matter have been discovered in cysts, upon its external surface, and tumours have been found attached to its substance.

HYDROCEPHALUS ACUTUS. See Hydroce.

phalus.

HYDROCEPHALUS EXTERNUS. Water between the brain and its membranes.

HYDROCEPHALUS INTERNUS. Water in

the ven ricles of the brain.

HYDROCOTYLE. (From vdap, water, and xolunn, the cotula.) 1. The name of a genus of plants in the Linnman sys-Class, Pentandria. Order, Digy-

2. The name, in some pharmacopæias, for the common marsh or water cotula, or penny-wort, which is said to possess acrid qualities.

HYDROCYSTIS. (From usag, water, and uvsis, a vesicle,) An encysted dropsy.

HYDROGEN. from (Hydrogenium; usag, water, and zwomas, to become, or γενναω, to produce, because with oxygen it produces water.) Base of inflammable air.

Hydrogen is a substance not perceptible to our sensations in a separate state; but its existence is not at all the less certain. Though we cannot exhibit it experimentally uncombined, we can pursue it while it passes out of one combination into another; we cannot, indeed, arrest it on its passage, but we never fail to discover it, at least if we use the proper chymical means, when it presents itself to our notice

in a new compound.

Hydrogen, as its name expresses, is one of the constituent elements of water. Its existence was unknown till lately. It is plentifully distributed in nature, and acts a very considerable part in the processes of the animal and vegetable economy. It is one of the ingredients in the mixtures of bitumen, of oils, fats, ardent spirit, ether, and, in fact, of all the proximate component parts of all animal and vegetable bo-It forms a constituent part of all animal and vegetable acids. It is one of the bases of ammonia and of various other compound gases.

It possesses so great an affinity with caloric, that it can only exist in the state of gas; it is consequently impossible to procure it in the concrete or liquid state, inde-

pendent of combination.

Solid hydrogen, therefore, united to caloric and iight, forms HYDROGEN GAS.

Properties of Hydrogen Gas. This gas, which was formerly called inflammable air, was discovered by Mr. Cavendish, in the year 1768, though it had been noticed long before by the ancients. The famous philosophical candle attests the antiquity of this discovery.

Hydrogen gas, like oxygen gas, is a triple compound, consisting of the pon-derable base or hydrogen, caloric, and light It possesses all the mechanical properties of atmospheric air. It is the lightest substance whose weight we are able to estimate: when in its purest state, and free from moisture, it is about thirteen times lighter than atmospheric air. It is not fitted for respiration; animals, when obliged to breatne in it, die almost instantaneously. It is decomposed by living vegetables, and its basis becomes one of the constituents of oil, resin, &c. It is inflammable, and burns rapidly when kindled, in contact with atmospheric air or oxygen gas, by means of the electric spark, or by an inflamed body; and burns, when pure, with a blue lambent flame; but all burning substances are immediately extinguished when immersed in it. It is, therefore, incapable of supporting combustion. It is not injurious to growing vegetables. It is unabsorbable by most substances; but water absorbs about one-thirteenth of its bulk. It is capable of dissolving carbon, sulphur, phosphorus, arsenic, and many other bodies. When its basis combines with that of oxygen gas, water is formed; with nitrogen it forms ammonia. It does not act on earthy substances. It is decomposible by a great variety of bo-

Method of obtaining Hydrogen Gas .- A ready method of obtaining hydrogen gas consists in subjecting water to the action of a substance which is capable of decom-

posing this fluid.

1. For this purpose, let sulphuric acid, previously diluted with four or five times its weight of water, be poured on iron filings, or bits of zinc, in a small retort, or gas-bottle, called a pneumatic flask, or proof; as soon as the diluted acid comes in contact with the metal, a violent effervescence takes place, and hydrogen gas escapes without external heat being appled. It may be collected in the usual manner over water, taking care to let a certain portion escape, on account of the atmospheric air contained in the disengaging vessels.

The production of hydrogen gas in the above way is owing to the decomposition of water. The iron, or zinc, when in contact with this fluid, in conjunction with sulphuric acid, has a greater affinity to oxygen than the hydrogen has; the oxygen, therefore, unites to it, and forms an oxid of that metal, which is instantly attacked and dissolved by the acid; the other constituent part of the water, the hydrogen, is set free, which, by uniting with caloric, assumes the form of hydrogen gas, The oxygen is therefore the bond of union between the metal and the acid.

The hissing noise, or effervescence, ob-

servable during the process, is owing to the rapid motion excited in the mixture by means of the great number of air-bubbles quickly disengaged and breaking at the surface of the fluid.

We see also in this case, that two substances exert an attraction, and are even capable of decomposing, jointly, a third, which neither of them is able to do singly, viz. if we present sulphuric acid alone, or iron or zinc alone, to water, they cannot detach the oxygen from the hydrogen of that fluid; but if both are applied, a decomposition is instantly effected. This experiment, therefore, proves that the agency of chymical affinity between two or more bodies may be dormant, until it is called into action by the interposition of another body, which frequently exerts no energy upon any of them in a separate state. Instances of this kind

were formerly called predisposing affinities, 2. Iron, in a red heat, has also the property of decomposing water, by dislodging the oxygen from its combination with hy-

drogen, in the following manner.

Let a gun-barrel, having its touch-hole screwed up, pass through a furnace, or large crucible perforated for that purpose, taking care to incline the barrel at the narrowest part; adjust to its upper extremity a retort charged with water, and let the other extremity terminate in a tube, introduced under a receiver in the pneumatic trough. When the apparatus is thus disposed, and well luted, bring the gun-barrel to a red heat, and when thoroughly red-hot, make the water in the retort boil; the vapour, when passing through the red-hot tube, will yield hydrogen gas abundantly. In this experiment, the oxygen of the water combines with the iron at a red heat, so as to convert it into an oxyd, and the caloric applied combines with the hydrogen of the water, and forms hydrogen gas. It is, therefore, the result of a double affinity, that of the oxygen of the water with the metal, and that of its hydrogen with caloric.

The more caloric is employed in the experiment of decomposing water by means of iron, &c. the sooner is the water decom-

osed.

Hydrogen gas is frequently found in great abundance in mines and coal-pits, where it is sometimes generated suddenly, and becomes mixed with the atmospheric air of these subterraneous cavities. If a lighted candle be brought in, this mixture otten explodes, and produces the most dreadful effects. It is called, by miners, fire-damp. It generally forms a cloud in the upper part of the mine, on account of its levity, but does not mix there with atmospheric air, unless some agitation takes place. The miners frequently set fire to

it with a candle, laying at the same time flat on their faces, to escape the violence of the shock. An easier and more safe method of clearing the mine is, by leading a long tube through the shaft of it, to the ash-pit of a furnace; by this means the gas will be conducted to feed the fire.

Hydrogen gas, in whatever manner produced, always originates from water, either in consequence of a preceding decomposition, in which it had cen combined, in the state of solid or fixed hydrogen, with one of the substances employed, or from a decomposition of water actually taking place during the experiment.

There are instances recorded of a vapour issuing from the stomach of dead persons, which took fire on the approach of a candle. We even find accounts, in several works, of the combustion of living human beings, which appears to be spontaneous. Dr. Swediaur related some instances of porters at Warsaw, who, having drank abundantly of spirit, fell down in the street, with the smoke issuing out of their mouths; and people came to their assistance, saying they would take fire; to prevent which, they made them drink a great quantity of milk, or used a more singular expedient, by causing them to swallow the urine of the by-standers, immediately on its evacuation.

However difficult it may be to give credit to such narratives, it is equally difficult to reject them entirely, without refusing to admit the numerons testimonies of men, who were, for the most part, worthy of credit. Citizen Lair has collected all the circumstances of this nature which he found dispersed in different books, and has rejected those which did not appear to be supported by respectable testimony, to which he has added some others, related by persons still living. These narratives are nine in number; they were communicated to the Philomatic Society, at Paris, and inserted in the bulletin, Thermidor, An. 5, No. 29. The cause of this phenomenon has been attributed to a development of hydrogen gas taking place in the stomachs of these individuals.

Citizen Lair believes that the bodies of these people were not burned perfectly spontaneously, but it appeared to be owing to some very slight external cause, such as the fire of a candle, taper, or pipe.

HYDROGEN GAS, SULPHURATED. Sulphurated hydrogen gas possesses the properties of an acid; for when absorbed by water, its solution reddens vegetable blues; it combines also with alkalies, earths, and with several metallic oxyds. Sulphurated bydrogen gas possesses an extremely offensive odour, resembling that of putrid eggs. It kills animals, and extinguishes burning bodies. When mixed

with oxygen gas, or atmospheric air, it is inflammable. Mingled with nitrous gas, it burns with a yellowish green flame. is decomposed by ammonia, by oxygenated muriatic acid gas, and by sulphureous acid gas. It has a strong action on the greater number of metallic oxyds. Its specific gravity to common air is as 1106 to 1000. It is composed, according to Thenart, of 70.857 sulphur, and 29.143 hydrogen. It has the property of dissolving a small quantity of phosphorus.

Sulphurated hydrogen gas may be obtain-

ed in several ways :-

1. Take dry sulphuret of potash, put it into a tubulated retort, lodged in a sandbath, or supported over a lamp; direct the neck of the retort under a receiver placed in the pneumatic trough; then pour gra-dually upon the sulphuret diluted sulphuric or muriatic acid; a violent effervescence will take place, and sulphurated hydrogen gas will be liberated. When no more gas is produced spontaneously, urge the mixture with heat, by degrees, till it boils, and gas will again be liberated abundantly.

The water made use of for receiving it should be heated to about 80 or 90; at this temperature it dissolves little of the gas; whereas, if cold water be made use of, a vast quantity of it is absorbed.

Explanation. - Though sulphur makes no alteration on water, which proves that sulphur has less attraction for oxygen than hydrogen has, yet, if sulphur be united to an alkali, this combination decomposes water whenever it comes in contact with it, though the alkali itself has no attraction

either for oxygen or hydrogen.

The formation of this gas explains this truth. On adding the sulphuret of potash to the water, this fluid becomes decomposed, part of the sulphur robs it of its oxygen, and forms with it sulphuric acid; this generated acid unites to part of the alkali, and forms sulphate of potash. liberated hydrogen dissolves another part of the sulphur, and forms with it sulphurated hydrogen, the basis of this gas, which is retained by the separated portion of the alkali. The sulphuric acid added now extricates it from the alkali, and makes it fly off in the form of gas.

The mixture in the retort therefore contains an alkaline sulphure, properly so called, or the simple combination of sulphur with alkali; sulphate of potash, and, lastly, sulphurated hydrogen gas, dissolved in the alkaline sulphure, or an hydroge-

nated sulphuret.

Diluted muriatic acid seems best adapted for the production of sulphurated hydrogen gas from alkaline sulphurets. If nitric acid be made use of it, must be much diluted. Sulphuric acid yields little gas, unless assisted by heat. When the proportion of sulpur in the sulphuret exceeds that of the alkali, the dense sulphuric acid poured upon it emits sulphuric acid gas, much loaded with sulphur. All the rest of the acids may be made use of for decomposing the sulphurets.

2. When iron and sulphur are united together, they afford a large quantity of sulphurated hydrogen gas, on submitting them to the action of heat, in contact with

Melt together, in a crucible, equal parts of iron filings and sulphur; the product is a black brittle mass, called sulphuret of iron. Reduce this to powder, and put it, with a little water, into a tubulated retort; add diluted muriatic acid, and apply a gentle heat, till no more gas is disen-gaged. The philosophy of this experiment is analogous to the former. Part of the oxygen of the water unites to part of the sulphur, and forms sulphuric acid; another part oxydates the iron, which, dissolved by the acid, forms sulphate of iron: the hydrogen of the water unites to another part of the sulphur, and forms sulphurated hydrogen, which gazeous by the addition of caloric.

Sulphurated hydrogen gas may also be obtained by heating an alkaline sulphuret, with the addition of water, without the affusion of an acid. In this case, the water is also decomposed; its hydrogen unites with part of the sulphur, and forms sulphurated hydrogen; the oxygen of the water unites with another part of the sulphur, and produces sulphuric acid, which joins to the alkali and forms a sulphate. The sulphurated hydrogen becomes disengaged

by heat in the gazeous form.

4. Sulphurated hydrogen gas may be obtained by passing hydrogen gas through sulphur, in a state of fusion.

For this purpose, put sulphur into a gunbarrel, or Wedegwood's tube, and place it across a furnace; fit to the lower extremity a bent glass tube, which goes under a receiver placed in the pneumatic trough, and adapt to the upper extremity a tubulated retort, or other apparatus proper for producing hydrogen gas. The sulphur must then be heated, and, when melted, and the hydrogen gas evolved, must be made to pass over it, which, in this manner, will dissolve part of the sulphur, and become converted into sulphurated hydro-

5. It may likewise be procured in a direct manner; for that purpose, let a small quantity of sulphur be enclosed in a jar full of hydrogen gas, and melt it by means of a burning-glass. This method does not succeed, except the hydrogen gas be as dry as possible, for its affinity to sulphur is weakened in proportion to its

moisture.

HYDROGEN GAS, PHOSPHORA-TED. Phosphorated bydrogen gas consists of phosphorus dissolved in hydrogen

Properties.—It is the most combustible substance in nature, and it is particularly distinguished from all other gases, by the property of taking fire immediately when brought in contact with atmospheric When mixed with oxygen gas, or with oxygenated muriatic acid gas, it burns with great vehemence. When bubbles of it are suffered to pass through water, they explode in succession as they reach the surface of this fluid. It has an insupportable odour, similar to that of putrid fish. It is partly absorbable by distilled water, freed from atmospheric air at low temperatures. Distilled water absorbs about onefourth, and gives it out again without alteration by heat. Water containing atmospheric air decomposes it, when suffered to stand with it for some time. When exposed to vivid light, it deposits phosphorus in a crystalline form.

Methods of obtaining it.

1. Take a small retort; put into it one part of phosphorus and ten of a concentrated solution of potash, or soda; make the mixture boil, and receive the liberated gas over mercury; or, if it be intended for immediate use, it may be collected over water. In this experiment, a decomposition of the water takes place. Its oxygen unites to part of the phosphorus, and forms phosphoric acid, which joins to the potash, and forms phosphate of potash. The liberated hydrogen dissolves another part of the phosphorus, and becomes converted into phosphorated hydrogen gas.

In thus preparing this gas, the body of the retort should be filled as nearly as possible with the mixture, otherwise the first portion of gas which is produced inflames in the retort; a vacuum is formed, and the water forced up into the retort,

and endangers the bursting of it.

2 Phosphorated hydrogen gas is also obtained, if, by a direct exposure to a strong heat, we effect a combination of phosphorus and lime, and then throw this compound into water, a great quantity of phosphorated hydrogen gas will soon be formed, and may be collected in the usual manner, over water or mercury.

The production of phosphorated hydrogen gas in this manner, is analogous to the first, with the only difference that here the decomposition of the water takes place at

common temperatures.

3. Phosphorated hydrogen gas may also be obtained, according to Davy, in the

following manner:

Let water be decomposed in the usual manner, by means of zinc and sulphuric acid, and add to the mixture a quantity of phosphorus. The hydrogen evolved will dissolve part of the phosphorus; phosphorated hydrogen gas will be produced, and take fire at the surface of the fluid, so long as the decomposition of the water is made, with considerable rapidity. the gas produced in this process burns with a more lambent flame than that obtained in the usual manner, probably on account of containing a larger quantity of hydrogen. The experiment is nevertheless brilliant; for the gas is disengaged in small bubbles, which cover the whole surface of the fluid; they disengage themselves rapidly, new ones are produced, and the whole fluid resembles a well of fire.

For the success of this experiment, it is essential that the water, during the action of its decomposition, be considerably heated, which may be effected by a copious addition of sulphuric acid, and that the phosphorus be present in a considerable quantity. Half a part of phosphorus cut into small pieces, one of granulated zinc, three of concentrated sulphuric acid. and five of water, answer this purpose

exceedingly well.

Phosphorated hydrogen gas is also produced by nature. The air which burns at the surface of certain springs, and forms what is called burning-springs, and the ignis fatui (Jack o'lanterns), which glide along burying-grounds, or places where animal matter is putrefying, consists of hydrogen gas, holding phosphorus in solution.

Hydrogen gaz, light, carbonated.

Carbonated hydrogen gas.

Hydrogen gaz, heavy, carbonated. Carbonated hydrogen gas.

HYDROLAPATHUM. (From usug, water, and hanzelov, the dock ) Herba Brittanica. Lapathum aquaticum. The water-dock. Rumex hydrolapathum, of Linnaus:-floribus hermaphroditis, valvulis integris graniferis, foliis lanceolatis. The leaves of this plant manifest considerable acidity, and are said to possess a laxative quality. The root is strongly adstringent, and has been much employed, both externally and internally, for the cure of some diseases of the skin, as scurvy, lepra, lichen, &c. The root powdered is said to be an excellent den-

HYDROMELI. (From vdag, water, and μελ, honey.) Mulsum. Aqua mulsa. Melicratum. Braggat. Hydromel. Water impregnated with honey. After it is fermented, it is called vinous hydromel, or

mead.

HYDROMETRA. (From voag, water. and unter, the womb.) Hydrops uteri. Dropsy of the womb. A genus of disease in the class cachexie, and order intumes. centia, of Cullen. It produces a swelling of the hypogastric region, slowly and gradually increasing, resembling the figure of the

uterus, yielding to, or fluctuating on, pressure; without ischury or pregnancy. Sauvage enumerates seven species. It must be considered as a very rare disease, and one that can with difficulty be ascertained.

HYDROMPHALUM. (From υδως, water, and ομφαλος, the navel.) A tumour of the

nave! containing water.

Hydronosos. (From υδως, water, and νοσος, a disease.) The sweating-sickness, called Ephidrosis and Sudor anglicus.

HYDROPEDESIS. (From υδωρ, water, and πιδαω, to break out.) A breaking out into

a violent sweat.

HYDROPHOBIA. (From vswg, water, Rabes canna. Cynanand polew, to fear.) thropia. Cynolesia. Capine madness. This disease arises in consequence of the bite of a rabid animal, as a dog or cat, and sometimes spontaneously. It is termed hydrophobia, because persons that are thus bitten dread the sight or the falling of water when first seized. Cullen has arranged it under the class neuroses, and order spasmi, and defines it a loathing and great dread of drinking any liquids, from their creating a painful convulsion of the pharynx, occasioned most commonly by the bite of a mad animal.

There are two species of hydrophobia: 1. Hydrophobia rabiosa, when there is a

desire of biting.

2. Hydrophobia simplex, when there is

not a desire of biting.

Dr. James observes, that this peculiar affection properly belongs to the canine genus, viz. dogs, foxes, and wolves; in which animals only it seems to be innate and natural, scarcely ever appearing in any others, except when communicated from these. When a dog is affected with maduess, he becomes dull, solitary, and endeavours to hide himself, seldom barking, but making a murmuring noise, and refusing all kinds of meat and drink. He flies at strangers; but, in this stage, he remembers and respects his master; his head and tail hang down; he walks as if over-powered by sleep; and a bite, at this period, though dangerous, is not so apt to bring on the disease in the animal bitten as one afflicted at a later period. The dog at length begins to pant; he breathes quickly and heavily; his tongue hangs out; his mouth is continually open, and discharges a large quantity of froth. Sometimes he walks slowly, as if half asleep, and then runs suddenly, but not always directly, forward. At last he forgets his master; his eyes have a dull, watery, red appearance; he grows thin and weak, often falls down, gets up, and attempts to fly at every thing, becoming very soon quite furious. The animal seldom lives in this latter state longer than thirty hours; and it is said, that his bites, towards the end of his existence, are the most dangerous. The throat of a person suffering hydrophobia is always much affected; and, it is asserted, the nearer the bite to this part the more

perilous.

Hydrophobia may be communicated to the human subject from the bites of cats, cows, and other an mals, not of the canine species, to which the affection has been previously communicated. However, it is from the bites of those domestic ones, the dog and cat, that most cases of hydrophobia originate. It does not appear that the bite of a person affected can communicate the disease to another; at least the records of medicine furnish no proof of this circumstance.

In the human, species, the general symptoms attendant upon the the bite of a mad dog, or other rabid animal, are-the part bitten, at some indefinite period, and occasionally long after the bitten part seems quite well, a slight pain begins to be felt in it, now and then attended with itching, but generally resembling a rheumatic pain. Then come on wandering pains, with an uneasmess and heaviness, disturbed sleep, and frightful dreams, accompanied with great restlessness, sudden startings, and spasms, sighing, anxiety, and a love for solitude. These symptoms continuing to increase daily, pains begin to shoot from the place which was wounded, all along up to the throat, with a straitness and sensation of choaking, and a horror and dread at the sight of water, and other liquids, together with a loss of appetite and tremor. The person is, however, capable of swallowing any solid substance with tolerable ease; but the moment that any thing in a fluid form is brought in contact with his lips, it occasions him to start back with much dread and horror, although he labours perhaps under great thirst at the time.

A vomiting of bilious matter soon comes on, in the course of the disease, and an intense hot fever ensues, attended with continual watching, great thirst, dryness and roughness of the tongue, hoarseness of the voice, and the discharge of a viscid saliva from the mouth, which the patient is constantly spitting out; together with spasms of the genital and urinary organs, in consequence of which the evacuations are forcibly thrown out. His respiration is laborious and uneasy, but his judgment is unaffected, and, as long as he retains the power of speech, his answers are distinct.

In some few instances, a severe delirium arises, and closes the tragic scene; but it more frequently happens, that the pulse becomes tremulous and irregular, that convulsions arise, and that nature, being at length exhausted, sinks under the pressure of misery.

The appearances to be observed, on dis-

59I

section, in hydrophobia, are unusual aridity of the viscera and other parts; marks of inflammation in the fauces, gula, and laryux; inflammatory appearances in the stomach, and an accumulation or effusion of blood in the lungs. Some marks of inflammation are tikewise to be observed in the brain, consisting in a serious effusion on its surface, or in a redness of the pia mater; which appearances have also presented themselves in the dog.

hi some cases of dissection, not the teast morbid appearance has been observed, citterin the fances, diaphragm, stomach, or intestines. The poison has therefore been conceived by some physicians to act inport the nervous system, and to be so whilely confined to it, as to make it a matter of doubt whether the qualities of the blood

are altered or not.

HYDROPHTHALMIA. (From υδας, water, and οφθακμος, the eye. Hydrophthalmium. There are two diseases, different in their nature and consequences, thus termed. The one is a mere anasarcous or edematous swelling of the eyelid. The other, the true hydropthalmia, is a swelling of the bulb of the eye, from too great a collection of the vitreous or aqueous humours.

ΗΥDROPHTHALMIUM. (From υδως, water, and οφθαλμος, the eye.) See Hydrophthalmia.

Hydrophysocele. (From ωδας, water, φυση, flatulence, and κηλη, a tumour.) Hernia, combined with hydrocele.

HYDROPICA. (From object, the dropsy.) Medicines which relieve or cure dropsy.

Hydropiper, (From obag, water, and ririque, pepper; so called from its biting the tongue like pepper, and being a native of marshy places.) Biting arsmart Lakeweed. Water-pepper. Polygonum hydropiper of Linnaus. This plant is very common in our ditches; the leaves have an acrid burning taste, and seem to be nearly of the same nature with those of the arim. They have been recommended as possessing antiseptic, aperient, diuretic virtues, and given in scurvies and cachexies, asthmas, hypochondriacal and nephritic comptaints, and wandering gont. The fresh leaves have been applied externally, as a stimulating cataplasm.

Hypnopneumosanca. (From υδας, water, τουμα, wind, and σαςξ, flesh.) A tumour of air, water, and solid substances.

Hypnoronnes. (From object, a dropsy, and obse, likeness.) A term formerly applied to liquid and watery excrements.

IN DROPS. (From wwg, water.) Dropsy. A preternatural collection of serous or watery fluid in the cellular substance, or different cavities of the body. It receives

different appellations, according to the particular situation in which it is lodged.

When it is diffused through the cellular membrane, either generally, or partially, it is called anasarca. When it is deposited in the cavity of the cranium, it is called hydrocephalus; when in the chest, hydrothorax, or hydrops pectoris. When in the abdomen, ascites. In the uterus, hydrometra; and

within the scrotum, hydrocele.

The causes of these diseases are, a family disposition thereto, frequent salivations, excessive and long continued evacuations, a free use of spirituous liquors, (which never fail to destroy the digestive powers,) schurosities of the liver, spiecn, pancteas, mesentery, and other abdominal viscera; preceding diseases, as the jaindice, diarrhoa, dysentery, phthis s, asth-ma, gout, intermittents of long duration, scariet fever, and some of the exanthemata; a suppression of accustonicd evacuations, the sudden striking in of eruptive humours, ossification of the valves of the heart, polypi in the right ventricle, aneurism in the arterics, tumours making a considerable pressure on the neighbouring parts, permanent obstruction in the lungs, rupture of the thoracic duct, exposure a length of time to a moist atmosphere, laxity of the exhalents, defect in the absorbents, topical weakness, and general

HYDROPS AD MATULAM. Diabetes.

HYDROPS ARTICULI. A white swelling of a joint is sometimes so called.

HYDROPS CYSTICUS. Any dropsy enclosed

in bags or cysts.

Hydrops genu. An accumulation of synovia, under the capsular ligament of the knee. Hydrops medulae spinalis. See Hydrorachitis and Shina bifida.

Hydrops ovarii A dropsy of the ova-

rium. A species of ascites.

HYDROPS PECTORIS. See Hydrothorax.

HYDROPS PULMONUM. Water in the cellu-

lar interstices of the lings.

Hydrops cteri. See Hydrocele. Hydropetra.

HYDROPYRETUS. (From vdag, water, and mugilos, fever.) The sweating fever or sick-

ness. See Sudor Anglicus.

HYDRORACHITIS. (From ωως, water, and ραχω, the spine.) A fluctuating tumour, mostly situated on the lumbar vertebræ of new-born children. It is a genus of disease in the class cachexia, and order intumescentia of Cullen, and is always incurable. See Spina bifida.

Hyphosaccharum. (From ωδας, water, and σακχαςω, sugar.) A drink made of sugar and water.

II and water.

Hyprosanca. (From use, water, and

rage, the flesh.) Water in the cellular membrane. See Anasarca.

HYDROSARCOCELE. (From whag, water, rage, the flesh, and whin, a tumour.) Sarcocele, with an infusion of water into the cellular membrane.

HYDROSATUM. (From udwg, water, and godov, a rose.) A drink made of water, honey, and the juice of roses.

HYDROSELINUM. (From vdag, water, and GEANOV, purslane.) A species of purslane, growing in marshy places.

Hydrosulphuretum stibii luteum. See

Sulphur antimonii præcipitatum.

HYDROSULPHURETUM STIBII RUBRUM. Kermes mineralis. A sulphuret of antimony formerly in high estimation as an expectorant, sudorific and antispasmodic, in difficult respiration, rheumatism, diseases of the skin

and glands.

HYDROTHORAX. (From υδως, water, and θωςαξ, the chest.) Hydrops thoracis. Hydrops pectoris. Dropsy of the chest. A genus of disease in the class cachexia, and order intumescentia, of Cullen. Difficulty of breathing, particularly when in a horizontal posture; sudden startings from sleep, with auxiety, and palpitations of the heart; cough, paleness of the visage, anasarcous swellings of the lower extremities. thirst, and a scarcity of urine, are the characteristic symptoms of hydrothorax; but the one which is more decisive than all the rest is, a fluctuation of water being perceived in the chest, either by the patient himself or his medical attendant, on certain motions of the body.

The causes which give rise to the disease are pretty much the same with those which are productive of the other species of dropsy. In some cases, it exists without any other kind of dropsical affection being present; but it prevails very often as a part

of more universal dropsy.

It frequently takes place to a considerable degree before it becomes very perceptible; and its presence is not readily known, the symptoms, like those of hydrocephalus, not being always very distinct. In some instances, the water is collected in both sacs of the pleura; but at other times, it is only in one. Sometimes it is lodged in the pericardium alone; but, for the most part, it only appears there, when, at the same time, a collection is present in one or both cavities of the thorax. Sometimes the water is effused in the cellular texture of the lungs, without any being deposited in the cavity of the thorax. In a few cases, the water that is collected is enveloped in small cysts, of a membranous nature, known by the name of hydatids, which seem to float in the cavity; but more frequently they are connected with, and attached to, particular parts of the internal surface of the pleura.

Hydrothorax often comes on with a sense of uneasiness at the lower end of the sternum, accompanied by a difficulty of breathing, which is much increased by any exertion, and which is always most considerable during night, when the body is in an horizontal posture. Along with these symptoms there is a cough, that is at first dry, but which, after a time, is attended with an expectoration of thin mucus. There is likewise a paleness of the complexion, and an anasarcous swelling of the feet and legs, together with a considerable degree of thirst, and a diminished flow of urine. Under these appearances, we have just grounds to suspect that there is a collection of water in the chest; but if the fluctuation can be perceived, there can then remain no doubt as to the reality of its presence.

During the progress of the disease, it is no uncommon thing for the patient to feel a numbness, or degree of palsy, in one or both arms, and to be more than ordinarily sensible to cold. With regard to the pulse, it is usually quick at first, but, towards the end, becomes irregular and intermitting.

Our prognostic in hydrothorax must, in general, be unfavorable, as it has seldom been cured, and, in many cases, will hardly admit even of alleviation, the difficulty of breathing continuing to increase, until the action of the lungs is at last entirely impeded by the quantity of water deposited in the chest. In some cases, the event is suddenly fatal, but in others it is preceded, for a few days previous to death, by a spit-

ting of blood.

Dissections of this disease shew that, in some cases, the water is either collected in one side of the thorax, or that there are hydatides formed in some particular part of it; but they more frequently discover water in both sides of the chest, accompanied by a collection in the cellular texture and principal cavities of the body. The fluid is usually of a yellowish colour; possesses properties similar to serum, and, with respect to its quantity, varies very much, being from a few ounces to several quarts. According to the quantity, so are the lungs compressed by it; and, where it is very considerable, they are usually found much reduced in size. When universal anasarca has preceded the collection in the chest, it is no uncommon occurrence to find some of the abdominal viscera in a schirrous state.

HYGIENE. (From vytawa, to be well.) 'Hygiesis. Hygeia. Modern physicians have applied this term to that division of therapia which treats of the diet of the sick and the non-natural.

Hygiesis. See Hygiene.

Hrona. (From vygos, humid.) Liquid plasters.

HYGREMPLASTRUM. (From uyess, moist, and sundaseev, a plaster.) A liquid plas-

HYGHOBLEPHARICUS. (From vyeos, humid, and Exequeor, the eye-lid.) Applied to the emunctory ducts in the extreme edge, or inner part, of the eye-lid.

HYGROCINCOCELE. (From opens, moist, rigoos, a varix, and κηλη, a tumour.) Dilated spermatic veins, with dropsy of the

scrotum.

HYGROCOLLYRIUM. (From vygos, liquid, and κολλυgιον, a collyrium.) A collyrium composed of liquids.

HYGROLOGY. (Hygrologia; from υγςος, a humour or fluid, and λογος, a discourse.)

The doctrine of the fluids.

HYGROMA. (uzpoma: from uzeos, a liquid.) An encysted tumour, whose content- are either serum or a fluid like lymph. It sometimes happens that these tumours are filled with hydatids. Hygromatous tumours require the removal of the cyst, or the destruction of its secreted surface,

HYGROMETER. (Hygrometrum; from υρεος, moist, and μετεον, a measure.) Hydrometer. An instrument to measure the degrees of moisture in the atmosphere. It also means an infirm part of the body, affected by moisture of the atmosphere.

HYGROSCOPICS. Substances which have the property of absorbing moisture from the atmosphere. See Atmosphere.

HYGROMYHUM. (From vyeos, moist, and µugor, a liquid ointment.) A liquid ointment.

HYGHOPHOBIA. The same as hydrophobia.

(un, matter.) The materia medica, or matter of any kind which comes under the eognizance of a medical person.

HYMEN. (From Hymen, the god of marriage, because this membrane is supposed to be entire before marriage, or copulation.) The hymen is a thin membrane, of a semilunar or circular form, placed at the entrance of the vagina, which it partly eloses. It has a very different appearance in different women, but is generally, if not always, found in virgins, and is very properly esteemed the test of virginity, being ruptured in the first act of coition.

The remnants of the hymen are called the carunculæ myrtiformes. The hymen is also peculiar to the human species. There are two eircumstances relating to the hymen which require medical assistance, is sometimes of such a strong ligamentous texture, that it cannot be ruptured, and prevents the connection between the sexes. It is also sometimes imperforated, wholly closing the entrance into the vagina, and preventing any discharge from the uterus; but both these cases are extremely rare. If the hymen be of an unnaturally firm texture, but perforated, though perhaps with a very small opening, the inconve-

niencies thence arising will not be discovered before the time of marriage, when they may be removed by a crucial incision made through it, taking care not to injure the adjoining parts.

The imperforation of the lymen will produce its inconveniencies when the person begins to menstruate. For the menstrnous blood, being secreted from the, uterus at each period, and not evacuated the patient suffers much pain from the distention of the parts, many strange symptoms and appearances are occasioned, and suspicions injurious to her reputation are often entertained. In a case of this kind, for which Dr. Denman was consulted, the young woman, who was twenty-two years of age, having many uterine complaints, with the abdomen enlarged, was suspected to be pregnant, though she persevered in asserting the contrary, and had never menstruated. When she was prevailed upon to submit to an examination, the circumscribed tumour of the uterus was found to reach as high as the navel, and the external parts were stretched by a round soft substance at the entrance of the vagina, in such a manner as to resemble that appearance which they have when the head of a child is passing through them: but there was no entrance into the vagina. On the following morning, an ineision was carefully made through the hymen, which had a fleshy appearance, and was thickened in proportion to its distention. Not less than four pounds of blood, of the colour and consistence of tar, were discharged; and the tumefaction of the abdomen was immediately removed. Several stellated incisions were afterwards made through the divided edges, which is a very necessary part of the operation; and care was taken to prevent a re-union of the hymen till the next period of menstruation, after which she suffered no inconvenience. The blood discharged was not putrid or coagulated, and seemed to have undergoue no other change, after its secretion, but what was occasioned by the absorption of its more fluid parts Some caution is required, when the hymen is closed in those who are in advanced age, unless the membrane be distended by the confined menses; as Dr. Denman once saw an instance of inflammation of the peritonæum being immediately produced after the operation, of which the patient dicd as in the true puerperal fever, and no other reason could be assigned for the dis-

The carunculæ myrtiformes, by their elongation and enlargement, sometimes become very painful and troublesome.

HIMENEA COURBARIL (Hymenea, corrupt of anime, or animea.) The systematic nime of the tree which affords the resin anime. See . Inime.

HYO. Names compounded of this word

3 E \*

belong to muscles which originate from, or are inserted into, or connected with, the os hy ides; as, Hyo-glessus, Hyo pharyngeus,

Genio hyo glossus, &c.

HYO GLOSSUS. Cerato glossus of Douglas and Cowper. Basio-cerato chondroglossus of Albinus. Hyo-chondroglosses of Dumas. A muscle situated at the sides, between the os hyoides and the tongue. It arises srom he basis, but chiefly from the corner of the os hyoides, running laterally and forwards to the tongue, which its pulls inwards and downwards.

HYOIDES OS. (nosiges : from the Greek letter v, and ewos, likeness; so named from its resemblance.) This bone, which is situated between the root of the tongue and the larynx, derives its name from its supposed resemblance to the Greek letter v, and is, by some writers, described along with the parts contained in the mouth. Ruysch has seen the ligaments of the bone so completely ossified, that the os hyoides was joined to the temporal bones by anchylosis. In describing this bone, it may be distinguished into its hody, horns, and appendices. The body is the middle and broadest part of the bone, so placed that it may be easily felt with the finger in the fore part of the throat. Its fore-part, which is placed to-wards the tongue, is ir egularly convex, and its inner surface, which is turned towards the larynx, is unequally concave. The cornua, or horns, which are flat, and a little bent, are considerably longer than the body of the bone, and may be said to form the sides of the v. These horns are thickest near the body of the bone. the extremity of each is observed a round tubercle, from which a ligament passes to the thyroid cartilage. The appendices, or lesser horns, cornua minora, as they are called by some writers, are two small processes, which in their size and shape are somewhat like a grain of wheat. They rise up from the articulations of the cornua, with the body of the bone, and are sometimes connected with the styloid process on each side, by means of a ligament. It is not unusual to find small portions of bone in these ligaments; and Ruysch, as we have already observed, has seen them completely ossified. In the fœtus, almost the whole of the bone is in a cartilaginous state, excepting a small point of bone in the middle of ks body, and in each of its horns. The appendices do not begin to appear till after birth, and usually remain cartilaginous many years. The os hyoides serves to support the tongwe, and affords attachment to a variety of muscles, some of which perform the motions of the tongue, while others act on the larynx and

HYOPHARYNGEUS. (From voesd'in

the hyoid bone, and pagents, the pharynx.) A muscle so called from us origin in the os hyoides, and its insertion in the pharynx.

HYOPHTHALMUS. (From us, a swine, and οφθαλμος, an eye; so named from the supposed resemblance of its flower to a hog's-eye.) Golden starwort; hog's-eye

plant.

HYOSCIAMUS. (From vs, a swine, and nuamos, a bean; so n med because hogs eat it as a medicine, or it may be because the plant is hairy and bristly, like a swine.) 1 The name of a genus of plants in the Linnaan system. Class, Pentandria. Order, Monogynia

2. The pharmacopoial name of the henbane, called also Faba suilla. Apollinaris altercum. Agone. Altercangenou. Common or black henbane. Hyosciamus niger; foliis amplexicanlibus sinuatis, floribus sessifoliis amplexicanlibus sinuatis, floribus sessifoliis.

libus of Linnæus.

The leaves of this plant, when recent, have a slightly footid smell, and a mucilaginous taste; when dried, they lose both taste and smell, and part also of their narcotic power. The root possesses the same qualities as the leaves, and even in a more

eminent degree.

Henbane resembles opium in its action, more than any other na cotic does. In a moderate dose, it increases at first the strength of the pulse, and occasions some sense of heat, which are followed by diminished sensibility and motion; in some cases by thirst, sickness, stupor, and dimness of vision-In a large quantity, it occasions profound sleep, hard pulse, and sometimes fierce delirium, ending in coma, or convulsions, with a remarkable dilatation of the pupil, distortion of the countenance, a weak tremulous pulse, and eruption of petechia. On dissection, gangrenous spots have been found on the internal surface of the stomach. Its baneful eff cts are best counteracted by a powerful emetic, and by drinking largely of the vegetable acids.

Henbane has been used in various spasmodic and painful diseases, as in epilepsy, hysteria, palpitation, head-ache, paralysis, mania, and scirrhus. It is given in the form of the inspissated juice of the fresh leaves, the dose of which is from one to two grains; which requires to be gradually increased. It is sometimes employed as a substitute for opium, where the latter, from idiosyncrasy, occasions any disagreeable symptom. The henbane also is free from the constipating quality of the opium.

HYOSCIAMUS ALIUS. This plant, a native of the south of Europe, possesses similar virtues to the hyosciamus niger. See Hyosciamus.

HYOSCIAMUS LUTÆUS. A species of to-

HYOSCIAMUS NIGER. The systematic name or henbane. See Hyosciamus.

HYOTHYROIDES. (From vouses, the hy-

vid bone, and dugousns, the thyroid cartilage.) A muscle named from its origin in the hvoide bone and insertion in the thyroid cartilage.

HYPACTICA. (From υπαγω, to subdue.)

Medicines which evacuate the fæces

HYPALEIPTRUM. (From υπαλειφω, to spread upon.) A spatula for spreading ointments with.

HYPELATA. (From υπέλαω, to move.) Cathartics

HYPEHÆSTHESIS. (From υπεραισθος, to feel excess.) Error of appetite, whether by excess or deficiency. It is synonymous with Dr Culien's order of Dysorexia.

HYPERCATHARSIS. (F: om unse, supra, over or above, and xx8xgw, to purge.) Hyperinesis Hyperinos. An excessive

purgi g from medicines.

HYPERC RYPHOSIS. (From unig, above, and модифи, the vertex.) A prominence, or pro oberance. Hippocrates calls the lobes of the liver and lungs Hypercoryphoses.

HYPERCRISIS. (From unsergious : from unse, over or above, and neww, to separate.) crit cal excretion above measure; as when a fever terminates in a looseness, the humours may flow off faster than the strength can ear, and therefore it is to be checked.

Hypendnosis. (From unig, in excess, and odag, water.) A great distention of any part from water collected in it.

Hyperemesis. (From une, in excess, and eueco, to vomit. An excessive evacuation by vom ting.

Hyperephobrosis. (From vire, excess, and ideac, sweat.) In modera e swearing.

HYPERICUM. (From varg over, and thay, an image, or specti; so named because it was thought to have power over and to drive away evil spirits.) I The name of a genus of plants in the Linnæin system. Class. Polyadelphia. Order, Po-

lyundria. St. John's wort

2. The pharmacopæial name of the perforated or common St. John's wort, called also fuga demonum, and androsemum. Hypericum perfoliatum of Linnaus:-floribus trigynis, caule ancipiti, foliis obtusis pellucido-punciatis. This indigenous plant was greatly esteemed by the ancients, internally in a great variety of diseases, and externally as an anodyne and discutient, but is now very rarely used. The flowers were formerly used in our pharmacopæia, on account of the great proportion of resinous only matter, in which the medical efficiety of the plant is supposed to reside, but are now omit ed.

Hypericum perfonatum. The systematic name of the St. John's wort. See

Hupericum.

HYPERICEM SAXATILE. Hypericoides. Co. ris lutea. Coris ligitima cretica. Bastard St. John's wort. The seeds are said to be diuretic, emmenagogue, and powerfully antispasmodic.

Hyperina. (From uneg, in excess, and www, to evacuate.) Medicines which purge excessively.

Hyperinesis. See Hypercatharsis.
Hyperines. See Hypercatharsis.
Hyperines. (From une, above, and ou, os.) The palate.

HYPLROPHARYNGAUS. (From ung, above and pagon &, he pharynx.) A muscle named from its situation above the pharynx.

HYPEROSTOSIS. (From uneg, upon, and

oseov, a bone. See Exostosis.
Hyperoum. (From urig, above, and wov, the roof, or palate.) A foramen in the upper part of the palate.

HYPERSARCOMA. (From uneg, in excess, and ragog, flesh.) Hypersarcosis. A polypus in the nose. A fleshy excrescence. A polypus.

Hypersarcosis. See Hypersarcoma.

HYPEYODOS. (unegodos: from uno, under, and egoc, passing out.) A flux of the

HYPNOBATES. (From vTvos, sleep, and Extra, to go.) Hypnobatasis. One who walks in his sleep. See Oneirodynia.

Hypnologia (From utros, sieep, and λογος.) A dissertation, or directions for the duc regulation of sleeping and wa-

HYPNOPOLETICA. (From υπνος, sleep, and ποικω, to cause.) Medicines which procure sleep. See Anodynes.

Hypnotics (Hypnotica, sc. medicamenta, υπνωτικα; from υπνος, to sleep.) Adnodynes.

HYPOÆMA. (From uno, under, and aima, blood; becan e the blood is under the cornea.) An effusion of red blood into the chambers of the eye. 5" "

Hypocanones. (From una and nagos, a carus.) Hepocarothis. One who labours

under a low degree of carus.

Hypocathausis. (From viw, under. and xabaiew, to purge.) It is when a medieme does not work so much as expected, or but very little. Or a slight purging, when it is a disorder.

HYPOCAUSTHUM. (From vTo, sub, under, and xaiw, to burn.) A stove, or hot-house, or any such-like contrivance; or place to sweat in, or to preserve plants from cold

HTPOCERCHALEON. (From wow and use y vos, an a perity of the fauces. A striduious kind of asperity of the fauces.

Hypocheomenos. (From 070, under, and χω, to pour.) One who labours under a cataract.

Hypocheorosis. (From uno, and xxxxgaous, the green sickness.) A light degree of chlorosis

HYPOCHONDRIAC REGIONS. giones hupochindriace; from was nuder, and xordeos a cartilage.) Hypochondria. The spaces in the abdomen that are under the cartilages of the spurious ribs on each side of the epigastrium.

HYPOCHONDRIASIS. From υποκρόδρισκος, one who is hipped.) Hypochondriacus morbus. Affectio hypochondriaca. Passio hypochondriaca. The hypochondriac affection. Vapours, spleen, &c. A genus of disease in the class neuroses, and order adynamie, of Cullen, characterized by dyspepsia; languor, and want of energy; sadness and fear, from uncertain causes; with a melancholic te. perament.

The state of mind peculiar to hypochondriacs is thus described by Cullen :- "A languor, listlenesss, or want of resolution and activity, with respect to all undertakings; a disposition to seriousness, sadness, and timidity, as to all future events, and apprehension of the worst or most inhappy state of them; and, therefore, often upon slight grounds, an apprehension of great evil. Such persons are particularly attentive to the state of their own health, to every the smallest change of feeling in their bodies, and from any unusual sensation, perhaps of the slightest kind, they appreliend great danger, and even death itself. In respect to these feelings and fears, there is commonly the most obstinate belief and persuasion." He adds, that it is only when the state of mind just described is joined with indigestion, in either sex, somewhat advanced in years, of a melancholic temperament, and a firm and rigid habit, that the disease takes the name of Hopochondriacism.

The seat of the hypochondriac passion is in the stomach and bowels; for first these parts are disordered, then the others suffer from the connection.

The causes are, sorrow, fear, or excess of any of the passions; too long continued watching; irregular diet. Those habitually disposed to it, (and these causes have little effect in other constitutions,) have generally a sallow or brown complexion, and a down-cast look; a rigidity of the solids, and torpor of the nervous system. Whatever may occasion nervous disorders in general, may be the cause of this in particular.

The signs of this complaint are so various, that to describe them is to describe almost every other disease; but, in general, there is an insurmountable indolence, dejected spirits, dread of death, costiveness, a slow and somewhat difficult inspiration, flatulencies in the prime viæ, and various spasmodic affections. It is seldom fatal; but if neglected, or improperly treated, may bring on incurable melancholy, jaundice, madness, or vertige, palsy, and apoplexy.

madness, or vertigo, palsy, and apoplexy. On dissections of hypochondriacal persons, some of the abdominal viscera (particularly the liver and spleen) are usually found considerably enlarged. In some few instances, effusion and a turgescence of

the vessels have been observed in the brain.

HYPOCHONDRIUM. (From υπο) under, and χοπόρος, a cartilage.) That part of the body which lies under the cartilages of the spurious ribs.

HYPOCHYMA. (From v70, and  $\chi v u$ , to pour; because the ancients thought that the opacity proceeded from something running under the chrystaline humour.) Hypochysis. A cataract.

Hypocistis. (From vito, under, and xisis, the cistus.) A plant called by Linneus Asarum hypocistis, a parasitical plant, growing in warm climates, from the roots of the cistus. The juice, succus hypocisticis, is a mild astringent, of no particular smell nor flavour. It is seldom used.

HYPOCLEPTICUM. (From υπο, under, and κλεπτω, to steal.) A chymical vessel for separating liquors, particularly the essential oil of any vegetable from the water; and named because it steals, as it were, the water from the oil.

HYPOCOELON. (From v70, under, and κοιλον, the cavity above the upper eye-lid.)
The cavity under the lower eye-lid.

Hypocornosis. Cophosis, but in a less degree.

Hypogranium. (From 1270, under, and 2gaver, the skull.) A kind of abscess, so called because situated under the cranium, between it and the dura mater.

HYPODEIRIS. In Rufus Ephesius, it is the extremity of the fore-part of the neck.

Hypodermis. (From  $\nu\pi\sigma_0$ , under, and  $\delta\epsilon_0\mu\alpha$ , the skin.) The cuticle under the chtoris, which covers it like a prepuce. The clitoris.

Hypodesis. (From  $\nu\pi 0$ , under, and  $\delta \epsilon \omega$ , to bind.) An underswathe, or bandage.

HYPODESMUS. A bandage like the former.

HYPOGALA. (From  $u\pi o$ , under, and  $\gamma a\lambda \alpha$ , milk; because it is a milk-like effusion, under the cornea.) A collection of white humour, like milk, in the chambers of the eye. There are two species of this disease: the one takes place, it is said, from a deposition of the milk, as is sometimes observed in women who suckle; the other from a depression of the milky cataract.

HYPOGASTRIC ARTERIES. See Ilia ac arteries.

HYPOGASTRIC REGION. (Regio hypogastrica; from vno, under, and vasne, the stomach.) The region of the abdomen that reaches from above the pubis to within three fingers' breadth of the navel.

HYPOGASTRIUM. (From uno, under, and yasne, the stomach.) The lower region of the part of the belly.

HYPOGASTROCELE. (From uncyasgiov, the hypogastrium, and war, a tumour.)

A tumour, or herma, in the hypogastric

Hypoglossis. (From vao, under, and γλωσσα, the tongue.) The under part of the tongue, which adheres to the lower

Hypoglossus, (From wto, under, and λωσσα, the tongue.) A nerve which goes

to the under part of the tongue.

Hypoglottibes. (From υπο, under, and γλωτία, the tongue.) They are a kind of medicine to be held under the tongue until

they are dissolved.

HYPOGLUTIS. (From υπο, under, and γλετος, the nates.) It is the fleshy part under the nates towards the thigh. say it is the flexure of the coxa, under the

HYPOMIA. (From vno, under, and whos, shoulder. In Galen's Exegesis it is the

part subjacent to the shoulder.

HYPONOMOS. (From υσονομος, a phagedenic ulcer.) A subterraneous place. A

deep phagedenic ulcer.

Hyporedium. (From 1970, under, and wee, the foot.) A cataplasm for the sole of the foot.

(From υποφερομαι, to be HYPOPHORA. carried or conveyed underneath.) A deep

fistulous ulcer.

and οφθαλμος, the eye.) The part under, the eye which is subject to swell in a cachexy, or dropsy.

(From umo, under, and Hypophysis. φυω, to produce.) A disease of the eyelids, when the hairs grow so much as to ir-

ritate and off and the pupil.

HYPOPIUM. (From uno, under, and Tuoy, pus; because the pus is under the Mypopyon. Pyosis. Abscessus
An accumulation of a glutinous cornea.) Hypopyon. Pyosis. vellow fluid, like pus, which takes place in the anterior chamber of the aqueous humour, and frequently also in the posterior one, in consequence of severe, acute ophthalmy, particularly the internal spe-

This viscid matter of the hypopium is commonly called pus; but Scarpa contends that it is only coagulating lymph. The symptoms portending an extravasation of coagulable lymph in the eye, or an hypopium, are the same as those which occur in the highest stage of violent acute ophthalmy, viz. prodigious tumefaction of the eye-lids; the same swelling and redness as in chemosis; burning heat and pain in the eye; pains in the eye-brow and nape of the neck; fever, restlessnesss, aversion to the faintest light, and a contracted state of the pupil.

Hypoulnion. (From vmo, under, and en, the nose.) A name for the parts of the

upper lip below the nostrils.

Hyposarca. (From uno, under, and rage, flesh.) Hyposarcidios. An anasarca.

In Dr. Cullen's Nosology, it is synonymous with Physconia.

HYPOSPADIÆOS. (From υπο, under, and σπαω, to dr w.) The urethra terminating

under the glans.

Hypospathismus. (From υπο, under, and σπαθη, a spatula.) The name of an operation formerly used in surgery, for removing defluxions in the eyes. It was thus named from the instrument with which it was performed.

(From uno, under, and HYPOSPHAGMA. σφαζω, to kill.) Aposphazma. An extravasation of blood in the tunica adnata of the eye, from external injury.

(From uno, under, and HYPOSPLENIA. A small tumour of the  $\sigma\pi\lambda n\nu$ , the spicen.)

spleen.

HYPOSTAPHYLE. (From uno, and σαφυλλ, the uvula.) Relaxation of the uvula.

Hypostasis. (From voiskui, to subside.) A sediment, as the sediment in urine.

HYPOTHENAR. (From υπο, under, and θενας, the palm of the hand.) A muscle which runs on the inside of the hand. Also that part of the hand which is opposite to the palm.

HYPOTHESIS. A system of general rules, founded partly on fact and partly on conjecture. A theory explains every fact: an hypothesis explains only a certain number of facts, leaving some unaccounted for, and others in opposition to it.

ΗΥΡΟΤΗΕΤΟΝ. (From υπο, under, and τιθημι, to put.) A suppository, or medicine introduced into the rectum, to pro-

cure stools.

HYPOXYLON. (From υπο, and ξυλον, wood.) A species of clavaria, which grows under

HYPOZOMA. (From υπο, and ζωννυμι, to bind round.) The diaphragm.

HYPSIGLOSSUS. (From sufinosedes, the hypsitoid bone, and yawoox, the tongue.) A muscle named from its origin in the os hyordes, and its insertion in the tongue.

HYPSILOIDES. A name of the Os Hyoides; also of the Basioglossus muscle. See

Hyoglossus.

HYPTIASMOS. (From υπλιαζω, to lie with the face upwards.) A supine decubiture, or a nausea, with inclination to vomit.

HYPULUS. (From umo, under, and sax. a cicatrix.) An ulcer which lies under a cicatrix.

Hyssop. See Hyssopus.

Hyssop, hedge. See Gratiola.

HYSSOPITES. (From υσσωπος, hyssop.) Wine impregnated with hyssop.

HYSSOPUS. (veromos: from Azob, Heb.) 1. The name of a genus of plants in the Linnæan system. Class, Didynamia. Order, Gymnospermia. Hyssop.

2 The pharmacopæial name of the common hyssop. Hyssopus officinalis of Linnæus :- spicis secundis, foliis lanceolatis. This exotic plant is esteemed as an aromatic and stimulant, but is chiefly employed as a pectoral, and has long been thought useful in humoral asthmas, coughs, and catarrhal affections; for this purpose, an infusion of the leaves, sweetened with honey, or sugar, is recommended to be drank as tea.

HYSSOPUS CAPITATA. Wild thyme.

HYSSORUS OFFICINALIS. The systematic name of the common hyssop: See Hyssopus.

HYSTERA. (From vsegos, behind; so called because it is placed behind the other

parts.) The uterus, or womb.

HYSTERALGIA. (From υςτίζα, the womb, and αλγος, pain.) A pain in the womb. HYSTERIA. (From υςτίζα, the womb, from which the disease was supposed to arise.) Passio hysterica. Hysterics. Dr. Cullen places this disease in the class neuroses, and order spasmi. There are four species:

1. Hysteria chlorotica, from a retention

of the menses.

2. Hysteria à leucorrhaa, from a flucr albus.

3. Hysteria à menorrhagia, from an immoderate flow of the menses.

4. Hysteria libidinosa, from sensual de-

The complaint appears under such various shapes, imitates so many other diseases, and is attended with such a variety of symptoms, which denote the animal and vital functions to be considerably disordered, that it is difficult to give a just character or definition of it; and it is only by taking an assemblage of all its appearances, that we can convey a proper idea of it to others.

The disease attacks in paroxysms, or fits. These are sometimes preceded by dejection of spirits, anxiety of mind, effusion of tears, difficulty of breathing, sickness at the stomach, and palpitations at the heart; but it more usually happens, that a pain is felt on the left side, about the flexure of the colon, with a sense of distention advancing upwards, till it gets into the stomach, and removing from thence into the throat, it occasions, by its pressure, a sensation as if a ball was lodged there, which by authors has been called globus hystericus. The disease having arrived at this height, the patient appears to be threatened with suffocation, becomes faint, and is affected with stupor and insensibility; whilst, at the same time, the trunk of the body is turned to and fro, the limbs are variously agitated, wild and irregular actions take place in alternate fits of laughter, crying, and screaming; incolierent expressions are uttered, a temporary delirium prevails, and a frothy saliva is discharged from the mouth. The -pa.ms at length abating, a quantity of wind is evacuated upwards, with frequent sighing

and sobbing, and the woman recovers the exercise of sense and motion without any recollection of what has taken place during the fit, feeling, however, a severe pain in her head, and a soreness over her whole body.

In some cases, there is little or no convulsive motion, and the person lays seemingly in a state of profound sleep, without

either sense or motion.

Hiccup is a symptom which likewise attends in some instances, on hysteria; and now and then it happens, that a fit of hysteria consists of this alone. In some cases of this nature, it has been known to continue for two or three days, during which, it frequently seems as if it would suffocate the patient, and proceeds, gradually weakening her, till it either goes off, or else occasions death by suffocation; but this last is extremely rare. Besides hiccup, other slight spasmodic affections sometimes wholly form a fit of hysteria, which perhaps continue for a day or two, and then either go off of themselves, or are removed by the aid of medicine.

In some cases, the patient is attacked with violent pains in the back, which extend from the spine to the sternum, and at length become fixed upon the region of the stomach, being evidently of a spasmodic nature, and often prevaiting in so high a degree as to cause clammy sweats, a pale cadaverous look, coldness of the extremities, and a pulse hardly perceptible.

Hysteric affections occur more frequently in the single state of life than in the married; and that most usually between the age of puberty and that of thirty-five years; and they make their attack oftener about the period of menstruation than at any other.

They are readily excited in those who are subject to them, by passions of the mind, and by every considerable emotion, especially when brought on by surprise; hence sudden joy, grief, fear, &c. are very apt to occasion them. They have also been known to arise from imitation

and sympathy.

Women of a delicate habit, and whose nervous system is extremely sensible, are those who are most subject to hysteric affections; and the habit which predisposes to their attacks is acquired by inactivity and a sedentary life, grief, anxiety of mind, a suppression or obstruction of the menstrual flux, excessive evacuations, and a constant use of a low diet, or of crude unwholesome food.

Hysteria differs from hypochondriasis in the following particulars, and, by paying attention to them, may always readily be dis inguished from it. Hysteria attacks the sanguine and plethoric; comes on soon after the age of puberty; makes its onset suddenly and violently, so as to deprive the

HYS

399

patient of all sense and voluntary motion; is accompanied with the sensation of a ball rising upwards in the throat, so as to threaten suffocation; is attended usually with much spasmodic affection; is more apt to terminate in epilepsy than in any other disease; and, on dissection, its morbid appearances are confined principally to the uterus and ovaria.

The reverse happens in hypochondriasis. It attacks the melancholic; seldom occurs till after the age of thirty five; comes on gradually; is a tedious disease, and difficult to cure; exerts its pernicious effects on the membranous canal of the intestines, as well by spasms as wind; is more apt o terminate in melancholy, or a low fever, than in any other disease; and, on dissection, exhibits its morbid effects principally on the liver, spleen, and pancreas, which are often found in a hard, schirrhous, or corrupted state.

Another very material difference might be pointed out betwixt these two diseases, which is, that hysteria is much relieved by advancing in age, whereas hypochondriasis

usually becomes aggravated.

The two diseases have often been confounded together; but, from considering the foregoing circumstances, it appears that a proper line of distinction should be drawn

between them.

The hysteric passion likewise differs from a syncope, as in this there is an entire cessation of the pulse, a contracted face, and a ghastly countenance; whereas, in the uterine disorder, there is often something of a colour, and the face is more expanded; there is likewise a pulse, though languid; and this state may continue two or three days, which never happens in a syncope.

It also differs from apoplexy, in which the abolition of sense and voluntary motion is attended with a sort of snoring, great difficulty of breathing, and a quick puise; which do not take place in hysteric cases.

It differs from epilepsy, in that this is supposed to arise in consequence of a distention of the vessels of the brain; wher as, in hysteria, the spasmodic and convulsive motions arise from a turgescence of blood in the uterus, or in other parts of the gental system.

However dreadful and alarming an hysteric fit may appear, still it is seldom accompanied with danger, and the disease never terminates fatally, unless it changes into epilepsy, or that the patient is in a very weak reduced state.

HYSTERIA CILOROTICA Hysterics from obstructed menses. See Hysteria.

HYSTERIA FEBRICOSA. A tertian fever, with spisms and convulsions.

Hysteria a Leucorum Ea. Hysterics from fluor albus. See Hysteria.

HYSTERIA LIBIDINOSA. Nymphomania, or female libidinous propensity. See Hysteria.

HYSTERIA A MENORRHAGIA. Hysterics from profuse menses. See Hysteria.

HYSTERIALGES. (From v518ga, the womb, and any os, pain.) An epithet for any thing that excites pain in the uterus. Hippocrates applies this word to vinegar; and others signify by it the pains which resemble labour-pains, generally called false pains.

HYSTERITIS. (From v5:62, the womb.) Metritis. Inflammation of the womb. A genus of disease in the class pyrexia, and order phlegmusia, of Cullen; characterized by pyrexia, heat, tension, tumour, and pain in the region of the womb; pain in the osuteri when touched, and vomiting.

In natural labours, as well as those of a laborious sort, many causes of injury to the nterus, and the peritonæum which covers it, will be applied. The long continued action of the uterus on the body of the child, and the great pressure made by its head on the soft parts, will farther add to the chance of injury. Besides these, an improper application of instruments, or an officiousness of the midwife in hurrying the labour, may have contributed to the violence. To these causes may be added exposure to cold, by taking the woman too early out of bed after delivery, and thereby throwing the circulating fluids upon the internal parts, putting a stop to the secretion of milk, or occasioning a suppression of the lochia.

An inflammation of the womb is sometimes perfectly distinct, but is more frequently communicated to the peritoneum, Fallopian tubes, and ovaria; and having once begin, the natural functions of the organ become much disturbed, which greatly adds to the disease.

It is oftener met with in women of a robust and plethoric habit than in those of lax fibres and a delicate constitution, particularly where they have indulged freely in food of a heating nature, and in a use of spirituous liquors. It never prevails as an epidemic, like puerperal fever, for which it has probably often been mostaken; and to this we may, with some reason, ascribe the difference in the mode of treating the disease, which has taken place among physic ans.

An inflammation of the uterus shews itself usually about the second or third day after delivery, with a painful sensation at the bottom of the belly, which gradually increases in violence, without any kind of intermission. On examining externally, the uterus appears much increased in size, is hard to the feel, and, on making a pressure upon it, the patient experiences great soreness and p in.

Soon afterwards there eusues an increase

in heat over the whole of the body, with pains in the head and back, extending into the groins, rigors, considerable thirst, nausea, and vomiting. The tongue is white and dry, the secretion of milk is usually much interrupted, the lochial discharge is greatly diminished, the urine is high-coloured and scanty, and if the inflammation is extended to the bladder, is then so totally obstructed as to render the use of a catheter necessary; the body is costive, and the pulse is hard, full, and frequent.

These are the symptoms which usually present themselves, when the inflammation does not run very high, and is perfectly distinct; but when it is so extensive as to affect the peritonæum, those of irritation then generally succeed, and soon destroy

the patient.

Uterine inflammation is always attended with much danger, particularly where the symptoms have ran high, and the proper means for removing them have not been timely adopted. In such cases, it may terminate either in suppuration, scirrhus,

or gangrene.

Frequent rigors, succeeded by flushings of the face, quickness and weakness of the pulse, great depression of strength, delirium, and the sudden cessation of pain and soreness in the region of the abdomen, denote a fatal termination: on the contrary, the ensuing of a gentle diarrhæa, the lochial discharge returning in due quantity and quality, the secretion of milk recommencing, and the uterus becoming gradually softer and less tender to the touch, with an abatement of heat and thirst, prognosticate a favourable issue.

When shiverings attack the patient, after several days continuance of the symptoms, but little relief can be afforded by medicine, the event being generally fatal. In this case, the woman emaciates and loses her strength, becomes hectic, and sinks under colliquative sweating, or purging.

Upon opening the bodies of women who have died of this disease, and where it existed in a simple state, little or no extravasated fluid is usually to be met with in the cavity of the abdomen. In some instances, the peritonmal surfaces have been discovered free from the disease; whilst

in others, that portion which covers the uterus and posterior part of the bladder has been found partially inflamed. The inflammation has been observed, in some cases, to extend to the ovaria and Fallopian tubes, which, when cut open, are often loaded with blood. The uterus itself usually appears of a firm substance, but is larger than in its natural state, and, when cut into, a quantity of pus is often found. Gangrene is seldom, if ever, to be met with.

HYSTEROCELE, (From usea, the womb, and knan, a tumour.) An hernia of the womb. This is occasioned by violent muscular efforts, by blows on the abdomen at the time of gestation, and also by wounds and abscesses of the abdomen which permit the uterus to dilate the part. Ruysch relates the case of a woman, who, becoming pregnant after an ulcer had been healed in the lower part of the abdomen, the tumid uterus descended into a dilated sac of the peritonæum in that weakened part, till it hung, with the included fœtus, at her knees. Yet, when her full time was come, the midwife reduced this wonderful hernia, and in a natural way she was sately delivered of a son.

HYSTEROCISTICUS. (From usiga, the womb, and wusis, the bladder.) Applied to a suppression of urine from the pressure of the uterus against the neck of the blad-

der.

Hysteron. (From v5:gos, afterwards; so named because it comes immediately after the fœtus.) The placenta.

HYSTEROPHYSA. (From υσεξα, the womb, and φυσα, flatus.) The womb distended

with air.

HYSTEROPTOSIS. (From υσεφα, the womb, and πιπίω, to fall.) A bearing down of the w mb.

HYSTEROTOMY. (From υσειζα, the womb, and σεμνω to cut.) See Casarian

operation.

HYSTRICIASIS. (From vsgiz, a hedgehog, or porcupine.) A disease of the hairs, in which they stand erect, like, porcupine quills. An account of this rare disease is to be seen in the *Philosophical Transactions*, No. 424.

HYSTRICIS LAPIS. See Bezoar porcinum. HYSTRITIS. See Hysteritis.

BERIS. (So named from Iberia, the place being but partially diffused, and in having of its natural growth.) 1. The name of a genus of plants in the Linuxan system. Class, Tetradynamia. Order, Siliculosa.

2. The pharmacopeial name of the plant

which is also called Cardinantica. The Lepidinm iberis of Linnæus. Sciatica cresses. It possesses a warm, penetrating, pungent taste, like unto other cresses, and is recommended as an antiscorbutic, antiseptic, and stomachic.

IBIRACE. See Guaiacum.
IBIRACUM. A wild species of liquorice found in Brasil.

IBIRA PATANGA. Logwood.

IBIS. Ific was a bird much like our kingfisher, taken notice of by the Egyptians, because, when it was sick, it used to inject with its long bill the water or the Nile into its fundament, whence Langius, lib. ii. ep. ii. says they learned the use of clysters.

(From isis, the stork, who was IBISCUS. said to chew it, and inject it as a clyster.)

Marshmallow.

IBIXUMA. (From ιζισκος, the mallow, and ιζος, glue; so named from its having a glutinous leaf, like the mallow.) The soaptree, or Supmaria Arbor.

ICE. Glacis. Water made solid by the application of cold. It is frequently applied by surgeons to resolve external inflamma-

tory diseases,

ICHOR. (Ixag.) A thin, aqueous, and

acrid discharge

ICTHYA. (1χθυες, a fi-li-liook; from ιχθυς, a fish.) The skin of the Squatina, or monkfish: also the name of an instrument like a

fish-hook, for extracting the fætus.

ICHTHYOCOLLA. (From ιχθυς, a fish, and MANA, glue ) Colla piscium. Isinglass. Fish-glue. A substance, partly gelatinous, and partly lymphatic, which is prepared by rolling up the air-bladder of the Accipenser strurio of Linnæus, and several other fishes, and drying it in the air, after it has been twisted into the form of a short cord, as we receive it. It affords a viscid jelly by ebullition in water, which is used in medicine as an emollient in disorders of the throat, intestines, &c

ICHTHYOSIS-(From ιχθυα, the scale of a fish; from the resemblance of the scales to those of a fish.) A genus of disease of the second order of Dr Willan's diseases of the skin. The characteristic of ichthyosis is a permanently harsh, dry, scaly, and, in some cases, almost horny texture of the integuments of the body, unconnected with internal disorder. Psoriasis and Lepra differ from this affection, in
